Background: Lebanon is a Mediterranean country located at the crossroads of the three continents of the ancient world. Its population is estimated to be around 4.5 million inhabitants. From its beginnings with the Phoenicians more than 7000 years ago, the country has evolved through numerous empires. This has led to the development of a multi-religious, multi-cultural, multi-lingual country that includes approximately 18 different religions, including Christian, Muslim, and Druze, living on 10,452 km2 of land. The Lebanese medical education system is highly regarded in the Middle East, and many students from the region come to Lebanon to study medicine. The aim of this study is to assess whether the multi-cultural, multi-religious dimension impacts on the medical education system.

Method: The descriptive data were collected from the medical schools' institutional website. The analysis was performed by the authors.

Results: Currently, there are seven medical schools in Lebanon, which represent the highest ratio of medical schools to population among countries in the region. Ownership: only one school is public, all of the remaining medical schools are privately owned, with tuition fees. Language of instruction: Although Arabic is the country's official language, medicine is taught in either English (4) or in French (2), with one using both.

Pathways to a medical degree: Lebanon is among the rare countries where we have 2 pathways; indeed students can choose to:

- take a seven-year undergraduate medical degree (MD) as a first tertiary degree directly after secondary school graduation. This "French system" is adopted in 4 schools.
- or first complete a bachelor's degree (three years, usually in the medical sciences) and then apply for a four-year MD program. 3 schools have opted for the "American system"

Conclusion: This study clearly demonstrates the profound impact of the societal structure on the medical education system. In one country, different pathways can both lead to excellence, despite some challenges.

Take-home message: The diversity of medical training programs in Lebanon reflects the "mosaic" of the society. The challenge is to unify medical curricular content and to establish a national numerus clausus.

Assessment strategies based on mainstream education – a systematic review of their impacts in nursing programs

Authors
Frederic Douville, Université Laval, Quebec City, Canada
Miriam Lacasse, Université Laval, Quebec City, Canada
Marie-Pierre Gagnon, Université Laval, Quebec City, Canada
Kathleen Lechasseur, Université Laval, Quebec City, Canada

Presenter: Frederic Douville, Université Laval, Quebec City, Canada

Background: Over the last decade, the number of students experiencing disability and/or needing accommodations has increased. University programs in health sciences have to adapt to the growing number of students with disabilities. In order to ensure the success of the largest number of students, many university nursing programs have opted to incorporate mainstream education in their curriculum development. Many studies identified mainstream learning strategies; however, mainstream assessment strategies are not summarized. This systematic review aims to identify the impact of mainstream education assessment strategies in nursing programs.

Method: The databases Education Source, ERIC, Cinahl, Embase, Medline, and PsycINFO were searched until March 2017 for studies evaluating mainstream teaching strategies for nursing students with disabilities. Stufflebeam's CIPP model guided data extraction, which followed the PRISMA statement. The synthesis of extracted evidence is illustrated through descriptive statistics.

Results: Of the 16344 screened titles, 56 studies promoting mainstream education for nursing students were identified. Only 6 studies reported on mainstream assessment strategies. The most frequent assessment strategy was the use of online exams (n=5). However, most studies did not report the information needed to compute their efficacy due to the sample size and to methodological design. No program evaluation of these assessment strategies has addressed context, input and process, but most studies have addressed products (students' satisfaction 50% and effectiveness assessment 83%). Mainstream assessment strategies have increased students' confidence and clinical skills, these strategies appear to be leading to a decrease in the attrition of students in training and an increase in the success of the entrance examination to the profession.

Conclusion: The effectiveness of assessment strategies based on mainstream education is seldom reported in the literature, despite a wide range of studies evaluating learning strategies inspired from mainstream education approach for nursing students. These studies focus mainly on a large diversity of teaching methods to meet the need for student inclusion, but few assessment strategies other than online exams are reported. Mainstream assessment

strategies would benefit from more rigorous evaluation methods to ensure good knowledge translation and appropriate educational decision to improve nursing programs.

"We are all so different that it is just … normal."
Normalization practices in an academic hospital in Netherlands

Authors
Hannah Leyerzapf
Petra Verdonk
Halleh Ghorashi
Tineke Abma

Presenter: Hannah Leyerzapf, VU University Medical Center, Amsterdam, Netherlands

Background: To link up with plural society and diverse patient populations, academic hospitals internationally focus on cultural diversity and diversification of the work force. However, although medical student populations are relatively diverse, cultural minority professionals in academic medicine are underrepresented and especially in leading positions. Leading professionals report difficulties with recruitment, selection and retention of minority. Earlier studies show how undergraduate minority students are met with micro-aggressions by majority teachers and students. In particular, minority experience exclusion upon entering the clinic and have difficulty entering postgraduate education. Insight in workplace interactions is lacking yet may explain this status quo.

Method: An ethnographic study on clinical wards in a Dutch academic hospital performed participant observations (approx. 100 hours) and interviews (n= 62) with majority and minority medical, care, supportive and paramedical staff.

Results: Professionals engaged in normalization practices that (re)produced dominant norms of professionals as neutral and professionalism/quality as objective. With this, diversity was rendered irrelevant in a work context and made into being only about 'The Other'. Hence, diversity issues as experiences of exclusion of minority were ignored. Simultaneously, through normalization, an ideal worker norm that constituted being male, from higher socio-economic background, heterosexual and white was (re)produced. Majority and minority professionals disciplined themselves and each other in fitting this ideal worker norm in order to qualify as professional. As a result, seemingly 'same/normal', generally majority, professionals more easily fitted into the image of the ideal worker and were seen as qualified, while others, generally minority, were identified as 'different' and had more difficulty fitting into this image and qualifying.

Discussion and Conclusions: Professionals normalize and legitimize unequal distribution of privilege for majority and disadvantage for minority professionals in the academic hospital. A societal exclusivist ideal of equality-as-sameness supports the normalization of professionals as 'same'/professional or 'different'/unprofessional. Unsettling these normalization practices is thus key in quality improvement of medical education.

Take-home message: For structural inclusion of diversity in academic hospitals in Netherlands and beyond, policy makers, supervisors and students need to critically review and challenge professionalism norms of neutrality and the underlying social hierarchies.

Teaching modes and social-epistemological dimensions in Medical Massive Open Online Courses

Authors
Renée A Hendriks, Leiden University Medical Center, Leiden, Netherlands
Peter GM de Jong, Leiden University Medical Center, Leiden, Netherlands
Marlies EJ Reinders, Leiden University Medical Center, Leiden, Netherlands

Presenter: Marlies E J Reinders, Leiden University Medical Center, Leiden, Netherlands

Background: Massive Open Online Courses (MOOCs) are a new way of delivering medical education. They also offer opportunities for including high quality materials in regular classroom teaching. To our knowledge, modes of instruction, interaction, and assessment in medical MOOCs have not been studied in detail before. Furthermore, social and epistemological dimensions have hardly been described for medical MOOCs. To inform decisions about including MOOCs in classroom teaching, insight in teaching modes and social and epistemological dimensions is desired.
Method: An overview of MOOCs on a medical topic has been compiled using the course search engine www.class-central.com. Inclusion criteria for the study were: medical condition in title; English language; course available between September 2017 and February 2018; no course fees; and target group does not exclude students. Data collection consisted of the investigators enrolling in selected MOOCs and analyzing instruction, interaction and assessment modes after thorough examination of all course pages. Materials were categorized in social and epistemological dimensions according to the Teaching Approach Framework.
Results: The overview consisted of 410 medical MOOCs; 35 were included based on the criteria above. Data analysis of 19 MOOCs shows the following modes of instruction: video (100%), readings (95%), slideshows (42%) and illustrations (37%). Games were only used in 16% of the MOOCs. Regarding interaction, 84% of the MOOCs provide a forum. In 47% faculty participate in Q&A forums, but only in 5% staff is active on discussion boards. For assessment, all MOOCs use multiple choice questions, while essays are used in 37%. 74% of the courses offer formal assessment. All MOOCs offer materials with individual-objectivist approach, beside group-objectivist (53%), group-constructivist (53%) and individual-constructivist (32%) approaches.
Conclusion: Medical MOOCs contain a rich variety of teaching modes of which videos, discussion boards and multiple choice questions are used regularly. Prior research has indicated that MOOC teaching approaches focus mostly on objectivist views of knowledge; this study shows that in medical MOOCs constructivist approaches are also well represented. Both findings are of interest when innovating classroom teaching.
Take-home message: Medical MOOCs offer materials and teaching approaches to innovate classroom teaching.

Creating a 4-year Learning Management System for a Geographically Dispersed International Medical School

Authors
Joy Checa, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
Robert Hecht, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antillies; Florida Atlantic University Charles E. Schmidt College of Medicine, Boca Raton, USA; Nova Southeastern University College of Allopathic Medicine, Davie USA
Steve Ash, American University of the Caribbean School of Medicine, Sint Maarten, Netherland Antilles; Ealing Hospital, Southall UK
Ian Scobie, American University of the Caribbean School of Medicine, Sint Maarten, Netherland Antilles
Kimberly Kirkland, American University of the Caribbean School of Medicine, Sint Maarten, Netherland Antilles
Julie Taylor, American University of the Caribbean School of Medicine, Sint Maarten, Netherland Antilles; The Warren Alpert Medical School of Brown University, Providence, USA

Presenter: Joy Checa, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles

Background: American University of the Caribbean School of Medicine (AUC) is an international medical school with its medical science campus in St. Maarten and clinical sites throughout the USA, Canada, and UK. The geographic distribution of the student body often times has made the medical school feel like two separate programs. To further that divide, the medical and clinical courses were housed on two different learning management systems (LMS), limiting student and faculty access to information and resources.
Method: AUC underwent an extensive review of LMS options to find one that fit the needs of multiple international locations and the identity and feel of the university. Canvas was selected and a year-long process was developed and implemented to move and update courses from multiple LMS into one, along with a revised clinical curriculum.
Due to a hurricane that devastated the island of St. Maarten, the medical sciences portion of the LMS was delayed and will be completed in September of 2018. The clinical sciences portion of the LMS has been created and launched January 1st, 2018. Training of students, faculty and staff across three continents has been completed. Initial feedback from faculty and students is positive. Statistical information on student and faculty access is currently being collected.
Discussion: With increasing integration of medical and clinical sciences, it makes sense to combine those courses and materials into one LMS, especially if the students are

geographically dispersed. With Canvas students can refer to the medical science lectures when they encounter a patient in the hospital with a disease they learned about in their first year. This allows students to build upon their medical science knowledge and integrate clinical presentations and management, further strengthening the academic program and their understanding.

Conclusion: LMS can help students and faculty feel connected although they may be physically in different locations. The benefits of one LMS for all four years of a program are continuity, ease of use, better understanding of expectations, and most importantly the ability to review previous courses and material to strengthen medical knowledge.

Embedded e-learning in the presentation of professional communication skills – system-driven feedback improves students' identification of professional communication skills

Authors
Wolf Langewitz, University Hospital, Basle, Switzerland
Theresa Tondorf,University Hospital, Basle, Switzerland
Christof Daetwyler, Drexel Medical School, Philadelphia, USA
Christoph Becker,University Hospital, Basle, Switzerland
Michael Wilde, Deans Office, Medical Faculty, Basle Switzerland
Sabina Hunziker,University Hospital, Basle, Switzerland

Presenter: Christof Daetwyler, Drexel Medical School, Philadelphia, USA

Background: Peer-learning and learning from senior role models are major sources in the acquisition of professional behaviours (Glynn 2006; Hulsman 2013; Ten Cate 2009; Overeem 2012). However, in order to profit from professional behaviour of others, students must first be able to identify moments in which target behaviour is displayed.

Method: We developed a web-based interactive platform that asks students to identify elements of professional communication and offers immediate feedback on their performance. Second year medical students were shown two videos, in which a doctor displayed certain communication techniques. Their task was to mark segments on a time bar below the video when certain target behaviours occurred (e.g. echoing; mirroring on emotion; explicit structuring of the consultation). Prior to the exercise they had received 3 x 2 hours of lectures on patient-centred communication and seen video with embedded comments explaining when and why a doctor used certain communication skills. Students' marks were registered in a SQL data file, immediate feedback was given showing whether a mark was correct or not. Students had to finish at least two attempts to get credits. We investigated whether the exercise improved students' ability to identify professional communication.

Results: Data from all 171 2nd year students were analysed with a combination of correct responses and unsuccessful attempts. For video 1 percentage of correct hits (± SD) between trial 1/2 was: 68.5(22.2)/82.1(17.6) for explicit structuring, 89.8 (22.0)/97.8(12.1) for summarising,

25.0(63.4)/43.5(60.0) for mirroring. Video 2 corroborated these results, furthermore an example of echoing was added that students found difficult to identify with 36.6(67.5)/68.4(65.8) percent, respectively; paired T-test yielded differences between trial 1 and 2 always $p < 0.01$ except for summarising in video 2 because of a ceiling effect.

Conclusion: After using the web-based training module students are better able to identify professional communication behaviour; this will improve their chances to learn from peers and senior role models. Teachers learn which techniques students find difficult to recognise, enabling them to launch refresher lectures focussing on problem techniques.

Take-home message: Providing system-driven feedback on students' performance improves recognition of professional communication behaviour

7O4 (3498)
Joint Action Between University and Governmental Organisation as Opportunity to Develop Digital Competencies for Health Professionals

Authors
Juris Barzdins, University of Latvia, Riga, Latvia
Evija Palceja, University of Latvia, Riga, Latvia
Jana Lepiksone, Centre for Disease Prevention and Control, Riga, Latvia
Santa Pildava, Centre for Disease Prevention and Control, Riga, Latvia

Presenter: Juris Barzdins, Centre for Health Management and Informatics, Faculty of Medicine, University of Latvia, Riga, Latvia

Background: Recently launched course in studies of medicine at the University of Latvia (UoL) introduces students to administrative operational and financial data that are needed to analyse the efficiency of healthcare delivery. For attendees with advanced interest in organisational aspects of health care, the lack of access to real data appears to be an obstacle to develop respective digital competencies.

Method: With the dual aim - to promote the organizational research opportunity during the professional studies in medicine, and to develop a more data-driven healthcare system, in 2016 UoL and the Centre for Disease Prevention and Control initiated a join project "Transparency and health care system data - towards public monitoring for quality and efficiency".

Results: Since the start of the project, the integration of data over last three years to specially designed analytical database has already been realised and the practical task of identification, description and initial validation of performance indicators has begun. As the process for the adaptation of the legal framework is still ongoing, the access to integrated data and, therefore, the involvement of students and health professionals in health services research is still limited.

Discussion: The increasing awareness and understanding from both health professionals and policy-makers on the value of physicians' involvement in health services

performance assessment and research, serves as a solid basis for realization of this important project.

Conclusion: This collaboration represents an innovative approach to partnership between the university and a governmental organization. It also points to the simultaneous need for the development of the digital competences for physicians and to extend the ability to apply these competences to organizational improvements in healthcare.

Take-home message: The professional autonomy of physicians for independent bedside decisions is increasingly linked to the responsibility for the balance of clinical and resource dimensions of the whole organization. This is a profound change in the medical profession, and it demands the integration of targeted training for new competencies into medical curricula.

7O5 (2181)
The patient, the doctor and the computer: Understanding and incorporating computer-related communication skills in medical education

Authors
Kirsten G Engel, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark
Lisa D Christensen, Rigshospitalet, Copenhagen, Denmark
Anne Mette Mørcke, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Presenter: Kirsten G Engel, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Background: The widespread implementation of electronic medical records (EHR) poses challenges, as well as opportunities, with respect to the patient-physician relationship. In recent years, there has been a growing focus on computer-related communication skills in medical school; however, additional insight is needed to guide its integration into the curriculum. The perspectives of key stakeholders are vital to decision-making regarding the content, structure and timing of medical education in this area.

Method: This project is a qualitative study involving observation at two hospitals in the Capital Region of Denmark, as well as focus groups. We observed medical students for approximately 20 hours during direct patient interactions within both surgical and medical subspecialties. In addition, four focus groups are being conducted with three distinct populations: patients with chronic diseases, medical students, and experts in education and communication. Observation field notes and focus group transcripts are being analyzed with qualitative techniques for content analysis.

Results: Preliminary results indicate that students frequently choose to separate their computer-related and patient care responsibilities. However, in ambulatory settings these tasks typically coincide, and students face practical and personal challenges in providing patient-centered communication, while fulfilling their documentation obligations. Patients identify several specific strategies which providers use to effectively balance patient communication and computer-related activities. In addition, they highlight improved information

access and technology-facilitated patient engagement as opportunities for physicians to enhance interactions with patients. Patients advocate that medical student education should focus first on teaching patient-centered communication and, thereafter, the integration of computer-related skills. Results from additional focus groups are forthcoming.

Conclusion: Clinical observations and the perspectives of key stakeholders provide valuable guidance regarding the incorporation of computer-related communication skills into the medical school curriculum. Medical students must not only acquire strategies for managing the challenges that are associated with computer use, but also learn to take full advantage of opportunities which technology provides to enhance patient-centered communication.

Take-home message: The widespread presence of computers during patient-physician encounters necessitates thoughtful modifications in medical education to ensure effective coupling of demands for clinical efficiency and patient-centered care.

Strengthening medical education with offline, self-directed e-learning in a low-resource setting in Zambia, Africa

Authors
Sandra Barteit, Heidelberg University, Institute of Public Health, Heidelberg, Germany
Annel Bowa, Chainama College of Applied Sciences, Lusaka, Zambia
Geoffrey Chileshe, Chainama College of Applied Sciences, Lusaka, Zambia
Gregory Malunga, Chainama College of Applied Sciences, Lusaka, Zambia
Henry Barigye, SolidarMed, Swiss Organisation for Health in Africa, Switzerland
Florian Neuhann, Heidelberg University, Institute of Public Health, Heidelberg, Germany

Presenter: Sandra Barteit, Heidelberg University, Institute of Public Health, Heidelberg, Germany

Background: Zambia has an unmet demand for qualified medical personnel, particularly in remote areas. In 2002, Chainama College of Health Sciences (CCHS) introduced the medical licentiate practitioner (MLP) program. MLPs are placed primarily in rural Zambia to provide key clinical responsibilities. The 3-year in-service training largely takes place as on the job training in decentralized teaching hospitals and is challenged by staff shortages and high workload of medical consultants at practicum sites, as well as insufficient learning materials on location. Addressing these challenges, a self-directed e-learning platform was introduced to supplement teaching and learning for MLP students.

Method: The MLP e-learning platform was evaluated. The principal questions to be answered were: how adequate the employed technology is, how students use the e-learning platform, how it enables them to learn, how useful learning materials are and what challenges were encountered.

Results: The e-learning intervention proved feasible, and the evaluation pointed to shortcomings such as quality and quantity of e-learning materials (more interactive materials, more multimedia materials), the involvement of medical teachers in the development of materials, as well as e-learning and tablet training for students and staff. The e-learning platform was actively used, especially as a reference during ward rounds and to prepare for the final exam. Involvement of medical teachers in peer-review and development of e-learning materials remains challenging. Evaluation results confirm a successful implementation of the medical e-learning platform in this resource low-environment by employing readily available open-source software and low-priced but qualitative hardware. Our evaluation findings show that the technological framework (e-learning, tablets) is useful and supportive to students and well received and accepted by students and medical teachers, while also identifying challenges. Students reported using the e-learning platform for their daily medical practice, also in remote areas.

Conclusion: We want to emphasize that medical e-learning needs active local support, active involvement of medical teachers, ICT support and ongoing evaluation. Medical e-learning can be a beneficial and enabling tool, especially for low-resource settings, but requires high upfront investment and ongoing support.

7P1 (1482)
Students' motivation in the clinical setting

Authors
Eliane Ayoub, USJ, Beirut, Lebanon
Joanna Tohme, USJ, Beirut, Lebanon
Nicole Naccache, USJ, Beirut, Lebanon
Fady Haddad, USJ, Beirut, Lebanon
Elie Nemer, USJ, Beirut, Lebanon

Presenter: Eliane Ayoub, Saint-Joseph University medical school (USJ), Beirut, Lebanon

Background: Students enter medical school with internally or externally generated motives. The intrinsic motivation relies on three basic psychological needs for autonomy, competence and relatedness. Clinical training plays a major role in shaping students' knowledge and experience.
This study aims to determine factors that motivate students during the clinical clerkship phase.
Method: Medical students in 6th or 7th year were included in a survey regarding students' motivational profile. We evaluated reasons they choose medicine, impact of their preclinical training (from the second till fifth year), the importance of a reflexive approach during their clerkship and teachers' implication in their motivation. The school's Ethics committee approved the study.
Results: Seventy seven medical students (65%) answered to the survey. Statistical analysis was performed using the SPSS software version 22. Quantitative variables were represented by their means, medians and standard deviations. The students indicated their level of agreement with each item according to a 5-point Likert scale. The motivational profile of our students was self-determinated (4,35). The importance of a reflexive approach during their clerkship (4,05) and teachers' implication in their motivation (3,63).
Factors associated with higher intrinsic motivation were: choosing medicine for humanitarian causes, choosing a surgical specialty, importance of early contact with patients, the diversified training ground, and supervision by experts in pedagogical approach.
Students' motivation and involvement in their practice is mainly self-determined. However, it is important to promote motivational dynamics, and according to this study's results, motivation is increased by supporting a reflexive approach in clinical situations.
Conclusion: Students' motivation is very closely related to the pedagogical quality of the clinical training. Therefore, it should be a major concern to improve it. It is important to encourage early contact of medical students with patients and to incarnate to fundamental principles of authenticity of the context and cognitive companionship. A parallelism between a medical professional and a professional in sports discipline can de drawn; both

achieve a high level of professionalism, through intensive practice and coaching both practical and theoretical, and starting from a young age.

7P2 (3018)
The Learning and Study Strategies Inventory (LASSI): Skill, Will, and Self-Regulation Among Medical Students at Alfaisal University in Riyadh, Saudi Arabia

Authors
Maram Alrefai, Alfaisal University, Riyadh, Saudi Arabia
Walaa Elsekaily, Alfaisal University, Riyadh, Saudi Arabia
Sara Ahmed, Alfaisal University, Riyadh, Saudi Arabia
Lamya Alrayes, Alfaisal University, Riyadh, Saudi Arabia
Peter cahusac, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Maram Alrefai, Alfaisal University, Riyadh, Saudi Arabia

Background: The Learning and Study Strategies Inventory (LASSI) is a 5-scale, 60-item assessment of students' awareness about use of learning and study strategies related to Skill, Will, and Self-regulation components of strategic learning. The LASSI is a valid and an effective tool to measure students learning techniques, the feedback from which can help improve their academic performance.
Method: Students from years 1 to 5 filled out the 60-item questionnaire online and were asked to give details about their GPA, academic year, gender, and high-school education background. Students chose their preferred answers on a 5-point likert scale (1 = not at all typical of me, 5 = very typical of me) on topics of Skill (split into Information Processing, Selecting Main Ideas, Test Strategies), Will (split into Attitude, Motivation, Anxiety) and Self-regulation (split into Concentration, Time Management, Self-testing, Using Academic Resources).
Results: A total of 109 responses were received. Study skills were generally high, however, Test-taking strategies scored relatively low (M:62%, F:60% selected 1 or 2 on the Likert-scale). 63% of students carried out proper Self-regulation in the form of Concentration, but just 38% and 22% used available resources and self-testing methodologies respectively. Of most significance was the Will component of the study, which showed that highly-motivated students had a much higher GPA (3.60 vs 3.51). All 60 questions have also been compared and correlated with GPA, gender, academic level, and high-school education background.
Medical students are generally well adapted to use appropriate study skills and self-regulation skills. Those scoring higher in these categories have better academic success. Additionally, the will component results showed that students who have a good anxiety management have higher motivation which leads to higher academic performance.
Conclusion: The several factors looked at in the LASSI provide us a unique insight into the studying strategies of any given student. Students can find out their strengths and weaknesses and get feedback on where they can improve. More importantly, specific programs and courses can be implemented at institutions to help students achieve their desired level.

7P3 (3236)
The concept of emotional intelligence at King Saud bin Abdulaziz University for Health Sciences at Saudi Arabia

Authors
Afnan Khoja, King Saud bin Abdulaziz University for Health Sciences, Jeddah, Saudi Arabia
Linda Jones, Univeristy of Dundee, Dundee, UK

Presenter: Afnan Khoja, King Saud bin Abdulaziz University for Health Sciences, Jeddah, Saudi Arabia

Background: Emotional intelligence (EI) is a personal characteristic that enables persons to monitor their own and others' emotions (Mayer, 1997). Fostering EI is important for developing the medical students. Where it helps to maintain professional values in medicine, such as self-regulation and effective patient–doctor relationships (Arora et al., 2010; Cherry et al., 2014), which enhances patient satisfaction (Ravikumar et al., 2017; Weng et al., 2011).
Three objectives were initially identified: to identify the extent to which EI is understood by students and faculty at KSAU-HS; to identify similarities and differences in perceptions of EI among participants; and to identify models for developing EI education. A secondary objective was outlined to identify EI from the medical educator's perspective at UOD.
Method: Semi-structured elite interviews were conducted with two medical educators, from KSAU-HS and UOD. Focus group discussions were also undertaken with fifteen medical students at KSAU-HS. During which both students and the medical educators discussed the three research questions about their perspectives and the suggested model for EI development. A thematic analysis was then carried out using the interview transcripts.
Results: Four main topics were identified from respondents' comments: participants' understanding of EI and its benefits, what participants thought about EI within current curricula and recommended approaches to developing EI. The findings suggest that few students had encountered EI, but medical educators were familiar with the concept. All participants agreed that EI is not explicitly stated in curricula at either institute.
Conclusion: These findings emphasise the importance including EI in formal curricula, using the spiral curriculum and development methods, such as reflective practices, role modelling and faculty development. The findings suggest that the spiral curriculum, reflective practices, role modelling and faculty development are optimal approaches for developing EI at educational institutes. It was also clear from the study's interview sessions, which introduced EI to participants, that students and faculty are keen to explore EI further.
Take-home messages:
- Encourage state EI within the formal curricula.
- Further study is needed to explore the applicability of EI within KSAU-HS.

7P4 (3284)
Can Self-Efficacy Predict First Year Medical Students' Academic Success?

Authors
Jennifer L Volberding, Oklahoma State University Center for Health Sciences, Tulsa OK USA
Jana Baker, Oklahoma State University Center for Health Sciences, Tulsa OK USA

Presenter: Jennifer Volberding, Oklahoma State University Center for Health Sciences, Tulsa, USA

Background: Self-efficacy (SE), the ability for an individual to believe in their own capabilities, has been connected to an individual's ability to succeed, deal with resistance and failures, and cope with challenges, all skills that are essential for competent physicians. SE has been found to have a positive impact on college student academic performance, but has not been evaluated in medical students. The purpose of this study was to measure first year medical students' SE and to determine what characteristics impacted their academic success in their first semester of medical school.
Method: 61 (29 male, 32 female) first year medical students at a single osteopathic medical school were asked to complete the SE scale and additional demographics. Data was combined with undergraduate (UG) GPA, MCAT score, first semester GPA, and class rank. Basic descriptives, means, standard deviations, and pearson correlation values were calculated.
Results: Four variables were found to be significantly correlated with first semester GPA (level of athletic performance of UG $r=.311$, $p=.015$; number applications submitted $r= -.414$, $p=.000$; UG GPA $r=.488$, $p=.000$; science GPA $r=.467$, $p=.000$) and three with class rank (number applications $r=.355$, $p=.005$; UG GPA $r= -.483$, $p=.000$; science GPA $r= -.495$, $p=.000$). General SE was significantly correlated to the size of hometown ($r=.256$, $p=.049$). This study determined that medical students' first semester academic success was better predicted by academic preparation rather than a student's self-efficacy. This is in contrast to current undergraduate literature that demonstrates a significant impact on GPA and retention. Self-efficacy may therefore be more applicable to astute clinical skills rather than pre-clinical academic performance.
Conclusion: While this study did not find SE to be a predictor of first year medical student academic performance, the ability to control thoughts, feelings, and actions in stressful situations is critical to overall success as a physician. Academic programs should seek out options to assess and improve these skills prior to entering the clinical setting.

7P5 (1248)
Emotional Quotient in Iranian Nursing Students: a descriptive cross-sectional study

Authors
Marzieh Hasanpour, NIDCAP Professional, Department of Newborn Intensive Care and Pediatric Nursing, School of Nursing and Midwifery, Tehran University of Medical Sciences, Tehran, Iran
Maryam Bagheri, Department of Nursing, Nursing and Midwifery Care Research Center, Faculty of Nursing and Midwifery, Isfahan University of Medical Sciences, Isfahan, Iran
Fatemeh Ghaedi Heidari, Department of Nursing, Nursing and Midwifery Care Research Center, Faculty of Nursing and Midwifery, Isfahan University of Medical Sciences, Isfahan, Iran
Akbar Hasanzadeh, Department of Statistics and Epidemiology, Faculty of Health, Isfahan University of Medical Sciences, Isfahan, Iran

Presenter: Marzieh Hasanpour, School of Nursing and Midwifery, Tehran University of Medical Sciences, Tehran, Iran

Background: Nursing is a profession which deals with people directly on a day to day basis. Training the nursing students as future professional nurses is always a major concern of the nursing centers globally. Emotional Quotient is important in both personal and professional aspects of life (Thomas & Natarajan 2017)). As, EQ has an important potential role in nursing education and is necessary for personal mental health and professional practice. The aim of this study was to assess the emotional quotient nursing students in the one of University of Medical Sciences in Iran.
Method: This was a descriptive cross-sectional study. The study population included 169 nursing students who were selected using proportionate stratification. Data were collected by a questionnaire that consisted of two parts: demographic characteristics and "Bar-On EQ-i" questionnaire which included 90 questions and 15 subscales. Data analysis was conducted using description statistics tests (mean, frequency, standard deviation) and inferential statistical tests with SPSS 16.
Results: The finding of this study revealed that the nursing students' EQ mean score was 336.53(33.08). In addition, the results showed significant correlations between the score of EQ in nursing students with their married status (P= 0.02, t = 2.21) and academic term (P= 0.05, r = 0.15), and also, there was significant differences between the score of EQ in different levels of education from Bachelor's to Doctoral Degrees (P< 0.05). As well as, findings of study indicated significant correlations for some of subscales of EQ in nursing students such as empathy, responsibility, reality testing, stress tolerance and optimism (P < 0.05).
According to finding of this study, considering that emotional Quotient/Intelligence is important for high quality professional care and the necessity of fostering this concept in nursing students is so clear.
Conclusion: Therefore, researchers recommended an appropriate educational program consistent to level of academic degrees of students to improve EQ during of their study. It could be effective in promoting the health care systems and improving the services provided by nurses with high level of EQ in the future.

Evolution of medical students´ learning strategies in a competency-based undergraduate curriculum. Results from a cross sectional study

Authors
Asja Maaz
Sarah Hiltner
Marta Gogluska-Obirek
Harm Peters

Presenter: Asja Maaz, Charité-Universitaetsmedizin Berlin, Germany

Background: Fostering lifelong learning is one of the central aims of competency-based medical education. The use of different learning strategies reflects the interaction between personal (individual) and curriculum-related (situational) factors. There is limited empirical information on how learning strategies of medical students are influenced by competency-based curricula and their teaching formats.
Method: The learning strategies of medical students were examined in a voluntary cross sectional study at the Charité- Universitätsmedizin Berlin, Germany. Students were in the early (year 1/ 2: predominance of PBL) and later stages (year 4/ 5: predominance of bedside teaching) of their studies in a competency-based undergraduate program. Learning strategies were assessed by an established quantitative questionnaire for life-long learning on a five-point Likert scale (LIST, Schiefele/ Wild 1996, range -2 = fully disagree over 0 = neutral to 2 = fully agree). The data were analyzed using descriptive statistic measures.
Results: A total of 489 medical students (response rate 65%, 65% female) provided information. Overall, the results indicate that the medical students are employing primarily deep learning strategies independent of the year of studies. The deep learning strategies mainly used are "Elaboration" (year 1+2: M=2.03, SD= 0.58; year 4+5: M= 2.68, SD= 0.59) and "Metacognition" (year 1+2: M= 2.52, SD= 0.55; Year 4+5: M=2.46, SD= 0.49). The internal resource-oriented learning strategy "Effort" was employed to a lesser degree (Year 1+2: M=2.48, SD= 0.68; Year 4+5: M= 2.41, SD=0.7). Use of collaborative learning strategies decreases over the course of studies (year 1+2: M= 0.55; SD= 0.81; Year 4+5: M=-0,01; SD= 0.78).
Conclusion: The learning strategies of students seem likely to be already acquired und consolidated before entering medical school. They seem more influenced by individual rather than situational factors such as teaching formats of the curriculum. The analysis of actual student learning strategies provides useful information for faculty teachers and curriculum developers.
Take-home message: Medical students in our competency-based curriculum prefer deep level learning strategies. Collaborative learning plays an insignificant role.

Evaluation of formative assessment practice in medical education

Authors
Youn Seon Lim

Presenter: Youn Seon Lim, Zucker School of Medicine at Hofstra/Northwell, Hempstead, USA

Background: In self-directed learning (SDL) environment, the significance of formative assessment (FA) has been increasingly recognized because FA helps students build their skills for monitoring and assessing their own learning. It has been well observed that congruence should exist between instruction, assessment and outcomes for such positive effects to occur. The rationale for this study was a view that students should be involved in decisions about their FAs in the way of understanding assessment processes and the implications as learners.

Method: This study examined undergraduate medical education (UME) student perceptions and preferences of FAs by administrating two newly proposed theory-based questionnaires. Participating UME students (N = 140) were registered in an SDL-based-curriculum UME program. Factor analyses were conducted to confirm the conceptual model of the questionnaires. The estimates of internal reliability were examined. The validity and reliability of subscale scores were further examined in one-factor structure. Descriptive statistics were estimated to explore student perceptions and preferences of FAs. Mean and median comparison tests were conducted to evaluate gender-based, grade-based, and race-based differences.

Results: The five-factor and four-factor models were fitted well with the questionnaires (medical knowledge FA RMSEA = 0.004 (.004, .080), Cronbach-alpha = 0.840; SDL skill FA RMSEA = 0.012 (.012, .125), Cronbach-alpha = 0.863). The findings reveled that students have overall positive perceptions and preferences towards FAs (mean percentage of negative = 11.76%; mean percentage of positive = 72.54%). Significant between-group differences (gender, school year, race) were observed.

Discussion: The results clearly showed that UME students have overall positive perceptions and preferences on their FAs for their learning. Nonetheless, it suggested that students should be more consulted and informed about the forms of FA tasks; diverse students should be involved in the assessment decision process.

Conclusion: In revealing the multi-dimensions of UME student perceptions and preference, this study can help medical educators and researchers appreciate, not only the values of FAs in UME SDL-learning environment, but beyond. It is suggested that researchers develop a more complete picture of student perceptions and preferences of FAs and corrective feedbacks from diverse UMEs.

7Q: Short Communications: The Teacher

Location: Lima, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

7Q1 NOT PRESENTED

7Q2 (1705)
How can role model attributes be developed in a health professions teacher?

Authors
Ruchith Priyananda, National Institute of Health Sciences, Kalutara, Sri Lanka
Asela Olupeliyawa, University of Colombo, Sri Lanka
Gominda Ponnamperuma, University of Colombo, Sri Lanka

Presenter: Ruchith Priyananda, National Institute of Health Sciences, Kalutara, Sri Lanka

Background: Development as a good role model is essential for a health professions teacher. It is important to identify the strategies which promote such development. Although several studies conducted globally explore attributes of health professions teacher role models, only a few studies explore methods and strategies of their development. Therefore we explored how role model attributes can be developed in a health professions' teacher within the Sri Lankan context.
Method: This qualitative study on role model attributes and their development utilized the phenomenological heuristic design. In-depth Interviews were conducted with 38 teachers and 28 students representing multiple health professions including Medical Laboratory Technology, Nursing, Pharmacy, Dental Therapy, Electrocardiography, Electroencephalography and other categories of Public Health. Framework thematic analysis method was employed. This abstract discusses the findings on role model attribute development.
Results: The findings emphasized the need to embed the development within an outcome based curriculum for teacher training, with role model as an exit outcome. Main strategies and methods suggested for the development of role model attributes were reflective practice with portfolios for the overall development of all attributes; total well being practice including mental training for the development of empathy, compassion and other humanistic qualities; lecture discussions, role plays, case studies & videos to introduce the positive and negative attributes of health professions teachers; and a micro teaching system for the development of teaching skills. Teacher training programs in Health Professions Education should include not only the methods of the development of professional attributes and teaching attributes but also the humanistic attributes such as empathy, sympathetic joy. Meditation of loving kindness, mindfulness practice should be in-cooperated for this purpose. Reflective practice with portfolios should be introduced for all the health professions teachers for the continuing professional development.

Conclusion: Role model attributes should be developed through a well-planned outcome-based approach. Innovative methods such as total well being practice maybe useful.
Take-home message: Practice meditation daily to improve humanistic role model attributes.

7Q3 (3326)
What it means to be a medical educator: A bi-national comparison between Canada and Mexico

Authors
Silvia Lizett Olivares Olivares, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Mildred Vanessa López Cabrera, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Miriam Lizeth Turrubiates Corolla, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Yvonne Steinert, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Presenter: Silvia Lizett Olivares Olivares, Tecnologico de Monterrey, School of Medicine and Health Sciences, Monterrey, Mexico

Background: The professional identity of medical educators describes the construction and organization of the understanding of themselves and their role as faculty. This identity must be congruent with the processes in which individuals develop their behaviors, ideas, preferences, aspirations and teaching-style. Allowing to reframe the concept of "working as faculty member" towards "being a medical educator".

Method: This study explores how faculty integrate their teaching role into their identity. A qualitative study was performed involving 26 medical educators at a Canadian (13) and a Mexican medical school (13). Teachers were interviewed with the question: what it means to be a medical educator? and their narratives were coded using Kegan (1982) developmental stages of professional identity: 1)imperial, 2)interpersonal, and 3)institutional. Imperial stage takes into account the view of others but predominate whose own interests. Interpersonal when the individual is able to view multiple perspectives and is concerned about others perception. Institutional is an individual who can assume a role and enter into relationships while assessing them in terms of self-authored principles and standards independently of others.

Results: Distribution of answers of Mexican clinical educators were: 46% imperial, 38% interpersonal,15% institutional. Canadian faculty members were coded as: 15% imperial, 46% interpersonal and 38% institutional. Identity formation on Canadian participants are in higher stage levels.

The early stages are related to the self-knowledge of the individual creating their own beliefs and values. This values are molded by the experiences with others as team player on the interpersonal stage, as the teaching and learning process. However, in order to keep reaching higher levels, the person needs to lead initiatives for others to help them to create their identity.

Conclusion: The process of identity formation starts from peripheral participation to full participation through the social interaction in communities of practice. In order to improve identity formation for medical educators is important to facilitate faculty development with transformation projects where they may interact with simultaneously with students and peers.

Reading Between The Lines: What do Psychiatry Learners Tell us About Educator Effectiveness?

Authors
Sheila Harms, McMaster University, Hamilton, Canada
Bryce Bogie, McMaster University, Hamilton, Canada
Anne Lizius, McMaster University, Hamilton, Canada
Karen Saperson, McMaster University, Hamilton, Canada
Megan McConnel, Univeristy of Ottawa, Ottawa, Canada

Presenter: Sheila Harms, McMaster University, Hamilton, Canada

Background: The shift in postgraduate medical training towards a competency-based framework has focused on the competencies of medical educators, in addition to learners. Research has identified traits of good educators, but these findings do not consider the clinical context. This study examined narrative comments in Psychiatry faculty evaluations to understand educator effectiveness and compared findings with existing literature.

Method: Using available data, descriptive qualitative methods were applied to narrative comments on all faculty evaluation forms by three independent reviewers to answer the question: What do learners in Psychiatry tell us about educator effectiveness? Data consisted of all McMaster University Psychiatry faculty evaluations completed in 2015-2016 by postgraduate and undergraduate learners (N=268) in clinical and didactic settings. Saturation of themes was achieved prior to completion of coding.

Results: Qualitative analysis revealed four major themes and two sub-themes. Effective psychiatry educators demonstrated specific personal characteristics, which aligned with previous frameworks[1]. Data revealed novel themes, including the importance of relationships between the learner and the educator. Affective factors such as learner security and inspiration through role modeling were important relationship qualities that were identified. These attributions transcended the importance of medical expertise within an educator. Effective educators were described as embodying pedagogy in a way that moderated learning barriers.

Medical expertise and educator-learner relationships continue to be important in the educational process. However, the findings provide an opportunity to consider more deeply the affective domain of educator qualities and competencies in Psychiatry and their relative importance for desired learning.

Conclusion: Discussions of educator effectiveness in Psychiatry have excluded the dynamic, relational, and affective components of the educational exchange highlighted in the current study. This may be an important focus for future educational research in Psychiatry, as competency-based medical education becomes the dominant training framework in Canada.

[1]Srinivasan, M., Li, S. T. T., Meyers, F. J., Pratt, D. D., Collins, J. B., Braddock, C., ... & Hilty, D. M. (2011). "Teaching as a competency": competencies for medical educators. Academic Medicine, 86(10), 1211-1220.

7Q5 (3210)
Exploring the impact of gender on medical educators' professional identity development

Authors
Jo Horsburgh, Imperial College, London, UK
Alan Cribb, King's College, London, Uk

Presenter: Jo Horsburgh, Imperial College, London, UK

Background: The impact of gender on the practice and identity of medical educators is relatively under acknowledged and researched (Verdonk et al, 2007). Literature from education more widely suggests gender differences exist in the ways males and females approach teaching and other educational activities (e.g. Becher and Trowler, 2001) as well as links between gender and the status of teaching in higher education (e.g. Deem, 2003., Coate and Kandiko-Howson, 2016). Therefore the aim of this work was to explore the impact of gender on the professional identity development of a small group of medical educators.

Method: 15 semi-structured in-depth interviews were conducted with medical educators who had completed a Master's in Education. The impact of gender on their professional identity and practice was one aspect that was explored with participants. Interviews were audio recorded, transcribed and then coded and thematically analysed.

Results: Approximately one third of participants were able to identify differences between male and female educators in their approaches to teaching and some participants made links between gender and the status of these activities. Some female participants in particular discussed choosing a career focused on medical education because it was more compatible with family responsibilities. For some participants, the gendered nature of some specialties impacted on the type of educational activities that were considered acceptable.

Discussion and conclusion

Gender differences in the way in which males and females engaged with medical education were recognised by some but not all participants. Findings supported previous literature regarding the gendered nature and status of some teaching activities but also revealed that this was an under examined aspect of identity by a significant proportion of participants.

Conclusion: These findings suggest that in some cases, gender appears to impact on the identity and practice of medical educators, and faculty developers should be aware of this when supporting those developing their medical educator identity.

7R: Round Table: Multiple Mini Interview

Location: Hong Kong, 2nd Floor, CCB
Date: Monday 27th August

Relationship between student performances in non-cognitive skills in Multiple Mini Interview & Integrated Practical Examination

Authors
Ayesha Rauf, National University of Medical Sciences, RWP, Pakistan
Ali Tayyab, Islamabad Medical and Dental College (IMDC), Islamabad, Pakistan
Amena Masrur, Islamabad Medical and Dental College (IMDC), Islamabad, Pakistan

Presenter: Ayesha Rauf, National University of Medical Sciences (NUMS), Rawalpindi, Pakistan

Background: In Pakistan more than 18,000 candidates applied for admission to medical colleges in Punjab in 2009 alone which had increased to nearly 33,000 by 2011 against 3305 available seats in medical colleges.
Admission process of most public sector medical colleges in Pakistan still relies heavily on the assessment of cognitive mastery. The assessment of non-cognitive skills of the candidate by conducting semi structured interviews in addition to the admission test have been described as subjective and variable, while their reliability is also questionable.
Shifa College of Medicine focuses on training and assessment of non-cognitive skills especially communication, in the college curriculum. During the pre-clinical years, the students are assessed in their communication skills during their practical examinations. To ensure selection of candidates that not only excel in academics, but also show high achievement in non-cognitive skills, the college shifted from the traditional interview to Multiple Mini Interview (MMI).
Method: The objective of this study was to investigate the relationship between the performance of selected candidates in non-cognitive skills in Multiple Mini Interview and Integrated Practical Examination (IPE) of the first year of medical school. Cross-sectional observation study with statistical support. Student performance in communications skill at 8 station Multiple Mini Interview was compared with their scores in communication skills in the first Integrated Practical Examination. Descriptive statistics were calculated Pearson's Correlation was calculated to investigate the relationship between the two scores. A p value of <0.05 was taken as significant.
Results: The mean score in MMI was 130.38 ±9.90 as compared to a score of 79.96 ±19.74 in the IPE. This relationship has a statistically significant (p<0.001) positive correlation, with a Pearson correlation of 0.52.
Conclusion: Similar studies showed that MMI was a strong predictor of performance in communication skills as compared to problem solving or data acquisition. Our finding further validates the MMI as an assessment strategy for soft-skills.
Take-home message: MMI can be used as an admission strategy to select students demonstrating effective communication skills.

7R2 (2161)
The use of a standardisation method to control MMI assessors' bias

Authors
Christian Bourdy
Robert Gagnon

Presenter: Christian Bourdy, Université de Montréal, Canada

Background: In the province of Québec (Canada), a standard MMI format has been used since 2010 in four distant sites. Since average scores of candidates significantly differ from one site to another, a score standardization procedure across sites was instituted from the beginning in order to generate a common list of candidates looking for admission. In spite of standardization by site, current analysis of interviewers/assessors profiles show the presence of systematically generous or more severe types that may still presents validity threats to our results.
Method: Data from 2017 Admission process were used: raw scores from 10 stations for 1 162 candidates who were assessed by 195 different interviewers. We used to resampling method design to estimate the probably distribution of expected mean scores of individual assessors under the assumption of random error. We developed an Excel spreadsheet that permits to standardize the scores at the level of assessors. All scorings are centered using the global average and standard deviation of all assessments for any given station. Candidates' global MMI score is the summation of standardised score on 10 stations.
Results: Simulation from 2017 data show that raw score are : site 1 (mean = 197.3; sd = 26.6) and site 2 (mean = 207.5; sd = 24.5). Overall Cronbach alpha is 0.64 (site 1 = 0.66; site 2 = 0.59). Following proposed standardisation procedure mean for both sites are 202 and overall alpha is 0.77.
Conclusion: This method permits to level the individual bias of raters and to reduce the differences in rating between sites at the very basic level of raters. Reliability of scores are greatly affected by this procedure. MMI is a great addition to selection tools in medicine by sampling multiple situations; on the other side, the impact of using many different assessors needs more study and statistical methods to control for individual bias.
Take-home messages: Bias's identification in MMI; Methods to control bias by assessors' standardisation of setting and by statistical means.

7R3 (3101)

Do sociodemographic factors of medical students play a role in MMI ratings and their subsequent prediction of OSCE performance?

Authors

Mirjana Knorr
Hubertus Meyer
Anja Schwibbe
Stefan Zimmermann
Wolfgang Hampe

Presenter: Mirjana Knorr, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: With issues such as widening participation and test fairness in mind, the impact of sociodemographic factors on admission tests like multiple mini-interviews (MMI) continues to be of high interest. In this context, demographic, cultural and socioeconomic factors are frequently considered. Whether having a physician as a parent is associated with an advantage has yet to be thoroughly investigated. Most importantly, there has been no investigation whether these sociodemographic factors influence the prediction of MMI results on OSCE performance.

Method: During the student admission process in Hamburg, over 90% of the candidates voluntarily provide sociodemographic data each year. In a first step, we analyzed the impact of gender, age (under 21 vs. 21 and older), German as first language and medical family background (no vs. at least one parent is a physician) on MMI performance ratings for eight cohorts (N = 1438). Next, we investigated whether MMI performance predicts second year OSCE performance considering the same sociodemographic factors and their interactions with MMI performance for two cohorts (N = 186). Both analyses were conducted using general linear models.

Results: Female gender (β = .19, p < .001), older age (β = −.14, p < .001) and German as first language (β = −.14, p < .001) were significantly related to MMI performance while medical family background was not. MMI performance (β = .16, p < .05) and female gender (β = .13, p < .05) both had significant main effects on OSCE performance. None of the interaction terms were significant.

Conclusion: Our study replicates the finding that female gender, older age and first language are related to better MMI performance. In the Hamburg MMI, applicants with a medical family background do not seem to have an advantage. MMI performance weakly predicts OSCE performance but sociodemographic factors do not moderate this prediction indicating that the predictive value of the Hamburg MMI is independent of sociodemographic background.

Take-home message: While gender, age and language have an impact on MMI ratings, the results and the predictive value of the Hamburg MMI are not dependent on sociodemographic background.

7R4 (3528)

The Development and Implementation of an MMI Approach in Postgraduate Selection in Anesthesiology: A case study using a validity framework

Authors

Natalie T. Buu
Carlos Gomez-Garibello
Scott Nordstrom
Rachel Fisher
Catherine Paquet

Presenter: Natalie Buu, McGill University, Montreal, Canada

Background: Contemporary validity frameworks advocate for generating evidence to evaluate claims to support the use and interpretations of assessments. Validity evidence is required in order to support the use of assessment and to justify the information generated in making decisions. An Anesthesiology selection program revamped their traditional method based on interviews to a scenario-based multiple interview (MMI). The present study examines evidence using a Cizekian validity framework about the use of this method of selection and the justification of the decisions made.

Method: Over several months a multiple mini-interview (MMI) approach for selection process was developed. Identified stakeholders were asked to define desirable and less-desirable characteristics in a postgraduate trainees in Anesthesiology at our institution. This information was used to design scenarios (medical and non-medical) to assess salient characteristics. Corresponding rubrics using the CanMEDS framework for each scenario were designed. Evaluators used the rubrics to generate a global rating scale (GRS). Evaluators were also asked to identify characteristics considered completely unacceptable in the scenarios. The evidence generated allowed the examination of two claims: 1) the MMI captures relevant applicants' attributes that can be predictive of their performance in the program; 2) The process provides sufficient and well-supported information to make informed decisions regarding selection of candidates. This approach was used for the assessment of about 180 candidates over three years. Applicant and interviewer posttest acceptability was assessed using surveys.

Results: Descriptive qualitative data show acceptance of this interview process by candidates, staff and residents involved in the selection process. Quantitative data show a positive correlation between scores from rubrics and GRS.

Conclusion: A residency selection process using an MMI approach and assessment rubrics within CanMEDS framework provides better information for members of the selection committee and is perceived favorably by candidates. This approach appears to better identify candidates less-suited to our residency program. Evidence supports the use of the MMI approach as an adequate process to capture salient attributes of candidates and justify the decisions made. This constitutes the first step in generating evidence of the use and interpretation of the scores generated by the MMIs.

7S: Workshop: The Steps of Curriculum Integration - practical and playful understanding (105)

Location: Wettstein, 2nd Floor, Swissotel
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters
Ugo Caramori, UNICAMP (University of Campinas), Brazil
Maria Helena Senger, Pontifical Catholic University of São Paulo, Sorocaba, Brazil
Lara Teheux, Radboud University, Nijmegen, Netherlands
Katerina Dima, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract Text: Understanding the curriculum is one of the greatest skills to be achieved by the medical educator. The purpose of this workshop is to reflect on the importance of curricular integration as the maximum step for the construction of a curricula based in the real world, that is, the modern curricula.
This workshop is a practical adaptation of the brilliant article "The integration ladder: a tool for curriculum planning and evaluation" by Ronald Harden. From the perspective presented by Harden we will approach the different facets of the curriculum integration steps and discuss the best teaching-assessment methods that apply in a given curriculum configuration, participants will be encouraged to learn about teaching-learning methodologies, assessment methods and the SPICES model for curricular evaluation.The workshop concludes with a playful intervention, that is, the artistic construction of the images of the curricular steps proposed by Ronald Harden.

7T: Workshop: Interprofessional communication in clinical settings: from training professionals to changing culture (11)

Location: Helvetia 3, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters
Katherine Blondon, University Hospitals of Geneva, Switzerland
Alexandre Farin, Riviera Chablais Hospital, Vevey, Switzerland
Patricia Picchiottino, Interprofessional Simulation center, Geneva, Switzerland

Abstract Text: Communication failure occurs in more than half of preventable adverse events in hospital settings. Handoffs, or the transfer of patient information and accountability from one health professional to another, can potentially affect patient safety and quality of care. Communication is one of the five key principals for collaborative practice in the TeamSTEPPS® framework,

which includes tools for improvement, in particular for handoffs. Recent studies have shown effective ways to improve handoffs, in particular with the standardization of the handoff process.
Who should attend: educators, healthcare professionals (physicians, nurses, midwives, etc.), students
Structure of workshop: During this workshop, participants will take part in interactive activities to experience the theoretical concepts that will be presented. Groups discussions will allow participants to share their experience, needs and future plans.
Intended outcomes: you will learn how to improve handoffs, both in content and in form. We will present the TeamSTEPPS® framework and discuss some of the tools to help improve handoffs in your clinical practice. You will receive hands on experience in improving handoffs, in particular for standardizing its content. You will also learn how to give feedback using validated handoff assessment tools.
Level: Introductory/intermediate

7U: Workshop: The Role of the Educator in Improving the Quality of Postgraduate Medical Recruitment and Selection processes (147)

Location: Helvetia 4, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters
Sheona MacLeod, Health Education England, Leicester, UK
Moya Kelly, NHS Education Scotland, Glasgow, UK
Claire Kennedy, Health Education England, Birmingham, UK
Jonathan Howes, Health Education England, Birmingham, UK

Abstract Text: As different medical specialties develop more sophisticated methods for their selection of doctors into postgraduate medical training, we, as teachers, become increasingly certain that we each have the best processes in place. Yet a global assessment of specialty processes and comparisons across specialties, and regions, is often lacking.
The UK Medical and Dental Recruitment and Selection Quality and Standards committee was created to improve standards across all UK medical recruitment and selection processes and ensure equity for candidates. We have seen that the insight gained from learning about best practice and how issues have been addressed in other specialities, challenges the thinking of medical educators and helps us recognise that we need to evolve and improve.
Structure of workshop: We will offer our experience of creating cognitive dissonance to drive improvement, sharing some key elements of the range of work the committee has overseen in the UK; ensuring consistency between assessors, increasing equity in portfolio assessment, hearing the voice of the Public with the use of lay representatives, developing assessments with validity across specialties, and involvement in a high stakes assessment of doctors still in training.

We will then open the debate around "how do we, as educators, ensure our process really do have the high utility, reliability and validity which ensures the development of future professionalism, equity for trainees and high quality care and safety for patients"

Who should attend: This will be of interest to anyone involved in designing, delivering and creating policy around postgraduate medical recruitment and selection processes. It will also interest those involved in medical assessment and in undergraduate medical recruitment and selection as the principles to be discussed are transferable to other parts of the medical education system

Intended outcomes: Delegates will gain insights into how the MDRS committee approached challenges and made significant improvements in UK medical recruitment and selection, and will hear different perspectives and divergent views on what constitutes best practice in this area.

By sharing ideas and engaging in discussions delegates will be able to reflect on their processes and challenge themselves and others about how they as educators can improve the processes they are responsible for.

7V: Workshop: Medical Humanities today: how to teach it (1305)

Location: Helvetia 5, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

Jonathan McFarland, Sechenov University, Moscow, Russia
Margaret Chisolm, Johns Hopkins University, Baltimore, USA
Joaquim Gea, University of Pompeu Fabra, Barcelona, Spain
Irina Markovina, Sechenov University, Moscow, Russia

Abstract Text: In the last 100 years, medicine has progressed greatly and the medical tools available to doctors have multiplied so that previously untreatable diseases can now be cured. This is the miracle of the twentieth century, due largely to scientific discoveries and technological breakthroughs, and has changed medical practice significantly. But, Medicine is becoming too reductionist, with an over dependence on the scientific, without taking into account the "uncertainty", and "doubt" that are ever present.

Nowadays, machinery has all but replaced the doctor's eyes and ears, and although this has brought about a standardization of medical practice, it has also transformed the doctor-patient relationship to such an extent that there is literally, and perhaps figuratively, more distance between them since before the days of Rene Laennec. Modern doctors are turning away from the stethoscope and physical examination to the MRI and CT scan. Clinical judgment has been superseded by algorithmic thinking and increasingly by 'machine learning', so, what is the answer?

We believe that Medicine is an art, based on science, with the humanities being as important as science to the practice of medicine. Our aim is to discuss and debate how best to (re)introduce the humanities as an integral part of a Doctor's lifelong learning, as we are convinced that the

varied scope of experiences, concerns, beliefs and cultural backgrounds that they bring with them will enrich Medicine

Who should attend: This symposium is open to ALL those who are curious about or already have an interest in medical humanities

Structure of workshop: Introductory discussion; Developing a list of potential problems and sharing experiences; Brainstorming best teaching strategies

Intended outcomes: After participating in this highly interactive symposium, learners will be able to:

1. Define medical humanities and discuss their importance for 21st-century medical practice and education

2. Describe the different varieties and disciplines within Medical Humanities

3. Give examples of other participants' perspectives and experiences using medical humanities in education, including different ways of introducing the humanities into the lifelong learning patterns of doctors

7W: Workshop: Where do I start? Planning a health education systematic review. A BEME workshop (846)

Location: Helvetia 7, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

Morris Gordon, University of Central Lancashire, Preston, UK
Madalena Patricio, University of Lisbon, Portugal
Michelle Daniel, University of Michigan Medical School, Michigan, USA

Abstract Text: Many health education systematic review reports are limited by a lack of clarity in stated goals or a mismatch between the actual aims of the work and the needs for synthesis in the field. As such issues are rarely related to the methodology or scope of the work itself, but merely planning, in this workshop, BEME will explore this vital stage of the review process for all potential authors of health education systematic review. We will also present the idea of a focussed or rapid review and when such a review may be indicated and how this can be done without reducing quality.

Intended outcomes: To develop skills in: devising specific aims for systematic review in healthcare, particularly considering those that give the best potential outcomes from the works; planning a coherent review from research question into the transference to practice.

Structure of workshop: The workshop will start with participants reviewing a topic in small groups and devising different review titles to meet different goals (different context, educational problems, resource and time limitations). Participants will review a sample of titles, backgrounds and conclusions from actual BEME reviews and identify potential areas of concern using a variety of tools, with a whole group debrief to identify key areas of focus when planning and how research questions were addressed in conclusions Small groups will then work on

their own research title and question in small groups, with support within the groups from a facilitator.

Who should attend: All those interested in writing any kind of systematic review and evidence synthesis in all fields of healthcare.

Level: Introductory / intermediate

7X: Workshop: Continuing Health Profession Education: Innovative approaches to putting theory into practice for curriculum development (667)

Location: Osaka, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

David C Thomas, Icahn School of Medicine at Mount Sinai, NY, USA

TJ Jirasevijinda, Weill Cornell Medical College, NY, USA
Reena Karani, Icahn School of Medicine at Mount Sinai, NY, USA
Monica Lypson, University of Michigan Medical School, Ann Arbor, USA
Carolin Sehlbach, School of Health Professions Education, Maastricht University, Maastricht, Netherlands

Abstract Text: Health Professional educators are often tasked to develop continuing education programs across the health professions; however, few have any formal training in this area. In this contemporary environment of limited resources and high accountability, it is imperative that educators gain the knowledge and skills to design educational experiences that impact patient care and inter-professional practice. This interactive workshop is designed for an international audience of educators interested in mastering the skills necessary to design innovative continuing professional development programs that meet the needs of multiple health professionals. We will demonstrate curricular development principles using a health professions model.

Who should attend: Participants will be health profession educators with an interest in developing and implementing educational programs for faculty development, continuing professional development and continuing health profession education programs.

Structure of workshop: The workshop will consist of a brief presentation on how practicing clinicians learn followed by how medical educators can develop a curriculum for health professionals. The majority of the workshop will engage the participant in an interactive skills building session on their own individual project in continuing health professions education.

Intended outcomes: By the end of the session, participants will 1) state the fundamental theories of how practicing clinicians learn and incorporate changes into their practice, 2) gain skills in instructional design for continuing education program development, 3) practice developing a model curriculum using a stepwise approach

and 4) develop an outcomes framework for their curriculum related to actual clinical performance.

Level: Intermediate

7Y: Workshop: The Science of Teams: Developing and Transforming Effective Teams (1994)

Location: Samarkand, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

Darshana Shah, Marshall University Joan C. Edwards School of Medicine, Huntington, WV, USA
Elizabeth (Betsy) Dawkins, VCU, Richmond, Virginia, USA

Abstract Text: Successful teamwork in all professions depends upon behaviors that promote team building and collaborative thinking. Working effectively as part of a team is also incredibly important in academic settings. Sooner or later, all of us participate as a member or leader of committees, task forces, and teams. These can be either a waste of time and resources or an effective means of moving an issue, problem or need forward. Unfortunately, most of us have never been taught how to best use the tools called committees, task forces, and teams. Effective teamwork is identified as a requirement for enhanced clinical outcomes in the provision of healthcare and healthcare research. However, the current education does not appropriately train either physicians or scientists in these endeavors. Leadership and teamwork skills have received little formal attention, although acquiring these skills is critically important to trainees as they advance and assume supervisory responsibilities for medical teams. This workshop will provide an overview of Team Science and offer evidence-based insights and techniques on Team Science leadership. It will also demonstrate tools and resources that promote collaboration, communication, trust, and conflict management in teams.

Structure of workshop: Through a combination of lecture, interactive small group activities, case studies, and discussion this workshop will offer participants a collection of evidence-based tools and resources for implementing effective practices in team building.

Who should attend: This workshop is designed for educators, practitioners, program staff, and medical students.

Intended Outcomes: Participants will be able to:

• Understand what Team Science tells us about working together

• Identify team-friendly behaviors and skills

• Identify key Team Science concepts that can be used today

• Describe resources for forming teams and achieving results in teams

7Z: Workshop: I Teach, Therefore I Am: Examining Pedagogical Identity for Online and Face-to-Face Learning (1971)

Location: Guangzhou, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

Holly Meyer, Uniformed Services University of the Health Sciences, Bethesda, USA
Eric Meyer, Uniformed Services University of the Health Sciences, Bethesda, USA
Dario Torre, Uniformed Services University of the Health Sciences, Bethesda, USA
Steven Kanter, University of Missouri Kansas City, Kansas City, USA
Lauren Maggio, Uniformed Services University of the Health Sciences, Bethesda, USA

Abstract Text: Health profession educators are increasingly asked to transition their face- to-face (F2F) teaching to online or blended learning modalities. Teaching and learning cannot be separated from the context in which they occur. Many teachers find themselves in an unfamiliar teaching setting, feeling pressured to use an approach incongruent with their pedagogical and personal identity. Such "identity dissonance" can generate frustration and can result in downstream negative effects on learner outcomes. This workshop provides participants a conceptual framework based on Pratt's five teaching perspectives(TPs) that will allow educators to gain insight into their own pedagogical and personal identity, consider strategies to manage a transition to an online teaching context, and share solutions to restructure and mitigate potential identity dissonance.
Who should attend: Faculty developers and teaching faculty (both junior and senior) should attend.
Structure of workshop: We will provide a brief overview of the TPs highlighting how as a conceptual framework they can assist educators in identifying and retaining their pedagogical identities while transitioning from F2F to online teaching.
Next participants will determine their own dominant teaching perspective by completing the freely available, online Teaching Perspective Inventory (TPI; http://www.teachingperspectives.com/tpi/). The TPI measures teachers' self-reported actions, intentions, and beliefs and identifies respondents' dominant teaching perspective.
In small groups, participants will share and discuss their dominant teaching perspective. Using a structured worksheet that introduces a real case scenario, the groups will consider how their dominant TP can help or hinder a shift from F2F to online teaching.
The workshop will conclude with a large-group summary of practical strategies participants can apply at their institutions that will ultimately enhance their teaching in the online setting without undermining their personal teaching identities.

Intended outcomes: At the end of this workshop, participants will be able to
• Describe the TPs
• Identify their dominant teaching perspective and understand its effect on their teaching approach across different leaning contexts
• Recognize and discuss strategies to mitigate identity dissonance when transitioning from F2F to online teaching
• Apply the conceptual lens of the TPs to facilitate a transition to new teaching contexts
Level: Introductory, no prior knowledge of topic required

7AA: Workshop: How to shoot, edit and distribute educational videos through Social Media (SoMe) (3625)

Location: Nairobi, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters:

Tobias Todsen, Department of Otorhinolaryngology, Head and Neck Surgery & Audiology, Rigshospitalet and Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark
Mads R Dahl, Center for Health Sciences Education Aarhus University, Aarhus, Denmark

Background: Students are increasingly exposed to videos on SoMe which they also use for educational purposes. If optimized, videos are an effective teaching modality as it provides flexible learning opportunities. Students are constantly bombarded with information and using video content can therefore by an important educational tool for the medical teacher interacting with the SoMe generation. However, development of videos may challenge many medical teachers and therefore this workshop will provide some basic but effective tools and principles for optimal development of videos.
Who Should Attend: Medical educators interested in using video in medical education
Structure of Workshop: This workshop will teach the essential steps from idea over production and editing to the phases of distributing and integrating your video content on SoMe. We introduce some basic rules of video shooting and editing that will improve the quality of your video. The workshop will be interactive and demonstrate the principles in a short live video making session. Afterwards participants will have to shoot and edit a video using their own smartphone or tablet in small groups and upload it on an Youtube channel created for the AMEE workshop. Selected videos from the participants will be presented and discussed in plenum to wrap up the workshop.
Intended Outcomes: Be able to shoot and edit your own educational video and know how to optimize the design of the video to benefit the intended learning.
Level: Introductory

7BB: Workshop: Context matters: Exploring the role of place in health professions education (3091)

Location: Mexico, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters

Julia Blitz, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa
Ian Couper, Ukwanda Centre for Rural Health, Stellenbosch University, Cape Town, South Africa
Rachel Ellaway, Office of Health and Medical Education Scholarship, University of Calgary, Alberta, Canada
Roger Strasser, Northern Ontario School of Medicine, Ontario, Canada
Susan Van Schalkwyk, Centre for Health Professions Education, Stellenbosch University, Cape Town, South Africa
Paul Worley, Prideaux Centre for Health Professions Education Research, Flinders University, Adelaide, Australia

Abstract Text: A socio-cultural perspective on learning requires us to acknowledge the role of context in that learning, contrary to the common underlying assumption that knowledge is objective or context-independent. Bates et al (2016) suggest that, while it is something 'so intrinsic to the field of medical education, the concept of context remains troubling to scholars and those running medical education programmes'. In particular, this has relevance across the global spectrum of health professions education (HPE) and the way in which different approaches to the training of students can play out in these multiple contexts. Awareness of these differences, and of the 'pedagogy of place', can help guard against practices being directed solely from a single (dominant) position, thus being more responsive to the needs and dynamics of different contexts. In this workshop we will explore perspectives on HPE from a range of different contexts guided by principles of social accountability and community engagement, and discuss why context matters in our teaching practice.

Who should attend: Educators and students with an interest in the role of context in HPE (undergraduate and postgraduate) across professional groupings, from any region or geographic area.

Structure of workshop:

1. Introductions
2. Brief inputs:
   - Ian Couper – Overview of context in HPE
   - Rachel Ellaway – Key theories of context
   - Roger Strasser – The NOSM experience
   - Paul Worley – The Flinders network
   - Susan van Schalkwyk – The Stellenbosch University Rural Clinical School longitudinal study.
3. Small group discussions will focus on the following:
   - What is important in participants' contexts and how that shapes teaching and learning;
   - How these contexts can be more effectively utilised for learning and in addressing social accountability issues;
   - How programs can innovate, evaluate, and research context through the lenses of social accountability and community engagement
4. Plenary feedback

Intended outcomes: By the end of this session participants will:
• better understand the role of context in HPE and its value in their own training context;
• develop ideas for enhancing the value of 'place' when developing curricula, particularly for clinical training;
• be able to plan research to evaluate context, taking into account local program and societal needs.

Level: Intermediate

7CC: ePosters: Multiple perspectives - diversity, well-being & communication

Location: Kairo 2, Ground Floor, CCB

Evaluation of the medical student perception related to delivering bad news compared to experts doctors

Authors
Carlos Miranda, Ribeirão Preto School of Medicine São Paulo University, Ribeirão Preto-SP, Brazil
Antonio Pazin-Filho, Ribeirão Preto School of Medicine São Paulo University, Ribeirão Preto-SP, Brazil
Islã Ventrua, Ribeirão Preto School of Medicine São Paulo University, Ribeirão Preto-SP, Brazil

Presenter: Carlos Miranda, Ribeirão Preto School of Medicine, São Paulo University, Ribeirão Preto-SP, Brazil

Background: The goal of this investigation was compared the perception of the medical students related to delivering bad news to experts doctors in this issue (clinical oncologists).
During an interactive classroom about delivering bad news the medical students received a transponder allowing them to respond in "real time" to question that was formulated by several experts and applied to 500 oncologists during survey of participants at of the American Society of Clinical Oncology.2000
The answers of 111 medical students were compared to 500 clinical oncologists (medical students vs. experts doctors). Have you had any specific teaching or training for breaking bad news: formal teaching (30% vs. 05%); sat in with clinicians interviews (05% vs. 39%); both (43% vs. 14%), neither (14% vs. 42%), p= 0,007. How do you fell about your own ability to break bad news: Very good (03% vs. 13%), Good (10% vs. 40%), Fair (44% vs. 39%), Poor (32% vs. 08%), Very poor (04% vs. 00%); p<0.0001. Have you had any training in the techniques of responding to patient's emotion: formal teaching (41% vs. 08%); sat in with practicing clinician (03% vs. 34%), both (36% vs. 10%), neither (14 vs. 49%); P<00001. Did you find that the SPIKES protocol made sense to you: Yes (90% vs. 95%); p=0.30. Do you feel that the SPIKES protocol is practical and can be used in your clinical practice: Yes (84% vs. 88%), p=0.326. Which element of the SPIKES protocol do you think you would find most difficult: Setting (01% vs. 02%), Perception (02% vs. 16%), Invitation (01% vs. 19%), Knowledge (10% vs. 07%), Emotions (75% vs. 52%), Strategy (02% vs. 03%), p<0.0001.
The medical students recognize the useful of the protocols such as SPIKE for delivering bad news and considered addressing the patient's emotions the most difficult task in this situation.

7CC3 (836)
Calling for Help: Teaching Medical Students about SBAR

Authors
Claire Gibbons, University Hospital of Coventry and Warwickshire, Coventry, UK
Rebecca Darge, University Hospital of Coventry and Warwickshire, Coventry, UK

Presenter: Claire Gibbons, University Hospital of Coventry and Warwickshire, Coventry, UK

Background: Newly qualified doctors often struggle with clinical handover. We have observed this in final year medical students in high-fidelity simulation sessions and colleagues across two sites have reported similar observations. SBAR (Situation, Background, Assessment and Recommendation) is a recognised tool used to aid clinical communication.
We aimed to pilot a new tutorial to improve medical students' confidence in using SBAR. We designed a one hour tutorial, to be delivered by two faculty members, to teach students to:
1. Describe and evaluate SBAR.
2. Critically appraise model SBAR procedures.
3. Develop SBAR good practice through low-fidelity simulation.
We evaluated session outcomes using student questionnaires, comparing results with answers from students who did not attend.
We invited 20 final year medical students on their acute clinical placements to attend the tutorial; ten attended. Students reported having limited opportunity to practice using SBAR previously. Of those who attended, six reported significantly improved confidence in using SBAR, and four reported slightly improved confidence. Qualitative feedback was positive. Students liked the use of simulation, receiving individual feedback, and small-group learning in a positive environment. They felt the session could be improved by additional clinical scenarios. Almost all the students surveyed felt that their acute clinical placements had improved their confidence in using SBAR. However, students who attended the tutorial reported greater overall confidence in using SBAR, and saw a greater increase in their confidence, than their peers who did not attend.
After acting on feedback the tutorial has been assimilated into the mandatory undergraduate teaching timetable, and postgraduate training.
Medical students benefit from practicing communication skills in simulated settings. By recognising and acting upon gaps in student abilities it is possible to introduce new, effective and relevant teaching. It should not be assumed that students will develop key communication skills by clinical exposure alone; these skills require teaching and practice with dedicated feedback. Simulation can provide a safe environment for this to occur and can facilitate experiential learning.
Facilitated practice with feedback can help improve confidence in using SBAR at the undergraduate level.

Applying Multi-Disciplinary Simulations to Demonstrate SPIRES Protocol for Teaching Medical Ethics and Communication Skills

Authors
Pei-Wei Wang
Ting-Fang Chiu
Li-Lin Kuo
Lin-Yang Chi
Oscar K. Lee1

Presenter: Pei-Wei Wang, Taipei City Hospital, Taipei, Taiwan

Background: For teaching communication, the SPIRES protocol, which consists of 6 steps, is a specialized form of skill training in physician-patient communication. Simulation-based teaching has also been applied extensively in medical education. This study is to share our experience of promoting the interests of our hospital staff for teaching medical ethics and communication skills with the method of multi-disciplinary simulations.
With the collaboration of trained standardized patients, a multi-disciplinary simulation theater workshop was developed since 2016. The performances required approximately 2 hours. To enhance the learning effect, we further introduce and apply the SPIRES protocol to demonstrate the appropriate communication skills in the final version since 2017. Hospital staff attending the ethics course completed pre- and post-tests for the Perceived Confidence Scale and simple quizzes to assess whether SPIRES protocol are understood.
There were 475 questionnaires collected and analyzed. In analyzing the Perceived Confidence Scale, all of the post-test scores for each item were significantly higher than the pre-test scores. Participants were also completely correct about the post-test quizzes of assessing the learning effect of SPIRES protocol. The reflections and suggestions given by the participates were also very enthusiastic.
Previous studies have clearly demonstrated that communication skills can be taught. We chose SPIRES protocol as our main concept of teaching communication skills because it is easy to remember and contains important skills. SPIRES and SPIKES are almost identical except that fourth step replaces knowledge by recommendation. To demonstrate actively the SPIRES protocol, we employ a multi-disciplinary simulation theater, which combines theater performance and the actual case for teaching communication skills and medical ethics. All participants are very appreciative and agree that this model is fascinating and has good learning effects.
In combination with multi-disciplinary simulations, SPIRES protocol can be specifically demonstrated, and participants can easily master the key communication skills.

Guiding eprofessionalism-devleoping social media workshiops for health students

Authors
Jennifer May
Jess Stokes Parish
Lauren Cone
Miriam Grotowski

Presenter: Jennifer May, University of Newcastle, Tamworth, Australia

Background: Social media is part of the medical landscape in the 21st century. The experience of "participatory medicine" (clinicians and patients connecting in ways other than face to face) is now a day to day reality for all those involved in delivery of health care. The development of an educational framework in which to teach and support students to manage these participatory interfaces is understandably new.
Dr Kendall Ho and colleagues from UBC Canada developed an interactive workshop to equip students with safe social media habits This approach was reviewed and redesigned for an Australian context. This poster seeks to explore the experiences of students who participated and review the educational value of the workshop
An interactive workshop was piloted on a rural group of medical and allied health students. .After identification the utility and variety of social media available students discussed current guidelines for universities, health services and professional bodies. Participants completed a case-study based questionnaire prior to the workshop, and then reviewed their answers in an interactive format. Case studies were themed to demonstrate privacy, confidentiality, online conduct, professional boundaries and reputation concerns. Students rated the appropriateness or otherwise of the behaviours described.
Tools to evaluate social media information were reviewed with students identifying sources of information for course work considering content, credibility and captivation
Students provided constructive feedback about the delivery and utility of the workshop. The content validity and reliability of Likert scales for the assessment of the scenarios was reviewed and refined. Tools for social media contribution and approaches to social media content were considered desirable
Responsible social media use by health professionals will not just happen. Workforce and tertiary policies do not cover the "grey" areas of safe social media use. The implementation of a practical workshop was a useful way of exploring and challenging different knowledge levels and experiences. The application to nursing and allied health disciplines appears clear cut and further development of a social media curriculum is important for all involved in the delivery of health care.

What is necessary to support female physicians in Japan?

Authors

Rieko Goto, Kumamoto University Hospital, Kumamoto, Japan

Hiroshi Takayanagi, Kumamoto University Hospital, Kumamoto, Japan

Kota Oyama, Kumamoto University Hospital, Kumamoto, Japan

Michito Sadohara, Kumamoto University Hospital, Kumamoto, Japan

Junichi Taniguchi, Kumamoto University Hospital, Kumamoto, Japan

Kunihiko Matsui, Kumamoto University Hospital, Kumamoto, Japan

Presenter: Rieko Goto, Kumamoto University Hospital, Kumamoto, Japan

Background: The persantage of female professors, associate professors, and docents is extremely low (3.6%) in Kumamoto University. Many female physicians quit their works by sexual division of labor when they have to take care of children in Japan. We have conducted a questionnaire survey to clarify the problem in acquiring an academic career of female physicians.
The questionnaire was distributed to 26 department managers in Kumamoto University Hospital in 2017. We divided into three groups: male (M), female (F), and female in childcare (FC). We asked questions of what are the numbers of physicians who have attended at academic meetings, who have submitted some papers, and who have had some certified medical specialty, in 2016. Nineteen of 26 department managers answered the questionnaire. There were 399 physicians in M group, 124 physicians in F group, and 37 physicians in FC group. The ratio of physicians in FC group who attended at the academic meeting (M: F: FC = 70.9%: 49.4%: 32.4%), and who submitted some papers in 2016 (32.3%: 19.4%: 13.5%) were significantly lower than those of the other groups. There was no difference in the ratio of physicians who had some certified medical specialty in each group (13.3%: 16.1%: 18.9 %).
In spite of the ratio of female physicians of 23.7%, only 3.6% of female have risen in academic position at Kumamoto University Hospital. Though female physicians can gain the certified medical specialty, improving the place of women may be hard especially in university hospital in Japan. As physicians in university hospitals in Japan are assigned all three roles of clinician, researcher, educator, at the same time, female physicians in childcare may give up their academic career because of focused busyness. We have organized "Kumamoto Career Support Center for Women Doctors" to develop Working-Style reforms, Child-care support system and supporting academic career system. We hope our activity may increase academic position of female physicians in Japan.
Working-Style reforms, Child-care support system, and supporting academic career may be necessary to fulfill the gender equality in university hospital in Japan.

7CC7 (1682)
Feminisation of postgraduate medical training influences burnout in medical residents

Authors

Maud Kramer, 1 School of Health Professions Education (SHE), Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands; 2 Zuyderland Medical Centre, Heerlen, Netherlands

Karen D. Könings, School of Health Professions Education (SHE), Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands

Jelle T. Prins. MCL Academy, Medical Centre Leeuwarden, Leeuwarden, Netherlands.

Frank M. M. A. van der Heijden, Department of Neuropsychiatry, Vincent van Gogh Institute for Psychiatry, Venlo, Netherlands

Ide C. Heyligers. 1 School of Health Professions Education (SHE), Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands; 2 Zuyderland Medical Centre, Heerlen, Netherlands.

Presenter: Maud Kramer, School of Health Professions Education (SHE), Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht and Zuyderland Medical Centre, Heerlen, Netherlands

Background: High prevalence of burnout in medical residents is alarming. Female residents have higher risk to become burnout. At the same moment, an ongoing feminisation process of the medical profession is taking place (worldwide 46% female doctors in 2015, while 29% in 1990). Feminisation leads to a shifting gender composition in postgraduate medical training. Our study aims to understand the influence of last decade feminisation on the relation between gender and burnout in residents. Dutch medical residents filled out a questionnaire in 2005 (N = 2115) and 2015 (N =1231). Burnout was measured using the Utrechtse Burnout Schaal (UBOS-C), a validated Dutch version of the Maslach Burnout Inventory Human Services Survey. High scores on the scales emotional exhaustion and depersonalisation and low scores on personal accomplishment are indications for burnout. We used multilevel models to analyse the influence of percentage of respectively female physicians and residents per specialty in 2005 and 2015 on the relation between residents' gender and their UBOS-C scores.
Female residents scored higher on emotional exhaustion than males. Male residents scored higher on depersonalisation and personal accomplishment than females. Between 2005 and 2015, emotional exhaustion and depersonalisation decreased and personal accomplishment increased in both genders' residents. Percentage of both female physicians and residents moderated the relation between residents' gender and emotional exhaustion: more female physicians and residents related to higher exhaustion for male residents and lower scores in female residents.
Burnout-related symptoms in both genders' Dutch medical residents decreased during last decade feminisation. Feminisation of postgraduate medical training decreases risk at emotional exhaustion in female residents, while leaving other aspects of burnout unaffected and

negatively impacts emotional exhaustion in male residents. These findings indicate that feminisation has different impact for male and female residents. Burnout-related symptoms in both genders' medical residents overall decreased during last decade feminisation.

Optimising work culture during ongoing feminisation needs attention, as female residents are still most at risk for burnout. However, feminisation might also lead to more emotional exhaustion in male residents.

Assessing the impacts of Inter Professional Education Initiatives at a newly established tertiary hospital in Singapore

Authors

Wai Ching Lee, General Medicine, Sengkang General Hospital, Singapore
Chaoyan Dong, Education Office, Sengkang General Hospital, Singapore
Aw Derrick, General Medicine, Sengkang General Hospital, Singapore
Chua Melvin, General Medicine, Sengkang General Hospital, Singapore

Presenter: Wai Ching Deanna Lee, Sengkang General Hospital, Singapore

Background: Interprofessional Education (IPE) has the potential for improving professional relationships, increasing efficiency and coordination in enhancing patient care (1). Our 1,400-bed hospital is newly established with diverse healthcare professionals and one priority of building patient- centered care pathways. We started the hospital-wide monthly IPE Grand Rounds hoping to create a common platform for discussion and collaboration, to identify diseases to establish the care pathways and related protocols and policies. The topics were collated amongst our hospital staff to promote interest, participation, and usefulness in their daily clinical practices. The monthly IPE sessions started from August 2016, covering a wide range of topics such as diabetes management, end of life care, subcutaneous hydration. The first phase of data collection to evaluate the usefulness and impact amongst the staff started in Oct 2017. The validated Interprofessional Attitudes Scale (IPAS) (2) was administered through an online survey link to 120 hospital staff from different disciplines who attended the IPE sessions. The outcomes include reactions, change in perceptions and attitudes, perceived behavioural changes, acquisitions of knowledge and skills. Thereafter focused group discussions were conducted among agreeable survey responders to participate in further study to explore further impact of IPE sessions and suggestions to improve future sessions.
A total of 81 respondents (49.3% nurses, 31.6% allied health professionals) completed IPAS survey and 44 of them consented to participate in the focus group discussions . The result of the IPAS survey showed improvement in reactions, perceptions, attitudes and knowledge in domains of Teamwork, Roles, and Responsibilities (62.4%), Patient-Centeredness (53.5%), Interprofessional Biases

(30.7%), Diversity & Ethics (53.2%), and Community-Centeredness (56.7%). The focused group results will be available by June. Preliminary comments from participants revealed that IPE sessions has been "engaging", "interesting", "useful", "beneficial", and suggestions for improvement include "more frequent sessions" and "other topics".
The preliminary results show positive overall impact of IPE. For the follow-up studies, we would measure changes in practice and patient care quality.
IPE can improve quality of healthcare delivery and promote collaboration.

Narratives of care: the use of digital story-telling to understand lived experiences of care

Authors

Assad Malik, Barts and The London School of Medicine and Dentistry, London, UK
Clare Morris, IHSE, Queen Mary University London, UK
Claudia Gore, Imperial College NHS Trust, London, UK
Pip Hardy, Patient Voices, Cambridge UK
Tony Sumner, Patient Voices, Cambridge UK

Presenter: Assad Malik, Barts and The London School of Medicine and Dentistry, London, UK

Background: Person-centred care (PCC) shifts the consultation narrative from 'what's the matter with you' to 'what matters to you' (Barry et al 2012). This has implications for medical education, where the place of the patient has historically been that of 'exemplar' of their condition rather than 'expert-by-experience'. This study explores the value of first person digital stories (DS) as an approach to teaching PCC. The study draws upon the work of Patient Voices, an organisation who help create first-person stories of healthcare, using audio, video and images.
The digital-stories are openly available for use by healthcare educators: our study draws on young people's stories about living with multisystem allergic disease (MSAD).
This is a qualitative study, using a cross over design, where medical student participants watch pairs of digital stories (young person and parent) followed by consultant led teaching on the same topic (or vice versa). They are asked to write freely on what they know about MSAD and its impact, adding and amending this text after each viewing. A focus group 2 to 4 weeks later seeks to identify lasting influences of thinking.
The elicited data will be analysed in two ways. Firstly, the free text documents will be used to explore changes in thinking after each type of teaching intervention. Secondly, the focus group data will be thematically analysed with the hope of identifying the usefulness of first person digital stories as a teaching method focussed on promoting person centred care. (Data available April 2018).
The goal of this study is to explore practical and accessible approaches to teaching person-centred care in a medical school setting. It will compare the impact of watching first

person digital stories with more traditional consultant-led teaching. Implications will be presented and discussed. Person centred care means re-thinking patient involvement in medical education.

First person digital stories are an accessible and powerful way of bringing patient voices into medical education

International Use and Correlates of Dundee Ready Educational Environment Measure (DREEM) in Assessing Learning Environments Within Undergraduate Medical Education: A Narrative Review

Authors

Kang Sim, Institute of Mental Health, Singapore
YW Chan, Institute of Mental Health, Singapore
MY Sum, Institute of Mental Health, Singapore
PC Tor, Institute of Mental Health, Singapore
G Tan, Institute of Mental Health, Singapore

Presenter: Kang Sim, Institute of Mental Health, Singapore

Background: The Dundee Ready Educational Environment Measure (DREEM) was specifically designed to measure the undergraduate medical educational environment. This study seeks to review the adoption of DREEM internationally, and its association with different learning contexts and learner factors in order to better support our learners and facilitate future applications and research.

A systematic literature review was conducted on all articles that adopted and reported data using the DREEM from 1997 through April 2017.

Overall, the majority of 106 included studies from over 30 countries were conducted in Asia and Europe (76.4% of studies) within medical, dental and nursing programs (86.8% of studies). Seventy-nine out of 98 studies (80.6%) which reported DREEM scores observed a mean total DREEM score within the range of "more positive than negative" (101-150 out of maximum 200 points). Higher DREEM scores were associated with better past academic achievement, quality of life, resilience, positive attitudes towards course, mindfulness, preparedness for practice, less psychological distress and greater peer support. The majority of undergraduates rated their learning environments "more positive than negative". Juniors tended to score higher on DREEM compared to their seniors in undergraduate programs and higher DREEM scores were associated with different learner factors which can help in identification of learners needing greater support. Future studies may want to examine other correlates of DREEM such as coping styles, personality profiles, burnout level and DREEM scores can be incorporated into reviews of learning environments to ascertain longitudinal changes following educational interventions.

Take home points
• Global studies using DREEM were mostly conducted in medical, dental and nursing undergraduates

• The majority of undergraduates rated their learning environments "more positive than negative"
• Higher DREEM scores were associated with different learner factors
• DREEM scores can be incorporated into reviews of learning environments to ascertain longitudinal changes following educational interventions

Leonard Loh, KK Womens' and Children's Hospital, Singapore
Raymond Goy, KK Womens' and Children's Hospital, Singapore

Presenter: John Song En Lee, KK Womens' and Children's Hospital, Singapore

Background: Anaesthesiology Senior Residents take on the role of supervising and teaching junior residents during 16-24 hour overnight duties. They concurrently learn through the management of complex and critical emergency cases in the operating theatre and intensive care unit. A recent study demonstrated that the sensorimotor and executive function of anaesthesiologists were slowed after these demanding shifts. We studied the impact of these stressors on the cognitive abilities of the senior residents as clinicians, teachers and learners.

We adopted the constructivist approach and conducted a qualitative research, using the semi-structured interview format. 7 senior residents participated in focus group and individual interviews. An inductive and iterative process of information collection, analysis and thematic classification was conducted. Data collection continued until data saturation was reached. The audio-taped interviews were transcribed, analyzed, and themes were identified.

High levels of stress were experienced by the senior residents. Based on thematic classification, the categories of stressors included (1) clinical, (2) psychosocial and (3) cultural. Clinical stressors were predictable, and included inexperience in managing complex cases and crises, and demands in perioperative resource management. Psychosocial stressors included the concern with poor patient outcomes, complaints and self-doubt. Work-place cultural stressors included the concern of conflicts with other stakeholders, and appearing deficient to their supervising faculty. Collectively, these factors impacted negatively on their cognitive abilities, resulting in increased tunnel vision, poorer clinical judgement, and rash decisions. The senior residents were less inclined and motivated to teach and guide the juniors, and to allow procedural attempts. Their own ability to learn were significantly impaired.

We identified the stressors that impeded clinical management, teaching and learning. Reluctance to consult for fear of appearing deficient to the faculty were concerning. Recommended strategies included (1)

reducing the impediment to timely faculty consults, (2) providing case-based training, (3) improving communications with the stakeholders, (4) equipping with team-based management skills, and (5) engaging in inter-professional collaborations.

While stressors during overnight duties can hamper the clinical, teaching and learning abilities of Anaesthesiology senior residents, recommended strategies can be employed to reduce their impact.

Effectiveness of a self-selected "SMILeSS" Intervention to reduce and/or prevent depression and general well-being of preclinical medical student.

Authors
Thanita Thongtan
Tantawan Awirutworakul
Winitra Kaewpila
Karn Jumroonrojana
Jonggonnee Wattanapermpool

Presenter: Thanita Thongtan, Mahidol University, Bangkok, Thailand

Background: Medical education has always been perceived as highly stressful environment by students. Stressors affecting medical students' overall well-being were significantly related to the medical training especially academic matters. A good intervention was then focused to help reduce the stressful impact to the student. A 2-hour small group intervention based on the participant's preference was designed. The outcomes of the intervention on medical students' depression and general well-being score were then determined.

A controlled before-and-after study was conducted on 133 preclinical medical students. Their 9-item depression score (PHQ-9) and 18-item general well-being schedule (GWBS) were measured before the intervention and 2-month after the intervention. The self-selected "SMILeSS" intervention based on their preference in the aspects of stress management (S), motivation (M), interpersonal skills (I), learning skill (Le), self development (S), and self discipline (S). The independent sample T-test was applied to determine the effect of the intervention on the participant.

A total of 133 preclinical students (intervention = 69 and control = 64) completed the study. The depression score and the general well-being score between the intervention and the control group will be compared.

There are many issues that medical students face. SMILeSS model may also be a promising intervention for medical student to reduce and/or prevent a stressful impact especially in early stage of medical academics.

The medical school is composed of various expertise faculty members who are able to provide support in many aspects to medical students. Continuous of SMILeSS intervention can be easily implemented to match the need of all levels of medical training with the support provided by the faculty.

Integrating Skills Lab stations into a course on the principles of fracture fixation

Authors
Emanuel Gautier
Friedrich Baumgaertel
Peter Daescher
Barbara Niederée
Urs Rüetschi
Sandipan Chatterjee

Presenter: Emanuel Gautier, HFR Kantonsspital Fribourg, Switzerland

Background: The AO Foundation has been involved in education since the 1960s. The AOTrauma Basic Principles of Fracture Management course is now an integral component of residency programs in several countries. In 2013, a new educational simulation was introduced in the courses with the addition of 10 Skills Lab stations.
Method: The present-day Skills Lab stations started off with the idea of a 'Playground' – a time during the course when participants could experiment with drills, reduction tools, instrumentation, and bone models, to work out the principles of fracture fixation. Over the years, this activity was formalized, given a structure, and learning objectives for each station defined. Surgeons, engineers, and educationalists worked together to create a novel approach to teaching basic surgical principles and skills.
Results: The Skills Lab stations have now been used in over 300 courses worldwide. Implementation was monitored by conducting online surveys, and we received feedback from 318 participants, 146 faculty, and 91 Skills Lab directors. Faculty education programs, self-explanatory videos, and faculty guides for each station were prepared to educate faculty on the Skill Lab stations. In addition, during the early phase of the roll-out process, a surgeon expert and a member of the AO Education Institute accompanied the Skills Lab to every course.
Discussion & Conclusion: The Skills Lab has proven to be of great value to the AOTrauma Basic Principles of Fracture Management course. It is an effective way of reinforcing the concepts taught at the course, and in increasing interactivity between participants and faculty. The Skills Lab is now a core component of this course.
Take-home message: Integrating the concepts of fracture fixation within a course can be successfully performed using Skills Lab stations. The concepts addressed can be revisited, emphasized, and elaborated upon during the rest of the course in lectures, practical exercises or small group discussion. This educational simulation is highly interactive and proven to be very popular with course participants and faculty alike.

Novice Development of Cerebral Aneurysm Coiling Skills in Virtual Reality

Authors
Oleksiy Zaika, Western University, London, Canada
Mel Boulton, Western University, London, Canada
Roy Eagleson, Western University, London, Canada
Sandrine de Ribaupierre, Western University, London, Canada

Presenter: Roy Eagleson, Western University, London, Canada

Background: Endovascular surgical procedures require visual-spatial coordination in workspaces with restricted motions and temporally limited imaging. The acquisition of the procedural skills and error reduction strategies can be facilitated by 3D simulator-based training, however, cerebral angiography (CA) has lagged behind in this training approach due to the lack of validated, realistic training models, relying strictly on clinical case exposure frequency as a means of assessing proficiency. The ANGIO Mentor visual-haptic simulator has been regarded as an effective training tool, increasing performance in diagnostic CA, however, this simulator has not been assessed thoroughly in its ability to improve interventional skills such as effective aneurysm coiling.
Method: In this study, 12 novice medical students were given simulation-based diagnostic cerebral angiography training until a procedural plateau in performance, established in our previous work (Zaika et al., 2016). Subsequently, they were trained using video tutorials and written instructions to identify, measure and intervene with cerebral aneurysms using endovascular coils. Subsequently, over the span of 6 sessions, participants were assessed on their procedural pace, coiling quantity and quality, and perforation rates. Spatial ability was assessed using a mental rotation test (MRT) and used in the performance analysis.
Results: All individuals were able to perform the procedure faster after 6 sessions, reducing their average time from 42 to 24 minutes. Coil success rate improved over from 82% to 88% and coil packing rate remained consistent at 30% throughout testing. High perforation rate seen at the start of the study showed a trend of decreasing over the latter sessions, however, over half of aneurysms were still being perforated by the novice participants. No change in aneurysm coiling quality was found, with a slight decrease in number of parent artery coil protrusions. High MRT individuals were better able to establish necessary tools prior to coiling, however, no other MRT-specific changes were seen.
Conclusion: This work identifies the utility of simulation-based cerebral angiography training in identifying the particular difficulties trainees experience in learning procedural skills, including prevention of perforations, proper positioning and success of coils within the aneurysm.

7DD3 (2771)
First experiences in hospital-based simulation training in spinal decompression and fusion

Authors
Michael Grevitt, Queen's Medical Centre, Nottingham, UK
Staffan Källbäck, AOSpine, Dübendorf, Switzerland
Pipsa Ylänkö, AOSpine, Dübendorf, Switzerland
AOSpine Chairpersons (Ahuja S, Theiss S, Vialle E, Ito M, Al-Mutair A)

Presenter: Staffan Källbäck, AOSpine, Dübendorf, Switzerland

Background: Time away from clinical practice is a challenge for surgeons. Hospital-based education in the local setting using a simulator and supported by a blended learning approach should be explored as an alternative or complementary to external courses. A group of AOSpine surgeon faculty decided to design and evaluate a new, standardized program on simulation training in spinal decompression and fusion for international implementation.
Method: The surgeon faculty designed a program consisting of 2 hours of online learning materials, a 1-hour online tutorial for participants with the chairperson, and a 3-hour face-to-face event focused on simulated minimally invasive procedures. Microsurgical decompression and interbody fusion were selected and scheduled for groups of 2 participants to perform on a simulator with a lumbar pathology model and a microscope under the guidance of 1 faculty.
Results: The program was delivered to 81 orthopedic and neurosurgical trainees and fellows during 2017 in 6 events in England (n=18 participants), Wales (n=6), US (n=18), Japan (n=8), Brazil (n=19), and Kuwait (n=12) with a local chairperson and faculty. Evaluation by 62 participants (76%) showed 82% (range 64%-100%) learned something new and intend to use it in practice. All responders would recommend the event to colleagues. Positive feedback was noted regarding minimal interruption to regular work, enhancement with online pre-course activities, the authenticity of the simulator, the OR setting, and the high faculty to participant ratio.
Feedback from participants and faculty compare favorably to our other educational events. The evaluation instruments could be enhanced by the addition of procedure metrics for participants and faculty to receive and provide even more focused feedback. Projected advantages of condensed on-site time, no travel, and low costs were all found in these events. Future plans are to deliver such events on a larger scale. A detailed analysis and comparison with other events is currently being made.
Conclusion: Hospital-based education using simulation will be an effective alternative and complements existing education. Further study of its effectiveness and efficiency is warranted.

Exploration of learning curves for simulation-based training in hip-fracture surgery

Authors
Amandus Gustafsson, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark
Poul Pedersen, Department of Orthopedics, Copenhagen University Hospital Hvidovre, Copenhagen, Denmark
Bjarke Viberg, Department of Orthopaedics and Traumatology, Kolding Hospital, Kolding, Denmark
Henrik Palm, Hip Fracture Unit, Department of Orthopedics, Copenhagen University Hospital Hvidovre, Copenhagen, Denmark
Troels Rømer, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark
Lars Konge, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Presenter: Amandus Gustafsson, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Background: Several studies describe virtual reality (VR) simulators conveying training in osteosynthesis of hip fractures and their metrics' ability to differentiate between novices and experts. However, there is no evidence in simulated hip fracture surgery supporting a pass/fail standard based on proficiency. The aims of the study were to determine when novices and experts reached their learning plateau and to establish a pass/fail performance standard for trainees based on experts' performance.
Method: Thirty-eight orthopedic interns and eight consultants were included for simulation with cannulated screws, Hansson Pins and sliding hip screw on Swemac's TraumaVision, which has metrics with established validity evidence. The training ceased when a participant failed to improve the combined score for three consecutive times and a plateau score was defined as an average of combined scores of the last four tries.
Results: The novices trained for 168.5 minutes (range 82.1-295.5, SD: 52.1) compared to 143.3 minutes (range 83.1-198.9, SD: 40.9) for the experts. The highest achieved combined scores for novices was 92.0 % (range 82-98%, SD: 4.2) and the experts 95.6 % (range 92-98%, SD: 1.9), p=0.022. The plateau scores were 84.9 % for the novices (range 60-98%, SD: 7.7) and the experts 92.4% (range 84-97%, SD: 4.0), p=0.011. A pass/fail standard for the plateau score using contrasting groups' methods was 88%.
Time needed to train to plateau was highly variable for both groups. The participants trained to a plateau without the motivation to attain a predefined standard and hence it cannot be concluded that the novices trained to their best of their ability, why we are reluctant to use contrasting groups' method to establish a criterion for proficiency, but prefer a mastery performance criterion.
Conclusion: The variability of time spent to reach plateau emphasizes that simulation-based training should continue to a predetermined criterion with supporting validity evidence. We suggest a mastery learning criterion of 92 % based on the experts' average plateau score.

Take-home message: A plateau score of 92 % on Swemac Traumavision VR trainer for hip fracture osteosynthesis is recommended as a mastery learning pass/fail standard.

improving basic surgical skill with suture practice assignment at home for medical students

Authors

Nicko Rachmanio, Surgery Division of University of Muhammadiyah Yogyakarta, Yogyakarta, Indonesia
Meyki Fredianto, Orthopaedics Division of University of Muhammadiyah Yogyakarta, Yogyakarta, Indonesia
Supriatiningsih, Gynecologist Division of University of Muhammadiyah Yogyakarta, Yogyakarta, Indonesia
Arlina Dewi, Public Health Division of University of Muhammadiyah Yogyakarta, Yogyakarta, Indonesia

Presenter: Nicko Rachmanio, Universitas Muhammadiyah Yogyakarta, Indonesia

Background: The limited time to practice during practicum becomes a problem for students to have good basic surgical skills. Home assignment of making some types of sutures such as simple interrupted sutures, continuous sutures, horizontal mattress sutures and vertical mattress sutures is expected to be a solution.
Method: A cross sectional descriptive analytic study was carried out on total sample of 20 students that divided into two groups. Group A, group of 10 students were given four kinds of sutures (simple interrupted sutures, continuous sutures, horizontal mattress sutures and vertical mattress sutures) tutorial and they were given assignment to do the four kinds of sutures at home every day and collected in the next day for seven days. Group B, group of 10 other students that were only given four kinds of sutures tutorial and opportunities to try independently during the practicum and allowed if they want to practice any of the time in the practicum room. After one week, an assessment was done based on the time it takes for each student to do four types of sutures
Results: Data analyzed with independent T-test. There were significant differences between two groups (sig.(2tailed) 0,00 < 0,05). The average time from group A to make the four types of sutures is 283 seconds while group B obtained the average time making the four types of sutures is 374 seconds.
Conclusion: From the evaluation result it was found that there was significant time difference between group A that were given assignment with group B that were not given assignment to practice at home. The method of assignment is still effective in the world of education, a significant result indicates that individual awareness only is not optimal enough if it is not accompanied by other factors.
Take-home message: Home assignment is effective to improve learning outcome especially for limited time practicum conditions

Cricothyroidectomy 3D Simulation Model

Authors

Wang Feifan
Yen Ching-Chiuan
Chow Wai Tung
Raymond Ngo

Presenter: Feifan Wang, National University Hospital, Singapore

Background: Cricothyroidectomy is an emergency life-saving surgical procedure performed on the airway. Cricothyroidectomy training is crucial to ensure the competency of our doctors. This entails thorough knowledge of the procedure, steps, airway anatomy, and ability to detect subtle surface anatomy to perform the procedure with confidence.
Current available model in cricothyroidectomy simulation teaching is not anatomically accurate, and is unable to replicate real life tactile sensation. We hope to improve this with our model.
Method: We utilized an amalgamation of 3D printing resources and produced a prototype model of the laryngeal framework to replicate the surgical field over the neck. The skin substitute made from an admixture of silicon materials bears close resemblance to skin thickness and feel, allowing for accurate tactile simulation. Performing the cricothyroidectomy procedure on the prototype model closely replicates the actual surgical procedure. With the prototype, we conducted training sessions for our junior medical officers. We evaluated their confidence in performing the procedure with a survey with both qualitative and quantitative elements before and after the training session.
Results: Our simulation model is anatomically accurate and silicon replica as skin substitute accords reasonable real-life simulation. Confidence scores of seven participants improved after the training session over all domains (Understanding of airway anatomy, Ability to surface mark, Procedural Steps, Performing the procedure). After the training session, all participants were assessed to be competent by a senior ENT surgeon. A significant residual concerns participants have is the challenge of performing the procedure under time constraints, with anatomical or positional variation in real life scenarios.
Conclusion: An anatomically accurate 3D simulation model for cricothyroidectomy is an advancement in the training of this critical procedure. Trainees were competent after the training session. They are also more confident in performing the procedure.

Interprofessional team-based in situ simulation in the intensive care unit

Authors
Hao-Ming Chang, NDMC, TSGH, Taipei, Taiwan
Feng-Cheng Liu, NDMC, TSGH, Taipei, Taiwan
Tai-Long Cha, NDMC, TSGH, Taipei, Taiwan

Presenter: Hsu-Kai Huang, NDMC, TSGH, Taipei, Taiwan

Background: Most teaching hospital provide off-site simulation, but within the hospital in-house training center in Taiwan. Interprofessional teamwork training can reduces clinical errors. We design interprofessional, team-based in situ simulation courses for patient safety. The course focused on critical thinking, problem solving, effective communication and collaboration.
Method: The in situ, announced simulation course was held monthly in the intensive care unit. The participants were chosen from nurse, nurse practitioners, respiratory therapy or residents based on clinical scenario. To evaluate the teamwork and management critical patients after course, the database of reporting system of patient safety was applied.
Results: Participants were satisfied to join the simulation course and had feedback with benefit to their clinical work, especially in communication. The quarterly database of reporting system showed no improvement of patient safety. The published studies indicated in situ simulation may be more effective than other types of simulation model in medical education. In situ simulation provides participants realistic condition and environment for achieving the learning objectives. Our finding showed the interprofessional team-based in situ, announced simulation course can help participants to have effective communication. To improve patient safety in the intensive care unit maybe need continuous and more authentic learning course.
Conclusion: Designing interprofessional, team-based simulation course was challenging, and we think the in situ, announced simulation course can provide learner to get more real experience for patient safety in the teaching hospital.

7DD9 (2243)

Using a 360° video based Virtual Reality environment of a kidney transplantation and donation procedure in different phases of the medical curriculum

Authors
Arianne D Pieterse, Leiden University Medical Center, Leiden, Netherlands
Volkert AL Huurman, Leiden University Medical Center, Leiden, Netherlands
Beerend P Hierck, Leiden University Medical Center, Leiden, Netherlands
Jos A van der Hage, Leiden University Medical Center, Leiden, Netherlands
Peter GM de Jong, Leiden University Medical Center, Leiden, Netherlands
Marlies EJ Reinders, Leiden University Medical Center, Leiden, Netherlands

Presenter: Arianne Pieterse, Leiden University Medical Center, Leiden, Netherlands

Background: 360° degree Virtual Reality (VR) is a digital technology where learners using VR equipment are able to "look around" in an artificial world. The VR experience gives medical students the opportunity to be involved in activating experiences and to be engaged in actual clinical situations before entering these in real life. To our knowledge this technology has not yet been applied in teaching medical students on the topic of renal transplantation procedures.
Method: Two 360° videos of an actual kidney donation and transplantation procedure were recorded at the Leiden University Medical Center. Both the 360° view of the operating room and the direct surgical view were incorporated in the VR environment. The 360° video was shown to fourth year medical students and surgical residents equipped with 3D glasses. During and after watching the video, the students took additional assignments focusing on observed behavioral skills in the operation room and the student's knowledge regarding different tasks of the operating team and procedure.
Results: The medical students experienced the 360° video realistic and stated unanimously that they had a better idea of what actual participation in operative procedures would be like, and which role every professional has. This preparation was found to be superior to immediate exposure during internships. Students indicated VR is an inspiring addition to traditional course materials, and helps them to feel better prepared for complex and dynamic environments such as the operating room. Surgical residents indicated that the environment would be helpful in preparing for assisting in the operation room. Introducing VR in the medical curriculum provides students and residents with more adequate preparation for live situations in the operating room. When clear learning goals and focussed learning assignments are provided, the same VR environment can be used for teaching different target audiences, ranging from medical students to experienced doctors.
Conclusion: Virtual Reality can be used in different phases of the medical curriculum to teach both behavioral skills and content knowledge.

7DD10 (2779)
"Masterchef" – a Simulation Component in Surgical Residency Selection

Authors
Saleem Ahmed, Tan Tock Seng Hospital, Singapore
Habeebul Rahman, Tan Tock Seng Hospital, Singapore
Kaushal Sanghvi, Tan Tock Seng Hospital, Singapore
Terence Huey, Tan Tock Seng Hospital, Singapore
Sarah Lu, Tan Tock Seng Hospital, Singapore
Tham Kum Ying, Tan Tock Seng Hospital, Singapore

Presenter: Saleem Ahmed, Tan Tock Seng Hospital, Singapore

Background: Background: In 2015 we re-designed our surgical residency program selection after an internal review and literature search. It now has 3 components: (i) semi-structured interview, (ii) manual dexterity test and (iii) a novel non-clinical simulation (i.e. baking) exercise to assess non-operative technical skills, during which NOTSS (Non-Operative Technical Skills for Surgeons) is used to grade the candidates.
Method: : We conducted a faculty development workshop that immerses participants in the candidates' task (whisking) and the assessor's work with the aim to challenge them to rethink their selection process. Participants were randomly grouped into teams, given a set of instructions, ingredients and equipment to whisk egg white into stiff peaks i.e. the candidates' tasks. They then wore the assessor's hat by watching videos of teams of candidates completing a baking task during an actual selection and graded them using NOTSS (score 1-4).
Results: 18 faculty members (grouped into 4 teams) attended the workshop of which 14 were experienced interviewers involved in candidate selection. 17 of 18 participants rated the overall effectiveness of the simulation exercise at 7.67 (6.66-8.68, max 9). Learning points fall into 3 categories: (1) attention to design of selection process and choice of tools, (2) desirable assessor attributes and burden of work during selection, especially when using NOTSS to assess "soft" skills, and (3) consideration to review selection tools that they are currently using.
Non-surgical technical skills are notoriously difficult to assess. Designing and implementing a reliable and feasible simulation exercise to assess such skills is a challenge. Replicating this simulation exercise in a faculty development workshop doubles the challenge but is critical in providing the immersive and fun element for participants to experience the candidates' perspective. NOTSS while widely used adds substantial burden to assessors when a team of 3-4 candidates are being observed simultaneously.
Conclusion: A non-clinical simulation component in residency selection promises to assess non-surgical technical skills. Replicating this simulation exercise in a faculty development workshop allows participants to gain insight and have fun. Any tool that assesses non-surgical technical skills, which are inherently complex, should not overburden the assessors.

7DD11 (2825)
Early simulated surgical practice improves learning effectiveness and attitude in clerkship

Authors
Guan Jin Ho
Li Chuan Kuo
TsungYing Chen
Jen-Hung Yang

Presenter: Guan Jin Ho, Tzu Chi General Hospital, Hualien, Taiwan

Background: Clerks under the new academic system are facing the challenge of shortened training time from 7 years to 6 years by Taiwan's medical education system. The Tzuchi "Basic skill learning programs on cadavers" for the 7th-year internship are changed to the 5th-year clerkship who has no clinical experience before and there are two-years of overlapping periods for this two different systems. This study will clarify if the goal of building the self-confidence and adaptation in the clinical environment have the same effectiveness in the new system.
Research Method and Structure: Quantitative
Method: Due to medical education system reform, there were two group clerks six-year (no clinic experience) and seven-year (two years of clinic experience) were tested. After standardizing the teaching of simulated surgeries, the survey was conducted using the questionnaire on "Effectiveness of Clerks in Learning Clinical Skills. Questionnaire". Descriptive statistics are presented in times, percentage, average, and standard deviation. The results of questionnaire analysis are compared by independent sample T test, with $p < 0.05$ being a significant difference.
Results: A total of 58 questionnaires, 36 from 5th-year clerks (male 22, female 14) and 22 from 7th-year clerks (male 11, female 10), were collected from September 2017 to January 2018. The results show the benefits for clerkship on familiarizing with the clinical settings and procedures and elevating self-confidence. In surgical skills, lack of previous clinical experience is the weak point on strengthening their spatial sense, confidence of clinical practice, and understanding the surgical impacts on patients. The clerks with no clinical experience focus more on basic skills, procedures, and are more dependent on teacher's teaching. By operating on the cadavers, the clerks can establish a physician's identity sooner and a more positive learning attitude.
Conclusion: As far as experiential learning, the clerks' early participation in simulated surgery courses may promote their confidence and positive attitudes in the workplace, and the clinical experience has vital impact in the training course. Based on this study, learner-centered training programs will be the principle in the future.

7DD12 (3495)
Laparoscopic Surgery: Based in Illumination Training System (Bits) Face, Content and Construct Validity

Authors
Jose Rosciano
Omaira Rodriguez
Alexis Sanchez
Genesis Jara

Presenter: Omaira Rodriguez, Universidad Central de Venezuela, Caracas, Venezuela

Background: The purpose of this work is to present and validate BITS (Based in Illumination Training System), an inanimate, low-cost and low-technology model, as a tool for laparoscopic surgery training. To determine the usefulness of this system was used face, content and construct validities

Method: We evaluated 16 participants divided into two working groups, experts and novice surgeons. Both groups made three BITS exercises and results were compared based on time, number of errors, and object drop while performing tasks. Participants completed a post-study questionnaire to evaluate face and content validity.

Results: The expert surgeons group made the three exercises faster, making fewer errors, and with less object drops than the novice surgeon group, showing significant statistical differences between the two groups. Expert participants found the model acceptable and rated the model favorably in terms of content and face validity.

Conclusion: The model described proved to be able to differentiate between novices and experts surgeons, and the experts surgeons rated the model favorably in terms of content and face validity, which validates this as an useful tool for laparoscopic surgery training.

Take-home message: BITS is a validated model for laparoscopic surgery training.

Medical Residency in Psychiatry from the students' and teachers' point of view: assessing the Medical Residency in Psychiatry of the University of the State of Rio de Janeiro/Brazil

Authors
Silvana A. T. Ferreira, UERJ, Rio de Janeiro, Brazil

Presenter: Silvana Ferreira, UERJ, Rio de Janeiro, Brazil

Background: Due to the challenges inherent to psychiatric clinical practice, much has been discussed about technical knowledge and competencies that should be achieved by students during their medical education as mental health specialists. In Brazil, National Medical Residency Committee provides guidelines to Medical Residency in Psychiatry programs concerning its theoretical contents and practical learning scenarios. However, when it concerns the desirable skills that should be achieved by the graduates, guidelines are more generic and amenable to different interpretations.
Method: The aim of this work was to assess professional training provided by the Medical Residency program in Psychiatry of the University of the Estate of Rio de Janeiro (MRP/UERJ). A semi-structured questionnaire was applied online to investigate the impressions of students (n=25) and teachers (n=9) regarding the strengths and weaknesses of MRP/UERJ, especially on their perceptions about the learning process in the three axes mentioned above : (1) theoretical content, (2) learning scenarios and (3) acquisition of personal skills necessary for future clinical practice.
This study is currently in progress and results are expected by the end of april/2018.
If, on the one hand, students generally are prone to value the relationship established between them and their teachers as a fundamental pillar in their professionalization process and acquisition of professional identity, on the other hand, faculties in the academic settings tend to cherish the acquisition of theoretical/technical knowledge to the detriment of the development of personal skills needed to a qualified psychiatric clinical practice.
Conclusion: Assessing teachers' and students' perceptions about learning processes can be an important tool to provide feedback to medical residency programs on curriculum changes and to highlight the importance of the teacher as a skill model to follow suit in professional practice.
Teachers' role involves the development of personal skills such as a reflective attitude towards vocation and the professional mission.
"I wish I had more time and learned more of how much you have to teach because you are an incredible teacher and a very inspiring psychiatrist".

7EE2 (372)
Action Research to Faciltate the Learning of Case Formulation in a Psychiatry Residency Program

Authors
David Choon Liang Teo
Vanessa Wai Ling Mok
Lay Ling Tan

Presenter: David Choon Liang Teo, Changi General Hospital, Singapore

Background: Case formulation (CF) is the process by which a psychiatrist understands a patient's presenting problems holistically and thereby plans specific, individualized treatment interventions. Faculty at Changi General Hospital observed residents having difficulty learning and demonstrating competency in this clinical skill. To improve training in CF, we used action research to understand this educational problem from both faculty's and residents' perspectives, and to collaboratively generate ideas to facilitate the teaching and learning of this skill.
Method: We adopted the action research methodology to improve residents' learning of CF. Faculty and residents were surveyed to understand their pre-existing perspectives on what constitutes CF, its importance, how it is presently taught, and how it can be taught better (reflect). We facilitated a video-recorded focus group including faculty and residents to collaboratively understand the problem and brainstorm on how to improve the teaching of CF (plan). Results of the survey were subsequently presented to highlight differences in perspectives. A consensus was obtained on how CF should be taught and practiced in day-to-day work and supervision (act). Thereafter, residents fed back that they better understood what CF is. Faculty observed improvements in residents' case formulations (observe). Future reflect-plan-act-observe cycles have been planned to further improve the training.
Results: Both faculty and residents agreed on the importance of CF. However, there were differing views about what constitutes CF, how and in what settings CF is learned. Both groups agreed that supervision is an ideal setting to learn the skill. Faculty favoured formal learning modalities like case write-ups and presentations, while residents preferred a more didactic approach such as lectures and worked examples.
Conclusion: Action research is a flexible circular process that allows understanding and change to be achieved concurrently in addressing educational problems. As the action for change was developed by the participants, there was a greater sense of ownership and better adoption of the strategies.
Take-home message: Through action research, assumptions can be made explicit. Facilitating a shared understanding of learning objectives and opportunities through this process can improve educational outcomes.

7EE3 (957)
Usefulness and Extent of Utilization of Balint Groups in Postgraduate Psychiatry Training in India

Authors
Jonas Sundarakumar, Spandana Institute of Psychiatry, Bangalore, India

Presenter: Jonas Sundarakumar, Spandana Institute of Psychiatry, Bangalore, India

Background: Postgraduate Psychiatry training programs in India mostly adopt conventional training methods, involving didactic teaching and clinical demonstration, that largely focus on imparting subject knowledge and clinical skills. Very few institutions in India have dedicated training methods for imparting non-clinical professional skills or promoting reflective learning. Balint groups were originally started among General Practitioners in the U.K. for this purpose.

Method: In-depth interviews were conducted with 15 current or recent Postgraduate Psychiatry trainees, who had participated in the weekly Balint groups at Spandana Institute of Psychiatry, Bangalore, India. In addition, 2 senior faculty, who were the Balint group leaders, were also interviewed. The first-hand experiences of the trainees and group leaders were recorded, to understand the usefulness of these groups to the trainees. Also, the curricula and training methods for Postgraduate Psychiatry courses, conducted by various teaching institutions across India were reviewed, to understand the extent of utilization of Balint groups in Postgraduate Psychiatry training in India.

Results: The trainees expressed that their participation in Balint groups was an enriching experience in several ways. Entry-level trainees found the groups useful to develop interviewing skills, empathy and to facilitate better rapport with their patients. All trainees felt that the groups offered a conductive environment to share and introspect about their difficult clinical interactions, to learn from the experiences of their peers, as well as to gain a deeper understanding about the emotional experiences of both their patients and themselves. Most trainees felt that time was a constraint, owing to their hectic schedules and rotational postings. Both the trainees and group leaders strongly recommended Balint groups as a routine part of Postgraduate Psychiatry training in India. However, it was found that throughout the country, Balint groups were extremely uncommon, grossly underutilized and not routinely prescribed as a part of Postgraduate Psychiatry training in India.

Conclusion: Balint groups can be an effective and feasible way of improving non-clinical professional skills, improving the doctor-patient relationship and offering a support network for trainees.

Take-home message: Postgraduate Psychiatry training programs in India should incorporate Balint groups as a regular part of training.

Psychiatry Boot Camp: A successful application of 4 weeks' intensive training for doctors new to mental health in Europe

Authors
David Rigby, North East London NHS Foundation Trust, London, UK
Ebru Lumley, North East London NHS Foundation Trust, London UK
Alexandre Wong, Central and North West London NHS Foundation Trust, London, UK
Andrew Roney, East London NHS Foundation Trust, London, UK
Peter Carter, North East London NHS Foundation Trust, London, UK

Presenter: David Rigby, North East London NHS Foundation Trust, London, UK

Background: The UK is currently experiencing a crisis in recruitment into psychiatry. Therefore our department needs to be more inclusive in their employment strategies to fill vacancies. The department took 3 doctors with no prior experience of psychiatry in the Europe. To ensure patient safety the recruits were inducted into a 4 week psychiatry 'boot camp.'

Method: Each recruit was allocated an educational supervisor and was attached to a clinical post for the 4 weeks. They also received 4 full days of teaching covering the basics of the profession with an emphasis on using simulated patients of common presentations in psychiatry. To ascertain the effectiveness of the boot camp the recruits were surveyed as to their level of confidence in various clinical skills using a Likert scale before and after the course. In addition they were set a 24 point MCQ using a matrix based on Romiszowski's (1981) analysis to ensure a breadth and depth in curriculum coverage. The pass mark was determined using a panel of experts applying the Angoff (1971) method.

Results: The recruits overall reported a significant increase in their confidence in basic clinical skills. They reported on average a confidence level of 5.5/10 in performing a psychiatric history before the course, this increased to 8/10 at the end. They reported an increase in feeling ready for on calls from 3/10 to 5/10. The MCQ pass mark was determined at 53%. All 3 recruits failed the exam at the start of the course scoring 29%, 46% and 50%. 2 out of 3 recruits passed at the end of the course scoring 58% and 54%, the third recruit could not attend the exam.

Conclusion: Our organisation was able to provide effective and focussed teaching to doctors with no previous experience in UK psychiatry as evidenced by improvement in MCQ score and confidence levels.

Take-home message: Think outside the box when dealing with recruitment shortfalls in your speciality but ensure you can evidence improvement in clinical skills and patient safety.

How psychiatry residents perceive the clinical teaching effectiveness under direct observation versus without direct observation

Authors
Lay Ling Tan
Jia Wen Carmen Kam

Presenter: Lay Ling Tan, Changi General Hospital, Singapore

Background: Residents in the National Psychiatry Program rotate to various sites for their one-year ambulatory training. Supervision of their training may be direct observation (DO) of clinical cases, without direct supervision (WDO) or a mixture of both (M). This study explores the residents' perceptions of teaching effectiveness under the different supervision framework with an aim to standardize their supervision at the different teaching sites.

Method: A survey was conducted amongst the residents at the end of their third year ambulatory training. Data was collected over three years (2014-2016) to establish a sample of 41 residents over 7 teaching sites. The Cleveland Clinical Teaching Effectiveness Instrument (CCTEI) was used to capture the residents' perception of the various domains of clinical teaching effectiveness.

Results: Fewer residents received DO (15/41; 36.6%) and M (7/41; 16.7%) compared with WDO (19/41; 46.3%). There was no statistical difference in the various domains of CCTEI scores of the 3 supervision formats. However, when asked for their preference, 20/41 opted for DO (increase of 36.6%) and 11/41 for M (increase of 57%). WDO was least preferred (10/41; decrease of 47.7%). The significant CCTEI domains for preferred M were (Q8) asking questions that promote learning (p=0.001) and (Q5) offering regular feedback (p=0.002). Surprisingly, Q2 (stimulates me to learn independently) and Q3 (allows me autonomy) were found to be insignificant.

Previous studies found DO anxiety-provoking with concerns of compromised autonomous learning. This study did not uncover similar concerns but highlighted the effectiveness of timely questions and regular feedback in clinical teaching with mixed method supervision.

Conclusion: Although DO is most preferred and is crucial in the initial months of training, it will not be sustainable with an increasing pool of residents. There is a need to standardize the ambulatory training supervision across teaching sites. Adoption of M supervision framework may be most feasible. However, further studies are needed to determine when residents can practice independently within this framework.

Take-home message: There should be flexibility in the supervisory framework for residents to function more independently when they are deemed to be competent and safe.

7EE6 (1567)

Applying Artificial Intelligence to enhance healthcare decision making reliability in a postgraduate course at a Brazilian Health Sciences University

Authors
Silvio Cezar Cazella, UFCSPA, Brazil
Johanna Dagort Billig, UFCSPA, Brazil
Melissa Santos Fortes, UFCSPA, Brazil

Presenter: Melissa Santos Fortes, Universidade Federal de Ciências da Saúde de Porto Alegre, Brazil

Background: Expert Systems are an Artificial Intelligence (AI) application that consist of a knowledge base of well-established facts and rules (SPIRLANDELLI, 2011; XAVIER, 2009). They are supplied with evidence based knowledge of some experts to provide other expert users with reliable and fast solutions to problems (SPIRLANDELLI, 2011). Some have been successfully used in health for diagnostic support and prevention (PROCHASKA, 2005; KHOSRAVI, 2015).

Method: A descriptive report of the educational experience in a healthcare postgraduate course of using the Expert SINTA Software to develop Expert Systems that support healthcare professionals in decision making in two healthcare scenarios. More specifically, we discuss the development by a medical postgraduate student of an Expert System to assist cardiology teams in the selection of the most appropriate transcatheter aortic valve prosthesis for aortic stenosis patients. We also detail another Expert System by a nutrition postgraduate student that aids in the diagnosis of adiposity pattern in adults.

Results: Our results show that the use of Expert SINTA Software in a healthcare postgraduate course can enhance decision making by specialists in Cardiology, Nutrition, Neurology, Anesthesiology, Physical Therapy, among others.

The introduction of Expert Systems in healthcare education provides for problem-based learning contexts. The students realize how complex their knowledge is when faced with the task of making factual and/or tacit specialized knowledge explicit to enable a machine to aid health professionals to make more reliable and fast decisions in everyday practice.

Conclusion: The development of Expert Systems in our postgraduate course demonstrates that Artificial Intelligence can be applied by non-experts in computing not only to aid but also to increase reliability in decision making in several healthcare contexts.

Take-home message: Artificial Intelligence should be part of healthcare postgraduate education as it provides for problem-based learning contexts in which students can transfer their specialized knowledge and reasoning into machines to help other health professionals in decision making in their practice.

7EE7 (3434)
Effect of Simulation-based Training in Diagnostic Abdominal Ultrasound: A Randomized Trial

Authors
Mia Louise Østergaard
Kristina Rue Nielsen
Elisabeth Albrecht-Beste
Michael Bachmann Nielsen
Lars Konge

Presenter: Mia Louise Østergaard, Copenhagen Academy for Medical Education and Simulation/Department of Radiology, Copenhagen University Hospital, Copenhagen, Denmark

Background: Ultrasound is a complex skill and ensuring the competency level of the operator is crucial for the outcome of the examination. Simulation-based training may overcome some of the educational challenges in modern medicine and possibly benefit performance levels.
Method: The project is a randomized controlled trial registered on ClincalTrials.gov (Identifier: NCT02921867) and reported using the CONSORT statement[1]. Twenty radiological residents from three regions of Denmark are enrolled before starting clinical ultrasound training.
All participants are randomized in a paired randomization to either control group (no simulation training) or intervention group (simulation training). The intervention group will attend a simulation-based mastery learning program, with nine modules correlating to the European level 1 ultrasound examiner, before starting clinical training[2].
All participants will score all ultrasound scans in the first six weeks of training using a standardized assessment sheet (OSAUS) for ultrasound skills with solid validity evidence[3].
Results: Eighteen out 20 participants have completed the study at submission deadline and data collection will end by 1st of March 2018. Final results will be ready no later than June 2018.
Conclusion: This project will contribute new knowledge on the effect of competency-based simulation-based training in diagnostic abdominal ultrasound and potentially providing a standardized simulation-based educational program suitable for mastery learning.
Take-home message: New knowledge of the effect of simulation-based training in diagnostic abdominal ultrasound; based on a multicenter, randomized controlled trial design.

SMART Learning for the Millennial Physician

Authors
Amulya A Nageswara Rao
Deepti Warad

Presenter: Amulya Nageswara Rao, Mayo Clinic, Rochester, USA

Background: The ultimate goal of medical education is the transformation of a learner into a competent physician who upholds the highest standards of professionalism. Providing quality care requires knowledge acquisition, clinical and communication skills development, self-awareness and self-directed learning that adapts itself to the ever-changing landscape of medicine. Medical training should be personalized and should incorporate adult learning methodology while keeping up with the digital age and current generational demands.
Method: In our pediatric hematology/oncology fellowship training program, we introduced an experiential and transformative learning process. Our curriculum follows the required elements of experiential learning:
- active learning (concrete experiences) using case simulations with standardized patients for breaking bad news and cross-cultural communication training,
- reflective observation using case-based education and chemotherapy competency training sessions creating an opportunity for practice with clinically relevant situations,
- abstract conceptualization through core lectures, article of the week sessions (an article is reviewed every week followed by board exam style quizzes), online quizzes and state of the art lectures by peers, faculty and renowned experts via web-based portals/video sessions, and
- active experimentation wherein the learner, through cycles of experience, reflection and knowledge acquisition, is able to add value to daily clinical and learning experiences.

Trainees also attend a teaching skills workshop and professionalism sessions covering issues such as challenging patients, death and dying, and stress and burnout.
Results: Trainee evaluations have been very positive. Initiatives such as the case-based education sessions, cross-cultural communication and chemotherapy competency training workshops are among the most highly rated within our fellowship program. These initiatives seem to also positively impact the subspecialty in-training exams.
Conclusion: A SMART learning process which allows the trainees to Seek their edge (to self-identify what they know versus areas of deficiency), be a Master educator (reinforce their learning through teaching peers and faculty), Acquire knowledge (through active and passive learning), and Reflect (by observing, analyzing and feedback) helps with the Transformation of the learner into a master clinician.
Take-home message: Training programs should incorporate an individualized SMART learning process which follows best practices of adult learning.

Use of three-dimensional (3D) printed models to enhance hands-on experience among residents attending basic and advanced colposcopy course

Authors
Muhammad Fairuz Abdul Rahman, KKH, Singapore
Peggie Pei Ting Loh, KKH, Singapore
Wai Loong Wong, KKH, Singapore
Swee Chong Quek, KKH, Singapore
Timothy Yong Kuei Lim, KKH, Singapore
Ieera Aggarwal, KKH, Singapore

Presenter: Muhammad Fairuz Abdul Rahman, KK Women's and Children's Hospital (KKH), Singapore

Background: Three-dimensional (3D) printing has allowed the rapid production of models which simulate human anatomy. In order to simulate colposcopy, we used 3D printed models to facilitate learning during our colposcopy course. It is unethical and impracticle to allow real-life patients to be examined by residents repeatedly during a colposcopy course. The purpose of this study was to evaluate the use of 3D printed models to enhance the hands-on experience among residents attending basic and advanced colposcopy course.
Method: A 3D printed model of a vaginal canal was used throughout five consecutive basic and advanced colposcopy courses conducted at KK Women's and Children's Hospital (KKH), Singapore, in 2016 and 2017. This plastic model consisted of a base, a stand, a flat backing and a hollow tube. Assembly of the model and attachment to smoke evacuator was quick and easy. In our centre, we used the ox tongue for its similarity in appearance and texture to a human cervix. The courses comprised of lectures and practical sessions. Residents attending the courses were given a pre- and post-course quiz and used the model throughout the practical component of the course.
Results: A total of 89 participants comprising predominantly junior and senior residents were involved in the five colposcopy courses conducted in 2016 and 2017. Facilitators comprised of consultants from the Department of Gynaecological Oncology, KKH. Feedback of the 3D printed model was highly positive, with residents and facilitators commenting on its ease of use, durability and reliability. Its quick assembly also meant a short turnover time between participants.
Conclusion: Colposcopy in clinical practice takes a substantial amount of knowledge, skills and experience in order to achieve competency. Use of simulation training with the 3D printed models allowed the residents to develop, refine, and apply the clinical knowledge without compromising patient safety. Its lightness, durability and ease of assembly could potentially make the 3D printed model a useful instrument for conducting courses anywhere around the world. There is probably more that 3D printed models can offer in enhancing the learning of residents in the future.

Workshop for difficult patient management containing of Significant Event Analysis and video-based discussion

Authors
Shoichi Ito, Chiba University, Chiba, Japan
Kiyoshi Shikino, Chiba University, Chiba, Japan
Kazutaka Noda, Chiba University, Chiba, Japan
Mayumi Asahina, Chiba University, Chiba, Japan
Masatomi Ikusaka, Chiba University, Chiba, Japan
Takahiro Soma, Chiba University, Chiba, Japan

Presenter: Shoichi Ito, Chiba University, Chiba, Japan

Background: We frequently experience difficult patient (DP) encounter, and have to manage such encounter appropriately for providing patient-centered care quality. To provide learning opportunities for DP management, we created e-learning videos showing DP encounter and developed workshop for improving DP management. Here, we report effectiveness of the workshop and the factors influencing its effect.
Method: Thirty second-year residents in our hospital participated in the workshop for DP management. Before workshop, their empathy was assessed by Jefferson's scale of Physician empathy, and their expectations for DP management as fellows after residency were also assessed. The workshop contained of two parts; Part 1: Significant Event Analysis (SEA) for participants' experiences of DP encounter, Part 2: video-based small group discussion for improving DP management. They completed self-assessment questionnaires regarding DP management.
Results: The workshop improved residents' confidence and learning motivation for managing DP. Almost all participants reported that they could acquire new knowledge. Positive correlation is observed between the participant's empathy and learning effect throughout the workshop. The expectations for DP management in fellowship program positively influenced improvement of leaning motivation.
Conclusion: The workshop including SEA and video-based discussion could develop participants' knowledge, confidence, and learning motivation for managing DP. SEA can be useful for improving patient-centered DP management and deep learning for professionalism of residents. Video-based discussion can be useful for improve learning motivation. Empathy in patient-centered care quality and expectations for DP management in the future are considered necessary for better DP management.
Take-home message: We can improve resident's knowledge and attitudes for DP management effectively by the workshop including SEA and video-based discussion. Empathy is important for better DP management.

Chen-Yin Tung, Department of Health Promotion And Health Education, National Taiwan Normal University, Taipei, Taiwan

Presenter: Jin-Lain Ming, Taipei Veterans General Hospital, Taipei, Taiwan

Background: Workplace violence is a global and severe problems in healthcare theatre. Prevention focused situational education is a good strategy to reduce the risk of violence.

Method: The aim of this study was determining the perception, attitudes and confidence in dealing workplace violence following a situational educational intervention. Using a experimental design, four hundred nurses were enrolled and assigned into two groups. 392 of them completed program of the workplace violence prevention in the study. Data were analyzed by Generalized Estimating Equation.

Results: The results indicated that the situational education group's participants had improve considerably in their perception, attitudes and confidence in dealing workplace violence at post-test (p < .001). Meanwhile, the participants in the post situational training program showed considerable improvements in their training compared with control group. We concluded that using workplace violence prevention training can increase the Workplace violence awareness, established the correct attitude forfacing Workplace violence.

Conclusion: We recommended that situational teaching education of workplace violence prevention may be used as a standard training program for nurse staff. Implications for different department of healthcare setting practice and future studies were also suggested.

7EE12 (334)

Improving the communication skills and ability of searching medical literature of postgraduate doctors by a standardized patient and a simulation scenario

Authors

Chiu-Ping Kuo, MacKay Memorial Hospital, Taipei, Taiwan

Ching-Chung Lin, MacKay Memorial Hospital, Taipei, Taiwan

Presenter: Chiu-Ping Kuo, MacKay Memorial Hospital, Taipei, Taiwan

Background: Doctors need lifelong learning. Postgraduate residents often face requests from the patients and family members for the evidence of medical advices. We designed a simulation scenario for postgraduate residents to practice the skills of EBM (evidence-based medicine). In the end of the test, immediate feedback is made from the examiner and the standardized patient.

Method: The topic of the simulation scenario is "Explain the benefit of therapeutic intervention to a standardized patient by medical evidence-the benefit of thoracoscopic surgery in a recurrent primary spontaneous pneumothorax". The examinees should realize the questions of the standardized patient and search the medical literature immediately on the internet. Then, explain the evidence and answer the questions. The Exam time is 15 minutes, and the time for instant feedback is 5 minutes (both examiner and standardized patient).

Results: We collected the data of test results during 2013-4-13~2016-6-18, and there are 247 examinees totally. Test results were analyzed by SPSS（Statistical Product and Service Solutions）software. The average score of the first year (2013, 3.50) is lower than the subsequent years (3.99, 3.86, 3.76). Communication is better than EBM skill from examiners' view (3.87±0.57 vs. 3.69±0.64); on the contrary, the standardized patients gave better scores on EBM skill than communication (3.78±0.80 vs. 4.03±0.94).

We had never used OSCE to test EBM skills till 2013. The lowest score at the first year (2013) may be due to the examinees were unfamiliar with such form of test. The reasons that the examiners and standardized patients scores oppositely on communication and EBM skills may be that they have different backgrounds and expectations.

Conclusion: We believe that regular test EBM skills of postgraduate residents can promote their performance. Instant feedback from the examiners and standardized patients can enhance the learning effects and offers complementarity.

Take-home message: EBM is the essential capability of postgraduate doctors. Training and evaluating EBM skills by a simulation scenario is feasible. Instant feedback from examiners and standardized patients offers complementarity.

7EE13 (574)
Long-term learning of junior doctors following high-fidelity simulation

Authors
Thomas O'Dell, Imperial School of Anaesthesia, London, UK
Helen Westall, London North West Healthcare NHS Trust, London, UK
Armadeep Riyat, London North West Healthcare NHS Trust, London, UK
Rita Russai, London North West Healthcare NHS Trust, London, UK

Presenter: Thomas O'Dell, Imperial School of Anaesthesia, London, UK

Background: Simulation based medical education (SBME) is an effective method of learning[1]. It provides safe rehearsal in a controlled and immersive environment while teaching both clinical and non-technical skills. However, beyond the demonstration of practical skills[2], little is known about the more complex long-term learning of candidates.

Method: Our study investigates junior doctors learning from SBME after one year. 165 Foundation Year 2 doctors were recruited over four academic years to complete a free-text questionnaire regarding their Foundation Year 1 medical emergency high-fidelity simulation training from multiple centres. Two researchers independently performed thematic analysis of the comments, combining results by common themes.

Results: 95.5% of responses demonstrated lasting learning and clear themes were highlighted consistently across year groups:
• A structured approach to the sick patient – 24.7%
• Escalation to senior colleagues – 15.6%
• Management of specific emergencies – 6.6%
• Importance of reassessment after intervention – 6.1%
Further points included: communication amongst team members (5.5%), the importance of staying calm (4.6%) and using clear or SBAR handovers (4.5%). 4.5% gave no response.
Most doctors recalled learning one year after SBME with popular learning topics echoing desired learning outcomes. Many doctors recalled a systematic ABCDE assessment encompassing new knowledge, behaviours and thought processes. These are generic and transferrable skills for clinicians, which cannot easily be taught outside of the simulation suite. Other learning points like 'communication', 'escalation' or 'teamwork' include an element of perceived behavioural change. It is recognised that these learning outcomes are self-reported rather than assessed, however they cover some important educational goals.
A minority of doctors reported no learning at one-year, this would need further exploration.

Conclusion: High-fidelity simulation may offer long-term learning in key clinical skills through acquisition of knowledge alongside perceived change in behaviour, attitudes and beliefs.

7EE14 (3623)
'Tech Savvy Teachers': Leading Engagement in Post Graduate Medical Education with a technology enhanced approach

Authors
Simon Blackburn, Great Ormond Street Hospital, London, UK
Emma Parish, Great Ormond Street Hospital, London, UK
Justin Poisson, Great Ormond Street Hospital, London, UK
Holly Boyd, Great Ormond Street Hospital, London, UK
Jeroen Poisson, Great Ormond Street Hospital, London, UK
Sanjiv Sharma, Great Ormond Street Hospital, London, UK

Presenter: Craig Knott, UK

Background: Within a large teaching hospital, it can be a challenge to signpost the appropriate learning opportunities, to the correct audience, in a timely manner. After feedback from staff about lack of awareness of teaching, especially inter-departmental opportunities, a need for clear communication was highlighted as a priority. The Post Graduate Medical Education (PGME) team at Great Ormond Street Hospital (GOSH) previously used traditional flyers and emails to advertise. We wanted to try a novel approach, bringing together teaching opportunities from across the Trust.

Method: The PGME team were trained in use of a new platform (Guidebook) to create an app specifically for GOSH education. Within the app a teaching calendar of events was created with details of how to book, venue, timings, main audience and option to provide feedback. The platform also allows sharing of relevant external and internal websites and trust projects. The app has been included in induction programmes to improve new starter engagement. At the same time, the use of PageTiger for creating a weekly newsletter pulling together teaching opportunities was also trialled. We continued to advertise using traditional methods.

Results: Our app has been downloaded 542 times, with 5921 guide sessions, since launching in November 2016, peaks are seen with each staff induction. We average 66 views of the newsletter per week, and rising. We have identified formal teaching programmes from across 5 departments which have been opened up to others within the Trust. The number of underfilled sessions has reduced. There have been challenges raising awareness of the app to all staff groups. Existing staff groups remain a particular challenge to reach. The content of the app now includes a 'PRAISE tool', to allow positive feedback for colleagues.

Conclusion: Over the coming months we will continue a quality improvement approach to developing the app's ability to provide immediate feedback to educators. Email alone is not enough for engagement.

Take-home message: Apps may not meet the needs of all staff, but having a centralised location for all teaching allows for more coordination and reduces waste of educational resources.

7EE15 (2926)
If you build it they will come and stay: Implementing a new Family Medicine Residency Program (FMRP) in an under-served community

Authors
Stuart Murdoch, University of Toronto, Toronto, Canada
Mary-Kay Whittaker, University of Toronto, Toronto, Canada
Caroline Abrahams, University of Toronto, Toronto, Canada
Linda Rozmovits, University of Toronto, Toronto, Canada
Risa Freeman, University of Toronto, Toronto, Canada

Presenter: Stuart Murdoch, University of Toronto, Canada

Background: In response to a government request to recruit and retain physicians in under-served communities, an FMRP was established 100km north of the University of Toronto at the Royal Victoria Regional Health Centre (RVH). This study investigated the correlation between postgraduate medical training and future practice locations, and the strengths, unique features and opportunities for improvement of this new under-served community FMRP.

Method: RVH graduates from 2010-2015 (40) were invited to participate. The current practice location of participants was determined using records from a government funded data centre and the public registry of the provincial licensing body. Semi-structured 1:1 interviews were conducted to gain insight into graduates' experience in the program. Interviews were recorded, transcribed and coded; thematic analysis and a constant comparative method were used, including anticipated and emergent findings and searches for disconfirming evidence. Purposive sampling was employed for thematic saturation.

Results: Tracking practice patterns of graduates demonstrated that 2/3 of participants continued to work in the RVH region after graduation and 3/4 work in the RVH/northern regions of the province. Of respondents who completed the survey, 93% were either very satisfied/satisfied with their work with only 17% indicating that they would very likely change their job setting in the next five years.

Analysis of qualitative data provided insights into an overwhelmingly positive educational experience with a wide range of learning opportunities. Strengths of the program included hands-on training opportunities and graduates perceived that the program added value to the local community by increasing capacity to provide care to an underserviced patient population.

Conclusion: The successful establishment of a new FMRP in an underserviced community provides a strong mechanism to recruit physicians to these communities. Training in this setting provides excellent educational experiences to residents who feel prepared for independent practice when they graduate.

Take-home messages: Establishment of a postgraduate FMRP has been an important physician recruitment and retention strategy for the RVH community.
The experience of RVH graduates suggest that this new program has much to offer as a model for successful expansion of community-based postgraduate medical residency programs.

7EE16 (1091)
Resident practice-sharing in an academic Family Medicine Teaching Unit: Exploring effects on patient care and the resident educational experience

Authors
Rachel Peters, Department of Family and Community Medicine, University of Toronto, Toronto, Canada

Presenter: Rachel Peters, Department of Family and Community Medicine, University of Toronto, Canada

Background: Family Medicine residents often manage their own "mini-practices" in Family Medicine Teaching Units (FMTUs), providing a limited number of half-days of care each week due to other clinical and educational commitments. This necessarily compromises their patients' access and continuity of care, contributing to a range of negative health and educational outcomes. Practice-sharing, in which paired residents jointly manage a merged practice, was explored as a possible solution to this issue.

Method: This study was conducted at an FMTU at the University of Toronto from September, 2016 through April, 2017. Four residents were recruited to form two practice-sharing pairs, with the remaining 24 residents at the site serving as controls. Data was retrospectively collected from the clinic's electronic medical record and the effects of practice-sharing on continuity of care metrics were analyzed using a multivariate difference-in-differences logit regression. The potential effects of practice-sharing on the subjective educational experiences of residents were interrogated using a focus group format. The main outcome measures were a continuity of care metric (the probability that a patient accessed one of their primary residents) and "no-show" rate, as well as resident focus group responses.

Results: The continuity of care metric increased by 11% (P=0.01), and the no-show rate decreased by 24% (P=0.01), both in the practice-sharing group relative to the non-practice-sharing control group. Practice-sharing residents subjectively perceived increased continuity of care, as well as the potential for improved cross-coverage, collaboration and mentorship with their partners. A small, acceptable increase in workload was noted.

Conclusion: Practice-sharing in an FMTU improved continuity of care for patients and reduced overall "no-show" rates, and resident perceptions of the intervention were almost uniformly positive. More extensive examinations of practice-sharing in educational environments, particularly employing prospective designs, are indicated. Assessment of patient satisfaction with practice-sharing would also be critical prior to widespread implementation of such an initiative.

Take-home message: Practice-sharing offers a potentially powerful, simple way to improve the experiences of both patients and residents in a primary care training environment.

7EE17   WITHDRAWN

7EE18 (1628)
How does general practice compare to hospital rotations? Comparison of the educational experience by junior doctors

Authors
Emily Haesler, ANU Medical School Academic Unit of General Practice, Canberra, Australia
Katrina Anderson, ANU Medical School Academic Unit of General Practice, Canberra, Australia

Presenter: Emily Haesler, ANU Medical School Academic Unit of General Practice, Canberra, Australia

Background: Teaching in general practice/family practice settings is becoming more popular, as the number of junior doctors increases and organisations seek to find appropriate clinical learning experiences for expanding cohorts of interns. In Australia and elsewhere, some medical education programs have incorporated the option for a general practice term into the junior doctor curriculum. However, there is a paucity of literature evaluating the educational effectiveness of a general practice/family medicine term.

Method: We conducted a longitudinal evaluation of a general practice placement compared to hospital rotations in one setting in Canberra, Australia. Junior doctor participants (n=37 total) completed an adapted version of the Postgraduate Hospital Educational Environment Measure (PHEEM) over one year. The PHEEM was completed online at the completion of each of the junior doctor's five clinical rotations. The adapted PHEEM included 20 statements to be ranked on a 5-point Likert scale that evaluated the subscales of: teaching, clinical skills, social support and role autonomy.

Results: Participants who undertook a general practice rotation generally did so by choice (82.4%) and a slight majority of participants (55.9%) were particularly interested in general practice as a career at the time of completing the survey. In all four PHEEM subscales, general practice rotations performed as well as, or better than, hospital rotations in areas such as emergency, medicine, and surgery. A general practice rotation was also considered to be a strong experience by junior doctors who were interested in a career in other specialities (e.g. paediatrics and psychiatry).

Discussion & Conclusion: This study demonstrates the educational value of a general practice placement compared with a hospital rotation. General practice placements expose junior doctors to the generalist skills of community-based medicine, providing strong experience in choosing investigations, diagnostics skills and patient-centred care. The broad range of patients seen in community-based medicine provides experiences relevant to other clinical specialities. Junior doctors found a general practice rotation was superior in promoting autonomy, responsibility and workplace culture.

Take-home message: Incorporating general practice into a junior doctor medical education program provides as strong a learning experience as the hospital setting.

7EE19 (2991)
The tutorial is dead: long live the tutorial

Authors
Bryony Sales
Emma Bowley
Rachel Elliott

Presenter: Rachel Elliott

Background: The tutorial is a long established educational activity used in both primary and secondary care. Historically tutorials have been topic based with less consideration given to the setting. We are now educating a new generation of trainee (Generation Y – 'Millennial's and Generation Z – 'Digital Native's') with new technologies available.

Method: General practitioner (GP) supervisors hold a weekly tutorial with their trainee. Data was collected via a questionnaire to ascertain what modalities are used in tutorials, where tutorials take place and the reasons why the structure/place is varied. A workshop, which included a short walk, was subsequently held with multi-specialty medical educationalists, sharing questionnaire data, gaining a wider perspective of the tutorial. Feedback was subsequently shared with the GPs, sharing ideas and validating the varied personalised approach.

Results: GP supervisor questionnaire results (n=21) demonstrated the following modalities are used during a tutorial: YouTube clips (52%), Online eLearning (58%), Shared tutorial (more than one trainee present) (81%), Role-play (81%) and tutorial with "other" practice member(s) (53%). Alternative settings included the trainee in the "consultation" seat ("chair of power") (86%), trainees room (71%), coffee/other room in practice (29%), café / restaurant [ensuring patient confidentiality] (52%), Supervisors home (43%), performed while walking (67%). General themes for changing the structure and venue were to address challenging issues/trainee and for variety. When in the multi-specialty professional workshop (n=32) the GP's present (1/4) had varied their tutorial style and location unlike the hospital doctors. At the end of the session all could see the benefit and felt they could adapt and do something different in the future.

Discussion & Conclusion: Tutorials aim to educate a professional life long learner. There is a drive to create a more personalised approach, looking at the wider picture of training during tutorials, developing 'softer skills', addressing the 'hidden curriculum'.

Take-home message: Alternative tutorial/small group work can help manage challenging issues and provide variety. Adaption of the current format of tutorial is required for new generation of trainee and enables additional learning needs to be addressed both in the primary and secondary care setting.

Can short term rural practice-based learning program promote clinical and non-clinical skills in CPIRD junior doctors?

Authors
Noppawan Pongsopa, Suratthani Hospital, Suratthani, Thailand

Presenter: Noppawan Pongsopa, Suratthani Hospital, Suratthani, Thailand

Background: Suratthani Medical Education Center take responsibility for providing CPIRD medical students in rural hospitals after graduation, the researcher want to evaluate how junior doctors has been implemented practice-based learning program in rural hospital for 2 months to improve skills, community bonding and teamwork.

Method: Twenty-eight juniors were asked 5-level Likert's scale questionnaires about their opinions towards appropriateness of time spent on rural hospital and benefits of training program. Medical personal workers (53 doctors, 228 nurses, 41 pharmacists) in rural hospitals were also asked questionnaires on junior doctors' performance. Descriptive statistics were used.

Results: From the study, Junior doctors' opinions were showed that mostly benefit of practice-based learning postgraduate curriculum in rural hospital were community bonding, improve clinical skills, processing analysis of caring patients, increase communication skills and teamwork 4.70 ± 0.53, 4.35 ± 0.74, 4.30 ± 0.57, 4.10 ± 0.64, 4.05 ± 0.68 respectively. Nineteen of junior doctors (67.8%) felt that short time spent in rural hospitals was not enough for gaining experiences. Also medical personal workers' opinions thought the program helped to improve teamwork, community bonding and clinical skills 4.45 ± 0.25, 4.23 ± 0.33, 4.00 ± 0.43 respectively.

Discussion: Evidence suggests that practice-based program in rural hospitals need to be applied during postgraduate period about clinical and communication skill, processing analysis of caring patients. The skill of community bonding and teamwork were highest gain to participate the multidisciplinary and being an effective doctor in rural hospital.

Conclusion: Postgraduated Practice-Based Learning program in rural hospitals provided the benefit for community bonding, improve clinical skills, processing analysis of caring patients, increase communication skills and teamwork.

Take-home message: Postgraduated Practice-Based Learning program in rural hospitals improve clinical and non-clinical skills in CPIRD junior doctors.

Presenter: Gominda G. Ponnamperuma, Centre for Medical Education, Yong Loo Lin School of Medicine, National University of Singapore, Singapore

Background: High levels of physician empathy have been suggested to correlate with positive health outcomes, including greater patient satisfaction. However, how empathy changes during undergraduate medical education is poorly understood. Although the US data show that there is a significant drop in empathy in the third year, Australasian studies do not. Hence, this study aimed to compare empathy change during undergraduate career in an Asia-Pacific Medical School with other such studies in the world; and to investigate whether there is a trend in the change of empathy related to the geographical region.
Method: Jefferson Scale of Empathy - Student Version (JESS), which had been previously validated during a cross-sectional study, was administered at the beginning of each academic year. For students who responded in all years (matched sample; n=31) repeated measures (within subjects) ANOVA was used to compare the yearly mean total empathy. Empathy of those who did not respond in all years (unmatched sample; n=120) was compared using between-subjects ANOVA. Year-wise comparison of the means of matched and unmatched samples was conducted using student's t-test. All analyses were carried out using SPSS (version 24) at significance level of $p<0.05$.
Results: Results were compared with studies in different regions. Means of total empathy for the matched sample (Year1=5.76; Year2=5.80; Year3=5.73; Year4=5.71; Year5=5.67) showed no statistically significant change across the years (F=0.608; p=0.638). Similarly, total means of the unmatched sample (Year1=5.70; Year2=5.71; Year3=5.69; Year4=5.71; Year5=5.72) did not show a significant change in empathy (F=0.25; p=0.999). Year-wise comparison of matched and unmatched sample means was also statistically insignificant.

Conclusion: Above results are different to the Western studies, but more similar to Australasian studies. The drop in empathy over academic years reduces progressively as one moves from West to East. Rather than a drop, there may be even an increase in empathy in the latter years of study in the Far East, as one Japanese study has shown.
Take-home message: There are indications of a trend where the drop in empathy over academic years becomes lesser as one moves from West to East.

Service-learning enhanced humanistic caring ability and empathy of medical students: A study from Shantou university medical college

Authors
Zhanqin Huang
Longshui Xu
Guanhua Fan
Changmin Lin
Frieda Law
Junhui Bian

Presenter: Zhanqin Huang, Shantou university medical college, Shantou, People's Republic of China

Background: Professionalism in medicine is an essential element of physician's competency. The importance of educating medical professionalism has been emphasized in medical schools. How to explore an effective and feasible program for the education of medical professionalism is a big challenge. At Shantou university medical college, we defined medical professionalism in students based on the theme of Physicians' HEART, in which "H" stands for Humanity, "E" for Empathy, "A" for Art of medicine, "R" for Respect and Responsibility, and "T" for Teamwork. This study was conducted to investigate whether the service-learning project in SUMC enhanced medical student perspectives of humanism, humanistic caring ability and empathy in their medical training.
Method: The investigation included 160 undergraduate medical students that were randomly divided into intervention group (n=80) and control group (n=80). The students in the intervention group participated in the service-learning project. They took part in the community service projects to provide health education and medical service to the community, especially in the poor rural areas. As part of the service-learning experience, students were required to submit a written self-reflection about their experience. In the qualitative study, data were extracted from student reflection report that were written in response to the service-learning project. In the quantitative study, data were collected after service-learning project finished. Respondents filled out anonymous questionnaires. The humanistic caring ability of nursing undergraduate assessment scale was used for the assessment of humanistic caring ability. The student version of Jefferson Scale of Physician Empathy was taken as study tools to measure empathy.
Results: The reflection reports about the service-learning showed that students improved their abilities in managing medical service, teamwork and interpersonal

communications. Students' sense of humanitarianism, empathy, social responsibility, compassion and dedication to service was strengthened. Compared with the control group, the total score of humanistic caring ability and the empathy level was significantly higher in the intervention group.

Conclusion: The findings of this study demonstrate that incorporating service-learning in the community is a beneficial way of educating humanism and empathy for medical students.

Residents' and Medical Students' self-assessed empathy levels do not correlate with patients assessments

Authors
Monica Oliveira Bernardo, University of Campinas (UNICAMP), Campinas, Brazil
Dario Cecílio-Fernandes, University of Groningen, Groningen, Netherlands
Patrício Costa, University of Minho, Braga, Portugal
Alba Regina de Abreu Lima, University of FAMERP, São José do Rio Preto, Brazil
Manuel João Costa, University of Minho, Braga, Portugal
Marco Antonio de Carvalho-Fillho, University of Campinas, Campinas, São Paulo, Brazil

Presenter: Monica Bernardo, UNICAMP, CAMPINAS, Brazil

Background: Empathy is a complex psychological trait with affective, cognitive, behavioral and moral components. Physicians' empathy is a crucial component of patient care, influencing clinical outcomes, patient satisfaction and physicians' well-being. Most of the research on physicians' empathy is based on self-assessment, and several pedagogical interventions designed to foster medical students and residents' empathy also relies on these measures. Self-assessment represents an inaccurate measure for most of physicians' competencies and we hypothesized the same phenomenon would be true for empathy.

Method: This is a multicentric longitudinal and observational study which enrolled 374 patients and 37 undergraduate students and 26 residents from clinical and surgical specialties from three University Medical Hospitals in Sao Paulo, Brazil. The study was approved by local ethics committees. The students and residents filled the Jefferson Scale of Physician Empathy (JSE) and the International Reactivity Index (IRI), and patients filled the Consultation and Relational Empathy scale (CARE), and the Jefferson Scale of Patient's Perceptions of Physician Empathy (JSPPPE).

Results: We did not observe any significant correlation between self-assessed empathy levels and patients' assessments of physicians' empathy. This was true for all the scores of all scales and also for the scores of the subdimensions of each scale.

Conclusion: The lack of correlation between self-assessed empathy levels and patients' perceptions demands for including patients in the process of empathy evaluation.

Pedagogical interventions to foster empathy should not be based only in self-assessment methods.

Take-home message: Training strategies aiming the development of empathy should include patients' evaluations and perspectives.

7FF5 (1888)
Longitudinal relationships between motivation and empathy among medical students during clinical years

Authors
Giovanni Piumatti, University of Geneva, Geneva, Switzerland
Anne Baroffio, University of Geneva, Geneva, Switzerland
Margaret W. Gerbase, University of Geneva, Geneva, Switzerland

Presenter: Giovanni Piumatti, University of Geneva, Switzerland

Background: Previous studies found that medical students with higher empathy reported higher interest in people oriented medical specialties, and that psychosocial values including being empathic, patient-centred and sensitive to patients' psychosocial needs correlated with internal motivations for becoming a doctor. However, the relationship between different sources of motivation (i.e., internal or external) to pursue a medical career and empathy among medical students remains partially unclear and the mutual longitudinal effects between these constructs in the context of medical studies are yet to be tested.

Method: Using longitudinal cross-lagged analysis we tested four different hypotheses on the reciprocal relations between internal and external motivations for becoming a doctor on one hand and empathy on the other hand: independency, motivation affects empathy, empathy affects motivation, and reciprocity. Our sample consisted of 189 medical students (mean age=24.51 years, SD=2.15, 56% female) from the Geneva medical school. Measures included internal (e.g., care for patients, save lives) and external (e.g., future earning potential, prestige) motivations to become doctors and the student's version of the Jefferson Scale of Empathy. Covariates included age and gender. Baseline and follow-up data collections took place respectively at the beginning (4th study year) and end (5th study year) of the clinical training in the medical school.

Results: The model stating motivation affects empathy provided the superior explanation, $\chi 2(4)=3.30$, p=.51, CFI=1.00, TLI=1.02, RMSEA=.00. Higher internal motivations ($\beta=.15$, p<.05) and lower external motivations ($\beta=-.18$, p<.05) at baseline predicted higher empathy scores during follow-up. No moderating effects of gender were observed.

Conclusion: Our analyses support the hypothesis according to which internal and external motivations for becoming a doctor can positively or negatively affect the development of empathy among medical school students during their clinical years. Conversely, self-reported levels of empathy do not explain students' motivations to become a doctor. This is true for both genders.

Take-home message: Empathy development among students wishing to pursue a medical career is modulated by individual differences in motivation.

7FF6 (1864)
Longitudinal assessment of empathy by two different instruments and evolution of gender relationships in medical students

Authors
Margaret W. Gerbase
Giovanni Piumatti
Milena Abbiati
Anne Baroffio

Presenter: Margaret Gerbase, University of Geneva, Faculty of Medicine, Geneva, Switzerland

Background: Empathy is a recognized key competence for medical practice. Numerous studies have assessed students' empathy during medical training showing gender differences with higher scores found in women. Evidence from longitudinal assessments of empathy throughout medical studies has been found relatively inconsistent, but results have been mostly gathered by single instruments and the longitudinal gender effect has not been sufficiently examined.
Method: We analysed longitudinal changes in empathy by gender in a sample of 189 undergraduate medical students from pre-clinical to clinical years using two widely adopted measures of this construct, namely the student's version of the Jefferson Scale of Empathy (JSE-S; administered during the 1st, 4th and 5th academic years) and the Empathy Quotient (EQ; 2nd, 4th and 5th academic years).
Results: According to growth curve modelling results, there was no significant change in empathy across assessments for either JSE-S or EQ measurements. Women showed systematically higher empathic scores than men across assessments (p level set at < .05), given the exception of JSE-S scores during the 4th academic year where scores did not significantly differ by gender. Examining gender differences across JSE-S sub-scales (i.e. CC-compassionate care, SPS-standing in the patient's shoes, and PT-perspective taking), women displayed significantly higher scores than men only for CC and these differences were consistent across time (Yr1: 69.2±0.5 vs. 65.9±0.8, p<0.001; Yr4: 70.3±0.7 vs. 67.9±0.8, p=0.025; Yr5: 69.3±0.7 vs. 65.8±0.9, p=0.04). By contrast, SPS and PT scores weren't significantly different comparing men and women.
Discussion & Conclusion: Empathy scores remained relatively stable overtime irrespective of the instrument used for its assessment. Gender stratification confirmed trends for differences shown in the literature, but statistical significance between men and women was domain-dependent and restricted to the Compassionate Care sub-scale of the JSE-
Take-home message: This fairly large cohort shows overall longitudinal stability of empathy across medical studies using two different instruments. Findings indicate that gender differences which have been generally reported as a global score might be limited to a specific construct.

Evaluating Outcomes in Empathy and Multicultural Competency Training: A Simulation-Based Approach

Authors
Daniel Salcedo
Mayumi Asahina
Shoichi Ito
Tomoko Inagawa

Presenter: Daniel Salcedo, Chiba University Hospital, Chiba, Japan

Background: Empathy and multicultural competency are critical skills for successful clinical interaction with patients which in turn leads to better health outcomes. Currently, a wide range of educational intervention formats exist for helping students and health professionals develop and improve these skills, yet the specific outcomes of these interventions remain difficult to measure reliably and objectively.
The purpose of this project was to develop an empathy and multicultural competency outcome evaluation approach based on valid and reliable measurement tools using simulated clinical encounters to provide clear evidence of outcomes of different types of interventions designed to improve these skills.
Method: Each participant completed at least 6 encounters with different simulated patients before and after participating in different types of empathy and multicultural competency related educational interventions.
We designed each simulated encounter to include a primary medical concern, a social issue and a cultural conflict, after which the simulated patient assessed each participant and after each series of encounters, the participants completed a self-assessment tool.
The primary measurements used were the Jefferson Scale of Physician Empathy (JSPE), the Consultational And Relational Empathy (CARE) Measure, encounter checklists and simulated patient personal impressions of the encounter (narrative).
Results: We conducted all simulated clinical encounters at the Chiba Clinical Skills Center which is host to a multinational team of simulated patients from 16 different countries who are trained to simulate complex social and multicultural conflict scenarios. This assessment methodology allowed to accurately and consistently identify pre and post-intervention empathy and multicultural skill changes for several formats of educational interventions.
Conclusion: Simulation provides an ideal environment for evaluating empathy and multicultural skills in a realistic setting, allowing a systematic evaluation of learning outcomes of various types education interventions. The use of self and simulated patient evaluation tools allow a more precise impression of individual skill levels.
Take-home message: Simulated clinical encounters offer a useful tool in the evaluation of the effectiveness of empathy and multicultural training.

Empathy – a core competence for clinicians? A question of attitude, personality or competence development in Medical Education and Postgraduate (Psychiatric) Training

Authors
Henriette Löffler-Stastka, Medical University Vienna, Austria
Richard Horn, Medical University Vienna, Austria
Felicitas Datz, Dept. for Psychiatry, General Hospital Vienna, Austria
Isabelle Wolf, Medical University Vienna, Austria
Isabella Klaus, Dept. for Psychiatry, General Hospital Vienna, Austria
Kurt Stastka, Dept. for Psychiatry, General Hospital Vienna, Austria

Presenter: Henriette Löffler-Stastka, Medical University Vienna, Postgraduate Unit /Teaching Center, Vienna, Austria

Background: Clinicians' competencies are essential for effective treatment. Taking up the assumption that empathy and the capacity to mentalize is a key element for professional clinical work, empirical data on the development of reflective functioning and the mentalizing capacity in clinicians from the beginning of clinical work and ongoing to postgraduate practice is essential. Besides, the question how subliminal affective experiences influence clinicians' interviews should be addressed.
Method: Assessment of mentalization capacities and results of training effects of an ongoing postgraduate MBT-training in a psychiatric ward compared to clinically experienced mental health professionals without MBT-training in the same ward with the MASC. MASC – the Movie for the Assessment of Social Cognition is a video-based test. The video shows an everyday dinner scene and is paused a total of 45 times to ask the participants questions about the feelings, thoughts and intentions of the actors. The MASC can be carried out in the group by means of a questionnaire. These completed questionnaires are evaluated with the scoring key. Correct answers receive 1 point and incorrect answers are scored in one of three ways: ToM excessive, ToM less, ToM No. To assess interventional competencies, how subliminal affective experiences influence clinicians' interviews (crisis intervention), micro-expressions (FACS) are analysed due to correlations to different interventions and their impact on working alliance (WAI) is measured.
Results: The current MBT-training is an ongoing one. Therefore we present preliminary data. The evaluation of the MASC-test of the participants at the beginning of MBT-training shows an above-average mentalization capacity in both groups - the MBT-Training group and the controll group and a different response to social situations in the film as well. This reflects a clinically high experienced staff.
Conclusion: Preliminary data shows different effects of MBT-Training in the different occupational groups.
To what extent is the above-average mentalization capacity due to their professional experience and age? How are the different ocupational groups developing in MBT-Training participants and in the controll group. Are the interventions and the accompanying microexpressions different in the investigated groups?

7FF9 (3730)
Empathy Among Undergraduate Medical Students

Authors
Mayar Helaly
Amany Elshaer
Dalia Sriwi
Eiad Ahmed Habib
Mohamed Iesar Abdelaziz Mohamed
Akef Obeidat

Presenter: Mayar Helaly, Alfaisal University, Riyadh, Saudi Arabia

Background: Empathy is the ability to understand and share the feelings of another. Therefore, it plays an essential role in a physician's success in comprehending and cooperating with their patients. Numerous studies have shown that as a student progresses through medicine, their level of empathy tends to be reduced in different aspects. In Alfaisal University, an extremely updated, modern curriculum has been implemented which focuses on emphasizing the importance of compassion in the doctor-patient relationship, and on various ways to increase it. Therefore, the aim of our study is to compare the degree of empathy among the different years of undergraduate medical students.
Method: A questionnaire was distributed among 311 medical students of Alfaisal University years 1 and 2. The Jefferson Scale of Physician Empathy, a validated scale to measure the extent of empathy, was used. It assessed whether the students' degree of sympathy as they advanced from year 1 to year 2 has been altered. Additionally, it compared empathy level between males and females. Note: The continuation of the study will include undergraduate medical students of all years.
Results: We have obtained two clear components "perspective taking" and "compassionate care" respectively. Using an exploratory Principal Components Analysis (PCA) the scores show that second year students are significantly stronger on the second component than first years. In addition, the results depict that males differ from females for the first component only in which females are stronger than males.
In the initial year, students don't possess empathy highly. In Alfaisal University, the Professional Skills course in first year focuses on different aspects of a physician's communication skills including empathy. Therefore, in second year, the students' compassion has been reinforced.
Conclusion: Empathy is an instinct in all human beings. However, the extent of it varies among people. According to the study, teaching and emphasizing on empathy showed an impact in the response of the medical students. Thus, medical schools should continuously provide courses and workshops to strengthen the sympathy as it is extremely vital in the physician-patient relationship.

Empathy, fake empathy and how to make an empathetic statement - the views of SPs

Authors
William Laughey, Hull York Medical School (HYMS), York, UK
Nora Sangvik Grandal, HYMS, York, UK
Gabrielle Finn, HYMS, York, UK

Presenter: William Laughey, Hull York Medical School, York, UK

Background: Empathy is one of the tenets of patient-centred consulting. The teaching of communication skills, including empathetic skills, frequently involves simulated patients (SPs). Despite the central role SPs play in teaching, there is little research around their views on that makes for good medical communications. This study aims to address this gap in the literature and this poster reports the findings on empathy.

Method: 18 SPs from two medical schools – HYMS & Durham – were interviewed, using an in-depth, one-to-one, semi-structured approach. Data, transcribed verbatim, were thematically analysed. The results around empathy were addressed for this poster.

Results: There were three main findings. First, the terms empathy and listening were used interchangeably, both were facilitated through the same non-verbal communication, especially eye contact. Second, whilst empathetic statements were welcomed, hollow or fake statements of empathy were easy to detect and could be irritating to patients. Third, for an empathetic statement to be sincere, words need to be accompanied by appropriate non-verbal communication, like a concerned expression: otherwise, words did not ring true. Indeed, non-verbal attributes like silence, or a faint smile of recognition, were preferred to words in some instances. SPs are well-placed to offer empathy advice: in their training and work as actors, SPs develop expertise in putting themselves into the shoes of others through the act of building a character.

Discussion & Conclusion: SPs welcomed the empathetic statement. However, their qualification that fake statements of empathy are easy to identify is supported by a philosophical inquiry into the nature of empathetic connection. Davis argues that empathy is akin to a process of 'crossing over' in which a person finds they are closely aligned to another, a crossing that cannot be forced. The advice that genuine empathetic statements need to be accompanied by appropriate non-verbal communication has backing from research indicating that when verbal and non-verbal signals conflict – e.g., saying 'that must be hard' with no eye contact and a grin – the non-verbal message prevails.

Take-home message: Empathy is linked to attentive listening and words need to be backed with body language. Fake empathy is easy to detect.

7FF11 (3437)
The skeleton in my closet: exploring empathy in health sciences students in relation to the hidden curriculum and burnout

Authors
Komal Atta, The University of Faisalabad, Faisalabad, Pakistan
Saadia Ijaz, Shalamar Medical and Dental College, Lahore, Pakistan
Asmara Ahmed ,Shifa Tameer-e-Millat University, Islamabad, Pakistan

Presenter: Komal Atta, The University of Faisalabad, Pakistan

Background: empathy in medical and health sciences students is a key component for progression in their fields as the are constantly handling patients at a very close level. The aim of this study is to explore how non-curricular factors such as the hidden curriculum and student burnout effect student empathy.

Method: Validated measures of both empathy and burnout were distributed in three different institutes in three different cities to Pakistan. study cohort included students of medical and allied health sciences at the three campuses, 2000 questionnaires were distributed of which complete data of 1100 (55%)were retrieved. In the second part of the study 2 focus groups were formed of 10-15 students each per campus for qualitative analysis of themes relating to the hidden curriculum and empathy.

Results: A negative correlation was established between empathy and burnout and the hidden curriculum proved to be a significant shape of student reactions in clinical setups. themes that emerged in correlation to empathy were " negative/positive role modelling", "unstructured healthcare setup", "sociopolitical scenario" and "communication skills and language" issues.

Discussion & Conclusion: Students from fields with greater burnout (e.g.medical students) reported lower levels of empathy as compared to others. Subsequently, the focus groups revealed that contrary to popular belief, hidden curriculum is not just limited to subconscious attributes of the teacher but is also affected by the sociopolitical scenario, administrative issues, patient issues and the overall ambiance of the surroundings of the student and is a major contributor to empathy in students. Our study shows that both burnout and hidden curriculum are key players in determining empathy in students of heath science departments. students are effected not just by teachers and staff members but by overall national/international issues, policy reforms in health care and the sociodemographic setups of their area.

Take-home message: The hidden curriculum plays a much more significant role in medical education then is usually attributed to it, to increase empathy in our trainees we must retrain ourselves first.

7FF12 (1471)
Relationship Between Level of Empathy During Residency Training and Perception of Professionalism Climate

Authors
Aliya B.Aziz, Aga Khan University Hospital, Karachi, Pakistan
Syeda Kauser Ali, Aga Khan University Hospital, Karachi, Pakistan
Faisal Ali, Aga Khan University Hospital, Karachi, Pakistan

Presenter: Aliya Begum, Aga Khan University Hospital, Karachi, Pakistan

Background: Empathy is crucial in the physician–patient relationship. Prior studies have proposed that physician empathy may decline in clinical phase of training. Unprofessional learning environment has been attributed as an important contributor to this decline. In this correlational study we have looked at the relationship between the empathy level and the perception of climate of professionalism during residency, by administering two self administered internet based surveys to assess professionalism in learning environment and the level of empathy.
Method: The study was a correlational study and included residents of women and child health division. They were surveyed using the web based Jefferson scale of physician empathy and the validated professionalism scale "climate of professionalism". Paired data for each respondent was analyzed for descriptors of empathy and professionalism and spearman rank analysis was performed to correlate the scores of both instruments.
Results: The overall response rate was 81.4%. The mean empathy level was 103 . The Cronbach's Alpha was 0.76 for JSPE scale and 0.65 for PCI instrument, There was female preponderance in the respondents, 81.4%. The difference in mean empathy scores between senior and junior residents in both specialties was not statistically significant. On the other hand female and male residents have statistically significant different mean empathy scores. (p = .012(95%CI, 2.27 to 17.59).The mean PCI score was 106+8.88 and no significant difference was found in the mean scores of both specialties. There was no effect of year of residency or gender on professionalism score either. Correlation of Empathy score with professionalism climate score was also not found significant (rS = .056, p = .64).
Discussion: The results of this study suggest that empathy is a relatively stable trait in this selected sample with female residents being more empathetic then males Climate of professionalism does not come out as reliable predictor of empathy level in these residents.
Conclusion: Acquiring competency in empathy has become mandatory by many postgraduate educational bodies. Much uncertainty still exists about the relationship of professionalism climate with empathy and inclusion of other specialties residents might be able to shed more insight into this .

Empathy training for nursing students through sociodrama

Authors
Miao-Ju Chwo, Department of Nursing, Fu Jen Catholic University, New Taipei City, Taiwan
Ming-Teh Lin, Department of Clinical Psychology, Fu Jen Catholic University, New Taipei City, Taiwan
Ting-Chun Chen, Department of Clinical Psychology, Fu Jen Catholic University, New Taipei City, Taiwan
Gin-Hong Lee, Department of Clinical Psychology, Fu Jen Catholic University, New Taipei City, Taiwan
Ping-Keung Yip, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan

Presenter: Miao-Ju Chwo, Fu Jen Catholic University, New Taipei City, Taiwan

Background: Sociodrama helps people understand the feelings and perceptions of roles in a social and cultural situation. This article describes using sociodrama in service-learning education for nursing students to expand the understanding of empathy.
Method: The authors invited an expert, specialized in drama and education, to assist teaching in three undergraduate nursing student's classes in Department of Nursing during 2017. One volunteer patient with Spinal Muscular Atrophy (SMA) was invited to the classes, sharing his life stories for an hour, followed by using sociodramatic techniques for an hour to help students to understand and articulate the hidden feelings in the story similar to the patient's situation. Strategy for engaging participants (before the exercise): Pair up and massage each other to warm up their bodies and get familiar with their roles prior the exercise. Strategy for finding values and applying knowledge in practice (after the exercise): Reflective writing: explore the learning after exercise, providing opportunity to gain self-knowledge through their thoughts and feelings. Group sharing: allow participants to apply the knowledge gained from the exercise in practice in the future. Qualitative feedback from students (n=140) and observation records were collected and further analyzed.
Results: Based on the analysis, the results showed that: (1) Instant somatic experience: students' somatic experience was created so that they had a deeper understanding about the patient's suffering. (2) Acknowledgement of different perspectives: role-playing different roles helped students acknowledge others' perception of the patient and his family, and how the behaviors of others affected the patient. (3) Expectations of having more empathy: after the experience students expected themselves to think and response from the patient's perspective with more respect, acceptance and empathy.
Conclusion: The advantages of sociodrama used for empathy training are to create instant somatic experience and a deeper understanding about others' feeling, and acknowledgement of different perspectives. Teachers need to create a warm and safe atmosphere, assisting students to fit in the roles through warm-up activities when using sociodrama.

Take-home message: The advantages of sociodrama used for empathy training are to create somatic experience and acknowledgement of different perspectives.

7FF14 (2047)
Online gaming on empathy - A friend? Or foe?

Authors

Yih-Jer Wu, Department of Medicine, Mackay Medical College, and Department of Medical Education, Mackay Memorial Hospital, New Taipei, Taiwan
Ling-Lang Huang, Department of Medicine, Mackay Medical College, New Taipei, Taiwan
Shu-I Wu, Department of Medicine, Mackay Medical College, and Department of Medical Education, Mackay Memorial Hospital, New Taipei, Taiwan

Presenter: Yih-Jer Wu, Department of Medicine, Mackay Medical College, and Department of Medical Education, Mackay Memorial Hospital, New Taipei, Taiwan

Background: Empathy is of paramount importance to patient-physician relationship and medical professionalism. Internet activity, gaming, or even addiction, have been more and more common among medical students. However, there's been no report showing whether internet behavior has a substantial impact on empathy in medical students.
Method: Internet behaviors are divided into two groups, "internet users without online gaming (IU)" and "internet users with online gaming (IG)", each group was further divided into 3 groups according to their average online retention time each day (6 hrs). Empathy was evaluated by the scores of the reports and humanities reflection after watching indicated movies, and by self-measured empathy questionnaire. All students taking the year-2 optional course ""Narrative, Comprehension, and Communication" were enrolled.
Results: As compared with students in IU group, those in IG group had significantly lower scores for the reports ($81.3+-3.7$ vs. $86.4+-5.1$, P=0.014). If further dividing students into 5 groups (IU< 2 hrs, IU 2-6 hrs, IG< 2 hrs, IG 2-6 hrs, and IG> 6 hrs), the scores were significantly and negatively correlated to online gaming with longer hours (r=-0.556, P=0.006). However, there was no significant difference between IU and IG groups ($33.0+-5.4$ vs. $34.8+-3.2$, P=n.s.), in terms of scores in the self-measured empathy questionnaire, neither was there any significant trend of scores along with longer online hours across the 5 groups (r=-0.164, P=n.s.).
Conclusion: To date, there has been no evidence showing whether different internet behaviors (with or without online gaming) have distinct impacts on empathy. Although all of medical students had a similarly good self-perception for empathy, our data suggested that online gaming did have a negative impact on their actual expression of empathy. Our observation has brought up an important issue for pondering: May IT- or gaming-assisted medical learning actually harm students' empathy?
Take-home message: Long hours of online gaming harms expression of empathy, though all medics think themselves a person of high empathy.

7FF15 (1515)
Comparison of empathy scores among students from two distinct medical curriculums (the Joint Medical Programme and the Regular Thai programme) across different stages in medical education

Authors

Wasin Boonnitchasin, Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand
Ramida Wattanapokasin, Joint Medical Programme (between Srinakharinwirot University and University of Nottingham), Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand
Panwara Paritakul, Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand
Wipada Laosooksathit, Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand
Amarin Narkwichean, Joint Medical Programme (between Srinakharinwirot University and University of Nottingham), Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand

Presenter: Wasin Boonnitchasin, Srinakharinwirot University, Bangkok, Thailand

Background: Faculty of Medicine, Srinakharinwirot University has 2 distinct medical curriculums: the Joint Medical Programme (Srinakharinwirot University and The University of Nottingham) where students experience early clinical exposure during the preclinical years at The University of Nottingham, and the Regular Thai Programme. This study, therefore, aims to find out the effects of early clinical exposure on students' empathy scores across different years between the two curriculums.
Method: A cross-sectional study recruiting 82 students from the Joint Medical Programme and 155 students from the Regular Thai Programme was conducted. Their empathy levels were assessed by Jefferson Scale of Empathy- Student Version (JSE). Results were subsequently analysed using two-ways (factorial) ANOVA model.
Results: There were no difference in the overall mean JSE scores among students from the Joint Medical Programme (111.20 ± 11.90) and the Regular Thai Programme (110.72 ± 12.35, p-value=0.774). However, a trend showing that final year students in the Joint Medical Programme scored higher than those in the Regular Thai Programme (111.00 ± 13.218 vs. 103.84 ± 14.919, p-value=0.104) is noted. A significant drop in scores for both curriculums is observed between students doing their final preclinical year and students doing their first clinical year (mean difference 8.609 ± 2.976, p-value<0.01).
Students with early clinical exposure experience seem to score higher. This trend is, however, not consistent. External factors such as adaptation to different learning environments (preclinical and clinical years) must be taken into consideration. Interestingly, there was a significant drop in scores for students in both curriculums once they had started their clinical clerkship.
There were no significant difference in the mean scores within the two curriculums; however, students in the Joint Medical Programme seemed to score higher than students

in the Regular Thai Programme in their final years.

Conclusion: Students in preclinical years scored higher in JSE scores in comparison to students in clinical years regardless of the curriculums; therefore, further measures must be put in place to enhance the empathy scores among students in clinical years.

Take-home message: Early clinical exposure could potentially be beneficial for empathy development.

7FF16 (1779)
Teaching Ethics through Art Using the Visual Thinking Strategy

Authors
Mary Mathew
Monica Solomon

Presenter: Mary Mathew, Manipal Academy of Higher Education, Kasturba Medical College, Manipal, Manipal, Karnataka, India

Background: Visual thinking strategy (VTS) is a novel strategy that has been recently incorporated in medical education to increase the art of observation. This tool in addition to enhancing the power of observation can aid in discussions revolving around doctor-patient relationships and ethical issues in medical practice.

Method: We employed this strategy using the workshop method in selected final year medical graduates. Each group was divided into five groups with five participants each from different cultural and religious backgrounds. Three artistic pieces were projected on the screen based on the Doctor-patient encounters. The works of art included: 'The Doctor' – Sir Luke Fields, 'Mr. S is Told He Will Die' – Robert Pope and 'The Anatomy Lecture of Dr. Nicholas Tulp' – Rembrandt. A facilitator ensured that all students were given an opportunity to express their opinions and justify the reason for the particular observation. A scribe was assigned to note the discussions points and a feedback was obtained following the VTS process.

Results: Majority of the participants found the workshop enjoyable and useful. A few of the feedback comments from the participants included honing of observational skills, introspection, empathy and heightened sensitivity towards patients.

Discussion: VTS as an education tool has been explored in learners of different ages and is flexible to be adopted across disciplines. Research has shown that VTS is effective for writing and observational skills and critical thinking. We explored this novel strategy in teaching issues pertaining to the doctor-patient relationship and ethical dilemmas such as end-of-life issues.

Conclusion: VTS is an important tool which can be used as an aid to teaching ethics and doctor-patient relationships to medical graduates from diverse cultural backgrounds.

Take-home message: VTS enhances visual diagnostic skills and aids in identifying facial human emotions; Stimulates dialogue about doctor-patient relationships and difficult ethical decisions pertaining to end-of-life issues.

Case-Based Ethics Grand-Rounds have a positive impact on Ethical-Decision-making and Professional Behaviors in Interns

Authors
Shekhar Kumta, CU Medicine, Hong Kong
Paul Lai, CU Medicine, Hong Kong
HK Ng, CU Medicine, Hong Kong
Isabel Hwang, CU Medicine, Hong Kong
Sara Bergstresser, CU Medicine, Hong Kong
Yan Jin, CU Medicine, Hong Kong

Presenter: Shekhar Kumta, The Chinese University of Hong Kong, Hong Kong

Background: Ethics teaching outcomes for medical students, are best assessed by evaluating students' capacity to analyze the ethical dimensions of a problem and apply key principles towards a possible resolution of such conflicts.

Method: Our program for Bioethics establishes a solid foundation required to understand Ethical principles. Senior students (years 4-6) are exposed to grand rounds, involving Ethical dilemmas or professional misbehaviors. Student participation is obligatory for final year students with a 100% attendance requirement.

Results: To date, 430 students have participated in the grand rounds (n=8). These rounds require students to a) Identify the key Ethical Issues that arise in the context of the case b) Discuss possible conflicting principles and c) Provide a reasonable resolution based on the 4-principles approach that underpins much of our teaching of ethics. Student participation has been enthusiastic. The rounds are interactive and generate heated discussions. Students and staff members are required to vote using a green-red card, and this encourages everyone to participate.

Evidence of Impact: Focus group interviews of interns from 2 successive batches of CUHK* students (n= 44) who participated in these grand rounds revealed that rounds had a positive impact on their ability to apply ethical principles in case resolution, during their practice as interns.

Some of the interns also reported that they were able to identify issues of professional behaviors in themselves and amongst other healthcare workers – in particular conflicts between patient autonomy and paternalistic behaviors. The principle of justice became much more tangible and evident in their daily practice and in their views the rounds increased their sensitivity and improved their awareness towards the ethical dimensions of clinical care.

Conclusion: The discussion of real and authentic cases that happen in the health care environment where students are eventually going to practice, exposes them to some of the vagaries and realities of practice. Allowing students to discuss these cases without fear, and mentoring them to defend key ethical principles has been deeply valued. This is likely to have an impact in their practice behaviors and may counteract the hidden curriculum they are often exposed to.

Exploring the Gap between Ethics Education in Medical School and Clinical Application

Authors
Jung Hsieh, Chang Gung University College of Medicine; Chang Gung Memorial Hospital, Linkou, Taoyuan City, Taiwan
Chung-Hsien Chaou, Chang Gung University College of Medicine; Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou, Taoyuan City, Taiwan
Roy Ngerng Yi Ling, Chang Gung Medical Education Research Center, Taoyuan City, Taiwan
Shiuan-Ruey Yu, Chang Gung Medical Education Research Center, Taoyuan City, Taiwan
Ye-Che Chang, Chang Gung University College of Medicine; Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou, Taoyuan City, Taiwan

Presenter: Jung Hsieh, Chang Gung University College of Medicine; Chang Gung Memorial Hospital, Linkou, Taoyuan City, Taiwan

Background: Ethics education plays an important role in medical education, preparing students to better grasp ethical dilemmas they may face and apply ethical reasoning. Students receive ethics education in medical school, however, ethics training is not well-built into the clinical clerkship curriculum. Our study aimed to explore how to bridge the gap between ethics learning and application.
Method: Semi-structured interviews were conducted with 25 medical students who started medical school in 2013. Interviews were recorded, transcribed, and thematically analysed.
Results: Most participants highlighted a gap between the idealisation of ethics teaching in the classroom and their ability to apply their learning in clinical situations. Some participants interpreted taught ethical issues such as patient autonomy, living and dying, and organ transplantation as effectively preparing them for clerkship. Pregnancy termination and euthanasia were considered empty talk as relevant cases were rarely encountered during clerkships. Clinical variation and the short rotation of clerkships gave rise to fragmented learning experiences. Clerks act as intermediaries between clinicians and patients and can devote more time to communicate ethical concerns with patients. A lack of medical knowledge and inexperience in patient-engagement are barriers to ethical practice.
Faculty members might be disengaged from clinical management while physicians might not understand how to bridge ethics learning between classrooms and clinical application. Ethics curriculum and teaching reform, in both the medical school and clinical setting, could narrow this gap. The flexibility in clerkship rotations induce dual roles of being a physician and caregiver, providing an opportunity to enhance empathy and strengthen ethical learning. Encouraging students to cross-share their clinical experiences of ethical issues may increase the applicability to ethical teaching learned in the classroom. Students'

reflection during their application of ethics strengthens reinforces both their personal and professional identities.
Conclusion: An ethics learning framework could be developed based on clinical relevance, and training should better orientate faculty to the ethical skills and discussions students require to apply such notions in the clinical setting.
Take-home message: Ethics curriculum should be designed for better integration and seamless learning between theoretical approaches and application in the clinical setting.

Key Success of Teaching Medical Ethics in Clinical Years: WHO and HOW?

Authors
Patcharada Amatyakul
Suchila Srithippayawan
Apiradee Jirattigalachote
Taweesak Nopkasorn

Presenter: Patcharada Amatyakul, Department of Obstetrics and Gynecology, Faculty of Medicine, Naresuan University, Phitsanulok, Thailand

Background: Teaching medical ethics is a challenging topic in medical curriculum. During clinical years, medical students have chances to learn with real situations, but teaching and discussing about ethics in between clinical settings sometimes is difficult or inappropriate. Therefore, proper learning materials and methods are important tools for the success in teaching medical ethics.
Method: This cross-sectional study was performed with all 5th year medical students who studying in the department of obstetrics and gynecology from May 2016 to January 2018 in Naresuan university hospital. Ethics in OB&GYN were taught with case-based approach and small group discussion about medical errors and disclosure. A medical teacher played a role as a facilitator and discussed with students. Likert scale questionnaire and opened-end questions were designed to evaluate medical students' attitudes towards learning method, learning experience and also the preferable characteristics of medical teachers who should teach ethics.
Results: From 65 medical students, 98.5% agreed that small group discussion highly impacted on their learning process better than conventional lectures. The more mimic to real clinical situation of the case-based scenario brought more interested of students. Fifty-two percent of students suggested that case discussion among 4th – 6th year medical students may provide better points of views. After the class discussion, most of students (95.4%) felt more confidence about disclosure of the medical errors if they have faced these kinds of situation. The preferable characteristics of medical ethic-teachers were: optimal experience in academic working and teaching (32.3%), good listener (27.7%), good role model (24.6%), friendly (23%), good explanation and communication (16%).
Conclusion: A case-based with problem-oriented scenario stimulated students' critical and reasonable thinking. The characteristics of medical teachers positively affected medical students' attitudes and learning environment.

Take-home message: A case-based scenario and small group discussion with medical teacher as a facilitator are appropriate methods for teaching medical ethics. In addition, the facilitators with appropriate manners to teach ethics will lead to better learning outcomes.

7GG1 (750)
Integrated Health and Social Care Teaching

Authors
Sabia Dayala, University of Manchester, Manchester, UK
Debashree Ghosh, Lancashire Teaching Hospitals Foundation Trust, Preston, UK
Kay Cartwright, Lancashire Teaching Hospitals Foundation Trust, Preston, UK
Madhavi Paladugu, Lancashire Teaching Hospitals Foundation Trust, Preston, UK

Presenter: Sabia Dayala, University of Manchester, UK

Background: A national vision for a new model of care, the NHS 5 year forward view (NHS England, 2014), calls for health and social care to work in greater partnership. With this in mind we sought to teach medical undergraduates, the future workforce of the NHS, about the importance of integrated health and social care provision for the elderly population. The aim was to better equip them for professional practice in the future when the demand for integrated health and social care is predicted to be greater than ever due to rising needs in an elderly population.
Method: Pilot half-day sessions were held in nursing homes for 83 Year 4 medical students during an elderly medicine placement. Each session consisted of small group teaching of 5 students followed by individual history taking and presentation of findings, all facilitated by a GP tutor. Qualitative and quantitative evaluation was obtained by e-form.
Results: The evaluation response rate was 30% (25 responses). Over 90% of students said that the placement enabled them to learn very well or fairly well about the interaction between health and social services, the provision of long term care for older adults and the role of the multidisciplinary team. Positive comments included the opportunity to obtain the patient's narrative and to develop a better understanding of care in the community.
Discussion: Integrated health and social care teaching in a nursing home setting allows medical students to gain a better understanding of the multidisciplinary assessment and management of an elderly person's complex co-morbidities.
Conclusion: GP led teaching in a nursing home has improved students' knowledge of health and social care integration. This will help to prepare them for professional practice in the future when the population of over 75 year olds with complex co-morbidities is predicted to expand.
Take-home message: The importance of health and social care working in greater partnership to proactively and comprehensively respond to the health needs of the elderly population can be demonstrated to medical students through an integrated nursing home teaching session.

Enhancing Medical Education Reform and Medical Student Professional Development Through Longitudinal, Co-Curricular Distinction Tracks

Authors
Luan Lawson
Kelly Harrell
Susan Keen
Tim Reeder
Jenna Garris
Kori Brewer

Presenter: Luan Lawson, Brody School of Medicine at East Carolina University, Greenville, USA

Background: Despite calls to better prepare future physicians with leadership and adaptive learning skills, few undergraduate medical(UME) programs address this need. Brody SOM developed Distinction Tracks to provide co-curricular, longitudinal training customized to professional interests and core values.
Method: Advanced learning tracks combining didactics and independent projects were developed in four areas related to the mission of the school: Health System Transformation and Leadership (LINC), Medical Education and Teaching (MET), Service-Learning, and Research. Students participate in an immersion course following their M1 year, receiving advanced didactic and experiential training in conceptual foundations and competencies. Across the M2-M4 years, sessions focus on track-specific objectives and the development of an independent capstone project under the direction of a mentor resulting in a scholarly manuscript/portfolio. Upon completion of the program, Scholars receive recognition of their accomplishment in the academic transcript and senior awards/graduation programs.
Results: 66 students currently participate in one of the Distinction Tracks. Outcomes to date are: 28 research scholars have published 24 abstracts with accompanying national presentations, 4 published manuscripts, 5 national-level awards, and 2 grant submissions. 10 MET students served as teaching assistants for health professional students, completed 3000+ peer tutoring hours and made scholarly presentations. 20 Service-Learning students participated in individually-designed service projects throughout 10 countries, completed 2152 service hours, and presented at 3 regional/national meetings. 25 LINC Scholars are embedded in quality improvement projects throughout the healthcare delivery system resulting in 16 published abstracts and 12 presentations, with 9/10 Cohort 2 scholars trained as TeamSTEPPS Master Trainers.
Conclusion: Students receive advanced training and practice in an area of study that they would not normally be exposed to during the pre-clinical years. The educational initiatives addressed by each distinction track are grounded in the fundamental need to train physician leaders who can improve healthcare for both individuals and communities through education, research, improvement science, and service.
Take-home message: Alignment with UME through longitudinal, co-curricular distinction tracks promotes a

scholarly foundation for future career goals and adaptive learning through directed and independent activities in learning communities of students and faculty with similar career interests.

Exploring basic science discussion during internal medicine rounds with clerkship medical students

Authors
Jonathan Pai, University of California San Francisco, San Francisco, USA
Heidi Kirsch, University of California San Francisco, San Francisco, USA
Patricia O' Sullivan, University of California San Francisco, San Francisco, USA
Patricia Cornett, University of California San Francisco, San Francisco, USA

Presenter: Jonathan Pai, University of California San Francisco, USA

Background: Educators have suggested integrating basic science (BS) and clinical science to promote application of BS knowledge. Yet, clinical clerkship teaching appears to have shifted away from BS. Limited studies suggest that BS teaching is restricted due to competing demands and to underappreciation of the relevance of BS knowledge to clinical care.
Method: We performed a qualitative exploratory study using thematic analysis. Participants included internal medicine (IM) teams at UCSF Medical Center. We observed medical student (MS) patient presentations on IM rounds and tracked BS discussion content. Following observation, we conducted individual interviews with team members to clarify what was observed. Three investigators read transcripts independently, developed codes and a codebook. Codes were synthesized into themes after discussion.
Results: We observed three different IM teams and each team consisted of an attending, resident, two interns, and an MS. BS was a small fraction of total teaching and was primarily initiated by the attending and directed to the MS. Interviews (11 out of 15 observed team members) evoked three themes: 1) reasons to discuss BS, 2) goals of teaching and 3) barriers to BS discussions. Reasons to discuss BS included personal curiosity, unusual patient presentations, and importance for management. Goals of teaching BS included improvement of understanding and learner engagement. Barriers included time constraints, lack of attending comfort with BS knowledge, and lack of MS comfort with setting. All interviewees wanted to enhance BS discussions in the clinical setting.
Conclusion: Like others we found a time tension between clinical management and BS limiting discussion. We found this true despite professed interest in the BS topics. Several methods were used by teams to promote BS discussions such as brief teaching of BS by the MS during the assessment and plan of the patient presentation. Future directions include developing best practices for incorporation of BS on rounds.
Take-home message: BS continues to be under-represented on IM rounds. However, this study identifies strategies to use to improve BS discussion during clinical case presentations.

Will Early Clinical Training improve the professional skills? – Experience from a New Medical Education in Sweden

Authors
Stefan Särnblad, School of Medicine, Faculty of Medical Sciences, Örebro University, Sweden
Marie Lidskog, School of Medicine, Faculty of Medical Sciences, Örebro University, Sweden
Helena Walfridsson, School of Medicine, Faculty of Medical Sciences, Örebro University, Sweden
Hans Hjelmqvist, School of Medicine, Faculty of Medical Sciences, Örebro University, Sweden
Ann-Sofi Duberg, School of Medicine, Faculty of Medical Sciences, Örebro University, Sweden

Presenter: Stefan Särnblad, School of Medicine, Faculty of Medical Sciences, Örebro University, Örebro, Sweden

Background: The undergraduate medical education in Sweden is 5½ years long (11 semesters), followed by an 18 months internship before license. The university curriculum used to be 6 theoretical semesters followed by 5 "clinical" semesters. Today it is common with integrated curricula with an early introduction of clinical training.
Method: School of Medicine at Örebro University started in January 2011 and now admits 70 students every semester. The first students graduated in June 2016. The educational approach is problem-based learning and the curriculum is integrated with six themes based on physiological processes. Biomedicine, clinical medicine and professional development are integrated throughout the entire programme.
Results: In total, clinical placement constitutes 74 weeks of which 16 weeks are spread through the first six semesters. The remaining 58 weeks (semester 7-11) are divided into six longer periods related to the themes. The objective of clinical placement during the first 6 semesters is to practice general clinical skills like communication, history-taking and clinical examination, but also to understand the health care system and the tasks of other health care personnel. The clinical placement in semester 6 ends with a seminar for reflection around the professional development and the value of early clinical placement. The students appreciate the early clinical placements. They manage to acquire general professional skills at this early stage and have the possibility to reflect upon their choice of profession. This stimulates theoretical studies and makes them more comfortable when entering the long clinical placements related to the themes. This is beneficial also for the clinical tutors. The first Örebro students that graduated were satisfied with the preparation given "to work as doctors" and gave the University the highest rank in a national survey.
Conclusion: Early clinical training is beneficial for the development of professional skills; it motivates and gives the student an early understanding of their future professional role. A challenge may be to find enough placements and the need for coaching adjusted for different stages of professional development.

Take-home message: Early clinical training is beneficial for the development of professional skills.

7GG5 (3266)
Change from a classical to an integrated curriculum has an impact on the assessment?

Authors
Milton Severo
Fernanda Silva-Pereira
Maria Amélia Ferreira

Presenter: Milton Severo, Department of Public Health, Forensic Sciences and Medical Education, University of Porto Medical School, Porto, Portugal

Background: The success of integrated curriculum depends on the implementation of integrated assessment. This study aims to evaluate the effect of changing from a classical curriculum to an integrated curriculum.
Method: In academic year 2013/14 was implement an integrated curriculum on University of Porto Medical School. Eighty-eight disciplines were evaluated, 55 (62%) were from the new integrated curriculum, corresponding to 499 final examinations ranged from academic year 1 to 5. The number of multiple-choice questions that were flawed and were eliminate/changed during the test correction has been count. This number was compared before and after the implementation of integrated curriculum. A total of 1180 students answered a question if the assessment was adequated with a Likert scale ranging between 1 (total disagree) to 5 (total agree), after the implementation of the new curriculum.
Results: The proportion of examinations with items eliminated increase from 37.1% to 42.1%, when this proportion was adjusted for the curriculum year this proportion increased from 33.7% to 44.7% (p-value=0.021). The mean of adequacy of the disciplines assessment was 3.0 ranged from 1.4 to 3.9.
Conclusion: The number of flawed items increased after the implementation of integrated curriculum. The main reason pointed out to this was the fact that a new multi-choice question bank constructed from scratch was need for almost all disciplines and the time to test the questions was too short. In addition, the new questions should be create as teamwork from the different contributing disciplines and not as individual work.
Take-home message: To construct a integrate assessment we should plan the assessment at the same time as we prepare the disciplines to reflect integrated curriculum.

Clinical Application of Medical Sciences (CAMS) to Phase 1 Medical Students

Authors
Dinesh Kumar Srinivasan, National University of Singapore, Singapore
Dow Roon Koh, National University of Singapore, Singapore
Hwei Keong Koh, National University of Singapore, Singapore
Jenn Ye, National University of Singapore, Singapore
S Thameem Dheen, National University of Singapore, Singapore
Tan Ching Lau, National University of Singapore, Singapore

Presenter: Dinesh Kumar Srinivasan, National University of Singapore, Singapore

Background: The Yong Loo Lin school of Medicine (YLLSOM), National University of Singapore (NUS) actively pursues medical curricular reforms in order to better train doctors to be well grounded in the scientific basis for disease and treatment, clinical skills, whilst also enabling them to become good communicators and self-directed life-long learners. The main objective of this study was to introduce Year 1 (Phase I) medical students to the scientific basis for relevant physical examination skills so that it will reinforce basic principles in human structure and function.
Method: The Clinical Application of Medical Sciences (CAMS) module was designed and scheduled at the end of every teaching/ system blocks. CAMS sessions consists of five 2 hourly sessions. An online survey was done at the end of the semester to measure medical students attitudes towards CAMS. A 5 point Linkert scale was used. Students were given 8 weeks to provide their responses.
Results: About 89% of our students were satisfied with the quality of the module. 83% agreed that the learning outcomes were clear and relevant. 80% agreed that the learning and teaching methods were effective. Approximately 88% agreed that the tutors were good at explaining the concepts. Furthermore, CAMS was able to help students link theory to clinical application through hands-on practice. However, there was a significant number of students indicating that they should have more structured lesson plan, more equipment and handouts in advance. Overall, both students and tutors positively received the intervention.
Conclusion: Our initial experience on preclinical Year 1 medical students' approach towards exposure to CAMS showed promising results. Year 1 medical students displayed keen interest in CAMS. Introducing CAMS to preclinical medical students not only served as a link between didactic lectures (theory and practical) but also served as a platform to build on when the students enter Phase II.
Take-home message: CAMS provided an added dimension to teaching and making basic sciences more clinical relevant, thereby better preparing medical students for clinical years and beyond.

The structured frameworks of organ system-based integrated curriculum, curriculum integrated examination, and impediment monitoring system in undergraduate medical education

Authors
Bor-Ching Sheu, Center of Faculty Development, Curriculum Integration & Department of Obstetrics and Gynecology, National Taiwan University College of Medicine, Taipei, Taiwan
Yen-Hsuan Ni, Center of Faculty Development, Curriculum Integration & Department of Pediatrics,National Taiwan University College of Medicine, Taipei, Taiwan
Yu-Jung Lin, Center of Faculty Development, Curriculum Integration, National Taiwan University College of Medicine, Taipei, Taiwan
Wang-Huei Sheng, Center of Faculty Development, Curriculum Integration & Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan
Fen-Yu Tseng, Center of Faculty Development, Curriculum Integration & Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan
Shan-Chwen Chang, Center of Faculty Development, Curriculum Integration & Department of Internal Medicine, National Taiwan University College of Medicine, Taipei, Taiwan

Presenter: Bor-Ching Sheu, Center of Faculty Development, Curriculum Integration & Department of Obstetrics and Gynecology, National Taiwan University College of Medicine, Taipei, Taiwan

Background: The curriculum integration group of National Taiwan University College of Medicine (NTUCM) have constructed organ system-based integrated curriculum (OSB-IC) of the undergraduate medical program since 1992. New systems of organ system-based curriculum integrated examination (OSB-CIE) and Examination Impediment Monitoring System (EIMS) were launched since 2015. The present report illustrated the structured frameworks of OSB-IC, OSB-CIE and EIMS in our undergraduate medical education.
Method: The NTUCM implements the integration of basic and clinical disciplines into a unitary unit that allows courses in the same organ system to be completed within a structured time framework of teaching coordination. The new OSB-CIE changed the traditional exams and merged all subjects into the organ-system integration exam according to the teaching contents. The EIMS then monitored and calculated individual test results, analysis the difficulty of test questions, and the index of high and low scores of student achievement.
Results: Details about the structured frameworks of the OSB-IC, OSB-CIE and EIMS of NTUMC are illustrated. We unified proposition of subjects and distributions of exam scoring methods for the integrated test questions to all subject departments through the established scoring and analytic construction of OSB-CIE. The EIMS assess the problem occurred in examinations and statistical evaluate the difficulty of examinations in all subjects. The statistical results then provided to all subject departments

immediately for the reference of various adjusting disciplines.
Discussion & Conclusion: Integration throughout the whole organ and functional system-based curriculum is time-consuming and hard work is required for planning, organization and execution. Organ-functional-based curriculum integration is a distinguished educational aim, which entails achieving cognitive, conceptual, and practical connections among the complex categories of unified basic and preclinical knowledge. The present structured framework OBS-CIE and EIMS curriculum explicitly includes examinations of how integrating intelligence from basic and clinical disciplines on a biomedical basis. Our report applied a framework for monitoring the learning effectiveness of OSB-IC in an undergraduate medical curriculum.
Take-home message: The structured framework improved OSB-IC to the specific discipline of undergraduate medical education and may provide a potential and promising new teaching method that can be widely utilized.

7GG9 (2466)
Paediatric education in the Curriculum of the School of Medicine in the University of Örebro in Sweden

Authors
Myrsini Lemonaki, University Hospital of Orebro, Orebro, Sweden
Myrsini Lemonaki, University Hospital of Orebro and University of Orebro, Orebro, Sweden

Presenter: Myrsini Lemonaki, University Hospital of Orebro, Sweden

Background: In Sweden there are seven Medical Schools. Some of them have existed in more than 50 years whereas the School of Medicine at Örebro University was established in 2011. The education is built as 5,5 year studies (330 ECTS credits) and the Curriculum is integrated according to the PBL system. The aim is to present our approach to the training in paediatrics.
Method: The poster presents the theoretical and clinical studies, as well as the examination and the assessment system concerning the paediatric education. The medical students in Örebro study paediatrics during the study of the theme of Reproduction and Growth. This is formed in three steps during their studies, particularly in terms 2, 6, 9. As an integrated medical curriculum students have both theoretical and practical studies during all the terms. The learning methods are base studies, seminars, lectures, simulation training, and clinic practice.
In the second term, the medical students study embryology, genetics, anatomy and have some clinical practice in the paediatric primary health center. In the sixth term, they study about the healthy newborn, child and adolescent as well as normal and retarded growth and normal development and nutrition. Students also start their training in taking medical history and doing clinical examination. In the ninth term students have focus on the sick newborn, child and adolescent. Seminars on child abuse and neglect are given with a specialized pediatrician, a specialized lawyer and social worker as teachers.

Conclusion: The theoretical aims of the paediatric curriculum are obtained through clinical practice, team base groups, case seminaria, other seminaria, lectures, and self studies. The clinical skills are obtained through clinical skills training in paediatric units and simulation training. The examination system includes a writing exam after each term as well as an examination of clinical skills and a OSCE examination after the ninth term. The assessment of the students in the end of each term is very good.

Take-home message: The training in paediatrics in the Medical school of Örebro is formed in three steps in an integrated form.

Cees van der Vleuten, Maastricht University, Maastricht, Netherlands

Presenter: Yasushi Matsuyama, Jichi Medical University, Shimotsuke, Japan

Background: Context matters when striving to promote self-regulated learning (SRL). We previously showed that teacher-centered contexts hindered East Asian undergraduates from SRL whereas more learner-centered contexts promoted SRL in postgraduates (Matsuyama Y et al, Med Teach. 2017, Epub ahead of print). However, it is unknown whether changing from a teacher-centered to learner-centered undergraduate curriculum would encourage medical students to become better self-regulated learners.

Method: We conducted three focus groups that examined 13 East Asian undergraduates who shifted from a teacher-centered curriculum to a student-designed, student-selected component (SSC), and two focus groups that examined 7 students who remained in a teacher-centered curriculum (non-SSCs). Students were asked to discuss their 1) motivation to learn, 2) learning strategies, and 3) self-reflection in self-study during the period. Data were analysed using thematic analysis.

Results: Compared to non-SSCs, SSCs described losing indicators such as teachers' assessment and constructing an achievable self-image as an alternative indicator. Self-reflection revealed the gap between their current status and their achievable self-image, which they turned into a learning subject. To fill this gap, they actively employed learning strategies used by doctors or mentors, leading to the diversification of their learning strategies. Self-determination regarding learning activities without teachers' assessment promoted autonomous behaviors of reflection, forethought, and performance in learning. Changes in learning contexts could provide significant opportunities to promote SRL even where teacher-centered cultures prevail.

Conclusion: Changing from teacher-centered to learner-centered contexts encourages learners to become better self-regulated. They 1) construct achievable self-images, 2) identify the gap between their current and potential future selves, and 3) develop diverse learning strategies.

How to become a doctor? A preliminary report of pre-clerkship summer camp

Authors

Ching-Chih, Chang, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan
Hui-Chun Huang, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan
Chiao-Lin Chuang, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan
Wen-Shin, Lee, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan
Ling-Ju, Huang, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan
Ying-Ying, Yang, National Yang-Ming University School of Medicine and Taipei Veteran General Hospital, Taipei, Taiwan

Presenter: Ching-Chih Chang, National Yang-Ming University School of Medicine, Taipei, Taiwan

Background: In Taiwan, the clerkship starts from the 5th grade in medical school. However, a busy rotating course occupies the time-frame of clerkship. Lack of time and opportunity to understand the patient and other professionals make a clerk be incompetent of medical professionalism and collaborative practice. We therefore conducted a program to test whether an early engagement in hospital help strengthen Taiwanese medical students the relevant capabilities.

Method: We invited medical students from National Yang-Ming University at the end of the 3rd grade to join a 2-week summer camp at the ward of General Medicine in Taipei Veteran General Hospital, while they were having the summer vacation. Every participant was assigned to meet one patient and accompanied this patient throughout his/her hospital course, including going for examinations. Besides, they were asked to encounter other professionals, including nurses, social workers, pharmacists, and cleaners. They were asked to write a diary of hospital life every day. Every student had one senior doctor as his/her mentor who was responsible to check his/her diary and to have a discussion. Finally, they were asked to give a narrative feedback. They also had to complete pre- and post-camp questionnaires.

Results: Twenty-two medical students joined this program. The questionnaire include 10 questions involving professionalism, communication with patients/paramedical staffs, and understanding of working environment. The attitude towards these questions were scored as 1-5 points, ranging from disagreement to total agreement. Compared to the pre-test, the post-test showed that the score of overall performance improved after a 2-week camp. In addition, the scores of professionalism, communication with patients and

paramedical staffs were significantly improved. From the narrative feedback of students, most of them appreciated this program.

Conclusion: A pre-clerkship camp is worthy of continuing. Future development of the program is anticipating, since it help a medical student understand the importance of professionalism and collaboration with other professionals.

Take-home message: Under the current circumstances of medical education in Taiwan, if a medical student can be timely engaged in the clinical environment with a good guidance, they will be mature and empathetic easier and earlier.

Introductory course in Gynecology and Obstetrics based on medical practice settings: an experience of six years

Authors
Francisco Jose Candido dos Reis
Ricardo de Carvalho Cavalli
Rosana Maria dos Reis
Ana Carolina Japur de Sá Rosa e Silva

Presenter: Francisco Jose Candido dos Reis, Ribeirao Preto Medical School - University of Sao Paulo, Ribeirao Preto, Brazil

Background: The amount of knowledge available has grown exponentially in recent years and health care needs varies among different regional populations. Therefore we decided to modify our introductory course of Gynecology and Obstetrics from a traditional model to practice guided model.

Method: The course is a 135 hours rotation, during the year four of a six-years medical course, dedicated to introduce medical students to the basic concepts of women's health. It is a preparatory course for a posterior eight weeks rotation clerkship in year five and for a six weeks rotation in year six.

Results: In the traditional course the distribution of learning activities were: lectures = 35%; seminars = 16%; practice = 27%; self-study = 17%; assessment = 5%. In the new practice informed model the distribution of learning activities changed to: practice= 36%, self-study = 32%; case based discussion = 27%; assessment = 6%.

We evaluated the student performance using quantitative scales (0-100) obtained from: a written test based on ten clinical cases, and an OSCE of five stations (history taking, physical examination, Pap smear, interpretation of data, and patient orientation).

From 2011 to 2016, a total of 606 medical students completed the practice based course (Pr group). A sample of 287 students from the traditional course (Tr group) was used for comparison.

The mean (SD) of OSCE scores were 81.2 (8.9) for Pr group and 77.2 (8.4) for Tr group (P<0.001). Written test scores were 73.2 (10.6) for Pr group and 74.1 (48.9) for Tr group (P=0.75). Substantial improvement in performance of Pr

group was observed in physical examination, procedural and patient orientation abilities.

Conclusion: An introductory course in Gynecology and Obstetrics is feasible and associated with improvement of OSCE scores. The reduction of hours dedicated to traditional lectures did not impair the performance in written tests.

Take-home messages: To use the medical practice in the health system is a very effective way to guide content for introductory courses in medical specialties. It is associated with improvement in clinical abilities without loss in cognitive knowledge acquisition.

Reforming Undergraduate Medical Education at Five Universities in Vietnam

Authors
David B. Duong, Harvard Medical School - The Partnership for Health Advancement in Vietnam, Boston, USA
Hong Minh Thi Pham, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam
Todd Pollack, Beth Israel Deaconess Medical Center, Boston, USA
Nghia An Nguyen, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam
Lisa Cosimi, Harvard Medical School - The Partnership for Health Advancement in Vietnam, Boston, USA
Tuan Diep Tran, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam

Presenter: David Duong, Harvard Medical School - The Partnership for Health Advancement in Vietnam, Boston, USA

Background: The Vietnam Ministry of Health (MOH) has prioritized reform of undergraduate medical education (UME) to meet the population's evolving health care needs because of changing epidemiological trends and an overburdened healthcare system. The MOH identified 5 universities of medicine and pharmacy (UMP) to lead the reform and serve as models at other universities in the country.

Method: To support UME reform, the MOH, the World Bank, the USA Agency for International Development (USAID) and Harvard Medical School's Partnership for Health Advancement in Vietnam (HAIVN) are collaborating on a five-year project to reform UME at the 5 UMPS. Our approach includes initial needs assessments, formation of reform committees, introduction of the change management process, development of new curricula frameworks, a series of step-wise faculty development workshops, immersion trips between HMS and the UMPs, and faculty "twinning" for ongoing mentorship.

Results: Starting with an initial effort at Ho Chi Minh City UMP, the faculty developed new curricula that is student-centered, integrated between basic and clinical sciences, and has early exposure to clinical practice with a community-based experience. In 2016, Ho Chi Minh City UMP launched a new curriculum. Its faculty now serve as technical experts in the ongoing reform at the four other universities increasing the capacity for ongoing reform in the country.

Discussion & Conclusion: This is the first comprehensive UME reform in Vietnam and is ongoing at five different UMPs, each with different geographic, socio-economic and ethnic considerations. The collaboration has enabled the UMPs to undertake a comprehensive approach to curriculum reform that can serve as a model in Vietnam and for other resource limited settings.

Take-home messages:

- Collaboration for a successful and comprehensive curriculum overhaul requires a longitudinal and coordinated approach.
- A standardized process includes adaptation of change-management principles by leadership, faculty development workshops, immersion trips, and "twinning" between faculty to provide ongoing mentorship is feasible and effective.
- Shared agenda making, identification of host-country needs and leveraging of existing resources are factors in successful collaborations between low-and-middle income countries (LMICs) and resource-rich academic partners

7GG15 (392)
Improving Mental Health Literacy in the Community Through Implementation of a Student-Delivered Mental Health Curriculum

Authors

Jennifer Forbes, University of Utah PA Program, Salt Lake City, USA
Jared Papa, Idaho State University PA Program, Meridian, USA
Glenda Carr, Idaho State University Pharmacy Program, Meridian, USA
Talia Sierra, Idaho State University PA Program, Meridian, USA

Presenter: Jared Papa, Idaho State University PA Program, Meridian, USA

Background: The state of Idaho, located within the USA, has many confounding factors that have resulted in a concerning environment for mental health. Idaho ranks near the bottom in the nation with regards to the rate of suicides and health professional shortages in mental health.

Method: Faculty at one PA program developed a mental health curriculum to address health disparities through a community-based project. The curriculum was designed to enhance an existing interprofessional community health screening (CHS) project by incorporating mental health education into the screening process. Participants attending the CHS events are underserved individuals and are often from minority backgrounds. PA, nursing, and pharmacy students work collaboratively at the CHS events to provide a patient-focused comprehensive screening. The interactive mental health educational session was student-delivered through the use of iPads and a PowerPoint presentation. The curriculum included instruction on why mental health is important, contributing factors to mental health, recognizing signs of a mental health crisis, and provided a list of local and national resources for mental health evaluation and treatment. Community participants at the CHS events completed pre and post-curriculum surveys assessing their knowledge and attitudes regarding mental health. Students delivering the curriculum also completed a pre-survey prior to the first CHS event and a post-survey after the final CHS event of the semester.

The mean was determined for each statement in the survey and the pre and post survey results for each group were compared using paired t-tests.

Results: Participant results showed an increase in the mean on all seven of the survey statements. Three of these were determined to be statistically significant (P<.05). Student results showed an increase in the mean on six of the seven survey statements with three of these being statistically significant (P<.05).

Conclusion: The results of this study show an improvement in the knowledge and attitudes regarding mental health by both the community participants receiving the mental health education and the students delivering the curriculum.

Take-home message: Mental health literacy in the community can be improved through the implementation of a student-delivered mental health curriculum.

7GG16 (2384)
Medical Curriculum Development for the Pre-clinic Medical Students in Naresuan University, Phitsanulok

Authors

Saisiri Mirasena, Naresuan University, Phitsanulok, Thailand
Monthicha Sukkasem, Naresuan University, Phitsanulok, Thailand
Unyaporn Chusakul, Naresuan University, Phitsanulok, Thailand
Natthapit Jantaramanee, Naresuan University, Phitsanulok, Thailand
Supawadee Makanut, Naresuan University, Phitsanulok, Thailand

Presenter: Saisiri Mirasena, Naresuan University, Phitsanulok, Thailand

Background: Medical curriculum of Naresuan University (NU) has been implemented since 1995 for Collaborative Project to Increase Production of Rural Doctor (CPIRD) and One District One Doctor (ODOD) purpose. This curriculum was under the regulation of The Medical Council of Thailand and Thai Qualification Framework (TQF) for Higher Education, The Higher Education Commission.

Method: Medical lesson plan will start with general education at first year, for the second and third year will attend pre-clinic course organized by Faculty of Medial Science and Pharmaceutical Science with professional development (PD) course, and the clinic course will implement in the forth-sixth year hosted by NU Hospital and 5 Medical Education Centers. Then they will be assessed with the Medical Competency Assessment Criteria for National License. The learning outcomes (LOs) was implemented and integrated the desired characteristics of the medical student so called 7-star doctor in every subject..

The medical curriculum was developed continuously in every 6 year, the latest developed medical curriculum will be implemented on academia year 2019. This curriculum will be assessed with the World for Medical Education (WFME) Global Standards. The LOs and teaching methods for the pre-clinic classes will be revised and integrated to characteristics of 7-star doctor, the medical student sand the pre-clinical lecturers will be participated for the developed curriculum preparation. The pre-clinic teaching and hands-on methods; lecture, group discussion, skill lab, case-based learning (CBL), problem-based learning (PBL), Team-based learning (TBL), self-directed learning (SDL), small group discussion and Flipped classroom will be implemented and assessed. These would be helped the medical student for the integration of pre-clinic knowledge to clinic. The developed curriculum will be drafted and evaluated by the curriculum committee before submission to The Medical Council of Thailand and The Higher Education Commission.

Conclusion: Preparedness and understanding of the medical curriculum to students and lectures are very important to achieve the medical education purpose

7GG17 (2282)
Challenges, Success Factors and Pitfalls in the Implementation of Distributed Medical Education: A Multi-stakeholder Perspective from a Canadian Province

Authors
Anurag Saxena
Tom Smith-Windsor
Loni Desanghere
Kathy Lawrence
Sinead McGartland
Kent Stobart

Presenter: Anurag Saxena, University of Saskatchewan, Saskatoon, Canada

Background: There are only a few descriptive reports on implementation of distributed medical education (DME) and these provide accounts of successful implementation from the senior leadership perspective. In Saskatchewan, over a period of four years (2010-2014), four new sites of Family Medicine (FM) residency were opened and two additional sites could not be developed. The aim was to identify challenges, success factors and pitfalls in DME implementation based upon experiences of multiple stakeholders with both successful and unsuccessful outcomes.

Method: Data were obtained through document analysis (n=64, spanning 2009-2016; perspectives of government, senior leadership, management and learners), focus groups of management/operations personnel (n=10) and interviews of senior leaders (n=4). Challenges and success factors were ascertained through categorization. Iterative coding was used to determine themes in organizational dynamics.

Results: Both challenges and success factors included contextual variables, governance, inter- and intra-organizational relationships (most common success factor), resources (most common challenge), learning environment and pedagogy. Management/operations was

only a challenge. The conditions for success and the pitfalls included the pace of development across multiple sites, collaborative governance, continuity in leadership at the apex, operations alignment, and reconciliation of competing goals.

Discussion: The findings in our study on FM DME expansion reflect experiences and perceptions of multiple stakeholders with both success and failure to achieve desired results. The challenges and strengths spanned contextual factors, governance, management, inter-and intra-organizational relationships, resources, pedagogy and learning environment. The pitfalls referred to the pace of development, collaborative governance, leadership at the apex, operational alignment, and competing goals.

Conclusion: Emerging opportunities for DME can be leveraged through collaborative governance, aligned operations and resolution of competing goals even in constrained contexts to translate political will into success, however, there are pitfalls that need to be avoided. Our findings based upon multi-stakeholder perspectives add to the body of knowledge on deployment carefully considering the conditions for success and associated pitfalls.

7GG18 (1356)
Undergraduate Medical Education for the Future

Authors
Sam Lingam
Claire Lingam

Presenter: Sam Lingam, London International Medical School, London, UK

Background: The future medical education will need a revolution. In this internet era with most information and goods in the World Wide Web (www) a revolution is already taking place in every aspect of our lives. Undergraduate Medical Education is now more integrated; task -based and student-centred; with technology driving the change. At present, most medical schools in the world are using the traditional methods of teaching using the standard curriculum. It is usually a 5 to 6 years course.

Method: Our medical school is different in that as it will use the well-established curriculum as expected by WHO but will deliver the curriculum more flexibly; and using E-learning technology. This new programme will cover the whole syllabus including the clinical medicine in 4 ½ years. Also, our undergraduate medical programme will introduce "patient-focus format so that our students will be exposed to clinical practice from the beginning. Patient-based education introduced from the first week.
Our new programme will be a competency-based medical education. We will introduce the questions and answers sessions from very early in the course. We will concentrate in educating our students to well above the competency levels to pass USMLE (so that our doctors can work in the USA and Canada) and also pass UKMLA (to work in UK). If and when the Commonwealth gets its act right and when a Commonwealth-wide COMMLE comes into place they can work in any Commonwealth country. Thus from the beginning we will prepare our medical students to pass both examinations. This will give them

the golden key to open many doors.   We are preparing
doctors for the globe.

7HH: Posters: Approaches to Curriculum Evaluation and Education Environment

Competency testing of knowledge in management of emergency nephrology conditions in externs and interns indicates the need for change in the teaching process

Authors
Duangrat Tanratananon
Krisana Roysri
Bundit Thanaboonsombat

Presenter: Krisana Roysri, Clinical Medical Education Center, Surin Hospital, Surin, Thailand

Background: Externs have learned the necessary knowledge of medical practice in there preceding years while interns have gained additional experience in patient care. This study aimed to test the basic knowledge if externs and interns in management of emergency nephrology conditions before starting practice.
Method: A test composed of 100 point was delivered to 32 externs and 9 interns. Pretest and posttest scores were compared. The minimum passing score was set at 50 points.
Results: For the pretest scores, 71.9% of externs and 77.8% of interns was lower than the minimal passing level with average scores of 31.6 ± 4.2 for externs and 19.7 ± 6.8 for interns. For the posttest scores, 71.9% of externs and 100.0% of interns passed the minimal passing level with average scores of 68.6 ± 4.0 for externs and 66.9 ± 3.1 for interns. Both pre- and posttest scores were not different between externs and interns but posttest scores significantly positively correlated with pretest scores (p=0.015).
The low pretest scores and more than 70% of externs and interns failing the test could indicate a lack of conceptual knowledge. Even in the posttest, 28.1% of externs still did not pass the test.
Conclusion: Externs and interns may lack knowledge and experience in patient care which could lead to malpractice. Evaluation of their knowledge before practice may help guide attending physicians in better providing guidance to externs and interns.

7HH3 (3244)
Infrastructure, resources and the curriculum: An opinion at Facultad de Medicina, National Autonomous University of Mexico (UNAM)

Authors
Irene Durante Montiel
Cruz Montoya Mario Jacobo
Trejo Flores Paola Jaqueline
Fernández Altuna María de los Ángeles

Presenter: Irene Durante, Facultad de Medicina of National Autonomous University of Mexico, Mexico City, Mexico

Background: Developments in scientific knowledge and globalization, increasingly influence medical education. In this context, Facultad de Medicina at UNAM is evaluating its competency-based curriculum and searching for balance between what we teach and the resources used to achieve students' learning.
For that purpose, one of the focuses is to identify academic leaders' perception of the relation between the material resources used by the Facultad de Medicina, and its 2010 curricular model. This three-stage analytical research process took place from May 2017 to January 2018.
Method: First stage: National and international literature was reviewed regarding academic infrastructure and material resources in the achievement of competencies during higher education and medical education.
Second stage: Compilation of data on Facultad de Medicina UNAM's resources and infrastructure. Based on this data, a checklist was designed to identify academic leaders' perception of the relation between infrastructure, material resources and the 2010 curricular model.
Third stage: A group of academic leaders, randomly selected from department heads and education coordinators of the biomedical, clinical and sociomedical curricular areas were invited to answer several questions regarding the above-mentioned data through a Google Forms link. These answers were later contrasted and analyzed in a Microsoft Excel 2010 spreadsheet.
Results: The results showed partial congruency between the curriculum and certain material resources and infrastructure, such as the following: learning, academic staff, technological, informatics and communication resources. Material resources that showed greater congruence are bibliographic and hemerographic, administrative, cultural, recreational and sport.
Conclusion: This research will set the foundation for any future 2010 curriculum modifications, and to make sure that learning, academic staff, and technological, informatics and communication resources are appropriate for a specific curricular model.

7HH4 (1913)
The emergency paramedics' viewpoints on the compliance of their curriculum with job requirements

Authors
Seyed Masoud Hosseini, Mashhad University of Medical Sciences, Mashhad, Iran
Homeyra Forouzandehfar, Mashhad University of Medical Sciences, Mashhad, Iran
Maliheh Dadgarmoghadam, Mashhad University of Medical Sciences, Mashhad, Iran
Javad Malekzadeh, Mashhad University of Medical Sciences, Mashhad, Iran

Presenter: Seyed Masoud Hosseini, Mashhad University of Medical Sciences, Mashhad, Iran

Background: Due to some rapid changes in medical knowledge, it is recommended that the curriculum of the health disciplines should be revised periodically. The medical care providers' viewpoints about the compliance of their curriculum with job needs can provide first hand data for curriculum developers. This study is carried out to get the emergency paramedics' viewpoints about their attained qualifications.
Method: This cross-sectional study is carried out on 89 Emergency Medical Services (EMS) paramedics in Mashhad University of Medical Sciences, Iran. Data were gathered by a questionnaire and then analyzed using SPSS software. The questionnaire's validity and reliability was approved before administering it.
Results: Of the participants, 52.3% had an associate degree and the others had BSc. (47.7%). Most of the participants agreed that the "Theoretical Courses" had a positive impact on their competencies, strongly. Also, the "Practical Courses" impact on job competencies were rated as 3.42±0.75 (of 5) by the associate degree and 3.56±0.83 by the BSc. degree holders. Most of the paramedics (65%) agreed that the curriculum need a revision, especially on the practical courses and some courses contents and devoted time should be extended to prepare the graduates for their actual job needs, properly. Many of the participants expressed that they had felt high degrees of stress in the emergency situations due to lack of knowledge and practical competencies, for example on disaster management and huge accidents.
Conclusion: Iran is located in an area with yearly several disasters such as earthquake and flood. It seems that some courses of emergency paramedic's curriculum need to be paid more attention and their contents should be tailored, for example on how to act in huge accidents and manage the emergency situations.
Take-home message: Needs assessment is an important part of any instructional design. Although there are many methods to identify the learners' needs, expressed needs by the graduates of a discipline should be considered as an important source to develop or revise any educational curriculum.

7HH5 (1541)
Exit interviews are a useful complement to traditional course evaluations

Authors
Birgitta Björck, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden
Hans Gyllenhammar, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden

Presenter: Birgitta Björck, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden

Background: Written course evaluations are ubiquitous and give important information. However, what aspect of the course that resulted in a certain numeric result by the students can sometimes be difficult to understand. Short written comments are often not very informative. Exit interviews are prevalent in industry but rare in academia.
Method: The course in Clinical Medicine at our institution is 32 weeks and spans 2 semesters. At the midpoint of the course there are midterm interviews of the students performed by the course leader and another experienced educator. At the end of the course there is a comprehensive written course evaluation. In a project, starting in 2011 and continuing, we also introduced exit interviews at the end of the course after the final exam. An experienced educator with no connection to the course or prior knowledge of the students performed the interviews. Approximately 20 percent of students were randomly selected for these voluntary interviews.
Results: No student denied participation. The interviews were 20-30 min long. A structured analysis of the notes by the interviewer was performed. Clinical placements dominated the student's impressions from the course as they did in the written evaluations. In the midterm interviews the students were more positive than in the anonymous written evaluations at the end of the course. In the exit interviews students were more nuanced than in either of the previous evaluations and made obvious efforts to discuss both positive and negative experiences of the course.
The seemingly exact results from numeric course evaluations are hard to use for course development and midterm interviews by teachers complicated by tactical considerations by students. In the exit interviews the analysis of notes showed that a few areas dominated the student's impressions and experiences and could be discussed in a more nuanced form than in the two other forms of evaluations.
Conclusion: Exit interviews add cost and complexity but the outcome is worth the investment giving additional information for course improvement and, in our experience, was appreciated by the interviewed students.
Take-home message: Exit interviews are recommended for long clinical courses.

7HH6 (1118)

Applying the After Action Review (AAR) method to undergraduate medical curriculum development

Authors

Barbara A. Jennings, NMS, Norwich, UK
Trevor Killeen, NMS, Norwich, UK
Susan Miles, NMS, Norwich, UK

Presenter: Barbara Jennings, Norwich Medical School, Norwich, UK

Background: In 2011, we completed a curriculum redesign for our student selected components (SSC), and subsequently implemented significant changes to student-choice, tutoring, and assessment.
After Action Review (AAR) is a reflective and structured debriefing method that is used in the military; and it has been adapted for use in emergency medicine and medical simulation. By comparing expectations of a scenario with subsequent experiences after the event, it is possible to identify operational problems and communication gaps.
We used a modified AAR to gather longitudinal feedback from the first cohort to experience our revised, 4-year, longitudinal SSC curriculum.
Method: 9 students engaged in a three hour session that was facilitated by 2 faculty members. Short written comments were collected from each student and coded to describe (1) initial expectations and (2) actual experiences of the domains of the curriculum, e.g. student-selection; career planning; tutor support; formative and summative assessment; documentation; and evidence-based-medicine (EBM). Comments were paired for each individual but collected anonymously.
Results: All students provided detailed comments about their expectations and experiences for most domains. The comments about expectations were compared with actual experiences and categorised as negative (if expectations were not met); positive (if experiences were met or better than expected); or mixed (if expectations had been partially met). Paired responses indicated that reflections were domain-specific, i.e. individual students reported some positive experiences and some negative experiences across the domains. The learning gain for EBM was a particular strength, whereas documentation was noted as an area for attention. Data from the study were disseminated to academic leads to use in further curriculum development.
The structured AAR debriefing provided data to support quality improvement and to manage student expectations as appropriate. This AAR was designed to include a small voluntary cross-section of the student cohort; limiting the generalisability of initial conclusions.
Conclusion: The efficient AAR method provided rich, qualitative data that complemented our annual student evaluations of teaching. This method allowed a thorough debriefing between faculty and medical students at the end of a significant redesign of the SSC curriculum at NMS.

7HH7 (1630)

What's the CATCH? Evaluation of a Curriculum Designed for Physicians to Capture and Translate the Learning from the Review of Adverse Events and 'Near Misses' in Hospital Settings

Authors

Suzette Cooke
Michelle Bailey
Sarah Hall
Julie Fisher

Presenter: Suzette Cooke, University of Calgary, Canada

Background: Clinical case reviews (traditionally known as morbidity and mortality rounds) have the potential to serve as an effective quality improvement tool as the culture of medicine shifts towards greater expectations of accountability, continuous learning and translation of learning to practice. A review of case review models reveals a lack of standardization.
Method: We aimed to create, deliver and evaluate a curriculum to facilitate the review of in-patient cases where an adverse event or "close call" had occurred. We called the new curriculum "CATCH": Case Analysis and Translation to Care in Hospital. We incorporated specific strategies to promote: 1) a safe, supportive environment, 2) a culture of professional learning, 3) mentorship of case presenters, 4) input from physicians involved, 5) a framework to support case analysis and discussion and, 6) synthesis of tangible actions to improve clinical care. The curriculum consisted of 3 components: 1) an introductory workshop, 2) a podcast & mentor meeting for presenters, and 3) monthly CATCH rounds. Impact of the educational intervention was assessed by pre/ post participant surveys of the CATCH intervention, individual sessions, presenter and physicians involved and feasibility. Paired t-tests and thematic analysis were used to analyze quantitative and qualitative differences.
Results: Twenty-one physicians and 4 mentors participated in the 16 month study. Preliminary results reveal: i) a preference for the CATCH model vs. previous case review model, ii) high levels of satisfaction with CATCH sessions, and iii) positive presenter, physicians involved, and mentor experiences. Participants report the CATCH conference model is feasible, engaging, promotes a supportive environment for professional learning, facilitates awareness of tools for case analysis and provides opportunities for translation of learning to clinical practice.
Conclusion: Physicians seek to deliver optimal patient care yet recognize that this does not necessarily go as planned. When presented with a safe, supportive, predictable atmosphere and specific tools to objectively analyze cases, motivation is high to learn, develop new insights and synthesize specific strategies to translate this learning to practice.
Take-home message: The CATCH conference curricular model has significant potential to transform clinical case reviews in hospital medicine.

7HH8 (74)
The more difficult subjects on biggest Med School in Mexico

Authors
Maria de los Angeles Fernandez-Altuna, UNAM School of Medicine, Mexico City, Mexico
Diego Gutierrez-Rayon, UNAM School of Medicine, Mexico City, Mexico
Mariela Ramirez-Resendiz,UNAM School of Medicine, Mexico City, Mexico
Rosalinda Tellez-Rosado, UNAM School of Medicine, Mexico City, Mexico
Judith Balderas-Ortega, UNAM School of Medicine, Mexico City, Mexico
Irene Durante.-Montiel, UNAM School of Medicine, Mexico City, Mexico

Presenter: Maria de los Angeles Fernandez-Altuna, UNAM School of Medicine, Mexico City, Mexico

Background: Med School is complicated and demanding because medicine is a science that requires greater dedication to study its extensive content. At UNAM Med School in Mexico, as well as in other parts of the world, first year is the most complex because not all students can pass certain subjects.
Method/Results: Final grades of all subjects were analyzed from first to fifth year, school cycle 2010-2011 (School population 1,085 students). Most difficult subjects were identified.
In the first year, half of the subjects have a high rate of non-approval: Histology (49%), Anatomy (44%), Embryology (38%) and Biochemistry (28%). In the second year, a quarter of the subjects have a higher rate of non-approval: Physiology (3%) and Microbiology and Parasitology (3%). In the clinical cycles the phenomenon of failure is almost not observed, since third and fourth years of Med School reach an approximation of 1% of non-approval. Only 0.2% of students do not approve fifth year (Premed clerkship).
Subjects with higher rate of non approval are those having greater number of hours (higher curricular value): Histology, Anatomy, Embryology and Biochemistry. The subjects that are most approved are those that have less number of hours (lower curricular value) as Basic-Clinical Integration and Biomedical Informatics. Basic cycles´s subjects have a higher rate of non-approval compared to clinical cycles subjects. First year may be the most difficult due to the number of hours that students must devote to the study of those subjects among other factors.
Conclusion: More work must be done to avoid the high rate of failure in the first year. Qualitative studies are needed to better define the problem

7HH9 (2495)
Course alignment in a distributive model: student and preceptor expectations of clinical pharmacology knowledge and skills in a veterinary medical curriculum

Authors

Background: Veterinary medical graduates are expected to be competent in clinical pharmacology. During clinical training, the assessment of student knowledge and skills in pharmacology is performed by third party preceptors. Understanding how students perceive these assessments is essential to maintaining course alignment and ensuring appropriately trained graduates. An earlier study explored how preceptors assess student competency in pharmacology.
The purpose of this study is to explore the STUDENT EXPERIENCE of being assessed in pharmacology. Are the students aware of what actions/behaviors preceptors use to assess pharmacology knowledge/kills? Do the students understand the expectations that are equated with competence? Students completed a survey regarding their expectations and experiences in pharmacology during Year 3 of the curriculum.
Method: A mixed methods approach was used to analyze the survey results and compare to previously developed themes. Student responses were highly variable on questions regarding actions and behaviors associated with competence. Students were also unaware of course and discipline expectations. Student and preceptor expectations were in alignment with how students were assessed (through rounds). But alignment was lacking in other areas.
Results: Student confusion on expected behaviors is consistent with the gaps discovered in our previous study. With only general guidance from course syllabi and inconsistent guidance from preceptors, it is no surprise that students are confused about expectations in pharmacology knowledge and skills. The results from this study provide foundational information that will be used to inform a systematic evaluation of the pharmacology program assessing the effectiveness of the current curriculum. Ultimately this will inform changes and improvements in the delivery of pharmacology content and development of clinical pharmacology skills.
Conclusion: Aligning assessment with course and curricular objectives optimizes student learning. This study demonstrates the negative effect malalignment has on student perceptions. It also emphasizes the need to include student perceptions in systematic curricular reviews to gain a fuller picture. By understanding the student experience, curricular designers and course leaders can maintain course and curricular alignment. This survey approach can be adapted to other disciplines and used as a routine part of curricular review.

Medical Students Perception of the Quality of their Medical Education. A change is necessary?

Authors
Omaira Rodriguez
Tatiana Giusti
Maria Alejandra Pulido
Manuel Medina

Presenter: Omaira Rodriguez, Universidad Central de Venezuela, Caracas, Venezuela

Background: Evaluation is an essential and critical aspect of any learning process, acquiring more relevance when referring to medical curriculum design. A medical curriculum should constantly adapt in response to the needs of students, institutions and society. The purpose of the present study was to evaluate the student's opinion towards the current curriculum in "Luis Razetti" School of Medicine, as a part of the Curriculum Evaluation System that we are developing

Method: In order to collect data from students, we used a validated questionnaire (electronic survey), designed to evaluate the curriculum. The survey was anonymous and included a total of eleven (11) Likert-scale-type questions related to the student's perceptions of the program, as well as satisfaction with their learning.

Results: 46 questionnaires were completed by recent graduate medical doctors from the "Luis Razetti" medical school. Respondents indicated strengths and deficiencies in the current curriculum that also related to its competence. 52% of students considered that the quality of their formation was good overall.

Overall positive feedback was obtained in subjects like parasitology (97.8%), histology (91.27%), and surgery (80.4%). In contrast, we obtained negative feedback in subjects like public health (82.6%), legal medicine (71.7%), pathological anatomy (60.86%) and radiology (62.5%). We also observed difficulties acquiring skills in some areas. 73.9% of the students considered that the obtained education has allowed them to perform adequately during their practice. However, 86.7% also believe that a change in the current curriculum has to be made.

Students consider that the quality of their formation is good, allowing them to perform in an adequate way as medical doctors. This is supported by the strengths the current curriculum has. However, there are deficiencies related to acquired knowledge and skill acquisition in various subjects, this is why a significant proportion of students consider that a change is required in order to improve the actual curriculum program.

Conclusion: Continuous curricular evaluation provides valuable information on strengths and weaknesses, which will guide future efforts to optimize it,in order to improve the quality of the professionals that graduate from our school.

A survey to assess high school students' and medical students' perspectives on a research-focused medical curriculum and a seven-year integrated Bachelor of Science/Doctor of Medicine Degree (iBSc/MD) Program in Thailand

Authors
Watanya Chaiwong
Teerapat Ungtrakul
Wisut Lamlertthon
Chirayu U Auewarakul

Presenter: Watanya Chaiwong, Chulabhorn Royal Academy (CRA), Bangkok, Thailand

Background: The majority of Thai medical students have limited knowledge and skills in research leading to lack of confidence among Thai physicians to create and execute research. The development of a new medical curriculum has been contemplated. The aim of this study was to assess the high school students' and medical students' perspectives regarding research-focused medical curriculum and a seven-year integrated Bachelor of Science/Doctor of Medicine Degree (iBSc/MD) Program.

Method: An online structured-questionnaire was used to assess students' interests in a research-focused medical curriculum and a seven-year Bachelor of iBSc/MD Program. Descriptive statistics was used for data analysis.

Results: There were a total of 682 responders including high schoolers who wanted to become doctors (82.84%), pre-clinical year medical students (5.42%), clinical year medical students (3.38%), and others (8.36%). Overall, 80.93% of them showed a positive viewpoint towards a research-focused curriculum. However, 5% of them were not aware of the needs for doctors to do research. About a seven-year iBSc/MD program, 80.93% of them showed interests in it. The reasons that appealed to them were the opportunity to learn and acquire practical research skills and to receive both iBSc and MD degrees, 85.2% and 46.6%, respectively.

Conclusion: Even though most students recognized a crucial role of research in medical profession, some of them did not. Adjusting students' attitudes toward research are important in order to improve quality of medical practices of future physicians through research. Most Thai students showed interests in a seven-year iBSc/MD program.

Take-home message: The majority of students, especially high school students, had a positive view towards gaining more research knowledge and skills and showed interest in a seven-year iBSc/MD program. Developing this new curriculum should be considered to improve research confidence and output among Thai medical graduates.

Ádám Tibor Schlégl, University of Pécs Medical School, Pécs, Hungary

Presenter: Adrienn Vivien Juhász, University of Pécs Medical School, Pécs, Hungary

Background: As a provider, it is essential for the university to have a valid teacher evaluation system, what -besides it's quality assurance role- a great opportunity to map the student's expectations. The main goal of this study is a data-mining approach of the students satisfaction based on an educational inventory and to provide educational management with an adequate tool as well.

Method: An in-house 16-items inventory was created to evaluate students' satisfaction. Altogether 21338 anonym questionnaires were processed by a multi-language questionnaire at the Medical Faculty. 13 568 items were analyzed after data cleaning and balancing based on academic years and programmes. First, a statistical validity analysis was used by Confirmatory Factor Analysis. Secondly, an Item-Response Theory (IRT) and CHAID decision tree models were created.

Results: Statistically valid (77-84%) models were created. Significant differences were found between the preferences of the first-year and the second-year students. In the first year, quality of the lectures and motivation for independent thinking were the most important influencing factors compared with that of the second year students who preferred the general quality of subject. This tendency remains unchanged in the third year. In the clinical modul of education, the quality of the practices is the predominant factor.

Conclusion: IRT and decision tree models whit an adequate questionnaire can be an efficient tool to explore the components influencing students' satisfaction. These factors change dynamically through the academic years. Based on the results, our method is a valid predictive and descriptive tool for measuring students' satisfaction concerning education.

Take-home message: It is feasible to develop statistical models that can help us to find optimal modifications in education to increase the students' satisfaction.

7HH13 (3483)

Dynamic patterns in student assessment outcomes in Algarve Medical School: Cohort Study

Authors

Ricardo Afonso, Department of Biomedical Sciences and Medicine, University of Algarve, Faro, Portugal

Sofia Nunes, Department of Biomedical Sciences and Medicine, University of Algarve, Faro, Portugal

Pedro Marvão, Division of Medical Education, School of Medical Sciences, Faculty of Biology Medicine and Health, The University of Manchester, Manchester, UK; Department of Biomedical Sciences and Medicine, University of Algarve, Faro, Portugal

Manuel João Costa, School of Medicine, ICVS/3B's, PT Government Associate Laboratory, Braga/Guimarães, Portugal

Ana Marreiros, Department of Biomedical Sciences and Medicine, University of Algarve, Faro, Portugal

Presenter: Ana Marreiros, Department of Biomedical Sciences and Medicine, University of Algarve, Faro, Portugal

Background: Medical schools and other education institutions are increasingly looking for methods of assessing their teaching and at same time the students learning. Integrated Master in Medicine of the University of Algarve (MIM-UAlg) is a recent and innovative course in the Portuguese context that has been in operation since 2009, open exclusively to people already with a degree. The evaluation system is based on the best evidence: the theoretical knowledge is evaluated in PPI (Personal Progress Index, McMaster), and by PBL assessments focused on the objectives of the clinical problems studied. Practical skills assessed through Objective Structured Clinical Examinations in all years of the course and through Case Based Discussions in the last two years by hospital clinicians. Attitudes and communication are evaluated weekly in the first and second year by tutors in Primary Care. This work focus on the characterization of the dynamics of student evaluation and academic achievements in this Medical School as prospective study for implementation of teaching and learning assessment methods.

Method: In this study, was analyzed the pattern of student's academic performance using statistical data visualization techniques on medical students' academic data of University of Algarve. The main purpose is to perceive, understand and characterize the dynamic process of academic achievements.

Results: In both learning areas, knowledge and clinical skills, the students' academic output showed an increase of performance throughout the curriculum but a relative homogeneous profile among all cohorts. Exception was the observation of a general increase of student clinical skills performance from 2013 cohort, which coincides with introduction of three evaluation moments instead of a single one.

Conclusion: With relatively simple statistical data visualization techniques, we were able to characterize student academic patterns and conclude that, key areas of medical student instruction are being assessed homogenously since the beginning of Medical School in University of Algarve, opening the door to the implementation of a learning performance assessment.

Take-home message: Techniques for statistical data visualization are suitable to understand student academic output data structure and an approach method to start monitoring student-learning performance.

How good was our curriculum? Sixth year students' self-assessment of their theoretical knowledge and practical experience when starting their internship

Authors
Nuno Manso, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Sara Cabete, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Miguel Miranda, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Isabel Brito, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Madalena Patrício, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Isabel Pavão Martins, Departamento de Educação Médica da Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal

Presenter: Isabel Brito, Department of Medical Education (DEM), Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Background: Are medical schools' curricula well-adjusted and efficiently taught, so that young doctors have the required knowledge (TK) and practical experience (PE)? We aim to identify whether recently-graduated doctors learnt what their medical school aimed to teach them and if what they were taught matches what they need the most, now that they have started their practice.

Method: Following a 6th year pilot study presented at AMEE_2017 conference, all 350 first-year residents (FYR) were asked to self-assess their TK and PE, when they first started working, as well the number of opportunities for skill practice offered in 6th- year curriculum clinical rotations.

Results: Evaluation of TK was higher than PE in all rotations. Paediatrics skills were reported as the best known and most practiced (55% reported high TK / 38% reported high PE); Surgical skills were the worst rated in both domains (49% reported low PE and 61% reported low TK). Paediatrics was also the area in which students had more opportunities to practice the defined curriculum skills (44% had more >10 opportunities to practice) while Internal Medicine was the area in which a higher

percentage of students had no opportunity to practice the respective skills.

Students considered they gained high TK on Internal Medicine, Emergency Medicine, Paediatrics, Obstetrics-Gynecology, and General Practice (reported by 10-55%, depending on the area). However, there is a gap between what PE students are expected to acquire and what they end up with (high PE reported by 8-38%, depending on the area).

Conclusion: The identified gap from curriculum in paper versus in practice needs to be addressed. Students feel more confident about their knowledge than about their practical experience, especially in General Surgery, with all students considering this problem is crucial due to the lack of opportunities to practice.

Take-home message: All students felt they did not have enough opportunities to gain the practical experience they were supposed to. Since most Paediatrics' practice goals are met, a similar teaching-learning process could be used as a model for other weak curricular rotations, particularly General Surgery and Emergency Medicine.

7HH15 (2879)
Student evaluation of medical semiology practical teaching at Faculdade de Medicina da Universidade de Lisboa (FMUL): Implications for future teaching

Authors
Nuno Manso, Departamento de Educação Médica - Faculdade de Medicina, Universidade de Lisboa, Lisboa, Portugal

João Eurico da Fonseca, Instituto de Semiótica Clínica - Faculdade de Medicina, Universidade de Lisboa, Lisboa, Portugal

Madalena Patrício, Departamento de Educação Médica - Faculdade de Medicina, Universidade de Lisboa, Lisboa, Portugal

Presenter: Nuno Manso, Departamento de Educação Médica - Faculdade de Medicina, Universidade de Lisboa, Lisboa, Portugal

Background: Medical semiology is a pivotal teaching area in student transition to the clinical years. Taught in the 3rd year under the subject 'Introduction to Clinic' in 2017-2018 this curricular area underwent a significant reform in terms of study guides, examination protocols, teaching structure, student-teacher ratio, etc.

Method: The evaluation of the curricular reform was proposed by one IC student who designed the first draft of a written questionnaire to be filled by all students (n=353). With the supervision of the IC Coordinator and Medical Education Department, a final survey was designed to identify how students perceived the implemented changes namely: Preparatory study guide sent to students before the practical classes; More opportunities to skills practice during the practical classes; Students' self-evaluation after the practical classes; Teachers' evaluation (global performance).

Results: The allotment of additional class time exclusively dedicated to the practical training as well as the participation of patients and student monitors (peer-teaching) were the major strengths reported by students

while the reformulation of some of preparatory material was the major suggestion for improvement.

The introduced changes were globally well perceived, namely the reduction of lecture time to increase practical training as well as the opportunity for higher teacher-student interaction. The lack of time given to skills practice was the strongest criticism in previous years while more patient intervention was the main request, because it's now accepted that students should have contact with patients as early and as frequently as possible, regardless of eventual logistic difficulties. The weakest aspects relate to some specific themes namely with some study guides needing objectives and content reformulation, to match students' expectations. Future maintenance of these changes was confirmed by the Coordinator.

Conclusion: A student-led initiative triggered the evaluation of a newly implemented reform highlighting its strong and weakest aspects. The support given from the Coordinator is essential to guarantee further improvement of IC curriculum.

Measuring the educational environment across the curriculum in Physiotherapy: A Mixed Methodology approach

Authors

Brenda Fuenzalida, Physiotherapy Service Health Network UC-Christus, Santiago, Chile
Margarita Pizarro, Gastroenterology Department Pontificia Universidad Católica de Chile, Santiago, Chile
Javiera Fuentes, Health Sciences Department Pontificia Universidad Católica de Chile, Santiago, Chile
Viviana Rojas, Gastroenterology Department Pontificia Universidad Católica de Chile, Santiago, Chile
Oslando Padilla, Public Health Department Pontificia Universidad Católica de Chile, Santiago, Chile
Arnoldo Riquelme, Gastroenterology Department Pontificia Universidad Católica de Chile, Santiago, Chile

Presenter: Brenda Fuenzalida, Physiotherapy Service, Health Network UC-Christus, Santiago, Chile

Background: The educational environment (EE) has become relevant in the past decades due to its impact in learning process, social life and future professional work of the students. Our aim was to measure the perception of the EE among Physiotherapy undergraduate students at the Pontificia Universidad Católica de Chile (PUC).
Method: Mixed methodology was used. Quantitative component: Dundee Ready Educational Environment Measure (DREEM) questionnaire was applied to 1° to 4° year students. Postgraduate Hospital Educational Environment Measure (PHEEM) and Ambulatory Care Learning Educational Environment Measure (ACLEEM) were applied to 5° year students (clinical clerks). Qualitative component: based in two-open-questions in each instrument related to EE strengths and aspects to improve and focus group including 5° year students (clerkship).
Results: 334 students (83% of total universe) answered the questionnaires. The global mean of DREEM questionnaire was 135.74⍰19.15 revealing an EE "more positive than

negative". The major strength was the perception of the teachers' quality (73%) and the domain with lowest perception was the atmosphere (63%). Clerkship: PHEEM questionnaire was 105.55±20.19 (mean±SD) showing EE "more positive than negative, with room for improvement". The best evaluated domain was social support perception (69%) and worst evaluated was teaching perception (63%). ACLEEM questionnaire showed a mean of 152.87±16.71 revealing excellent EE perception. The best evaluated domain was clinical skills (86%) and the worst were protected time and clinical supervision, 62% each one.

Qualitative results gave specific information about basic science-profession relationship, homogenization of assessment criteria, expensive transfer between campi and students´ threatening by some tutors (clerkship). There were no differences in EE perception depending on student's sex.

Conclusion: EE measurements showed strengths and room for improvement depending on the different student curriculum stages allowing us to implement real actions on each step. Qualitative data complemented and enriched results with new topics like "professionalism", "curricula", "alumni profile" and "research".
Take-home message: A better EE will allow Faculty to form better Physiotherapist from professional and human point of view and this is fundamental for patient's care.

7HH17 (341)
Evaluation of the educational environment of a Singaporean Internal Medicine Residency program

Authors

Andrew Ming-Liang Ong, Singhealth Residency, Singapore
Warren Fong, Singhealth Residency, Singapore
Adrian Chan, Singhealth Residency, Singapore
Ghee-Chee Phua, Singhealth Residency, Singapore
Chee-Kian Tham, Singhealth Residency, Singapore

Presenter: Andrew Ming-Liang Ong, Singhealth, Singapore

Background: The educational environment has been shown to be positively associated with better learning within residency programs. The Postgraduate Hospital Education Environment Measure (PHEEM) is a reliable and validated measure for evaluating the educational environment amongst junior doctors. Poor educational environments have been shown to be linked to burnout and a study showed residents in Singapore have higher burnout rates than those reported in Western literature. Therefore, we aimed to determine the educational environment amongst internal medicine residents (IM) in Singapore to investigate possible areas for improvement.
Method: We applied PHEEM to measure the learning environment of Singaporean IM residents across 3 teaching hospitals within Singhealth. Residents' perception was compared between gender, level of training, years of working experience and posting hospital. Internal reliability was assessed using Cronbach's alpha coefficient
Results: 136/153 (88.9%) of IM residents completed the questionnaire (51% male, 31% R1/37% R2/ 32% R3). PHEEM showed high internal consistency with Cronbach's alpha of

0.946. The educational environment was deemed more positive than negative, with room for improvement (mean PHEEM 112.2 ± 16.7). No significant differences in total scores or subscales were detected between gender, level of training, years of work experience or posting hospital. Although mean PHEEM scores were good, several significant differences in responses to specific questions were found between groups, and these offer unique opportunities to intervene. Examples include: Females perceiving less opportunities to acquire practical procedures p=0.03, R3 more likely to perform inappropriate tasks than R1 p=0.009, R1 perceiving less access to educational programs compared to other residency levels p=0.01, R1 perceiving receiving less feedback than other residency levels p=0.01, doctors ≥ 5 years training perceiving less blaming culture compared to less experienced doctors p=0.002, Singapore General Hospital doctors receive more inappropriate calls, p=0.03). Singhealth IM residents generally have a positive perception of the educational environment. However, differing responses to specific questions between groups highlight areas that could be improved.

Conclusion: This study highlights areas within a Singaporean IM residency educational environment that are suboptimal. These deserve further qualitative evaluation, offering potential interventions to improve the educational environment and possible burnout.

7HH18 (1114)
Journeys in Change Management: Two Differing Medical Educational Experiences

Authors
Chris Skinner

Presenter: Chris Skinner, Medical School, Notre Dame University, Fremantle, Austria

Background: Change management in a medical curriculum can be considered as an oxymoron! The range of factors that exist are often complex ,culturally and historically problematic and the sheer ability to change at the individual, team and organisational levels can be highly problematic and personally daunting.
Through survey work of academic staff and preclinical year students, this work aims to develop a conceptual and useful way to consider and describe change in a medical curriculum.
Method: Based on student comment, together with academic staff interview and personal reflection , various key factors were identified for the process of successful change to take place. Both driving and resisting forces were considered. Two main change initiatives were investigated: Health and wellness and Ethics Integration. These two areas have been developed over the last three years at Notre Dame with varying results, and were chosen because they allowed for exploration of key change influences.
Results: Initial results suggest key individual, team and organisational factors need to be considered prior and during the change process. These include personal attributes, leadership and executive support, perceived relevance of course material, training provision for academic staff deliverers and the method of employed the change process itself.

Discussion & Conclusion: The complexity of change in a medical curriculum is worthy of major discussion and clarification. It is not feasible to simply have a good ideas but rather to understand the importance of the change process itself. The study survey initially points to key factors that support or hinder curricula change. Force field analysis and similar conceptual models can help in the identification of such factors. Importantly initial results provide a meaningful set of discussion points focusing on change in areas of health/wellness and ethics.

Take-home messages:
1. Involvement of key stakeholders including the executive is vital. Expertise of actual deliverers with appropriate resource provision is key to successful implementation.
2. Perceived course material relevance is central for actual student engagement.
3. A clear change model can guide and shape change effectiveness.

7HH19 (1593)
Unidimensionality, goodness-of-fit, and differential item function test of Korean version of Dundee Ready Education Environment Measure (DREEM) questionnaire

Authors
A Ra Cho, Department of Medical Education, College of Medicine, The Catholic University of Korea, Seoul, Korea; Institute of Medical Education, Hallym University College of Medicine, Chuncheon, Korea
Eun Young Lim, Division of Educational Evaluation, Korea Institute for Curriculum and Evaluation, Seoul, Korea
Kwi Hwa Park, Department of Medical Education, Gachon University College of Medicine, Incheon, Korea
Joo Hyun Park, Department of Medical Education, University of Ulsan College of Medicine, Seoul, Korea
Sun Huh, Department of Parasitology and Institute of Medical Education, Hallym University College of Medicine, Chuncheon, Korea

Presenter: A Ra Cho, College of Medicine, The Catholic University of Korea, Seoul, Korea

Background: Dundee Ready Education Environment Measure (DREEM) questionnaire is a tool to evaluating teaching and learning environment of educational institute by students. It consisted of 50 items of 5-point Likert scale including 5 categories developed in 1997. In 2013, survey with Korean version was done in 40 medical schools. It aims at evaluating pyschometric properties of the Korean version of DREEM questionnaire such as unidimensionality, goodness-of-fit, and differential item function by gender based on item response theory for more stable application of the measurement tool.
Method: A total of subject was 12,035. Out of them 9,096 students responded to survey. Out of them incomplete data that contained equal to or greater than 10 missing items were removed. Number of responses included in the analysis was 8,975. We tested unidimensionality of whole items and items of each 5 categories with POLYDIM. Goodness of fit and differential item function by gender

were tested with Winsteps where partial credit model was applied.

Results: P-value of unidimensionality test of whole 50 items was less than 0.0001.Those of 5 categories were more than 0.99. Infit means square of goodness of fit test of 50 items were all more than 0.5 and outfit means squares were all less than 2.0. At the test of each category, two items' outfit mean square value exceeded 2.0; however, the values were less than 2.01. There was no differential item by gender in the test of 50 items and each category.

Although unidimensionality of whole 50 items were rejected, that of each category was accepted. Goodness of fitness test results were all in acceptable range. Above psychometric properties of DREEM Korean version showed that it can be adopted to medical schools in Korea with concrete psychometric stability.

Conclusion: One thing we should consider is that survey itself is not unidimensional; therefore, the presentation and interpretation of simple total score should be cautious. The interpretation according to the result of each category is recommended.

7HH20 (2044)
Why we need mixed methods to explore the construct validity of scores from learning environment (LE) assessment tools: the UCEEM as a case-example

Authors
Pia Strand, Lund University, MedCUL, Lund, Sweden
Gudrun Edgren, Lund University, MedCUL, Lund, Sweden
Alexander Tejera, Lund University, MedCUL, Sweden
Christina Gummesson, Lund University, MedCUL, Sweden

Presenter: Pia Strand, Lund University, MedCUL, Lund, Sweden

Background: Reviews of tools for assessing LE's in medical education suggest that only a subset of validity evidence is utilized to explore the construct validity of scores. We applied a mixed methods (triangulation) design to examine the construct validity of scores from the Undergraduate Clinical Education Environment Measure (UCEEM).

Method: We conducted tests of internal structure of UCEEM-scores from clinical placements (at affiliated hospitals of a Swedish medical program) and analyzed data from focus groups and interviews with various stakeholders to examine response processes, the relations of scores to other variables (assessing similar domains), and the consequences of use.

Results: We found evidence based on internal structure, response process and relations to other variables supporting previous results of a high degree of construct validity of UCEEM-scores. However, qualitative data suggested that the stakeholders interpreted scores in different ways, and the consequences of use were sometimes inconsistent with what was intended.

Discussion & Conclusion: The UCEEM is currently used to measure clinical LE's in several medical education settings in Europe and Asia. Our study illustrates the need for continuous psychometric evaluation in the different settings with appropriate and varied methods as well as

contextual information when making inferences about the construct validity of scores.

The literature on LE assessment tools seldom presents or discusses evidence of response process, relations to other variables or consequences of use. Our study illustrates why mixed methods designs are necessary for examining construct validity of scores. More research is needed to understand how to turn scores into meaningful feedback.

Take-home message: A mixed methods study design is necessary for understanding response processes, the discourses around the feedback provided by LE assessment tools and the many facets of consequences of use. The extent to which measurement scores are valid is an epistemological issue as well as a matter of psychometric adequacy.

7HH21 (2046)
No such thing as a silly question: Overcoming the perception of humiliation in the learning environment for medical students. Does providing a safe environment for medical students to ask questions improve the learning environment?

Authors
Lakhbir Kaur, University of Central Lancashire, Preston, UK
Emma Hughes, University of Central Lancashire, Preston, UK
Habib Mohamed Bin Ismail, University of Central Lancashire, Preston, UK
Jesal Gohil, University of Central Lancashire, Preston, UK

Presenter: Lakhbir Kaur, University of Central Lancashire (UCLan), Preston, UK

Background: Teaching by humiliation is an approach that has been recognised since the 1980s and some doctors continue to use it to this day. This culture can create a negative learning environment with many studies suggesting that such an environment can result in adverse consequences on both health and confidence[1].

The aim of this study is to assess different methods of creating a safe learning environment whereby medical students can ask questions anonymously in order to reduce the possibility of humiliation and improve the student-teacher relationship. The objectives of this study are to assess first and second year medical students' confidence in asking questions during teaching sessions and their perception of the learning environment.

We will be conducting plan, do, study, action (PDSA) cycles.

Method: The first method we will use involves creating a box that students can post questions into anonymously. Each month we will run a panel-style meeting that medical students can attend, where their questions will be answered. The second method we will assess involves setting up a meeting with faculty members and using interactive technology to allow the medical students to ask anonymous questions and receive answers in real time Currently, there does not appear to be a validated tool available that can be used to assess medical student's self-confidence. Therefore, we have created a questionnaire using Bandura's 13 concepts of self-efficacy.

Results: Results are pending, ethical approval has been sought.

We hope that we can provide a platform through which students who normally do not feel confident asking questions in the learning environment can ask questions comfortably. We hope that this platform can be replicated across other medical schools.

Conclusion: A culture change is required in terms of the teaching approaches used with medical students, and effort should be made to create environments in which medical students feel they can safely ask questions.

Scott, K. M., Caldwell, P. H., Barnes, E. H., & Barrett, J. (2015). "Teaching by humiliation" and mistreatment of medical students in clinical rotations: a pilot study. The Medical Journal of Australia, 203(4), 185.

Student experiences in multilingual problem-based hybrid curriculum

Authors
Nina Peitsaro
Tiina Immonen

Presenter: Nina Peitsaro, University of Helsinki, Finland

Background: At University of Helsinki, the preclinical curriculum is offered in the two official languages of Finland, Finnish and Swedish. Upon graduation, all students are required to be able to practice in both languages. The enrollment to language tracks is through a substance-knowledge based entrance exam in the respective language. The language tracks differ only in the language of the problem-based learning (PBL) sessions; lectures are almost exclusively in Finnish and textbooks in English for both tracks. During the first-year course Genome and Development, students have an opportunity to volunteer for PBL in English.
Method: An electronic questionnaire was sent to all 202 course participants to explore their experiences of the multilingual curriculum on their substance learning and language skills, with reference to their language background.
Results: Annually 20-25% of the students apply for English-speaking PBL-groups. In 2017-18, 30 students volunteered for PBL in English, 34 studied in Swedish, and 138 in Finnish. Many students had bi- or multilingual background. The summative course exam was available in all three languages, and the students were allowed to answer in any of them. In the exam, 40% of students studying in English, 85% of students studying in Swedish and all students studying in Finnish used the respective language. The possibility to attend PBL-sessions in English was appreciated, reasons varying from wishes to brush up oral language skills to an opportunity to use one´s school language. Some students participating in PBL in Swedish, attending lectures in Finnish and reading course books in English experienced that the multilingual learning environment impaired their learning outcomes.
Discussion & Conclusion: Content and language integrated learning (CLIL) has widely been implemented in higher education (Cenoz, 2015. Language, Culture and Curriculum 28:8-24) and PBL has been seen as a meaningful way of acquiring language competencies (Jaleniauskiene, 2016. Procedia – Social and behavioral sciences 232:265-275). However, the increasing diversity in student´s language backgrounds should be acknowledged and the effect of multilingual learning environment to students´ learning monitored.
Take-home message: Multilingual approaches support students´ language skills, however, care must be taken not to complicate their content learning.

Yoichi Nakamura

Presenter: Naoki Hiroi, Center for Medical Education, Toho University, Tokyo, Japan

Background: Problem-based learning (PBL) has been widely acknowledged as an effective teaching method in medical education. Since the first introduction of PBL at our university in 2006, however, it has been a challenging task to use PBL to facilitate affordances of medical knowledge use and foster the critical skills required by physicians. The biggest difficulty we have found has been how to avoid PBL classes' becoming stereotyped or routine. This study was performed to investigate the effectiveness of the use of simulated patients (SPs) in PBL in this sense and in general.
Method: In January 2016, we conducted a clinical reasoning PBL tutorial with SP or without SP as part of regular classes for medical school students. All student experienced PBL both with and without SPs. Feedback of student was collected twice by questionnaire (once after each PBL), using closed questions and interviews. For the statistical analysis, a pairwise comparison (Wilcoxon signed-rank test) was performed using IBM SPSS Statistics version 22.
Results: On comparing the evaluations of PBL with and without SP, we found that the average of the student's evaluation was higher for the setting without SP and there was no statistically significant difference in the satisfaction derived from the PBL tutorials. However, the reasons for deriving satisfaction were different.
Conclusion: A feeling of tension in PBL with SP was cited as the reason for deriving satisfaction, and it appeared that the participation of SP led to a reduction of student's demotivation. Depending on the purpose of the PBL, it was speculated that SP participation could be a one of methods of PBL program practice. PBL with SPs seems to have potential as a one of useful methods to reduction of student's.

Dispelling some common misconceptions of PBL facilitation at a Graduate Entry Medical School

Authors
Diane O Doherty
Helena Mc Keague
Sarah Harney
Gerard Browne
Deirdre Mc Grath

Presenter: Diane O Doherty, Graduate Entry Medical School, University of Limerick, Ireland

Background: The integrated curriculum for years 1 and 2 at the Graduate Entry Medical School at the University of Limerick is delivered though problem-based learning (PBL). This study investigated the experiences of PBL tutors and our findings address several common misconceptions that exist regarding PBL facilitation, including: That facilitating PBL requires little input or effort from the tutor. That PBL tutors are required to be content experts.
Method: A mixed method study was completed with tutors based at the Graduate Entry Medical School at the University of Limerick (n=33). Tutors took two online surveys with an 89% response rate. Two follow-up focus groups took place with 13 participants. A descriptive quantitative analysis and thematic analysis was completed.
Results: Facilitating PBL was associated with considerable effort and input from experienced tutors. Survey results show that tutors spent more than >120 minutes preparing for each case and that a majority reported having to offer 'some' or 'quite a bit' of input to help students to generate the relevant learning objectives. This effort was associated with an overall 'positive' or 'very positive' attitude by 93% of tutors. Facilitating PBL was rewarded by a beneficial effect on clinical practice (77%). Supportive qualitative discussions deepened our understanding of the role of a PBL tutor.
Tutors reported that their input is needed to maintain good group dynamics, ensure successful collaboration of the group and that the students meet the required learning objectives for each case. The majority of tutors reported that facilitating PBL in the basic sciences had a positive effect on their day-to-day clinical practice which included improving their listening and communication skills, reflection and revision of basic sciences aiding clinical reasoning. The results of this study will inform practices and procedures with regard to training and support to enhance the experience of PBL for tutors and students.
Conclusion: Facilitating PBL is an active and demanding role, even for medically-qualified, content-expert tutors. However, the effort required is rewarded by an enjoyable, positive experience and the benefits that tutoring in the basic sciences can bring to clinical practice.

5-step PBL tutor training program - a practical faculty development experience to share

Authors
Ling-Yu Yang
William J. Huang

Presenter: Ling-Yu Yang, Department of Pediatrics, School of Medicine, National Yang-Ming University, Taipei Veterans General Hospital, Taipei, Taiwan

Background: Problem-based learning (PBL) has been widely accommodated as a learning format in curriculum. The tutors may not be content experts of the cases but they are required to be familiar with the PBL tutoring skills. Regarding a comprehensive training for new tutors, a basic tutor workshop training may not be enough.
Method: We have built up a 5-step PBL tutor training program and every new PBL tutor has to work through the 5-step process, including (1) attending the basic 1-day PBL workshop, (2) co-tutor training for two cases, (3) attending half day advanced PBL workshop, (4) tutoring under direct observation by senior tutors (5) formal independent tutor.
Results: In the past ten years, we have successfully trained 157 new PBL tutors. Ninety-one percent of them were quite satisfied with the 5-step training program. Eighty-five percent of them felt confident in their tutoring skill. And 88 % got good feedbacks (4.3/5 in Likert scale in average) from their students.
Most PBL tutor trainings are designed for one-day or two-day workshop. Continuous step-by-step training format is not widely applied in every institution. The customized guidance, experiences sharing, direct observation and immediate feedback from the senior tutors are all important in transmitting tutoring skills to the new tutors. 5-step PBL tutor training program is proved to be an effective model for training new PBL tutors. The trainee tutors' and PBL students' response are good. The training model makes the new tutors competent and confident in PBL tutorial and they are more engaged in PBL teaching after the program.
Conclusion: A 5-step PBL training program is a quality assuring and comprehensive model for continuous faculty development. The faculty feels confident and gets good feedback from peers and students after the 5-step training process. It can be introduced as a practical model for new schools to implement PBL in the curriculum.

Problem based learning (PBL) tutors' perceptions of factors affecting student engagement with PBL

Authors
Diane O'Doherty, UL, Limerick, Ireland
Helena McKeague, UL, Limerick, Ireland
Sarah Harney, UL, Limerick, Ireland
Gerard Browne, UCL, Preston, UK
Deirdre McGrath, UL, Limerick, Ireland

Presenter: Helena McKeague, University of Limerick, Ireland

Background: The integrated curriculum for years 1 and 2 at the Graduate Entry Medical School (GEMS) at the University of Limerick (UL) delivered though problem-based learning (PBL). This study investigated the experiences of PBL tutors. Several issues influencing student engagement in PBL were identified including the use of mobile device technology, unauthorised access to learning objectives and PBL cases, and how engagement can vary with different milestones of the academic year and between Years 1 and 2 of the course.
Method: A mixed method study was completed with PBL tutors based in GEMS, UL (n=33). Tutors took two online surveys with an overall 89% response rate. Two follow-up focus group discussions took place with 13 participants in total. A descriptive quantitative analysis and a thematic analysis was completed.
Results: One of the most serious factors negatively affecting student engagement with PBL identified was some students' unauthorised access to the cases and learning objectives in advance. Tutors discussed the different milestones in the academic year that influence students' engagement with the PBL process including the mid-semester changeover between groups and tutors and the pre-exam periods. Differences in the experiences between facilitating first and second year groups were noted. Year 1 tutors reported considerably more positive experiences with their groups than year 2 tutors, (50% versus 27.% had very positive experiences) greater discussion of cases and greater satisfaction with group dynamics. Tutors reported that banning the use of mobile electronic devices in PBL had improved student engagement.
One of the novel findings identified by this study was the issue of students' prior access to PBL cases and learning objectives and its influence on student engagement. Different times of the academic year affected attention and attendance. Banning the use of mobile electronic devices improved engagement. This study identified that there were differences in engagement between first and second year groups.
Conclusion: It is important that tutors and faculty recognise and address factors influencing engagement with PBL, group dynamics and participation. These factors may introduce variance in research studies on PBL.

Course observation to facilitate skill development for inter-professional problem-based learning (PBL) tutors

Authors
Mong-Wei Lin
Ai-Tzu Li
Jeng-Yi Shieh
Pei-Jen Lou
Fen-Yu Tseng
Chiun Hsu

Presenter: Mong-Wei Lin, National Taiwan University College of Medicine, Taipei, Taiwan

Background: Inter-professional PBL was designed to encourage inter-disciplinary communication and learning as early as possible. PBL tutors with different training backgrounds need a coordinated training program to facilitate professional development. This pilot study, based on community of inquiry, sought to use peer course observation as a coordinated platform for inter-professional PBL tutors to enhance tutoring practice.
Method: Fourteen PBL tutors from Departments of Medicine (DM), Pharmacy (DP), and Nursing (DN) volunteered to select at least 1 session of scenario discussion from DM PBL courses, facilitated by senior DM tutors, in the second (humanity/society), third (anatomy/physiology), or fourth (pathology/pharmacology) school years to observe. Tutors' observations and feedback were collected by a semi-structured questionnaire.
Results: Most tutors agreed that course observation provided them a rich opportunity to learn from peers. They were able to reflect upon their own tutoring and obtained new insights in how to facilitate group dynamics, employ cognitive strategies and provide structured feedback during scenario discussion. Content experts were considered critical, especially by DM and DP tutors, in scenario design and facilitation of the students' learning process. As more and more students used social media before scenario discussion to organize their prior knowledge and discussion, tutors may take a more active role in participating in these media to observe the students' self-directed learning process.
Conclusion: PBL tutors should be considered as active learners in the observation process. Explicit learning goals for the observing tutors may enhance the effectiveness of observation. More interactions before and after the scenario discussion between the observing and the observed tutors are needed for better understanding of how individual tutorial groups functioned. Tutors should be encouraged to observe PBL courses at different DM school years to appreciate the students' progress in self-directed learning.
Take-home message: Training of inter-professional PBL tutors should be designed at team and organizational levels to enhance cohesiveness among tutors from different disciplines.

PBL in primary care: Is it feasible?

Authors
Gustavo Salata Romão, UNAERP, Ribeirao Preto, Brazil
Eduardo Saab Marchiori, UNAERP, Ribeirao Preto, Brazil
Luis Rafael da Silva Miyazaki, UNAERP, Ribeirao Preto, Brazil
Débora Cristina Modesto Barbosa, UNAERP, Ribeirao Preto, Brazil
Lucelio Bernardes Couto, UNAERP, Ribeirao Preto, Brazil
Reinaldo Bulgarelli Bestetti, UNAERP, Ribeirao Preto, Brazil

Presenter: Gustavo Romao, UNAERP (University of Ribeirao Preto), Ribeirao Peto, Brazil

Background: When compared to traditional methodology, Pbl presents several advantages and promotes acquisitions of essential medical abilities such as team working, critical reasoning, analysis, research and problem solving. Although this methodology is widely used for cognitive learning in class sessions, there is little experience about its use in settings of clinical practice.
Method: In January, 2017, Pbl was firstly implemented in primary care settings from the first to the fourth year of the medical course in University of Ribeirao Preto. Activities are developed according to pbl steps in small groups of 8 to 10 students supervised by a trained facilitator. A report from a real patient attended in primary care drives the peer discussion. At the end of the first meeting, knowledge gaps are identified and learning goals are defined. After a two weeks period of self-directed study, the small group meet again to finalize the discussion and to stablish a care plan to the patient. Following the second meeting the care plan will be used by students in patient care under the supervision of a general practitioner. In December 2017 the medical students' perceptions about this activity was evaluated through the Dundee Ready Educational Environment Measure (DREEM) in a 0 to 4 Likert scale.
Results: 374 students answered the questionnaire. The total DREEM score was 122,6 and the average scores for activity, atmosphere, teachers, academic and social self-perception subscales were 25,55; 31,34; 19,7; 30,64 and 15,89, respectively. According to their perceptions the activity is student-centred (2,53), emphasizes long-term learning (2,38), develops problem-solving skills (2,54) and relevant competences to the healthcare career (2,80). Teachers are knowledgeable (2,45), provide constructive criticism (2,75), feedback (2,72) and adopt a patient-centred approach to consulting (3,27). The internal consistency (Cronbach´s alpha) was 0,92.
Conclusion: PBL In primary care promotes contextualized learning and can enhance acquisition of medical competencies in settings of clinical practice. Our results demonstrated that the overall students` perceptions of this educational environment was more positive than negative.
Take-home message: PBL is feasible, satisfactory and promotes acquisitions of essential medical abilities when applied in primary care settings

7I8 (236)
The impact of problem-based learning on internship doctors' performance: a cross sectional study

Authors
Amandha Boy Timor Randita, Faculty of Medicine Universitas Sebelas Maret, Surakarta, Indonesia
Amalia Ifanasari, Faculty of Medicine Universitas Sebelas Maret, Surakarta, Indonesia
Arsita Eka Prasetyawati, Faculty of Medicine Universitas Sebelas Maret, Surakarta, Indonesia

Presenter: Tonang Dwi Ardyanto, Faculty of Medicine Universitas Sebelas Maret, Surakarta, Indonesia

Background: Internship program is a mandatory requirement for physician who recently graduated in Indonesia. The aims were to practice and perform on their first contact with community as medical doctor, and continuing professional development on health services. The performance of doctor can be affected by several factors; one of them was experiential learning process. Therefore, this study aims to determine the correlation of previous learning process with problem-based learning (PBL) implementation with the perception of physician performance.
Method: Fifty-eight respondents were internship doctor who graduated from Faculty of Medicine, Universitas Sebelas Maret, selected by consequtive sampling method that has been adjusted with inclusion and exclusion criterions. Respondents were filled out two questionnaires, perception on PBL implementation (Patria, 2015) and internship doctor (ID) performance by Ministry of Research, Technology and Higher Education. The data were analyzed by Pearson correlation and multivariate regression test.
Results: There was a significant positive correlation between perception of PBL Implementation and the perception of ID performance (p=0,000; r=0,785). From multivariate linear regression test, there are three domains that showed great impact on ID performance; patient problems (p=0,000), self-directed learning (p=0,004), and student-centered learning/SCL (p=0,040).
PBL was a learning method which creating as self-directed learner, and has good clinical reasoning. The impact of PBL could be seen at the time of the doctor's first contact with the community or patient. Doctor-oriented patient problems have been demonstrated in the internship program, by always being a self-learning person and clinical problem-oriented. SCL's perceptions support the professional development process. Thus, the clinical reasoning of the physicians has been well as he trained during the previous PBL education.
Conclusion: Medical education continues to grow dynamically, and then the PBL method is also continuously evaluated to the continuing professional development phase. This study can be used as a reference that PBL process can give positive influence to train students in SCL, SDL and patient problem orientation. However, this study needs to be continued by comparing other learning methods, for example outcome-based, social re-constructivism, essential learning, or others.

Evaluating 2nd year graduate students' expectations and feedback in a problem based learning setting to improve student experience

Authors
Alexandrina Roman, Bath Academy - University of Bristol, Bristol, UK
Ben Marshall, University Hospital Southampton, Southampton, UK

Presenter: Alexandrina Roman, Bath Academy - University of Bristol, UK

Background: At the University of Southampton, the graduate entry program (GEP) includes problem based learning (PBL) group sessions with a facilitator. Barrows (1985) proposed that the main role of the PBL facilitator was to keep learning on target using non-directive stimuli, quizzical language and comments[1].
Method: The aim of this study was to establish students' expectations of facilitators and the detailed feedback facilitators received to help improve student experience. Two questionnaires utilising a mixture of open and dichotomous questions was created. The first questionnaire regarding student expectations of facilitators was distributed to students in their first session and the second feedback questionnaire was completed at the end of the term.
For the 2nd semester in 2017, a total of 40 2nd year GEP students were asked to complete the questionnaire. 40 students complete the introductory questionnaire and 31/40 (77%) completed the feedback form.
The open questions of expectations were recorded and the most common was for the facilitator to keep the discussion on track/ stimulating appropriate conversation 34% followed by adequate time keeping (19%).
All facilitators had taken on board students' expectations.
Results: With respects to positive comments, 21% of responses included students' appreciation of facilitators sharing pre-existing knowledge and a further 21% valued the positive learning environment created and the encourage natures of the facilitators. 61% (19/31) commented on areas for improvements and these included: better time keeping, more resources, more involvement from the facilitator in the games and further integration of the group.
Conclusion: Students have a range of expectations from facilitators, and feel the facilitators met all their expectations. Students have suggested areas for improvements that will help to improve their learning experience. Further work will trial how these will be implemented and improve their learning experience.
Take-home message: Students' expectations do not always match up with the role of the facilitator. Student feedback includes positive aspects but also of areas for development that can be used to guide improve student experience.

Do Prior Experiences of Teamwork Influence Students' Case Based Learning Experience?

Authors
Sarah Aruwajoye, University of Bristol, Bristol, UK
Simrath Kenth, University of Bristol, Bristol, UK
Oliver Catton, University of Bristol, Bristol, UK
James Berman, University of Bristol, Bristol, UK
Jason Hartas, University of Bristol, Bristol, UK
Simon Atkinson, University of Bristol, Bristol, UK

Presenter: Sarah Aruwajoye, University of Bristol, UK

Background: Whilst the majority of students appear to evaluate their experiences of Case Based Learning (CBL) positively, some students are less enthusiastic about this method of working and learning with others. Although students may choose a medical school based on a perception of their learning preferences and the kind of curriculum delivery that medical school offers, medical schools record little about each student's prior experiences of teamwork and will not normally take this into account in planning individualised learning. Despite this, successful teamwork is frequently assessed at interview and prescribed as a desirable characteristic by the Medical Schools Council. This student led study allows students to honestly and anonymously discuss their experiences of teamwork prior to university and how they relate to their participation in CBL.
Method: Year 1 Medicine students at the University of Bristol were randomly selected. Using constructivist grounded theory, different teamwork experiences of students both prior to and at university were explored. We conducted 10 interviews which were audiotaped and transcribed. Thematic analysis was performed through the theoretical framework of social cognitive personality theory, including the work of Bandura, in order to interpret the way in which students had modified their own expectations and behaviour based upon their prior experiences.
Results: Honestly reported negative prior experiences of teamwork are unlikely to arise in a high stakes admissions interview context, and a wide range of different experiences was reported, including those drawn from participation in sports and hobbies as well as academic and workplace contexts. There were several negative experiences which subjects were able to relate to their later studies at university, whilst positive teamwork also appeared to influence later enjoyment of group work.
Conclusion: Whilst teamwork is a valued quality of entrants to medical school, there appear to be difficulties in validly assessing prior success at working in teams, as well as an effective way of applying the knowledge gained about an individual's prior experiences to their future learning.
Take-home message: Prior experiences of teamwork can affect the way students work in groups at university.

7II11 (2827)
What Makes a Fantastic Case Based Learning Group?

Authors

Alex Ellison, University of Bristol, Bristol, UK
Rosie Dunbar, University of Bristol, Bristol, UK
Felicity Greenfield, University of Bristol, Bristol, UK
Anna Beak, University of Bristol, Bristol, UK
Ben Holland, University of Bristol, Bristol, UK
Simon Atkinson, University of Bristol, Bristol, UK

Presenter: Anna Beak, University of Bristol, UK

Background: The way a Case Based Learning (CBL) group is able to work together, sharing ideas and the discoveries of learning is crucial to the success of this method. The University of Bristol adopted a CBL approach in 2017, and this student-led project aims to explore the experience of CBL from a student perspective. We realised that formal evaluations were hampered in their ability to capture a true reflection of positive experiences of CBL as a student, and wanted to analyse why some groups worked so well together and enjoyed the process of learning so much. Group dynamics and the formation of group and professional identities are complex and subjective: we wanted to use grounded theory to explore qualitative experience in order to analyse what makes some groups such positive environments for learning.
Method: Using feedback from Y1 Medicine group members and facilitators we identified groups which learned and worked well together. Using constructivist grounded theory approach, we explored the different experiences of students in those groups, identifying key inputs, conversations and relationships which had contributed to the group's success. We conducted 1 focus group discussion and 10 interviews. Discussions were audiotaped and transcribed. Thematic analysis was performed through the theoretical framework of theorists such as Lewin, Schutz, Tuckman and Hackmann.
Results: Initial analysis of results highlights the ways in which developing interpersonal relationships and the survival of Tuckman's 'storming' phase can lead to a successful group dynamic. Other results indicate the importance of a developing sense of group purpose and goals, as well as the capacity of a group to offer each other support and encouragement, and activities which have facilitated trust to develop between group members.
Conclusion: Although diverse personalities can sometimes make group work a challenging process, there appear to be common features of successful groups which institutions could learn from and foster more deliberately, preparing students better for productive teamwork in their later careers.
Take-home message: Institutions using small group work should consider how students can best be prepared for their new roles as happy and successful group learners.

Uncover it, students would learn leadership from Team-Based Learning (TBL): The effect of guided reflection and feedback

Authors

Maryam Alizadeh
Azim Mirzazadeh
Dean X. Parmelee
Elizabeth Peyton
Leila Janani
Gholamreza Hassanzadeh
Ahmad Rouhi

Presenter: Dean X. Parmelee

Background: Little is known about best practices for teaching and learning leadership through Team-Based learning™ (TBLTM) with medical students. We hypothesized that guided reflection and feedback would improve shared leadership and shared leadership capacity, and enhance team decision quality in TBL teams. We used the Kolb experiential learning theory as the theoretical framework.
Method: The study was conducted at Tehran University of Medical Sciences. Three TBL sessions with 206 students (39 teams) participated in the study. Using a quasi-experimental design, one batch received guided reflection and feedback on their team leadership processes (n¼20 teams) and the other received only TBL (n¼19 teams). Observers measured shared leadership using a checklist. Shared leadership capacity was measured using a questionnaire. Scores on a team application exercise were used to assess quality of team decisions.
Results: Evidence did not support our first hypothesis that reflection and feedback enhance shared leadership in TBL teams. Percentages of teams displaying shared leadership did not differ between intervention and control groups in sessions 1 (p¼0.6), 2 (p¼1) or 3 (p¼1). The results did not support the second hypothesis. We found no difference in quality of decision making between the intervention and control groups for sessions 1 (p¼0.77), 2 (p¼0.23), or 3 (p¼0.07). The third hypothesis that the reflection and feedback would have an effect on shared leadership capacity was supported (T¼ 8.55, p>0.001 adjusted on baseline; T¼ 8.55, p>0.001 adjusted on gender).
We found that reflection and feedback improved shared leadership capacity but not shared leadership behaviors or team decision quality.
Conclusion: Adding structured reflection and feedback on leadership improves students awareness of leadership and identity to become team leaders and willingness to share leadership and collaborate as followers. Medical educators who apply TBL, should provide guided exercise in reflection and feedback so that students may better understand the benefits of working in teams as preparation for their future roles as leaders and members of health care teams.

Express Team-Based Learning (eTBL): Educational Effects of a Modified TBL Approach

Authors
Susanne Skjervold Smeby, Norwegian University of Science and Technology (NTNU), Trondheim, Norway
Børge Lillebo, Norwegian University of Science and Technology (NTNU), Trondheim, Norway
Tobias Schmidt Slørdahl, Norwegian University of Science and Technology (NTNU), Trondheim, Norway
Erik Magnus Berntsen, Norwegian University of Science and Technology (NTNU), Trondheim, Norway

Presenter: Susanne Skjervold Smeby, Norwegian University of Science and Technology (NTNU), Trondheim, Norway

Background: Team-based learning (TBL) is a student-centred instructional strategy that promotes active learning. After piloting TBL in our medical programme, student evaluations were positive but TBL was perceived as time-consuming. The individual and team readiness assurance tests (RAT) take up a significant amount of class time, but were rarely highlighted by students as helpful. By omitting the RAT, we designed a modified and time-efficient TBL method we have called Express TBL (eTBL). In this study, we examined what effects eTBL had on student learning as assessed in a summative examination.
Method: Neuroradiology for third year medical students has previously been taught in two 1.5 hour didactic lectures in CT and MRI diagnostics. Using a cross-over study design, the students were divided into two groups. One group undertook teaching in CT diagnostics by a 1.5 hour didactic lecture and MR diagnostics by a 45-minute eTBL session. The other group undertook teaching in CT diagnostics by a 45-minute eTBL session and MR diagnostics by a 1.5 hour didactic lecture. To compare effectiveness of the two teaching methods, we compared results on the neuroradiology part of the end-of-year written examination.
Results: The group which received teaching using eTBL in MRI diagnostics scored slightly higher on MRI questions in the examination (mean 2.34 vs. 2.24, of a total of 4 points), but the difference was not significant (p=0.415). The group which received teaching using eTBL in CT-diagnostics scored slightly higher on CT-questions (mean 3.69 vs. 3.58, of a total of 4 points), but the difference was not significant (p=0.182). The results suggest that teaching method (lecture vs. eTBL) had little impact on student performance as measured on the end-of-year examinations.
Conclusion: eTBL reduced in-class teaching time from 1.5 hours to 45 minutes, but did not lead to inferior student performance. By omitting the RAT, content learning was moved to out-of-class preparation, leaving in-class time to be spent on application exercises. Shorter sessions may ease implementation of TBL in the curriculum and allow for more frequent sessions.

Surveying learning outcomes of students with different learning style by combining flipped classroom and team based learning

Authors
Jyh-Gang Hsieh, Buddhist Tzu Chi General Hospital, Hualien, Taiwan
Tse-Chyang Wang, Buddhist Tzu Chi General Hospital, Hualien, Taiwan
Ying-Wei Wang, Buddhist Tzu Chi General Hospital, Hualien, Taiwan

Presenter: Jyh-Gang Hsieh, Buddhist Tzu Chi General Hospital, Hualien, Taiwan

Background: The development of flipped classroom and TBL provide many advantage in modern medical education. According to Kolb's argument, effective learning entails the possession of four different abilities and reflective observation. Kolb also identify four basic learning styles: converger, diverger, assimilator, and accommodator. This study tried to analysis the learning effect of different learning style after exposure in modern digital learning environment and new teaching method.
Method: We combined team-based learning with flipped classroom as a new model to teach the curriculum of Family Medicine for 4th grades medical students and Pediatric Nursing for 3th grades nursing students at a medical university in Eastern Taiwan from Feb. through Jun. 2016. Kolb's Learning Style Inventory was used to exam students' learning styles before curriculum. Questionnaire and deep interview were completed to after curriculum to survey their learning experiences of the new teaching method.
Results: There are 56 medical students and 231 nursing students included. The distribution of learning style in medical students is similar, but most nursing students are Diverger (40.3%), followed by Accommodator (26.0%)、Assimilator (25.1%) and Converger (8.7%). Students have higher satisfaction for learning material in films than in reading. The proportion of pre-class self-learning are accordance with the attitude of the materials, self-efficacy, peer and teacher norms, and learning atmosphere at classroom(p<.05). Students with different learning styles have no significantly different learning outcomes with different types of self-learning materials.
Conclusion: The model of combination of team-based learning and flipped classroom can indeed transfer boring educational lessons into practical and interesting lessons. It can enhance students' interest in learning, cultivating students' self-learning ability, communication skills, problem-solving skills and team corporation ability. It can also help students to apply their learning skills to the future clinical care ability.
Take-home message: TBL integrated different types of self-learning, classmate-interactive learning, using inductive and reasoning ability to solve the practical problems in one educational approach. So it can be applied to any kinds of learning styles of students and help them to achieve better learning outcomes.

Is Team-based learning an effective method of acquiring paediatric clinical skills in an undergraduate medical program?

Authors
Maha Desouki, College of Medicine, Qatar University, Doha, Qatar
Ayad Al-Moslih, College of Medicine, Qatar University, Doha, Qatar
Alison Carr, College of Medicine, Qatar University, Doha, Qatar

Presenter: Maha Desouki, College of Medicine, Qatar University, Doha, Qatar

Background: Individual learning has always been the usual method of learning in medical education. Team-based learning (TBL) was introduced a decade ago in medical schools, yet there are few reports of the use of TBL for learning clinical skills. We describe the effectiveness of team-based learning (TBL) in learning skills of measuring and interpreting child's growth and developmental milestones and how it benefited our first year medical students.
Method: 86 Qatar University year 2 medical students participated in a team-based learning activity. After providing relevant resources for self-directed learning prior to the session on measuring child growth parameters, students completed an individual readiness assurance test (IRAT). This was followed by a team readiness assurance test (TRAT) which involved intra-group and inter-group discussions. The session was concluded with student feedback being requested.
Results: The mean scores obtained in the IRAT and TRAT were 44% and 85% respectively for the 10 item test. Over 2 academic years feedback was completed by 15/ 46 students of cohort 1 and 33/ 73 students of cohort 2. Students' overall satisfaction with the session was 83.3 % in Cohort 1 and 91.3% in Cohort 2. Ninety eight % of the students rated the teaching method as good or excellent. Free text comments reported the session to be interactive and well received.
Scores improved after participating in the team-based discussion. This improvement supports TBL as reinforcing students' learning. Cumulative students' qualitative and quantitative feedback suggests team-based learning helps students learn skills in measuring and interpreting child's growth parameters and developmental milestones. Learning these clinical skills in a team-based learning session was enjoyable to students.
Conclusion: TBL enhances learning of skills in measuring and interpreting child's growth parameters and developmental milestones. Introducing TBL strategy at this early stage in the undergraduate medical programme for clinical skills acquisition adds benefit to the students' education. Combining individual based learning with the TBL strategy provides a forum to allow students to reinforce their learning.

Validation of a Peer Assessment Method for Team-based Learning in a Medical School Histology Course

Authors
Lukas Richards, Mayo Clinic, Rochester, Minnesota, USA
John Ratelle, Mayo Clinic, Rochester, Minnesota, USA
Jay Mandrekar, Mayo Clinic, Rochester, Minnesota, USA
Nirusha Lachman, Mayo Clinic, Rochester, Minnesota, USA
Wojciech Pawlina, Mayo Clinic, Rochester, Minnesota, USA
Christopher Wittich, Mayo Clinic, Rochester, Minnesota, USA

Presenter: Lukas Richards, Mayo Clinic, Rochester, Minnesota, USA

Background: Team-based learning (TBL) is an instructional method that promotes active learning and has equivalent or improved academic outcomes compared to traditional techniques. The ability to evaluate peers has been identified as a core competency of medical graduates. Currently, peer assessments of TBL are holistic and lack behavioral criterion. Therefore, we aimed to develop and validate the content and internal structure of a new, criterion-based TBL peer assessment method.
Method: We conducted a cross-sectional study of all Mayo Clinic Medical Students (N=52) during the first year Histology course. Histology is a 6-week course that utilizes a TBL approach (13 teams of four students). Short briefing sessions are followed by laboratory time (teams explore virtual microscopy assignments). Daily formative feedback based on clinical applications of histology is delivered using an audience response system. To assess TBL, we developed a new criterion based, 12-item peer evaluation instrument (Team Education Assessment Measure; TEAM). Content was derived from extensive review of the literature on team learning and peer evaluation and iterative revision by the co-investigators. Items were created to assess perceptions of teamwork concepts including preparation, contribution, interest, respect, and professionalism. All students completed the TEAM-12 instrument on their three team members at the end of the course.
Results: 52 medical students completed a total of 156 TEAM peer assessments. Factor analysis revealed a two-factor survey (7 items - Team Engagement, 4 items - Professional Behavior). One item loaded ambiguously and was dropped. Cronbach's alpha were excellent: 0.81 (Team Engagement), 0.83 (Professional Behavior), and 0.83 (11 items overall). Item mean scores (standard deviation) ranged from 4.69 (0.49) to 4.90 (0.32) on a 5-point scale.
Conclusion: We report a criterion-based peer assessment of TBL. Content validity was derived from the published understanding of team learning and iterative revision. Internal structure validity is supported by a two-dimensional model including engagement and professionalism. Future study should determine if associations exist between TEAM scores and student variables including assessments of knowledge and professionalism.
Take-home message: We report a new, criterion-based peer assessment of team-based learning with strong content and internal structure validity.

Integration of basic-clinical sciences: an experience of Team-Based Learning (TBL) vs. traditional method among undergraduate dental students

Authors
A Pakdaman
K Jahangard

Presenter: Afsaneh Pakdaman, Tehran University of Medical Sciences, Tehran, Iran

Background: In most dental schools, basic science course is delivered in the first two years, hence the relevance of it with clinical sciences remains unclear for undergraduate students. A range of educational methods was used to improve the learning capacity of undergraduate dental students and enhance the application of basic sciences in the clinical decision making.
The purpose of the present study was to evaluate the effectiveness of Team-Based Learning (TBL) sessions compared with lectures on dental students learning during the basic science course.
Method: A non-randomized controlled study was conducted in Tehran, Iran. A series on TBL sessions was designed to deliver Anatomy, Microbiology and Dental Material subjects. 237 students attended TBL sessions in addition to lectures in the school of dentistry, Tehran University of Medical Sciences. In the comparison group, 114 students attended traditional lecture course in the school of dentistry, Shahid Beheshti University of Medical Sciences. Students' feedback on their satisfaction on TBL sessions was collected using a 21-item questionnaire. For evaluating the change of knowledge between groups a pre- and post-test MCQ test was conducted. Data was analyzed using repeated measure (ANOVA) test in SPSS version 24.0.
Results: A significant difference between pre- and post test scores was found between lecture-based and team-based learning in Anatomy ($p = 0.047$) and Dental material ($p = 0.00$) courses. But enhancement of final score in Microbiology was not significant ($p = 0.26$). Students generally enjoyed and appreciated the TBL sessions and reported that the TBL classes were very useful in clarifying the application of the topics.
Conclusion: Application of TBL in the basic science course was successful in improvement of students' learning.

Team-Based Learning in physical examination skills: a pilot study

Authors
Jiska Patiwael, VU Medical Centre, School of Medical Sciences, Amsterdam, Netherlands
Anjeleen Douma, VU Medical Centre, School of Medical Sciences, Amsterdam, Netherlands
Franciska Koens, VU Medical Centre, School of Medical Sciences, Amsterdam, Netherlands
Hester Daelmans, VU Medical Centre, School of Medical Sciences, Amsterdam, Netherlands

Presenter: Jiska Patiwael, VU Medical Centre, School of Medical Sciences, Amsterdam, Netherlands

Background: Physical examination skills training for medical students consists of two parts: a clinical skills teacher first provides students with background knowledge on how to use these skills and on normal and possible pathological findings, students then practise physical examination skills. Students seem to adopt a relatively passive attitude during the first part of the training. In his dissertation, Duvivier suggests that a student based approach might be more suitable for teaching physical examination skills because it actively engages students. Team-Based Learning (TBL) is such an approach. A new teaching format, based on TBL principles, has been designed for the first part of the training. To investigate how students value this new teaching format, a pilot study was performed.
Method: The new teaching format consisted of 4 steps: 1. preparation at home; 2. individual readiness assurance test (iRAT); 3. team readiness assurance test (tRAT); 4. plenary team discussion. Students complete the training by practising physical examination skills.
All students at VUmc School of Medical Sciences, Amsterdam, Netherlands, who participated in this training at the start of their Master's program, were asked to provide written feedback by means of a tip and a top for each step of the training.
Data were analysed using open coding. Consensus on themes was achieved through iterative discussion amongst three members of the research team. Data were collected and analysed until sufficiency was reached.
Results: A total of 115 feedback forms were returned (100%) during the period June-September 2017. The main themes that were valued positively by students were: interaction, thinking for themselves, competition, testing prior knowledge and preparation. Tips concerned time management, completeness and structured overview of background material.
Using TBL principles in training physical examination skills is valued positively by students. They report that they prepare better and feel more actively engaged in the training. Future research will focus on how teachers value this training.
Conclusion: We conclude that TBL seems to actively engage students when training physical examination skills. TBL principles seem to stimulate active learning, prior to and during training physical examination skills.

Team-based learning strategy in Biochemistry: perceptions and attitudes of faculty and first-year medical students

Authors
Namrata Chhabra
Sahiba Kukreja
Sahil Chhabra
Sarah Chhabra

Presenter: Namrata Chhabra, SSR Medical College, Belle Rive, Mauritius, Curepipe, Mauritius

Background: Team-Based Learning (TBL) strategy has been widely adapted by medical schools all over the world, but the reports regarding the perceptions and the attitudes of faculty and undergraduate medical students towards TBL approach have been conflicting. The study aimed to introduce TBL strategy in curriculum of Biochemistry after evaluating its effectiveness through perceptions and attitudes of faculty and first- year medical students.

Method: 150 students of first professional M.B.B.S and five faculty members participated in the study. Team based learning was introduced as a teaching strategy to the First -year Medical students to cover the topics of "Study of Vitamins". Four TBL sessions were conducted to cover these topics. TBL sessions were held twice a month and each session lasted for 2 hours. The questionnaire-based feedback was collected from the students after the second and fourth TBL sessions to compare the differences in the perceptions and attitudes of the students regrading learning styles, behaviors, impact of team building and professional development. Faculty feedback based on questionnaire, focus group discussions, reflections and in-depth interviews was collected after the fourth TBL session.

Results: Majority of the students expressed satisfaction with team approach and reported improvement in the academic scores, learning styles, and development of problem solving, interpersonal and professional skills. The faculty, however, recommended a modified TBL approach to benefit all sections of the students for the overall success of this intervention.

Conclusion: TBL is an effective technique to enable the students to master the core concepts and develop professional and critical thinking skills, however, for the first -year medical students a modified TBL approach might be more appropriate for the effective outcomes.

Take-home message: Team-based learning is an effective teaching learning strategy to promote increased engagement within the classroom, appreciation of value of teams by students, acquisition of knowledge, and development of professional and critical thinking skills. A modified Team-based approach as an instructional technique might be the appropriate approach for the benefit of first-year medical students.

Peer observation: a quality improvement tool for clinical teaching

Authors
Pick Fong Chee, Tan Tock Seng Hospital, Singapore.
Wanzhen Zhao, Tan Tock Seng Hospital, Singapore

Presenter: Pick Fong Chee, Tan Tock Seng Hospital, Singapore

Background: Peer observation of clinical teaching was initiated to improve the quality of teaching among the clinical instructors (CIs). It involved peers providing feedback using a standardised tool and giving verbal and written narrative comments. The teaching activities included skill supervision and assessment, small group teaching and case discussion sessions.
Method: Twenty-nine peer observation sessions were completed over an eight-month period. All written narrative feedback provided by peers and comments documented by the CIs in the standardised tool were reviewed and analysed.
Results: All peer observers provided feedback specific to the teaching activities. 100% of the narrative feedback identified the strengths of the CIs and 41% highlighted areas for improvements with suggestions. All the comments documented by clinical instructors post-observation demonstrated reflective practice. Three CIs expressed stress being observed by their peers.
All CIs have received formal training in providing constructive feedback to students. The findings have demonstrated application of knowledge and transfer of learning during peer observations. The constructive feedback provided is a source of motivation and allowed reflection for improvement despite reported stress. The findings show that peer observation is useful as a quality improvement tool for clinical teaching. Constructive feedback specific to actual observed behaviours facilitates reflective practice for improvement in teaching and enhances professional as well as personal growth.
Conclusion: Peer observation among the CIs is strongly encouraged but not mandatory. More work needs to be done to promote this activity in view of its benefits. Barriers such as perceived stress being observed by peers, not wanting to be scrutinised and time constraints need to be addressed.

Experiential Learning through Clinical Observerships in Premedical Education: Benefits and Challenges

Authors
Rachid Bendriss, Weill Cornell Medicine, Doha, Qatar
Marco Ameduri, Weill Cornell Medicine, Doha, Qatar

Presenter: Rachid Bendriss, Weill Cornell Medicine, Doha, Qatar

Background: Adopting ontological and epistemological assumptions of an interpretivist paradigm, this study aims to explore the benefits and challenges of an experiential learning program as reported by participants. According to Mack (2010), "ontological assumptions of interpretivism are that social reality is seen by multiple people [who] interpret events differently leaving multiple perspectives of an incident" (p.8). Sometimes referred to as constructivism, interpretivism's epistemological assumptions claim that "knowledge is gained through personal experience" (p.8). When premedical students at Weill Cornell Medical-Qatar (WCM-Q) expressed their interest in participating in clinical experience early in their education, the premedical education division implemented the Clinical Observership Program (COP) partnering with the two largest hospitals in Qatar (HMC and Sidra). Although COP was open to all foundation and premedical students, it was optional and did not affect their marks.
Method: Students shadowed a practicing physician for a week-long period to expose them to the healthcare system of Qatar, learn about the daily practice of a medical professional, and get familiar with the various medical specialties. COP aimed to help participants in their career exploration and to experience challenges that physicians face on a daily basis. To avoid conflict with their busy schedule of classes, participants could choose only one session from three offered during the winter break. To receive a certificate of completion, students were asked to turn in an attendance sign-in sheet, write a reflection paper, and complete a survey.
Results: Out of 29 students who participated, five were foundation, 14 were first-year, and 10 were second-year premedical students. They observed physicians in the following specialities: internal medicine, radiology, pediatrics, general surgery, emergency medicine, and psychiatry. Using a mixed-methods approach (reflection papers, surveys, focus groups), the study revealed that students benefited more from learning about doctor-patient interactions than techniques and tools used in medicine. Students reported learning humanistic, soft skills like professionalism, collaboration, compassion, empathy, kindness, patience, and time-management, among others. Challenges included system chaos and communication setbacks, thereby necessitating program enhancement.
Conclusion: Early exposure to clinical experience engages premedical students beyond the classroom and strengthens their commitment to medicine.

Can Emergency Response Team (ERT) training by paramedic students improve basic life support quality in undergraduate students and university staff in Mahidol university?

Authors

Jaruwan Pruktayanunt, Emergency Medicine, Ramathibodi Hospital, Mahidol University, Thailand
Suwimon Moonsuwa, Emergency Medicine, Ramathibodi Hospital, Mahidol University, Thailand
Chaiyaporn Yuksen, Emergency Medicine, Ramathibodi Hospital, Mahidol University, Thailand
Yuwares Sittichanbuncha,Emergency Medicine,Ramathibodi Hospital, Mahidol University, Thailand

Presenter: Jaruwan Pruktayanunt, Ramathibodi Hospital, Bangkok, Thailand

Background: Sudden cardiac arrest is one of the leading causes of death in Thailand. Once cardiac arrest has occurred, early recognition is critical to enable rapid activation of the EMS and prompt initiation of bystander CPR. In Mahidol university, there are no CPR training for undergraduate student and university staff. Emergency Response Team(ERT) training aimed to train undergraduate student and university staff in Mahidol university to know how to do basic lift support and used of automatic electrical defibrillator(AED). This study aim to evaluate the effectiveness of Emergency Response Team(ERT) training in undergraduate student and university staff in Mahidol university by paramedic student.

Method: We conducted a 1-day ERT training, consist of lectures and workshop. Before and after the course, participants had been tested for BLS knowledge and confident in BLS by using the standard 20 items MCQ exam. Data were analyzed by using the Wilcoxon Sign Ranks Test.

Results: There were 1000 participants enroll to Emergency Response Team(ERT) training, male 415(41.5%), mean age were 29.5±15.2 years old. For BLS knowledge, the Pre-course evaluation was 12.3±3.5, and the score of Post-course evaluation was 17.5±2.2 and p-value < 0.05. For BLS confident of chest compression and use of automatic electrical defibrillator (AED), totally 5 points, the Pre-course evaluation was 1.5±0.5 , and the score of Post-course evaluation was 4.5±0.4 and p-value < 0.05

Conclusion: Emergency Response Team (ERT) training by paramedic student can improve competency of undergraduate student and university staff to BLS performance significantly in both MCQ and confident score. BLS training in undergraduate student can do by paramedic student.

Team Based Practice (TBP) - the new team based learning system of clinical clerkship at the surgical department - suitable for shy Japanese students

Authors

Soichi Murakami, Center for Medical Education, Dept. of Gastroenterological surgery, Hokkaido University, Japan
Yo Kurashima, Clinical Simulation Center, Dept. of Gastroenterological surgery, Hokkaido University, Japan
Toshiaki Shichinohe, Dept. of Gastroenterological surgery, Hokkaido University, Japan
Junji Otaki, Center for Medical Education, Hokkaido University, Japan
Satoshi Hirano, Dept. of Gastroenterological surgery, Hokkaido University, Japan

Presenter: Soichi Murakami, Soichi Murakami, Center for Medical Education, Dept. of Gastroenterological surgery, Hokkaido University, Sapporo, Japan

Background: It seems to be more difficult for Japanese medical students than the other countries' students to raise their aggressiveness and autonomy during the bedside training. Japanese nature is shy and they don't have sufficient training to obtain autonomy in the primary and secondary education. And they didn't have enough training for getting autonomy even in the early grade of medical university. When they start the clinical clerkship, they get realized the necessity to train by themselves, and bewildered. They can receive the good training if there are good instructors in the ward, however there are very few good instructors in the very busy surgical wards. To solve this problem, we developed the TBP for the students who come to our department for the first time, to make their training meaningful. TBP is a team-based learning system, consists of 4 domains - history taking, anatomical assessment (surgical indication), physiological assessment (tolerability), and operation - which are considered as essential evaluation and planning before surgery, and students can learn and act according to TBP. It is an excellent system to make the surgical clinical clerkship useful, and to foster the students' autonomy and activeness. We herein introduce the TBP and indicate the effectiveness of it.

Method: The survey was conducted to 104 students who came to our ward as a trainee of clinical clerkship for the first time, and answers obtained from 101 students who agreed to the survey were used for analysis. The parts of the answer data of the open-ended questions were classified by similarity, and achievements were divided into three categories - cognitive (C), affective (A) and psychomotor (P) domains - following Bloom's taxonomy. Training evaluations are also carried out.

Results: Top three Achievements were as follows: knowledge, understanding, and diagnosis of disease: 22 (C), knowledge of assessment of tolerability: 16 (C: 15, A: 1), knowledge and understanding of operation: 16 (C: 15, A: 1). Training evaluations revealed that 67/93 (72%) students considered TBP as a favorable system for surgical clerkship.

Conclusion: TBP is a useful system for clinical clerkship in gastroenterological department.

7JJ5 (43)

Assessing shared decision-making skills of 3rd year medical students

Authors

Lucille M.L. Ong, Academic Medical Centre, Amsterdam, Netherlands

Presenter: Lucille Ong, Academic Medical Centre, department of Medical Psychology, Amsterdam, Netherlands

Background: Around 70% of patients wants to be involved in their care. Shared decision-making (SDM) meets this need. Furthermore, it has a positive effect on patient: satisfaction, participation and adherence to treatment. Also, it diminishes decisional conflict in patients, as well as overtreatment.

Method: We teach our 3rd year medical students a 5-phase SDM model. The five phases are:
1. Start 2. Informing 3. Deliberation 4. Preference. 5. Decision. During two intensive classes with only 6 students, all students practice this SDM model with (trained) simulation patients. At the end of their third year, assessment of SDM skills takes place.
Assessment procedure: video recordings of students conducting SDM consultations with simulation patients are made and uploaded in students' portfolio. Furthermore, students provide written reflections on self-selected events in their consultation. Students both provide and receive peer-feedback (reflective portfolio assignment). Also, the recorded SDM consultations are assessed by trained teachers. Summative assessments are categorized as: below expectations (4-5), meets expectations (6-7-8), and above expectations (9-10).

Results: Results of this year's assessment are described below. A semi-structured rating list was developed to assess SDM skills of 360 medical students. The average assessment was 7,0 (out of 10). 24 students (7%) failed, whereas 22 students (6%) performed above expectations. The majority of students (87%) performed at 'meets expectations' level. All students fulfilled their reflective portfolio assignment.
SDM skills are essential for good (clinical) practice. When practised effectively, SDM can determine the treatment option which best fits patients' needs and expectations. Practising SDM however, is a challenge for most clinicians. Ideally, SDM training should be implemented in their medical education. In our hospital therefore,we offer a 4 hour SDM training for residents, medical specialists, and nurses.

Conclusion: Our 5-phase SDM model can be used to teach shared decision making skills. Students manage well with this model. We also conclude that shared decision making skills can be assessed using a semi-structured rating list. Shared decision-making skills can be taught and assessed.

7JJ6 (37)

Interviewing clinicians as a group assignment is an effective method to facilitate transformative learning in teaching Health Economics in Thailand

Authors

Win Techakehakij

Presenter: Win Techakehakij, Lampang Hospital, Lampang, Thailand

Background: Owing to the costs associated with rising healthcare demands, interest in health economics (HE) teaching in medical education has increased to promote cost consciousness and efficiency in clinical practice. However, provision of knowledge alone may not be enough to enable medical students to utilize HE theories to solve real-life economic-related medical problems. Thus, an HE group assignment (GA) was designed to be used alongside the knowledge-based study guide.

Method: Groups of 4-5 fifth-year students were assigned to interview medical specialists about their experiences in making clinical decisions related to efficiency or financial issues. The students used a list of 8 questions during the interview as a guide to extract relevant information concerning the influence of economic-related issues on decision making. These questions explore: 1) problems and context; 2) patients and choices of interest; 3) stakeholders; 4) information used in making clinical decisions; 5) other relevant information; 6) unknown information; 7) decision analysis relating to perspectives and insurances; and 8) students' own decisions. Results from the interviews were presented in class for discussion with classmates and the facilitator. After classes, students were asked to complete a questionnaire to reveal their perceptions of the GA activity.

Results: With a 100% response from 62 students, results demonstrated that: 88.7% stated that the GA helped them understand how to utilize the principles of HE in clinical practice; 88.7% reported that the GA emphasizes what they still don't understand about the topics; 82.3% agreed that the GA stimulated their interest in the effect of economic issues on clinical decision making; and 88.7% indicated that they would integrate the principles of HE into their clinical practice after doing the GA.

Conclusion: Using the GA appears to enhance students' understanding in HE and encourages them to apply the principles of HE in making clinical decisions. The GA also highlights what elements of HE they don't know and should learn more about. The GA is thus a promising tool to promote transformative learning in HE.

Take-home message: The GA proves to be an effective tool to promote transformative learning in HE.

7JJ7 (629)
Employing role-play and peer review to improve the attitudes toward patients and the communication skills of clerkship students during student-oriented hospital ward rounds

Authors
Hajime Kasai
Shoichi Ito
Hiroshi Tajima
Mayumi Asahina
Ikuko Sakai
Koichiro Tatsumi

Presenter: Hajime Kasai, Health Professional Development Center, Chiba University Hospital, Chiba, Japan

Background: Clinical clerkship (CC) is an essential experience for medical students to obtain clinical skills. Evaluation of and feedback on student performance during CC is usually completed by attending physicians. While role-play and peer review are used in training and evaluating communication skills in preclinical education, they are less likely to be used during CC. Thus, we evaluated the effect of role-play and peer review during student-oriented ward rounds during CC.
Method: Clerkship students conducted medical interviews with, and performed physical examinations on, their patients, which were reviewed by five peer students. Peer students observed the performance of the clerkship students while role-playing as senior physicians or patients' families. Peer students playing the roles of senior physicians were required to check (1) the medical interviews, (2) physical examinations, and (3) psychosocial aspects of the patients. The peer reviewers then provided feedback to the clerkship students. The performance of the clerkship student was then evaluated based on a four-point Likert scale. The performance was compared to a round of the hospital ward by a medical student with an attending physician, and a student-oriented round of the hospital ward. After receiving feedback, the students responded to questionnaires about the rounds.
Results: Forty-seven students completed the round, and the duration of each round was 39.3±7.7 minutes. The attitude and communication abilities of the students towards their patients showed significant improvement from before the round (2.7±0.5 vs. 3.4±0.8, p<0.001 and 2.8±0.5 vs. 3.5±0.5, p=0.001, respectively). There was also improvement in performance of medical interviews and physical examinations. Additionally, the round recognized the importance of multilateral viewpoints in patient care and improved self-directed learning.
Conclusion: Combining role-play and peer review with hospital rounds in CC improves the clerkship students' attitude towards patients and their communication performance. The student-oriented rounds also promoted the students' awareness of the importance of multilateral viewpoints in patient care. The study could encourage both comprehensive patient care considering the patient's bio-psycho-social aspects and an increase in learning motivation.
Take-home message: Role-play and peer review during student-oriented hospital ward rounds can improve the attitude and communication performance of clerkship students.

7JJ8 (2448)
A Critical Review of Bedside Teaching in Medical Education

Authors
Abhilash Balakrishnan

Presenter: Abhilash Balakrishnan, Singapore General Hospital, Singapore

Background: About fifty years ago, more than 75% of skills such as taking a good focused history and a thorough physical examination, was taught by the patient's bedside. Today, this traditional modality constitutes less than 25% of clinical teaching. The aim of this study is firstly to identify the reasons for the decline in bedside teaching, secondly to both review perceptions of the principal stakeholders and reinforce the known strengths of bedside teaching and finally to suggest strategies to overcome barriers to this form of teaching and re-introduce it back into medical education.
Method: The author reviewed the published literature from 1960-2017, using seven databases to understand the reasons for the decline, what the principal stakeholders (patients, learners and teachers) felt, and the known advantages of bedside teaching. The search was confined to full text, peer-reviewed journal articles in English while books, dissertations, and grey literature were excluded.
Results: There are several suggested causes for the decline, including teacher's lack of time, unfamiliarity with this method of teaching, learner's duty hour restrictions, their comfort with learning in a class room and greater use of technology and perceptions that patients may find it demeaning with the changing role of hospitals today. Surprisingly, evidence to the contrary was found. More than 90% of learners and teachers thought bedside teaching was an effective way to teach clinical skills. The author suggest methods to optimize this unique teaching tool and how to overcome the existing barriers to revive its use to the pre-eminent position it once held . This will help to produce better trained physicians to meet the future challenges of an ever-changing healthcare landscape.With the current push towards cost-effective medicine, it seems common sense to train our young doctors to develop sound clinical skills that will enable them to order only appropriate laboratory and imaging investigations
Conclusion: By championing bedside teaching, the author is not attempting to promote essential clinical skills as being superior to technology. Both are essential for best outcomes for our patients and deemed to be synergistic and not in competition.

7JJ9 (1925)
Medical students' perception of discharge planning

Authors
Yaw-Wen Chang
Fang-Yih Liaw
Ya-Ling Chang

Presenter: Chiung-Hsi Tien, NDMC (National Defense Medical Center), TSGH (Tri-service General Hospital), Taipei, Taiwan

Background: Continuity of care is facilitated by a physician-led, team-based approach to health care. Effective discharge planning is crucial to care continuity. The study aimed to explore the medical students' experience and perception while participating discharge planning (DP) in the family medicine clerkship.
Method: The DP course was delivered to 5th-year medical students during their core family medicine clerkship in this hospital. It included one-hour briefing, three-hour DP bedside visit, and one-hour group discussion. Students were supervised by family physicians and DP case managers. Every student had to complete reflective writing at the end of family medicine clerkship. The format was adopted Terry Borton's three stem questions: "What," "So What," and "Now what." A thematic qualitative analysis was used to explore the students' experiences and perceptions.
Results: The analysis identified four major themes in the context of continuity of care and it contained several domains of holistic care. (1) Teamwork is necessary: Students knew the team members, addressed their bridging roles and acknowledged the importance of teamwork. (2) The role of a doctor: Students realized the doctor's responsibility of providing continuous care. They began to think the service they could provide during the internship. (3) The patient needs following discharge from hospital: Students identified patient needs and recognized the importance of DP. They realized that patients might encounter new problems following discharge. (4) The help for patients/families: Students understand the role of case managers and their works of providing information for patients. They recognized that effective DP supported holistic care and doctor-patient relationships.
Conclusion: In the students' reflective writings, we could see many positive feedbacks to this DP course. This course allowed medical students to understand the works of DP and the operation of DP team, identify the patient needs after discharge, and recognize the supportive function of DP to the continuity of care.
Take-home message: We provide a useful learning experience for medical students on the topic of "Medical students' perception of discharge planning " by using modified Terry Borton's three stem questions.

7JJ10 (1960)
What did students learn during bedside teaching?

Authors
Chao-Huei Chen
Wei-Ting Hung

Presenter: Chao-Huei Chen, Taichung Veterans General Hospital, Taichung, Taiwan

Background: Bedside teaching is a common workplace teaching and learning method. Medical knowledge, patient care, communication skills are the main education themes. As we encountered more complex patients, the knowledge and skills of interprofessional collaborative care(IPC), quality improvement(QI) and long-term care also become essential. We used an electric recording system to document and analyze the learning themes during bedside teaching.
Method: An electronic recording system for bedside teaching was developed in a teaching medical center. After bedside teaching section, medical students could check the learning themes on the recording system and write down their reflection. We collected and analyzed the data from the system from January 2017 to December 2017.
Results: Total 1270 recordings were collected. Five hundred seventy-five recordings were from internal medicine, 270 from surgery, 98 from obstetric-gynecology, 116 from pediatric department and 211 from other departments.
The learning themes included: 90% on physical care of the patients (including history taking(HxT), physical examination(PE), interpretation of laboratory test(LabT), differentiate diagnosis(DDx) and drug prescription etc); 59.2% communication skill; 38.2% shared decision making, 25.6% medical ethics, 33.8% IPC, 33.3% QI, 40.8% social need of the patient and family (including home care, discharge planning, family and culture issue).
The pediatric teachers taught more on HxT, PE, LabT (83.0%). Internal medicine teachers emphasize not only the above items but also the DDx(40.3% and 37.6% sepeately). Internal medicine doctors also taught more on communication skills, IPC, QI and social need compared with other disciplines.
Conclusion: With this system, we could remind the clinical teachers to teach not only the physical care, but also IPC, communication skills, social issue and QI. The students could also use it to reflect what could be learned during bedside teaching. We are developing a mobile app for a more instant feedback to both teachers and students.
Take-home message: An electronic recording system could help teachers and students reflect on the education themes during bedside teachings.

7JJ11 (2070)
Witnessing death does not necessarily relieve death discomfort: analysis of the relationship between religiosity and thanatophobia in medical undergraduate students

Authors
Lucas A. Ribeiro, FACERES Medical School, São José do RIo Preto, Brazil
Thomas E.P. de Almeida, FACERES Medical School, São José do RIo Preto, Brazil
Luiza M. G. Bormio, FACERES Medical School, São José do RIo Preto, Brazil
Felipe C. Pacca, FACERES Medical School, São José do RIo Preto, Brazil
Patricia S. Fucuta, FACERES Medical School, São José do RIo Preto, Brazil
Patricia M. Cury, FACERES Medical School, São José do RIo Preto, Brazil

Presenter: Patricia Cury, FACERES Medical School, São José do Rio Preto, Brazil

Background: It is known that very few issues related to death and religiosity/spirituality are discussed during medical graduation. Learning to cope with death is still a problem and students facing terminally ill patients feel uncomfortable with these questions.

Method: After Ethics Committee approval, two validated questionnaires were applied to undergraduate medical students from one Brazilian medical school: The Duke University Religion Index (DUREL) and the Thanatophobia Scale. Nonparametric statistical analysis was performed.

Results: From 542 students, 332 (61.2%) answered the questionnaire. 90.4% agreed that it is important to address the theme of death and religiosity. 90.1% believed in God. 68.5% of Internship program students had witnessed death, and 52.5% had discomfort dealing with terminal patients. On the other hand, in the first year students, 31.3% of them answered feeling uneasy with terminal patients, although only 34.6% had already seen someone dying (P=0.031). It was observed that those who had contact with death were less likely to work with terminal patients (p = 0.033). High levels of intrinsic religiosity (23.8% of the students) associates with less discomfort when dealing with terminal patients compared to those with low intrinsic religiosity (p = 0.032).

Most of the students have some kind of religiosity and consider important to approach the theme of death and religiosity during the course. Higher rates of intrinsic religiosity seems to protect from thanatophobia, and religiosity seems to have a more powerful impact than the own experience of facing death.

Conclusion: Even with greater contact with death, first year students feel more uncomfortable with terminally ill patients than beginner students, reinforcing the importance of an appropriate approach to the topic throughout the course. Using empathy as a toll to use to deal with these questions could be a strategy.

7JJ12 (1691)
Evaluation of Training Scenario Validity: Analysis of Debriefing from the Viewpoint of Competence

Authors

Chika Hirota, Jichi Medical University, Tochigi, Japan
Michiko Kameda, Jichi Medical University, Tochigi, Japan

Presenter: Yoshitaka Maeda, Jichi Medical University, Tochigi, Japan

Background: In Japan, scenario-based simulated training prepares novice nurses for multitasking experiences. Scenarios are based on clinical events so that novices can experience the 7 competencies of nurses' multitasking, including risk management of turnover accidents, communication, and prioritization of tasks. In our scenarios, novice nurses experience all competencies through 3 patients: replacing drip devices, toileting assistance, and treating sudden coughing. Although training success depends on the scenario, the method of evaluating scenario validity is not clear. We propose a method to evaluate scenario validity based on the content of trainees' debriefing immediately after training.

Method: A total of 121 trainees were divided into groups of 6 to 8 and they discussed "their own behaviors in each patient's treatment" and "improvement points" immediately after training. This content was written on a white board for each patient. Next, the trainees sorted the contents of each discussion from the viewpoint of competence. The number of discussions per competence were compiled to verify the comprehensiveness of the scenario.

Results: An average of 30.7 items were discussed by the groups, and all the competencies were discussed by all groups, which confirmed the comprehensiveness of the scenario. This method also clarifies that competencies emphasized by the trainees varies depending on patients. For example, many discussions on risk management of turnover accidents have been conducted in debriefing for patients requiring toileting assistance.

Conclusion: This method confirmed the comprehensiveness of the scenario and clarifies which competence the trainee was exercising for a specific patient. Thus, this method clarifies the relevance between scenario and competence, as well as a new kind of performance evaluation criteria of trainees, such as "In this scenario, it is desirable for trainees to be aware of this competence at this timing."

Take-home message: Training scenarios can be validated by measuring how trainees sort out their debriefing contents from the viewpoint of competence. Given that this method makes it possible to clarify the relevance between the scenario and the competence, it can be implemented as a new performance evaluation criteria for trainees.

Teaching Medical Students the Elements of an Effective Patient Handover during the Clinical Years

Authors
Meenakshy Aiyer, University of Illinois College of Medicine, Peoria, Illinois, USA
Allison Ownby, McGovern Medical School, Houston, Texas, USA
Gregory Trimble, Virginia Common Wealth University School of Medicine, USA
Adam Garber, Virginia CommonWealth University School of Medicine, USA

Presenter: Meenakshy Aiyer, University of Illinois College of Medicine, Peoria, USA

Background: Giving or receiving a patient handover to patient care responsibility is one of the 13 Entrustable Professional Activities (EPAs) for Entering Residency defined by the Association of American Medical Colleges.
Method: Three schools collaborated in the development, implementation and assessment of the patient handovers during the M3 clerkship and M4 subinternships (SI).
At McGovern Medical School, the Obstetrics-Gynecology clerkship created a video module for the students to review and practice observing handovers. After watching the video, students are observed at least once during the clerkship performing a patient handover. During surgery clerkship, students are broken into small groups and given a patient scenario to practice the handover elements to other group members. Students are required to observe two patient handovers in the clinical setting during clerkship.
At Virginia Commonwealth University, students are introduced to handoffs using an active learning exercise focusing on rationalizing and prioritizing information important to convey to oncoming provider. Students are then introduced to the handoff framework and practice writing a written handoff using a case-based scenario. During the SI orientation, students are trained to use I-PASS through a mix of didactic, video example, and case-based scenarios in which they apply knowledge and skills to provide a verbal handoff with directed feedback. Students must have 2 observed direct observations on the wards using a standardized checklist template.
At University of Illinois, students are introduced to handoffs during clerkship orientation using active in class learning exercise. Students apply their recently acquired knowledge and skills to review a video handover using a standardized handover template. Students are expected to observe at least two handovers in each of their 6 core clerkships. The students then practice verbal handover to the residents where they provide and receive feedback on verbal handover on a standardized patient scenario.
Conclusion: Creating a common approach to patient handovers is challenging. Distilling the process into key elements helps the learner and faculty recognize what needs to be included and recognize handover is a multifactorial process.

Take-home message: It is feasible to implement and assess a patient handover tool across multiple institutions while still responding to institutional needs.

7JJ15 (658)
Relationships Matter: Enhancing Trust and Trainee Development with a (Simple) Clerkship Curriculum Reform

Authors
J.Kevin Dorsey, SIU School of Medicine, Springfield, USA
Austin Beason, SIU School of Medicine, Springfield, USA
Steven Verhulst, SIU School of Medicine, Springfield, USA

Presenter: J. Kevin Dorsey, Southern Illinois University School of Medicine, Springfield, USA

Background: The relationship between a supervisor and a trainee engaged in the performance of a clinical task is an essential component of medical education. Our school implemented a curriculum change for third-year clerkships that involved one-on-one pairing of faculty and students in addition to decreasing lectures and other activities that removed students from the clinical setting and fragmented the clerkship experience. Exploring the nature of this relationship in the context of this reform offered a natural experiment to understand its impact on trust and trainee development.
Method: The number of procedures performed by students in the traditional versus revised obstetrics clerkship served as a proxy for trust and meaningful participation. Survey comments from 48 students and a focus group of ten faculty members were qualitatively analyzed using a grounded theory approach to reveal themes influencing student participation in clinical work. Subsequently, eleven "rich picture" discussions with students and faculty were analyzed to identify themes of trust development and the nature of the supervisor-trainee relationship.
Results: Students in the single-mentor (revised) clerkship model delivered twice as many babies and performed twice as many pelvic exams compared to the traditional fragmented clerkship.
While student participation was found to be peripherally influenced by contextual factors (busy service, patient preference, competition with other learners) and characteristics specific to the student (engagement, being proactive, growth over time) and faculty (propensity to teach); both students and faculty recognized the nature of the relationship as being central to all entrustment decisions.
Discussions of "rich pictures" drawn by students and faculty revealed that good relationships are reciprocal and are influenced by: early alignment of goals, candid feedback based on frequent observation, and the engagement and positive attitude of both parties.
Discussion & Conclusion: Revision of clerkships to enhance supervisor continuity promoted mutual trust and resulted in more meaningful student participation. If "progress is made at the speed of trust" then optimizing the supervisor-trainee relationship is likely to accelerate student development towards competence.

Take-home message: A simple curriculum reform that improves the nature of the supervisor-trainee relationship can result in a more meaningful clerkship experience.

7JJ16 (3137)
The Clinical Teaching Practicum: An Important Learning Methodology for Instructional Development

Authors
Daniel Panisko, Department of Medicine, University of Toronto, Canada
Umberin Najeeb, Department of Medicine, University of Toronto, Canada

Presenter: Daniel Panisko, Department of Medicine, University of Toronto, Canada

Background: A Clinical Teaching Practicum [CTP] is a useful teaching and learning instrument in a longitudinal faculty development program. Each participant is required to present 20 minutes of their clinical teaching, followed by 20 minutes of class discussion and feedback, on 3 different occasions over the 2 year duration of our program. Each presentation must demonstrate a different teaching modality (large group, seminar, "chalk talk", bedside, simulation, procedural, podcast, ambulatory care, or one-on-one teaching, etc.). Presenters are encouraged to demonstrate areas of their teaching that "work well", in addition to areas where they encounter difficulty or feel that their teaching is sub-optimal. The other program participants provide feedback and useful insights to problem solve with their colleague. This helps participants to develop their peer review and teaching-coach skills. Participants can also ask questions on medical expert and clinical content of the presentation.
Method: We catalogued the content topics, teaching and learning methodologies, innovation instances, nature and content of feedback, and participant satisfaction from CTP presentations in our program over 2 years (n=27 participants).
Results: A variety of content topics and teaching methodologies were encountered across the cohort years. Feedback was provided on visual presentation, choice of teaching and learning style, interactivity techniques, and strategic choices of teaching methodology. Some participants chose to apply elements of a clinical teaching framework to structure their analysis. The sessions accrued a high degree of participant satisfaction. The consideration of the medical clinical content in the presentations amplified the relevance of the exercises to the participants and contributed to their utility.
Conclusion: CTP's provide a high degree of classical face validity to an instructional development program. They illustrate the triumphs and dilemmas of teaching in the moment and facilitate class participant bonding and cohesion, as the group works together toward teaching solutions. A wide spectrum of teaching styles and a large opportunity for teaching analysis and peer coaching are provided by these sessions.
Take-home message: Clinical Teaching Practica can be strongly considered as a valuable component of an instructional development program.

7JJ17 (2314)
Development and validity evaluation of learning self-efficacy scale toward clinical skills

Authors
Chien-Chih Wu, Taipei Medical University Hospital, Taipei, Taiwan
Yi-No Kang, Taipei Medical University Hospital, Taipei, Taiwan
Chun-Hao Chang, Columbia University, New York, USA

Presenter: Chien-Chih Wu, Taipei Medical University Hospital, Taipei, Taiwan

Background: The purpose of this study was to develop a universal scale of learning self-efficacy regarding to clinical skills (SESoL-CS). Learning self-efficacy that is based on self-efficacy reflects how confident a learner is about learning capacities in specific subjects within particular learning contexts. Relevant findings of learning self-efficacy in medical education were often confined to either a particular domain or skill, meaning they were not generalizable to the understanding of medical students' learning self-efficacy at a broader scope. Moreover, no comprehensive scale is applicable to measure medical students' overall learning self-efficacy in clinical practices.
Method: Two steps for the SESoL-CS development and verification were content validity index (CVI) and item analysis. The SESoL-CS that was based on Bloom's taxonomy of educational objectives was verified by expert penal survey for content validity evaluation in the first step. Eight experts from healthcare, medical education, and education evaluated the SESOL-CS by using a 4-point Likert scale. In the second step, 235 medical students filled the SESoL-CS pilot version that was passed expert panel survey by using a 4-point Likert scale also.
Results: The SESoL-CS consisted of 12 questions after expert consensus that showing no difference among professionals ($\chi2$ were between 0.000 and 6.857) in the first step. The second step, 12 items performed good discriminatory validity (t-values were between 11.719 and 24.175), good convergent validity (correlation coefficients were between .640 and .780), and good reliability (Cronbach's $\alpha > .90$). Moreover, no difference was observed between male and female (t = -0.049; 95% CI, -.115 to .109).
Conclusion: The SESOL-CS is the first verified scale of learning self-efficacy for clinical skills. The scale differs from previous tools in other studies [20-22] that measuring medical students' confidence on specific clinical skills or performance. Those scales cannot be easily transferred to different skillset. Although the SESOL-CS is a verified universal scale, further examination in relevant educational settings is needed.
Take-home message: The SESoL-CS is a short, well-constructed, and verified scale that can serve as a generic assessment tool when measuring medical students' learning self-efficacy toward clinical skills.

Senior Leadership Needs Assessment

Authors
Mia E. Lang
Cynthia J. Munro
Victor Shewchuk
Louanne Keenan

Presenter: Mia Lang, University of Alberta, Edmonton, Canada

Background: To design an effective leadership training program for senior leaders of the Faculty of Medicine & Dentistry, University of Alberta, Canada, an institutional ethnography study was done via: 1) a validation study of Lieff's et al. 2013 Academic Medicine study of Department Chairs, 2) group discussion, and 3) 1:1 interviews.
Method: Senior leaders were sent an on-line survey (open and closed questions) based on the 5 main themes and 19 subthemes identified by Lieff et al. A group meeting of these senior leaders (n=60) was held with discussion around leadership support needs, followed by one-on-one interviews with twelve senior leaders.
Results: 25 of 60 respondents to the survey had high levels of agreement with all sub themes, the highest rated sub-themes were strategic development, mentorship, cultivation of leaders, conflict management, understanding the system (rules), and engagement with/of others. Group discussion themes and 1:1 interviews validated these survey themes further.
The needs of senior leaders at our Faculty were similar to the five main themes identified in Lieff's 2013 study: 1) Network of support; 2) Infrastructure; 3) Interpersonal skills; 4) Cultural and structural awareness, and; 5) Ability to influence. New senior leaders expressed vulnerability in institutional knowledge and strategic vision. Listening to senior leaders in a variety of settings (on-line survey, group discussion, focused interviews) enabled a rich understanding of senior leadership needs that will better inform how a senior leadership support program is designed.
Conclusion: Senior leaders need support with skills in conflict management, human resource issues and strategic development. Mentorship and a community of leaders may help to meet some of these needs, especially for leaders new in their role.

A driver for individual and organizational change - The AO Foundation (AO) Leader Education Program (LEP)

Authors
Teija Lund
Chitra Subramaniam
Tatjana Topalovic
Miriam Uhlmann

Presenter: Tatjana Topalovic, AO Foundation, Basel, Switzerland

Background: Based on the need for leaders within the organization to develop, the AO (a medically guided, not-for-profit organization led by an international group of surgeons specialized in treatment of trauma and disorders of the musculoskeletal system) developed a leader education program, for the organization to progress based on its leaders and shared values.
Method: The LEP, as a forum for exchanging ideas and therefore as a driver for change has been offered five times (globally). Quantitative methods, as well as qualitative methods (including feedback and commitment to change as evaluation instruments) guided us during our data collection process of the LEP participants (~80 participants).
Working through specific examples (eg, communication, sharing a vision, creating an environment of trust, etc.) highlighted the learners' experiences on what is going well and what needs to be done differently. This process led to de-veloping a cohort of leaders who learn together and work with a common purpose based on shared values.
Discussion: Through practices such as (self-)reflection and self-assessment encouraged/taught at the LEP, as well as additional evaluation instruments we are assessing learners' standpoints, strengths and weaknesses, and whether this process leads to improved team building, leadership and management competencies, therefore creating opportunities for change.
Conclusion: Over the last thirteen months and based on assessment data from various evaluation instruments collected (quantitative and qualitative) we have identified that the LEP serves as a driver for change. Mentioned barriers to overcome are eg, time constraints; resistance to change; channelling new strategies upwards and therefore change can be slow.
Take-home message: Change is possible; getting a group of people together and building a community that works and learns together has proven to be successful. Leadership and its value are critical to move the organization forward; enabling change through practice and development and with the LEP as a forum for exchanging ideas, as well as sharing concerns.

7KK3 (1647)
Exploring Outcomes of the Dartmouth-Hitchcock Leadership Preventive Medicine Program

Authors
Tina Foster, Dartmouth-Hitchcock Medical Center, Lebanon, NH, USA
Molly Castaldo, Geisel School of Medicine at Dartmouth, Hanover, NH, USA
Alicia Zbehlik, Dartmouth-Hitchcock Medical Center, Lebanon, NH, USA
Stephen K. Liu, Dartmouth-Hitchcock Medical Center, Lebanon, NH, USA
Mary G. Turco, Geisel School of Medicine at Dartmouth, Hanover, NH, USA

Presenter: Tina Foster, Dartmouth-Hitchcock Medical Center/Geisel School of Medicine, Lebanon, NH, USA

Background: The Dartmouth-Hitchcock Leadership Preventive (LPM) residency is a graduate medical education (GME) program which combines Preventive Medicine (PM) training with other residency and fellowship programs to develop clinicians with population health and improvement skills who can lead change in today's complex health care environment. We interviewed graduates to explore our outcomes: what was learned, effect on careers, and connection to PM.
Method: 31/64 graduates were interviewed by phone. Interviews were conducted by an individual (MC) not affiliated with LPM using an interview guide developed by the program directors (TF, SKL, AZ) and interviewer. Telephone interviews were conducted between August 1 and September 29, 2016; interviews lasted 30-45 mins and were transcribed. An educational researcher (MT) performed qualitative analysis of the transcripts and prepared a report to the program.
Results: Interviewees included graduates from 2005 through 2016. 14/31 were Board-certified in PM and at least one other specialty. Themes included the unique skillset developed in the program, including reflection, strategic thinking, influencing culture change, and technical quality improvement skills. Important curricular aspects included the practicum experience, leadership and writing seminars, and courses/sessions on measurement and analysis. Skills relevant to leadership included the ability to deal with chaos, lead with confidence, and apply population health training. Graduates felt connected to PM by their work in prevention and health promotion, leading change, population management, and improving care delivery systems. Several reported the program made them attractive to employers and/or contributed to career advancement, and many are currently in leadership positions.
Discussion & Conclusion: Outcomes in GME are challenging to measure and traditionally captured primarily by Board pass rates and job titles/locations. These interviews help us understand the knowledge, skills and attitudes developed in the program, and how they are playing out in graduates' professional lives as long as a decade after graduation. Graduates also offered helpful advice on curriculum. A significant limitation was our inability to interview all graduates. Overall, the analysis

confirmed positive professional identity development and self-efficacy in leading others as outcomes of our program.
Take-home message: In-depth exploration of graduates' perceptions provides valuable insight into program strengths and opportunities.

7KK4 (2277)
Summative Assessment of Team Leader Performance: a Randomized Controlled Trial after Advanced Life Support Courses

Authors
Sabine Nabecker, Department of Anaesthesiology and Pain Therapy, University Hospital of Bern, University of Bern, Bern, Switzerland
Soeren Huwendiek, Department of Assessment and Evaluation, Institute of Medical Education Bern, University of Bern, Bern, Switzerland
Christian Seidl, Department of Anaesthesiology and Pain Therapy, University Hospital of Bern, University of Bern, Bern, Switzerland
Lorenz Theiler, Department of Anaesthesiology and Pain Therapy, University Hospital of Bern, University of Bern, Bern, Switzerland
Robert Greif, Department of Anaesthesiology and Pain Therapy, University Hospital of Bern, University of Bern, Bern, Switzerland

Presenter: Sabine Nabecker, Department of Anaesthesiology and Pain Therapy, University Hospital of Bern, University of Bern, Switzerland

Background: Even though advanced life support courses today teach leadership, summative assessments after these courses still mainly focus on the adherence to current cardiac arrest life support guidelines. This study's goal is to determine whether and to which extent two currently used summative assessment methods test leadership.
Method: With Ethics Committee review (Req-2017-00578), University of Bern medical students participate after their mandatory advanced life support courses in this ongoing study. We randomize students to one of two different summative assessments of standardized cardiac arrest scenarios: 1) "American Heart Association (AHA)" – the assessed student leads 3 other students forming together the cardiac arrest team, but only the team leader is assessed, versus: 2) "European Resuscitation Council (ERC)" - the assessed student leads a "cardiac arrest team" that is simulated by only one instructor. All assessments are videotaped, 2 experienced instructors not involved in the assessment, analyse independently the videos using the "Concise Assessment of Leader Management" form (L. Nadkarni et al., Simul Healthc 2017).
Results: Preliminary 10 AHA and 10 ERC assessments were analysed. Neither announcement of the leader's role, nor engagement of team members in decision making was observed in any assessment. Comparable team leader performance was found (all p>0.05) for: acting as a leader and leadership style, appropriateness of voice, explicit addressing of people, reinforcement of closed-loop communication, assignment and prioritizing of tasks,

global view and periodical reassessment of patients, the next steps in patient care and the global performance of participants.

AHA type assessment showed significantly more often how leaders assign roles and balance the workload of team members (p<0.01). In the ERC type assessment more students periodically summarized the cases (p<0.01). At the conference we will provide the complete data set.

Conclusion: After life support courses, these two assessment methods provide comparable evaluations of: leadership and communication skills, medical management, and global performance of participants. However AHA type assessment seems to evaluate team management skills better than the ERC type assessment.

Take-home message: According to our preliminary results, team management skills may be better assessed by the AHA type assessment.

7KK5 (1831)
Students as change leaders in medical education: current condition and perspectives for further development of medical education in Poland

Authors
Aleksandra Likonska, Medical University of Lodz, Lodz, Poland
Mateusz Marynowski, Medical University of Lodz, Lodz, Poland
Lukasz Adamus, Medical University of Lodz, Lodz, Poland
Janusz Janczukowicz, Medical University of Lodz, Lodz, Poland

Presenter: Lukasz Adamus, Medical University of Lodz, Poland

Background: Medical students are becoming active change-agents in their education. Our project explores Polish students` perceptions of current condition of Polish medical education and roles they might employ to influence its further development.

Method: The qualitative methodology was applied to explore students' understandings of excellence and reality of medical education, including their own engagement as change leaders.

The maximum variance sampling was applied to identify medical students from 15 Polish medical schools to share during the focus group interviews their educational experiences, reasons for their involvement in medical education and how their own universities encourage students' engagement. Their narrations were recorded, transcribed and coded using Atlas.ti software.

Results: Students defined the perfect medical school as an institution educating good doctors, integrating theoretical knowledge and practical skills, following the student-centred strategies, and encouraging to learn in a good educational climate.

Many of the modern methods used in medical education trends were identified as not fully implemented at participants' universities yet. Currently, students feel being figure-head type members of curriculum committees. They want to become real change leaders but active encouragement and support from the university is seen as a condition to fully engage in medical education.Ideas of

required changes, e.g. improvement of evaluation methods and more educational guidance during clinical rotations were indicated.

Discussion: There is often a vicious circle of students not feeling ready to participate actively in medical education and their school not providing them with appropriate support for such activities. Consequently, some students present unrealistic expectations towards possible development of curricula due to the lack of their knowledge in medical education. Moreover, students complain about lack of such knowledge amongst faculty

Conclusion: members. Summarizing, both students and faculty should further develop their knowledge in medical education in order to act together as a change leaders and implement informed educational changes. This process should be formally encouraged and endorsed by universities.

Take-home message: Joint efforts of faculty and students to broaden their engagement and knowledge in medical education should form a way to further develop students' role as change leaders in medical education.

7KK6 (595)
Leaders In Medicine Program: How Well Do Students Perform And Where Do They Go After Graduating?

Authors
Wayne Woloschuk, Cumming School of Medicine, University of Calgary, Calgary, Canada
Paul Beck, Cumming School of Medicine, University of Calgary, Calgary, Canada

Presenter: Wayne Woloschuk, Cumming School of Medicine, University of Calgary, Canada

Background: The 3-year MD program at the Cumming School of Medicine, University of Calgary, offers a Leaders in Medicine (LIM) option that allows students to work jointly towards an MD and a graduate degree. This study sought to examine the academic performance of LIM students compared to their non-LIM peers and which residency programs LIM students entered after graduating.

Method: Demographic, undergraduate performance and Medical Council of Canada Qualifying Exam Part 1 (MCCQE Part 1) data of recent LIM graduates (Classes 2012-2017) were compared to data of non-LIM graduates. Career choice of LIM and non-LIM graduates was also examined.

Results: Of the 993 MD graduates, 72 were LIM students who also received MA (1), MBA (1), MSc (38) and PhD (32) degrees. 55.6% of LIM graduates were female compared to 56.4% of non-LIM graduates, p >.05. At graduation the age of LIM students (M=30.07) differed from the age of their non-LIM (M=28.4) peers, p < .05. There were no statistically significant differences between the two groups on various performance measures (clerkship MCQ exams, in-training evaluation reports, clerkship OSCE and MCCQE Part 1). Family medicine (30.6%) was the most popular residency program of LIM graduates followed by internal medicine (23.6%) and neurology (11.1%). 55.4% of non-LIM graduates entered family or internal medicine residency programs.

At graduation LIM students were older than their non-LIM peers in part, because they typically stepped out of the MD program to attend to their graduate degree requirements. Although many LIM students interrupted their MD training their academic performance remained strong. More than half of LIM graduates became family and internal medicine residents which was similar to their non-LIM peers.

The academic talent of LIM and non-LIM students was comparable. Career preferences of both groups demonstrated a primary interest in generalist disciplines.

Conclusion: The LIM program at the Cumming School of Medicine, University of Calgary can successfully accommodate students who wish to pursue joint degrees.

7KK7 (2920)
Developing a resident programme "Leader in clinical education"

Authors

Hanna Lernbrink, Bramaregarden Health Center, Primary Health Care, Gothenburg, Sweden

Erik Myrberg, Dept of Rheumatology, Sahlgrenska University Hospital, Gothenburg, Sweden

Mats Wahlqvist, Education Unit/ Research, Development and Innovation, Sahlgrenska University Hospital, Gothenburg, Sweden

Catharina Tennerhed, Education Unit/ Research, Development and Innovation, Sahlgrenska University Hospital, Gothenburg, Sweden

Anders S Johansson, Education Unit/ Research, Development and Innovation, Sahlgrenska University Hospital, Gothenburg, Sweden

Presenter: Hanna Lernbrink, Bramaregarden Health Center, Primary Health Care, Gothenburg, Sweden

Background: In 2014, "Leader in clinical education" a special leadership course for eight residents started in the Västra Götaland Region, Sweden. The longitudinal programme comprised 1 d/week during 2.5 year. Main areas were Leadership and professional development, Higher education and workplace learning in medicine and Quality improvement in health care. Evaluation results from the first group of residents showed an overall positive outcome and also identified some gaps.

Method: In the following programme of 2016, learning objectives and learning methods were modified and aligned to formative and summative assessment. A new introduction term was formed with a start-up residential course and a mandatory external week of group training. Half-time evaluation materials from eight participants included formative assessment reports with participants' reflection on reaching learning goals, a summary of their logbook and an individual action plan. Learning methods in the quality improvement course were also developed by a graduated teacher (CT).

Results: The second group comprised eight residents. An altered sequence and learning process created an initial focus on group dynamics and development, self-reflection and leadership issues. Analysis of half-time assessment and evaluation materials displayed an eager-to-practice approach. Participants expressed that they wanted to be more active and involved in leading group meetings, to co-teach and assist in clinical tutors introductory courses.

Discussion: Repeated analysis of both assessment and evaluation results was fruitful when developing a new resident programme for leaders in clinical education. Support from the Region Västra Götaland also compensated loss of income during specialist training.

Conclusion: Our results suggests that early leadership and group development stimulated participants to practice their training skills.

Take-home message: An early focus on leadership, group development and reflection on the learning process was helpful when training leaders in clinical education.

Training undergraduate medical students in leadership

Authors

Maaike Matilewicz
JJS van de Kreeke
MC de Bruijne
MC Mak- van der Vossen
O El Tahir
K Reefman

Presenter: Maaike Matulewicz, VU University Medical Center, Amsterdam, Netherlands

Background: In practising medicine, physicians demonstrate leadership on a daily basis: they lead care teams, support and guide colleagues, delegate tasks, motivate patients, supervise students, etc. Undergraduate students in medicine are expected to become competent in leadership, one of the seven CanMED roles; as junior doctor they should be able to manage an inpatient ward from the start. How do we train undergraduate students in leadership?

Method: VU University Medical Center developed and implemented training in leadership in the medical master's program. In 2015 symposia were implemented throughout the medical master's curriculum to teach and train students in integrated competencies[1].

Each symposium contains two themes in a morning and an afternoon program structured around medical and societal themes addressing various competencies. A symposium is attended by a 150 students on average. Leadership was programmed in two different symposia: 'Personal leadership' in the first master's year and 'Leadership in clinical wards' in the third (final) master's year. In each program, students can select two out of five workshops, e.g. Managing colleagues, Negotiating, Visibility in the workplace, Work-life balance and Speaking up.

Results: Evaluations show a high level of student appreciation for the symposia on leadership. Both programs were considered interesting and useful for professional development, with workshop scores ranging from 3.8 to 4.2 on a 5-point Likert scale (response rate ranging from 78% to 83%). Trainers report that the workshops meet the needs of students since they match with leadership tasks students carry out during clerkships.

Conclusion: Although the leadership symposia are highly appreciated, the value of two daypart programs should not be overestimated. In the future we will further develop the leadership role by clarifying the development of students' leadership qualities during clerkships (e.g. in portfolios).

Take-home message: Allowing students to participate in symposium workshops on leadership is much appreciated by students and offer a suitable opportunity for training undergraduate medical students in leadership.

[1]*Reefman, K., Daelmans, H.E.M., Klumpers, U.M.H. et al. Perspect Med Educ (2017) 6: 429. https://doi.org/10.1007/s40037-017-0379-4*

Challenge of a Third Medical School in an Institution: Tutors' Perspective

Authors

Jill Cheng Sim Lee, KK Women's and Children's Hospital, Singapore
Mingyue Li, KK Women's and Children's Hospital, Singapore
Limin Kam, KK Women's and Children's Hospital, Singapore
Heng Hao Tan, KK Women's and Children's Hospital, SIngapore
Rajeswari Kathirvel, KK Women's and Children's Hospital, SIngapore

Presenter: Jill Cheng Sim Lee, KK Women's and Children's Hospital, Singapore

Background: KK Women's and Children's Hospital (KKH) is the leading training centre in Obstetrics and Gynaecology (O&G) in Singapore, caring for over 14,000 women annually. Singapore currently has 3 medical schools: Yong Loo Lin School of Medicine (YLL-NUS), Duke-NUS, and the latest addition, Lee Kong Chian School of Medicine (LKC). Students from all three schools rotate through KKH for clinical experience in O&G. There is however a finite number of O&G clinicians within a single institution.

Method: We surveyed 51 O&G clinicians from the Division of O&G at KKH about the presence of three medical schools within a single clinical campus. Participants consisted of 22 Consultants, 10 senior residents and 19 junior residents. Data were analysed using Microsoft Excel.

Results: 37 (72.5%) of participants taught students from more than 1 medical school. 94.1% believed it was important for KKH to be involved in the teaching of O&G for all 3 medical schools. 76.5% agreed that students and tutors will benefit from sharing of teaching and learning materials. 84.3% agreed that by teaching all 3 medical schools, both students and tutors can be exposed to new teaching methods. 49% believed there may be limited supervision of students by tutors. Only 27.4% and 29.4% respectively believed that there may be lack of research and elective opportunities for students.

Discussion: Change and additional responsibilities are challenging. Formal training and updates have been conducted for clinicians by each school to ensure tutors are well-prepared as educators and remain motivated to teach. The role of junior residents as near-peer tutors has been extended to jointly mentor students with senior faculty, conduct small group tutorials and supervise clinic attachments. Students from multiple schools are jointly invited to tutorials. Provision of protected time for teaching by the Division supports teaching activities and recognises tutors for their contributions.

Conclusion: Tutors believe it is important to undertake clinical rotations in busy tertiary centres. Careful planning of rotations and supportive departmental leaders within such centres can maximise teaching capabilities allowing both students and tutors to benefit from collaborations with multiple medical schools.

Challenge of a Third Medical School in an Institution: Medical Students' Perspective

Authors

Li Mingyue
Jill Lee Cheng Sim
Limin Kam
Heng Hao Tan
Rajeswari Kathirvel

Presenter: Mingyue Li, KK Women's and Children's Hospital, Singapore

Background: KK Women's and Children's Hospital (KKH) is the leading training centre in Obstetrics and Gynaecology (O&G) in Singapore as it caters for over 14,000 women every year. Singapore currently has 3 medical schools: Yong Loo Lin School of Medicine (YLL-NUS), Duke-NUS, and the latest addition of Lee Kong Chian School of Medicine (LKC). Students from all the three medical schools rotate through KKH for their clinical experience in O&G. The first batch of LKC students commenced their clinical O&G rotations in August 2016.

Method: We surveyed 91 students from the three schools at the start of their O&G rotation to determine their views about training in KKH in the presence of three medical schools within a single clinical campus. The survey findings were analysed using Microsoft Excel.

Results: 95.6% of participants agreed that it is important for KKH to be involved in the teaching of O&G for all three medical schools. 83.5% of the students agreed that they will benefit from sharing of learning materials from the other medical schools and 73.6% agreed that there will be opportunities to collaborate between medical schools. However, 75.8% felt that they may have limited exposure to patients and 60.4% felt that there will be a lack of learning spaces.

It was reassuring to note that majority of the students felt positive about the presence of students from 3 schools in a single institution. Their concerns were taken into account and the rotations were planned in collaboration with the three school co-ordinators and carefully organised to ensure that only students from one school was present in a particular clinical area at any one time. Junior residents were recruited as near-peer clinical tutors to enable students to have easier access to small group tutorials and resident clinic attachments on a one-to-one basis.

Conclusion: Students believe it is important to undertake clinical rotations in busy tertiary centres. Careful planning of rotations within such centres can maximise the number

of students who can benefit from such attachments and develop early opportunities for inter-university collaboration.

Analysis of formal and informal physical learning spaces in a university hospital: A case study

Authors
Andrea Flores, UNAM, Faculty of Medicine, Mexico City, Mexico
Carlos Gutiérrez-Cirlos, National Institute of Medical Sciences and Nutrition "Salvador Zubirán", Mexico City, Mexico
Melchor Sánchez Mendiola, UNAM, Faculty of Medicine, Mexico City, Mexico

Presenter: Andrea Flores, National Autonomous University of Mexico (UNAM), Mexico City, Mexico

Background: There is an increasing emphasis on the role of formal and informal learning spaces in medical education, mainly in developed countries. The evidence suggests that the attributes of learning spaces can facilitate or hinder educational activities in medical schools and hospital settings. There are no published studies about this theme in developing countries medical schools.
Method: The objective of the study was to explore the characteristics of formal and informal physical learning spaces, in a university hospital that trains undergraduate and graduate medical students. The setting was the National Institute of Nutrition and Medical Sciences "Salvador Zubirán", one of the training sites of UNAM (National Autonomous University of Mexico) Faculty of Medicine, in Mexico City. The methodology used was the case study approach, with site visits, focus groups of the different stakeholders, and application of the Learning Space Rating System instrument (LSRS, https://www.educause.edu/eli/initiatives/learning-space-rating-system).
Results: The different types of learning spaces have particular characteristics, for example the pedagogical potential offered by a corridor or cafeteria is different from a traditional classroom or a hospital ward. The structures in the physical spaces can affect the learning of important skills that future medical professionals must master. There is ample room for improvement in the design and use of formal and informal spaces in our university sites.
Conclusion: It is fundamental for university hospitals to identify the attributes that learning spaces have and its potential effects on learning, as well as the relationship that exists between formal and informal learning spaces. It is crucial to involve medical education scholars and trainees in the design of university and hospital buildings.
Take-home message: The formal study of learning spaces in hospitals and universities can inform the design and building process, and could improve the educational experience of teachers and students.

7KK13 (3560)
History of the feminization of the medical profession in Switzerland: what are the lessons ?

Authors
Lucie Begert, Institute of Humanities in Medicine-CHUV, Lausanne, Switzerland
Carole Clair, Policlinique Médicale Universitaire, Lausanne, Switzerland
Aude Fauvel, Institute of Humanities in Medicine-CHUV, Lausanne, Switzerland

Presenter: Lucie Begert, Institute of Humanities in Medicine-CHUV, Lausanne, Switzerland

Background: One professional change and development in medicine that can't be ignored is the feminization of the medical profession. It raises now many questions, since the feminization is not equally visible in the various fields and levels of the profession. In this context, it is important to look back at the beginning of this phenomenon. In Zürich in 1867, Nadejda Suslowa was the first women in the modern world to be awarded a medical degree after completing a fully co-educated pre-graduate medical education in a recognized university with high standards. It all began as a pedagogic experiment.
Method: This historico-sociological work focusses on both quantitative aspects of the "pedagogic experiment" of the first female physicians in Switzerland, as well as the study of the dynamics of the feminization. The quantitative part is based upon primary sources (archives), for example the list of students or the the list of awarded diplomas from the various universities'archives. The study of the dynamics is worked from the graphs we created and from the study of the socio-historical context with primary and secondary sources.
About the quantitative aspects, inclusion of women was a success; indeed, between 1902 and 1908, the majority of medical students in Switzerland were women (with a maximum of 70% of female medical students). However, since very few of them were swiss themselves and the laws at that time forbid non-swiss physicians to exercise, the phenomenon was not at all observed in post-graduate education nor the exercise of the profession, where Switzerland was somehow "late" compared to other countries. For example only 3% of swiss physicians were women in 1923. It changed slowly after the 1960's.
It is thus a combination of both socio-historical aspects of that time at most of swiss universities and the personality of the pioneer female physicians that permit the pedagogical experiment to be a success.
Conclusion: Faced with the challenges that offers the young generation of physicians, we can learn from the various aspects of a change in order to re-use them efficiently.

Service Motivation and Motivation to Lead

Authors
R. Stephen Manuel, UMMC, Jackson, USA
Nicole Borges, UMMC, Jackson, USA
John Smith, UMMC, Jackson USA

Presenter: R. Stephen Manuel, University of Mississippi Medical Center, Jackson, MS, USA

Background: Health professions programs have many factors important to them when choosing the next generation of health care providers. While leadership and service may be among the factors evaluated during the application and interview process, what do these factors look like for students who are actually entering the profession? Do accepted students in a health professions degree program have one or both factors—or neither? The purpose of this study is to investigate the relationship between service motivation, the desire to serve others through a career, and motivation to lead in health professions students. Motivation to lead is based the theoretical framework regarding leader behaviors and individual differences, such as personality, self-efficacy, values and the quantity and quality of leadership experience. (Chan & Drasgow, 2001). Motivation to serve others and its relations to career development are drawn from the vocational psychology and career assessment literature (Duffy & Raque-Bogdan, 2010).

Method: The Motivation to Lead instrument and the Service Motivation Scale were given to 38 (95% response rate) matriculating first year dental students at a US medical school during orientation. The Motivation to Lead measure has three elements, the social- normative measures leadership due to a sense of responsibility or duty, the affective measures leaders who like to lead others and the non-calculative measures those that do not weight the benefits or costs of leading. The 6-item Service Motivation Scale captures one's desire to serve others through one's career.

Results: No significant correlations existed between service motivation and any of the three elements of motivation to lead: Affective (p =.78), Non-Calculative (p=.19) and Social-Normative (p=.80). Overall, students scored higher on the Non-Calculative subscale (M=38.18, SD=4.32) and lowest on the Affective (M=31.63. SD= 4.47).

Conclusion: Dental students who desire to serve others do not chose to lead due to a sense of duty or responsibility to others. Future studies will seek a larger sample and include additional health professions students (i.e. medical, nursing, pharmacy).

Take-home message: The reasons that dental students chose to lead is varied and does not correspond to a desire to serve others.

7KK16 (1557)
Does workload affect quality of delivery of undergraduate medical education in primary care?

Authors
Tal Wasty, University of Manchester, Manchester, UK
Andy Conway, University of Manchester, Manchester, UK

Presenter: Tal Wasty, University of Manchester, UK

Background: There exist increasing workload pressures in primary care in the UK which poses a threat to practices having the capacity to deliver high-quality community undergraduate placements. This will perpetuate the problem of general practice (GP) workload by failing to recruit students if they aren't exposed to or experience good GP placements. We wanted to explore any relationship between GP workload and quality of educational delivery.

Method: Information was gathered from existing teaching practices on their practice size and number of full time equivalent (FTE) GPs. This was used as an index for their level of clinical workload and correlated against the number of undergraduate teaching days they committed to and their evaluation scores for that year.

Results: 49 practices returned the information requested. A wide range existed for number of FTE GPs per 10,000 patients (2.3-9.3). Commitment to undergraduate education did not correlate with clinical workload of a GP. Evaluation scores for placements did not correlate with their combined clinical and educational workload.

Discussion: Practices may worry about their clinical workload in being able to offer high-quality undergraduate placements. Our results show that this may not be the case given that evaluation scores didn't correlate with clinical and educational workload of a practice. Confounding factors need to be explored further.

Conclusion: Experiences of clinical placements can influence future career choices. To reduce the well-recognised GP workforce crisis in the UK, it is vital that medical students are offered high-quality placements to motivate them towards a career in general practice. Practices may feel unable to offer these in an increasingly busy working environment. Our results suggest that, probably by careful planning, educational quality can still be maintained despite this.

Take-home message: Increasing GP workload poses a threat to capacity for, and quality of, community placements for medical students. This could perpetuate the current GP workforce crisis in the UK. Despite the increasing workload, practices have continued to deliver high quality placements. Furthermore, quality doesn't appear to correlate with combined clinical and educational workload, but confounding factors need to be explored further.

SESSION 8: SIMULTANEOUS SESSIONS

Tuesday 28th August
1400-1530 hrs

8A: Symposium: Playing Devil's Advocate: Research that challenges how we think about Clinical Supervision

Location: Event Hall
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters:
Chris Watling, Western University, Canada
Mark Goldszmidt, Western University, Canada
James Brown, Eastern Victoria GP Training & Monash University, Australia
Sayra Cristancho, Western University, Canada
Tavis Apramian, Western University, Canada
Olle ten Cate, Utrecht University, Netherlands

Summary: Clinical supervision is widely recognized as a linchpin of work-based medical education. However, the last systematic review of clinical supervision concluded, almost two decades ago, that supervisory practice in medicine has very little empirical or theoretical basis, and the authors called for more robust empirical research into supervision in practice settings (Kilminster & Jolly, Med Educ. 2000 Oct;34(10):827-40). The 2007 AMEE Guide (Kilminster et al, Med Teach. 2007 Feb;29(1):2-19) offered a framework for clinical supervision, but acknowledged that much remained unknown including the influence of context, the variability of supervisory relationships, the implications of teams, the role of judgment, and the practice of observation. This symposium asks: a decade after the AMEE Guide, what are the big new insights and ideas about clinical supervision from empirical research? This symposium will present highlights from research into clinical supervision in the past decade, and discuss their implications for medical education. Speakers have been selected to represent research into clinical supervision in a range of medical contexts (e.g., internal medicine, general practice, surgery), supervisory situations (e.g., inpatient teaching team, ambulatory clinic, operating room) and learner levels (e.g., medical students, residents, fellows); their work also represents a range of theoretical perspectives. Using a TEDTalk style of presentation, each speaker will offer ONE BIG IDEA from their empirical research that elaborates or challenges our current way of thinking about clinical supervision:
1. What we see is not real: the impossibility of authentic observation (Chris Watling)
2. What we struggle with is not 'students these days', but 'systems these days' (Mark Goldszmidt)
3. What we assess is not independent: the challenge of coupled performance (Lorelei Lingard)
4. What we judge as 'competent' is a reflection of individual supervisor preferences (Tavis Apramian)
5. How we supervise compromises, rather than supports, trainee identity formation (James Brown)
6. Discussant to play devil's advocate, asking the implications of these BIG IDEAS (Olle ten Cate)
Each presenter will draw out ONE BIG IMPLICATION of their idea for current concerns in medical education, such as competency-based training, entrustment, coaching, and performance assessment. The discussant's role is both to try to apply these ideas but also to play devil's advocate, challenging the speakers to explain how their idea helps us understand (or completely rethink) a common clinical supervision scenario. We intend to use at least one clinical supervision scenario on video to engage the audience and apply the 'BIG IDEAs' to it, to get into dynamic debate with the audience about both the affordances and the drawbacks of these research insights for our approach to clinical supervision.
Who should participate in the symposium? This symposium will be of interest to clinical teachers, medical learners, educational leaders and researchers studying clinical teaching and learning.
What will they gain from participating? Participants will participate in a provocative discussion intended to challenge our assumptions and advance our understanding of a fundamental practice in medical education: clinical supervision. They will take away knowledge from new research regarding clinical supervision, and be able to critically reflect on how these 'big ideas' might cast their own clinical supervisory practices in new light. They will also come away with a sense of what remains to be explored regarding the nature and implications of clinical supervision in medical education.

8B - Developing consensus-based guidelines and education for Emergency Medical Teams for limb injuries in disasters and conflicts

Location: Montreal, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Ian Norton, WHO
Elhanan Bar-On, Sheba Medical Center
Jane Wiedler, AOEI
Stefanie Hautz, AOEI
Harald Veen, WHO

Summary: The main goal of this project was to improve outcomes for patients suffering limb injuries during disasters and complex emergencies. To ensure this, we provide the first open access training material platform for Emergency Medical Teams (EMT) to train EMT´s for limb injuries in disaster situations. All material is based on a competency-based curriculum. On this platform, EMT´s cannot only find a downloadable specific field guide, but

also topic-related learning videos, and a collection of available resources.

Outline - Why: As medical science improves and trauma rates decrease in high-income countries, well-intentioned surgical teams can find themselves unprepared for the realities of austere settings. To develop a limb surgery educational curriculum for global medical disaster responders' support and endorsement was granted by the AO Foundation, Switzerland. The project is run in collaboration with the AO Foundation, the International Red Cross and the WHO, with input from other partners and representatives of humanitarian response agencies, academic institutions, and surgical experts from low and middle-income countries (LIMC).

Process - How: To realize this project, an expert meeting with 30 international participants was held in December 2015 in Davos, Switzerland. Also, a core group consisting of surgeons as well as Sheba Medical Center, WHO, and AOEI staff from different backgrounds and different parts of the world was created to work constantly on content, look and feel of the physical field guide and the contents of the Website. After a period of one year, the constant iterations resulted in the launch of the first consented field guide on this topic on December 16, 2016. Based on the topics defined during the consensus meetings, educationalists, surgeons and other disciplines drafted and developed a competency-based curriculum for disaster limb injuries to go with the filed guide.The possibility to present such a product is due to the effort of many international world experts, working as volunteers together with the Sheba Medical Center, WHO and AOEI.

Symposium Topics: This symposium will present key lessons learned, demonstrate examples of the newly defined content adapted to the austere environment, and promote the exchange of opinion between panelists and participants.

Good intentions are not enough: why responding to disaster and conflict situations demands specific training.
Capturing best practice in an "evidence-free zone": building consensus among disaster and conflict opinion leaders to update guidance on the management of limb injuries in disasters and conflicts.
Developing EMT training materials that are up-to-date, accessible and attractive to the new generation of responders, especially national EMTs in disaster-prone countries.

Who should participate in the symposium? Whoever is interested in the methodology of a consensus process of large bodies and across countries and/or with an interest in developing shared results such as guidelines or even curricula.

What will they gain from participating? Participants will learn more about how the process of how a consensus can be reached on a topic affecting all parts of the world, various interests and opinions.

8C - Stimulating medical education and medical education research: the dean's perspective

Location: Sydney 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters

Norman Beauchamp, Michigan State University, East-Lansing (MI), USA
Richard Hays, University of Tasmania, Australia
Vishna Devi Nadarajah, International Medical University, Kuala Lumpur, Malaysia
Albert Scherpbier, Maastricht University, Maastricht, Netherlands
Monica van de Ridder, Michigan State University, Grand Rapids (MI), USA

Summary: Over time, the tasks of Deans have changed and have become more complex. (1) Deans do not only deal with educational challenges, such as curriculum management, interprofessional education and funding the educational mission, they also deal with challenges related to clinical care (e.g. health care reform, programmatic development), administration (e.g. space management, strategic planning, financial operations), and research (incentivizing research, funding new research initiatives). (2) The working environment is complex: research, clinical care and education have often-competing missions.
(1) Many faculty in medical schools don't feel acknowledged. They are of the idea that the Dean's office does not know how hard they are working; they feel invisible and not listened to. Furthermore, they feel the attention mostly goes to departments that bring in high amounts of research money, which is not so much the case in medical education. The many developments taking place in medical education which require greater collaboration and the engagement of a wider arrange of stakeholders including students, might have led to a gap between perception and understanding between deans and staff. The goal of this symposium is to explore and discuss with the audience and the panel a) the gap in perception and understanding between deans and faculty, and b) solutions and best practices how medical education and medical education research can be stimulated and made more visible. The topics for discussion will be derived from a questionnaire sent out to the audience prior to the conference.
1. Rich EC, Magrane D, Kirch DG. Qualities of the medical school dean: insights from the literature. Academic medicine : journal of the Association of American Medical Colleges. 2008;83(5):483-7. 2. Buckley PF. The medical school dean: leadership and workforce development. Academic psychiatry : the journal of the American Association of Directors of Psychiatric Residency Training and the Association for Academic Psychiatry. 2014;38(1):82-5.

Who should participate in the symposium? Both the leadership (associate deans, department chairs), and faculty, staff and students who are interested in how to make medical education and medical education research more visible in medical schools. To match the international audience of AMEE, the deans invited to

participate on the panel are from Asia, Australia, Europe and Northern-America.

What will they gain from participating? After a short introduction of the topic and the outcomes of the questionnaire (10'), the deans will give a seven-minute introduction about themselves, their medical school, and a best practice of how they stimulate medical education and medical education research (30'). This will be followed by a discussion with the audience and panel (40'). The best practices to stimulate medical education and medical education research will be summarized at the end of the meeting (10'). The outcomes of the discussion should be:

- A better understanding of the gap between deans and medical school faculty and staff;
- Examples of best practices provided by the deans, that can be used in other medical schools.

8D - What is the Value of Accreditation?

Location: Singapore 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
William Pinsky, Educational Commission for Foreign Medical Graduates (ECFMG), Philadelphia, USA
Lorna Parkins, Caribbean Accreditation Authority for Education in Medicine and Other Health Professions (CAAM)
Geneviève Moineau, Association of Faculties of Medicine of Canada, Ottawa, Canada
Moderator: John (Jack) R. Boulet, Foundation for Advancement of International Medical Education and Research (FAIMER), Philadelphia, USA

Given the rapid expansion of medical schools throughout the world, potential students need some assurance that the educational programme is of sufficient quality. The accreditation of undergraduate medical education (UGME) programmes is considered to be a valuable step for improving the quality of medical schools and the graduates they produce. The accreditation process, buttressed by external review, allows medical school staff to reflect on programme strengths and weaknesses and evaluate the school's performance with reference to defined standards. If these standards can be met, stakeholders, including students, can be assured that the educational process is "fit for purpose".
The goal of this session is to provide the medical education community with an update on the rationale for, and importance of, UGME accreditation. The panel session will cover the evolution of medical education accreditation standards, the current status of UGME accreditation, and research demonstrating the value of accreditation. In addition, the World Federation for Medical Education (WFME) recognition programme, developed to evaluate compliance of accrediting agencies with pre-defined criteria, will be discussed. This recognition programme ensures that accreditation of medical schools worldwide is at an internationally accepted and high standard.

The panelists will explore the value of, and challenges associated with, UGME accreditation from global, regional, and local perspectives.

8E: Research Papers: Career Trajectories & Mentorship

Location: Delhi, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

8E1 (47)

Are efforts to attract graduate applicants to UK medical schools effective in increasing the participation of under-represented socioeconomic groups? A national cohort study.

Authors
Ben Kumwenda, University of Aberdeen, Aberdeen, UK
Jennifer Cleland, University of Aberdeen, Aberdeen, UK
Rachel Greatrix, University of Nottingham , Nottingham, UK
Rhoda Mackenzie, University of Aberdeen, Aberdeen, UK
Gordon Prescott, University of Aberdeen, Aberdeen, UK

Presenter:
Ben Kumwenda, University of Aberdeen, UK

Introduction: Attracting graduates was recommended as a means of diversifying the UK medical student population. Graduates now make up nearly a quarter of the total medical student population. Research to date has focused on comparing the socio-demographic characteristics of applicants to and/or students on traditional and graduate entry programmes (GEMs), yet GEMs account for only 40% of the graduate medical student population. The broader picture of whether graduates and non-graduate applicants to medicine differ on a range of socio-demographic variables is relatively known. The Selecting for Excellence Final 2014 Report highlights that 'it is hard to determine whether graduate applicants have any significant impact on widening participation.1 Thus, we aimed to compare the socio-demographic characteristics, particularly those associated with widening participation2, and outcomes of graduates and non-graduate applicants across a range of programmes.

Methods: This was an observational study of 117214 applicants to medicine who took the UK Clinical Aptitude Test (UKCAT) from 2006 to 2014, and who applied to medical school through Universities and Colleges Admissions Services (UCAS). We included applicants' demographics and contextual markers, UKCAT total scores and offers in our analysis. Applicants were assigned as graduates or non-graduates on the basis of their highest qualification. The socio-economic status (SES) of the candidates was determined by parental National Statistics Socio-Economic Classification (NS-SEC) and Index of Multiple Deprivation (IMD), an area-based measurement of material deprivation. Multiple logistic regression was used to predict the odds of receiving an offer, after adjusting for confounders.

Results: Irrespective of graduate or non-graduate status, most applicants were from the highest socio-economic groups and were from a white ethnic background. Graduates and non-graduate applicants from top 20% affluent neighbourhoods (IMD 1) obtained better UKCAT scores than applicants from the 20% most deprived areas

(IMD 5). Receiving an offer was related to gender and ethnicity in both graduates and non-graduates. After adjusting for UKCAT score, the odds ratio of an offer for graduates vs. non-graduates was approximately 0.5 (OR=0.48, 95% CI 0.46-0.49).

Discussion: Unlike previous studies in this area, we compared a larger sample of graduate applicants with non-graduates, rather than comparing by course (traditional versus GEM). This allowed us to capture the characteristics of a broader group of graduate applicants compared to earlier studies. Our results show that graduate and non-graduate applicants to UK medical schools are very similar on a range of socio-demographic markers, including multiple markers of socio-economic status. Overall, we found that graduates were proportionally less likely to receive an offer than non-graduate applicants, and those graduates who were offered places had significantly higher UKCAT scores than their non-graduate equivalents.

Conclusion: Our study recognises the problem of allocating graduate applicants to an occupational group that depends on their family circumstances (area, parental occupation). However, the findings indicate that the aim of diversifying the medical student population on socio-economic grounds by attracting graduates has been only marginally successful. Graduate applicants from widening access backgrounds are less likely than others to be offered a place at medical school. Different approaches must be considered if medicine is to attract and select more socially diverse applicants.

Differences in Learning Experiences and Outcomes of International Health Elective Program Participants Who Visited Low-Middle Income or High-Income Countries: A Cross-Sectional Survey of Japanese Medical Graduates

Authors
Yuko Takeda, Juntendo University, Tokyo, Japan
Yoon Soo Park, University of Illinois at Chicago, Chicago, USA
Sachiko Ozone, University of Tsukuba, Tsukuba, Japan
Hiroki Hori, Mie University, Tsu, Japan
Tetsuhiro Maeno, University of Tsukuba, Tsukuba, Japan
Hiroshi Nishigori, University of Kyoto, Kyoto, Japan
Linda Snell, McGill University, Montreal, Canada

Presenter:
Yuko Takeda, Juntendo University Japan, Tokyo, Japan

Introduction: There is a growing interest in global health experiences for medical students with opportunities for learning in different social and cultural contexts to enhance students' awareness of social accountability. Prior literature shows that students who visited low-middle income countries (LMICs) were more interested in choosing careers in primary care and/or working for the underserved1. However, the educational effects of

overseas electives are often evaluated only using self-reported ratings or essays shortly after the program. There are only few studies reporting mid- to long-term impact on medical graduates. While more than 90% of medical schools in Japan have international health elective (IHE) programs, only 2-3% of students participate in the experience, and among them 80% go to high-income countries (HICs). This study explores differences in learning experiences and outcomes among IHE participants by graduation year (1985-2006 and 2007-2017) and by elective site (LMICs and HICs).

Methods: We developed and administered a survey to three organizations known for a history of providing IHE programs for medical students (one medical school, two foundations) in March 2017. We identified 362 medical graduates who participated in any of those three programs and invited them to complete an electronic or paper-based survey. Data were examined using descriptive statistics and regression analysis.

Results: The response rate was 163/362 (45%). Respondents were 54% male, age range 24 to 56 (median age 37); 68% participated in IHEs in HICs. Respondents who visited LMICs rated higher their learning about preventive medicine, health inequality, doctor's social roles, resource-limited care and social determinants of health (SDH) (all p=.001). Participants who went to HICs recognized lack of their clinical skills (p<.05) and faced difficulties in receiving effective teaching (p<.05) and organizing transportation (p<.001). When asked about topics from the list of global health competencies2, respondents in the LMIC group felt more comfortable in listing SDH (p<.05) and roles of World Health Organization (p<.001). The earlier graduates were more aware of doctors' social roles in health inequality (p<.05). Factors that positively influenced greater understanding of global health competencies included participation in IHE at LMICs (β=.18, p=.018) and active involvement in professional organizations (β=.25, p=.003). Overall, the odds of LMIC respondents working in remote areas was 3.11 times (95% CI 1.29-7.48) greater, and their willingness to work in international organizations was 2.10 times (95% CI: 1.03-4.26) greater than in HIC respondents.

Discussion: This study revealed significant differences between students' learning experiences when participating in IHEs in LMICs and HICs. Graduates who had electives in HICs recalled learning more in areas of clinical medicine, while social issues were more often recognized in the LMIC group. Since SDH exist in any country, regardless of resources, there may be missed opportunities for learning during overseas electives in HICs. Although electives in LMICs are considered more challenging, graduates experienced fewer difficulties, possibly due to better preparation because of this assumption.

Conclusions: Our survey showed strong association between learning experiences in LMICs and willingness to work in remote areas and/or work in international organizations. Whilst this could be due to a predisposing global orientation in students who went to LMICs, these experiences also provide a valuable opportunity to enhance their sense of social accountability. This implies the need to work closely with host organizations at LMICs to help maintain their educational resources and to establish sustainable and reciprocal relationships.

Perceived Organizational Support and Career Intentions: The Stories Shared by Early Career Doctors

Authors
Gillian Scanlan, The University of Aberdeen, Aberdeen, UK
Jennifer Cleland, The University of Aberdeen, Aberdeen, UK
Peter Johnston, NHS Education for Scotland, Aberdeen, UK
Kim Walker, NHS Education for Scotland, Aberdeen, UK

Presenter:
Gilllian Scanlan, The University of Aberdeen, UK

Introduction: Early medical careers decision making is a complex process involving weighing up job-related and personal factors. It is critical to understand this process given many early-career doctors are choosing to leave clinical medicine or work in contexts other than those in which they were trained.

Emerging evidence indicates that the experience of working in a supportive culture during early postgraduate years of medical training is a highly influential factor in terms of training preferences in early career doctors1. Additionally, residents/trainees place a lot of value on positive working environments and professional development when considering where they want to work. However, we do not understand what supportive culture and positive working environments actually mean to early career doctors and how perceived support may influence their career intentions. Therefore, our aim was to explore residents' (trainees) experiences of support in the workplace, and how this impacted on their career intentions. We targeted a group of doctors at a critical point in early medical careers decision making – the time when they are expected to apply for specialty training.

Method: This was a qualitative study using semi-structured interviews incorporating a narrative inquiry approach for data collection. The interview questions were drawn from the literature and informed by data from two focus groups.

Interviews were carried out in two UK locations (which differed in terms of locality and participant demographics), then transcribed for analysis. Initial data coding and analysis of the transcribed interviews was inductive, using thematic analysis to generate a non-interpretative coding scheme which was used to code all data and elicit themes and narratives.

On scrutinising these initial themes and stories, we were struck that many of the issues related to the relationships our participants had with the organization they worked for, and the people they worked with. We then used the social theory of Perceived Organizational Support (POS)2 as a theoretical framework underpinning secondary, deductive data interpretation, to aid conceptual generalizability.

Results: Twenty-one interviews were carried out in total: thirteen from one region, eight from the other. Eleven

interviewees had applied for specialty training, while ten had not. We examined the narrative data through the POS lens to identify common themes across the collected stories, as well as to illustrate the unique aspects of each story. Support from senior staff and colleagues influenced participants' job satisfaction and engagement. Positive relationships with senior staff and colleagues also seemed to act as buffer which helped our participants cope with challenging situations. Feeling valued (in terms of acknowledgement of efforts, and respect) was very important to participants. On the other hand, perceiving a poor level of support from the organisation and its representatives (supervisors, colleagues) had a detrimental impact on participants' intentions to stay and work within the NHS.

Discussion & Conclusion: Overall, this is the first study to explore directly how the experiences in postgraduate training can have a critical impact on the career intentions of trainee/resident doctors. We found perceived support in the early stages of postgraduate training was a pivotal factor in whether or not doctors applied for specialty training, and/or intended to stay working in the NHS. These findings can be used to inform workforce policy and planning nationally, and have transferable messages to other contexts which are struggling to recruit and retain junior doctors.

Mentor, coach and assessor: how faculty perceive their role in a multiple role mentoring system in undergraduate medical education

Authors
Stephanie Meeuwissen, Maastricht University, Maastricht, Netherlands
Renée Stalmeijer, Maastricht University, Maastricht, Netherlands
Marjan Govaerts, Maastricht University, Maastricht, Netherlands

Presenter:
Stephanie Meeuwissen, Maastricht University, Maastricht, Netherlands

Introduction: Programmatic assessment (PA) has been introduced to support student learning and evaluation of students' competence development over time and across various contexts. The success of PA hinges on a member of faculty fulfilling the role of 'mentor'. The mentor is tasked with coaching the student and stimulating their competence development through use of a portfolio. Both the mentor and an external assessment committee judge whether the student's development meets the required competency standards over time. As a consequence, the mentor role entails the potentially conflicting roles of coach and assessor. Given the pivotal role of mentors in

PA, we set out to investigate faculty's conceptualization of their mentoring role in a multiple role mentoring system and to explore the extent to which mentors experience role conflicts.

Methods: We conducted a qualitative study rooted in constructivist grounded theory, to elaborate an explanatory theory of the conceptualization of mentoring and possible role conflicts in a multiple role mentoring system in undergraduate medical training. We purposively sampled 12 physician-mentors in a PA system (Maastricht University undergraduate medical school) for semi-structured interviews. Using the constructivist approach, we specifically acknowledged existing experiential (SM) and theoretical (MG, RS) background in theories of programmatic assessment and mentoring in a multiple role mentoring system, which influenced the interview guide. Data collection was done iteratively, meaning data analysis occurred alongside data collection. Data was collected until saturation was met. By constant comparison and our explicit search for contradictory findings, themes were constructed.

Results: Conceptualizations of the mentor role could be grouped into three dominant mentoring styles: 1) empowering student development, 2) checking whether goals are met, and 3) directing student learning behaviour, where the empowering style was most common. Each style was influenced by the mentor's focus and practice in mentoring and encompassed different types of mentor-mentee relationships: 1) partnership, 2) instrumental and 3) faculty centred. Furthermore, faculty's personal objectives with mentoring and how they perceived their responsibilities with regard to students' development could be related to their inherent mentoring style.
Most of the interviewed mentors did not experience any debilitating role conflicts and felt that the support of the assessment system and their personal aim to empower lifelong learning, assisted them in being a good mentor. Notably, mentors that were identified as having a directive style reported experiencing role conflict which seemed to be related to their mistrust in the assessment system and their feeling personally responsible towards students' success. When experiencing a role conflict, these mentors used various coping strategies including deviation from assessment guidelines.

Discussion & Conclusions: Mentors' conceptualizations of their role could be categorized in three dominant mentoring styles and, in parallel, three different mentor-mentee relationships. The empowering mentor style seemed to be the most constructive style within a PA system as it foregrounds the development of students. Few mentors experienced role conflicts, but those that did, seemed to favour the directive mentoring style which is most at odds with the PA system and its focus on development. Faculty development for mentors in a PA system is recommended to create awareness about the potential mentoring styles, and to highlight those aspects of mentoring that focus on students' competency development over time. A longitudinal research design is warranted to understand the development of mentoring styles and relationships within a PA system over time.

Clinical Supervision in Postgraduate Medical Education – Theory and Practice

Authors
Anel Wiese, University College Cork, Cork, Ireland

Deirdre Bennett, University College Cork, Cork, Ireland

Presenter:
Anel Wiese, University College Cork, Ireland

Introduction: Postgraduate medical education (PGME) provides opportunities for trainee doctors to learn their craft through supervised practice. Trainees learn as they work in tandem with more experienced doctors. Supervisors are central to many work-related activities of trainees, and the supervisory relationship plays a significant role in how trainees experience and learn from clinical experiences, including adverse outcomes in patient care. The 'apprenticeship model' partially underpins the development of trainees through engagement with a supervising expert. However, contemporary trainee supervision extends beyond the traditional apprenticeship model to compensate for the current complexities of modern health care and training structures. This doctoral research programme aimed to 1) develop a realist theory of clinical supervision that takes into account the complexity of the clinical environment and 2) explore how workplace- and specialty-specific culture and practice impact on clinical supervision.
Methodology: Two approaches within the critical realist paradigm, Realist Synthesis and Multiple Case Study, were used to address the research aims. Realist review is a theory-driven approach to synthesising research evidence and translates the findings of empirical studies into context, mechanism and outcome (CMO) configurations, which state that in a particular context a particular mechanism generates a particular outcome. Theory is generated, tested, and refined through this process. The theory developed from the realist review was used as a framework for the case study research.
Case study research guides holistic study of a complex phenomenon to increase understanding through critical analysis and clarification of contextual factors. Four medical departments were purposefully chosen to investigate clinical supervision in different contexts regarding organisation and specialty. By a two-step qualitative data analysis procedure, the findings from fieldwork were analysed through pattern-matching and cross-case analysis, within the case and across cases.
Results: Realist Synthesis of literature on clinical supervision in PGME generated a realist theory describing three interrelated processes; Supervised Participation in Practice, Mutual Observation of Practice and Dialogue

about Practice. These processes are underpinned by interconnected mechanisms which are led by the supervisor, trainee or both; Entrustment, Support Seeking, Monitoring, Modelling, Meaning Making, and Feedback. The theory also describes the contextual factors which influence these mechanisms.
For the case study, the starting point was the realist theory of clinical supervision. Fifty consultant and trainee participants representing a range of disciplines and training levels were interviewed. All proposed theoretical mechanisms were experienced across all four cases, and the results of cross-case analysis illustrated the organisation and specialty-specific circumstances which impact on trainee supervision. The findings of the case study provided an enriched, more nuanced theory and understanding of the circumstances pertaining to specific workplaces and medical specialties that shape clinical supervision and, therefore, the professional development of doctors-in-training.
Discussion and Conclusions: The most noteworthy outcomes of the research were 1) a theoretical framework of clinical supervision and 2) findings on how workplace and speciality related conditions shape clinical supervision. The findings provide an accessible framework to allow supervisors/senior doctors and trainees to conceptualise and maximise their own contribution to clinical supervision. The results identified critical contextual factors which promote and inhibit clinical supervision useful for supporting the design and planning of clinical learning environments for postgraduate medical education.

Presenter:
Glaucia Moreira, Unicamp and Unifal-MG, Campinas, Brazil

Introduction: Aiming at inclusion and seeking diversity that reflects the population, several changes have been implemented in Brazilian higher education, but there is a debate about the performance of students who benefited from affirmative action (AA) programs. In 2004, the State University of Campinas initiated the Affirmative Action and Social Inclusion Program (Paais), a bonus system applied in the second phase of the college entrance exam (CEE), offering 30 points for public high school students and 10 points for self-declared blacks, browns, or indigenous people. Objectives: To evaluate the influence of the sociodemographic characteristics, the receipt of the bonus and the student scholarship on the predictive validity of

the performance in the college entrance exam in relation to the performance in medical graduation, and in the selection for the Medical Residency Programs (MR).

Subjects and methods: A retrospective cohort study was carried out with a secondary analysis of the data of the students enrolled in the 1st year of the Medical Graduation course between the years 2005 and 2008, comparing the performance in the CEE with the coefficient of performance in the sixth (GPA6) and in the twelfth (GPA12) periods, and in the selective process for admission to MR. One-way ANOVA and Tukey's Post-hoc test, Pearson's correlation, Chi-square (X2) and Student's T-test were used for analysis, adopting 95% confidence interval, the effect size was calculated with eta-squared. 417 medical students were included, and 84 (20.1%) used bonuses.

Results: The median age was 20 years (ranging from 17 to 33), with a predominance of females (55%). Four articles are presented in the results, the first one being a bibliographical review on the topic of affirmative actions (AA) in access to higher education. The second article shows that the grade of the first phase of the college entrance examination were associated with the performance during the graduation and that the overall performance in the CEE justifies 18% in the variation of the performance at the end of the course and 10% in the selection for MR, while Portuguese correlates moderately with GPA12 and mainly mathematics, physics and geography, with the performance in the MR exam. The third article shows that scholarship students had lower family incomes and improved academic performance during the medical course. The fourth article shows that bonus participants at medical school admission were older, had lower income and schooling of their parents, and presented lower GPA6, but similar performance for GPA12 and in the MR selection exam. Factor associated with GPA6 and GPA12, but not MR included maternal schooling, scholarship, lower age and most subjects for medical school admission.

Conclusion: Students receiving bonus at medical school selection exam completed the course under equivalent conditions to others and similar chances of admission to MR. It is suggested that the involvement with activities that allow the scholarship to be received during graduation, particularly for scientific initiation, contribute to the observed recovery among lower-income students.

Presenter:
Marwa Schumann, Alexandria Faculty of Medicine, Alexandria University, Egypt and Dieter Scheffner Center for Medical Education and Educational Research, Charité - Universitätsmedizin Berlin, Free and Humboldt Universitiy Berlin, Germany

Introduction: "Mass migration" is a term that has recently emerged in the medical education literature to reflect the magnitude of the migration phenomenon of health care professionals in general and physicians in particular. This form of migration has significant impact on the healthcare systems in source as well as in destination countries. Studies one so far concentrated mainly on the integration process itself, namely that of the target country's patients and physicians and the degree of satisfaction or dissatisfaction with migrating physicians.

This study focuses on the other side of the coin; the perspective of the migrating physicians and compare their expectations before and after migration. This 2 phase study is one of the few studies that compares the situation before and after migration; we explored the driving forces behind physicians' migration to Germany and compared them to the reality experienced after migration. We also explored barriers and facilitators of integration.

Methods: This qualitative study is based on social constructivism epistemology; we explored the situation of foreign physicians as "being constructed through social interaction". Focus group discussions and personal interviews were conducted in 2 phases:

Phase 1 (February till Mai 2017 in Egypt): Physicians attending the "preparatory course for German medical language examination at the Goethe Institute and the Medical Syndicate were invited to focus group discussions. For logistical reasons this phase included Egyptian physicians as it was very difficult to reach other nationalities of migrating physicians while they were still in their home countries.

Phase 2 (July 2017 till September 2017 in Germany): Foreign physicians working in different locations in Germany were invited for focus group discussions and interviews. This phase included physicians from Egypt, Iran, Syria, Jordan and Palestine.

After being audio- recorded, data was transcribed, translated and analyzed using framework analysis. For construction of the framework, we drew upon a priori items as well as emergent issues raised by the study participants. Coding was done using ATLAS-ti (a computerized indexing system).

Results: In phase 1, five focus groups were held a total of 18 participants from Egypt; 12 residents from different hospitals and geographic locations and 6 undergraduate medical students. In phase 2, one focus group discussion and 9 interviews were conducted with a total of 14

migrating residents working in different geographic locations in Germany.

Analysis of phase 1 data showed that the most significant driving force of migration to Germany was the relatively easy re-accreditation procedures. This adds a novel dimension to the already described in the literature such as the financial, professional and general pull and push factors

Analysis of phase 2 showed that almost all the expectations of the migrations physicians have been successfully met; however there was some disappointment regarding professional aspects; unequal learning opportunities and variable quality of training depending on the size and location of the hospital, the specialty and the personal connections with hospital staff.

Discussion & Conclusions: Egyptian physicians' migration is significantly shaped by medical licensing requirements in destination countries in addition to the so far reported pull and push factors. There is need for supporting integration program of foreign physicians with emphasis on cross-cultural training in the healthcare setting.

Presenter:
Lisette Hvid Hovgaard, Copenhagen Academy for Medical Education and Simulation (CAMES), Copenhagen, Denmark

Background: The use of robotic surgery for minimally invasive procedures has increased considerably over the last decade. Robotic surgery has potential advantages compared to laparoscopic surgery but also requires new skills. Virtual reality (VR) simulation can be used to facilitate acquisition of these skills through proficiency-based training—and this is dependent on solid validity evidence. This study aims to systematically collect validity evidence according to Messick's framework of validity for a simulation-based test for procedural competency in VR robotic simulation and establish a credible pass/fail standard for future mastery learning.
Method: Eleven novice gynaecological surgeons without prior robotic experience and 11 experienced gynaecological robotic surgeons were recruited. After familiarization with the VR simulator, participants completed six repetitions of the module 'Guided Vaginal Cuff Closure'. Validity evidence was investigated for 18 preselected simulator metrics (e.g. time, path length and errors). Internal consistency was assessed using Cronbach's alpha and a composite score from 0 to 100 was calculated based on the metrics with significant discriminative ability between the two groups. Finally, a pass/fail standard was established using the contrasting groups' method.
Results: The experienced surgeons significantly outperformed the novice surgeons on 6/18 metrics. Internal consistency (Cronbach's alpha) was 0.58. The experienced surgeons' mean composite score for all six repetitions were significantly better than the novice surgeons' (76.1 vs. 63.0, respectively, p<0.001). A pass/fail standard of 75/100 was established. Four novice surgeons passed this standard (false positives) and three experienced surgeons failed (false negatives).
Discussion & Conclusion: Only a minority of the built-in metrics could discriminate between novices and experienced surgeons, emphasising the need to collect validity evidence when setting standards in simulation-based skills training. The established pass/fail standard resulted in failing 3/11 experienced surgeons. However, it is important to use a representative sample of proficient robotic surgeons, otherwise the established standard could be either unachievable or too low. In conclusion, we have systematically gathered validity evidence for a simulation-based test for procedural robotic surgical competency and established a credible pass/fail standard for future proficiency-based training.
Take-home message: Validity evidence is important for standard setting in simulation-based skills training.

Presenter:
Abdullatif Aydın, MRC Centre for Transplantation, Guy's Hospital, King's College London, UK

Background: There have been considerable developments and subsequent use of simulation models in urology. However, utilising different modalities within a curriculum is suggested to be much more effective. The international SIMULATE curriculum for ureterorenoscopy (URS) employs the most evidence-based validated training models, in a structured fashion. The aim of this study is to assess the validity and transferability of the SIMULATE URS training curriculum.
Method: Junior urology trainees with less than 10 URS experience (n=46) were invited for training using the curriculum on five separate occasions in Manchester (n=15), Salzburg (n=15), Hokkaido (n=5), Guangzhou (n=9) and London (n=4). Participants performed cases on the URO Mentor VR simulator (Simbionix) and also the Uro-Scopic Trainer (Limbs & Things) and Advanced Scope Trainer (Mediskills) bench models. The first cohort were also given the opportunity to use fresh frozen cadavers with fluoroscopy. Performances were evaluated throughout the sessions using OSATS, by endourology and education specialists, all of whom were also invited for an evaluation survey following training. Construct validity was

assessed using a One-way ANOVA test to evaluate the level of progress throughout the curriculum. Trainees were followed up at their institutions and assessed for technical skills, using OSATS to evaluate transfer validity. Participants rated that the training significantly improved their skills (mean: 4.2/5) and that they gained transferrable skills (mean: 4.2/5). A One-way ANOVA test revealed significant improvement in both semi-rigid (p=0.0005) and flexible URS (p=0.0266) skills, with consecutive cases throughout the curriculum and the first OR performance (n=13). Furthermore, there was no difference in OR performance between the cadaveric (n=9) and non-cadaveric groups (n=12; p=0.6872). Of the used modalities, dry-lab models scored the highest with regards to instrument handling, laser stone fragmentation and stone extraction whilst C-arm control was the most highly rated aspect of fresh frozen cadavers (mean: 4.7/5).
The SIMULATE URS curriculum revealed face, content, construct and transfer validity. Participants are currently being followed up in the operating room for 25 URS procedures and will compared to an arm with no simulation experience, as part of the on-going SIMULATE randomised controlled trial.

Diving In Hands First – A New Approach to Training in Undergraduate Medical Education

Authors
Rajiv Shah
Alexandra Davidson
Michael Arnason
Anita Shah
Nicolette Caccia
Eliane M. Shore

Presenter:
Rajiv Shah, University of Toronto, Canada

Background: Clerkship students do not currently benefit from formalized hands-on training during their OB/GYN rotation at University of Toronto; however, they participate in multiple procedures. It has been suggested that incorporating technical skills practice into teaching sessions is not only superior to traditional lectures for delivering the material, but can also improve patient care and safety at the bedside. As a result, we aimed to introduce a perineal repair (PR) workshop with instruction on instrument and hand knot-tying into our curriculum. We piloted a PR workshop for clinical clerks in order to demonstrate perineal anatomy, laceration repair as well as suturing and knot-tying. Prior to the workshop, students' (n=82) baseline knowledge was assessed with a pre-test and their knot-tying speeds were recorded. Students were then given a tutorial on perineal anatomy and laceration repair as well as knot-tying. Following a small group demonstration, students practiced their skills on an inexpensive perineal model (that we created) and were provided with individualized instruction and feedback. Knowledge and knot-tying speeds were then reassessed. There were statistically significant improvements in both knowledge of perineal anatomy, lacerations and repair techniques (51.0%, 71.0%, p<0.05) as well as technical skills

with respect to knot-tying speeds (259s, 197s, p<0.05) after the workshop. Importantly, 94% of students agreed or strongly agreed that this method of learning was more enjoyable than and superior to traditional methods of teaching.
Results & Discussion: Increased need for practical skills and hands-on training has led to a movement towards incorporating simulation into undergraduate medical education. Patients have also been shown to be significantly more accepting of medical students performing procedures on them if the students have had previous practice with simulation. Our results support that hands-on practice in a simulated environment may bridge the gap between formalized teaching and clinical practice.
Conclusion: This highly reproducible and inexpensive teaching model ensures that the workshop is feasible for other health professionals (ie. Midwifery, family practice). It can be easily duplicated and incorporated into teaching curricula locally and internationally for the purposes of education and ultimately improved patient safety.

Li Felländer-Tsai, Center for Advanced Medical Simulation and Training, Karolinska University Hospital, Stockholm, Sweden

Presenter:
Cecilia Escher, Center for Advanced Medical Simulation and Training, Karolinska University Hospital, Stockholm, Sweden

Background: Increasing task complexity demanding more specialized staff and advanced equipment is a challenge to teamwork in multi professional operating room (OR) teams. Studies have pointed at non-proficient non-technical skills as a cause of adverse events and simulation based teamwork training as a possibility for improvement. The aim of this study was to find out how OR staff perceived a simulation based teamwork-training course and explore possibilities for transfer of learning from the training to the OR.
Method: In a prospective qualitative intervention study 32 experienced OR staff including 5 professions (surgeons, anaesthetists, OR nurses, nurse anaesthetists and nurse assistants) took part in a full day simulation based teamwork-training course with non-technical skills training goals. Data was collected during 5 focus group interviews

that were recorded. Transcripts were analyzed with thematic analysis.

Results: The screen between the sterile field and anaesthesia was related to as physical barrier and a metaphor for a divided OR team. Non-technical skills taught during the training were mentioned as a possibility to reduce this barrier.

"It seems like a time-out is a very good method to reduce the barrier between anaesthesia and surgery" (nurse anaesthetist).

Participants appreciated training in their own professional roles in a full authentic team. They expressed that team skills learned during the course would be possible to transfer to their workplace. Barriers to transfer of learning included organizational factors at the OR department and the fact that not all staff participated.

Discussion: The results indicate that OR staff perceive OR teams as divided into sub-teams which is in line both with Makary´s findings of diverse views on quality of collaboration by the OR professions and an ongoing discussion about the adverse effects of the prevailing professional silos in healthcare organizations and training.

Conclusion: A divided team can imply inferior conditions for good teamwork and a risk to patient safety. Experienced OR staff describe the screen between the sterile field and anaesthesia as a communication barrier indicating a possible risk to patient safety. Simulation based teamwork training offers a possibility to reduce the barrier.

Sustainable Open inguinal hernia repair simulation model: from residency training to global surgery – a 10 year learning curve

Authors

Parvathi Balachandran, Mayo Clinic, Rochester, USA
Mohammad Zeb, Mayo Clinic, Rochester, USA
Nicholas J. Prabhakar, Mayo Clinic, Rochester, USA
David R. Farley, Mayo Clinic, Rochester, USA

Presenter:
Parvathi Balachandran, Mayo Clinic, Rochester, USA

Background: The cost of simulation models available for practicing open inguinal hernia repair (IHR) is ~$500. The technical and economic sustainability of IHR models is very low in training surgery residents. We built a cost and resource-efficient open IHR model and introduced it into our education curriculum.

Method: We used low-cost fabric, yarn, and tubing to build anatomically accurate, reusable open IHR models. An instructor-led session of open IHR using the models with 30 surgical interns was conducted early on in each academic year. Thereafter, the models were available to trainees for practice. We biannually assessed the residents' knowledge of groin anatomy and surgical skills to accurately complete an open IHR. With proven benefits from this pilot project, we used the model to help train surgeons in Ghana, Africa.

Discussion: The materials cost less than $3 per model and took 20 minutes to create. On serial assessments, residents showed significant improvement in groin

anatomy knowledge (mean change 18%, p<0.01) and open IHR skills (42%, p=0.04). We used this model in 2017 in a comprehensive workshop to effectively assist 35 surgeons in Ghana learning the Lichtenstein IHR.

Conclusion: Inguinal hernia is a global health problem; it is crucial for all surgery trainees to be proficient in repairing inguinal herniae. A sustainable, reusable, low-cost model is essential for hands-on training and practice. We propose our model of IHR for surgical education programs, especially those with low resource availability.

Take-home messages: Simulation groin models allow trainees to improve their knowledge and skills in open IHR. Low-cost simulation models can assist worldwide surgical training for IHR.

Teaching in the robotic environment: Use of alternative approaches to guide operative instruction

Authors

Courtney A. Green
Simon Chu
Emily Huang
Hueylan Chern
Patricia O'Sullivan

Presenter:
Courtney Green, University of California San Francisco, USA

Background: The rapid growth of robotic-assisted surgery has prompted surgical residency programs to develop appropriate curricula. However, the unique learning environment in robotic operating rooms challenges educators to determine the most appropriate ways to instruct surgical residents. As a needs assessment for faculty development, we observed attending surgeons' instructional language and behaviors as they guided residents through robotic dissection of live tissue.

Method: In June 2017, six senior surgical residents participated in a four-hour operative session using live porcine tissue and the da Vinci Surgical System (Intuitive Surgical, Sunnyvale CA). Academic robotic surgeons provided instruction and were restricted to teaching without manipulating the operative console. Three observers documented the language, gestures and behaviors occurring at three different stations, and at a fourth station, obtained video and audio recordings of the instructional interaction. Afterwards, instructors and residents met in separate focus groups. We used qualitative content analysis to summarize the type and frequency of teaching behaviors. Focus group information helped to clarify this analysis. We compared these results to an existing taxonomy of 16 operative teaching behaviors in open and laparoscopic surgery.

Results: The instructors came from four different specialties with up to eight years of experience. They used 11 of the 16 open and laparoscopic teaching behaviors. These 11 behaviors did not vary by surgical specialty or experience, but frequency of use differed due to both relevance and need to expand use of behaviors than observed in laparoscopic and open surgical instruction. Additionally, robotic-specific behaviors were identified

that involved disengaging the resident from the operative console for either onscreen direction or for gesturing with verbal instruction. These unique disengaging behaviors were highlighted by the focus groups as essential for guiding operative performance with the robot.

Conclusion: Robotic instruction uses a different set of instructional approaches compared to open and laparoscopic surgery, relying extensively on verbalization to address a learner at a console. In this study, additional behaviors emerged impelled by the physical separation of the robotic environment. Future faculty development in this area will need to emphasize specific verbal and physical instruction.

The burnout epidemic: Who is accountable for creating safe physician work-environments and cultures that reduce burnout and promote resiliency?

Authors
Charlene M. Dewey
Teri Turner

Presenter: Charlene Dewey, Vanderbilt University Medical Center, Vanderbilt University School of Medicine, Nashville, USA

Background: Burnout has no borders and is prevalent in physicians in the United States, Canada, and Europe as well as other countries. Maslach identifies six sources of burnout as work overload, lack of control, values conflict, insufficient reward, unfairness and a breakdown of community. Maslach acknowledges the root of burnout is the mismatch between the nature of the job and the nature of the person who does the job. While the literature continues to grow identifying rates of burnout from students to physicians, few papers focus on the accountability of the healthcare system or the institution. The Center for Professional Health and the new National Academies of Medicine pose models that identify the opposing systems that increase burnout. The intrinsic/internal system of the individual and its relationship with the extrinsic/external system or culture/work environment is the center of this mismatch. Both play significant roles in causing or reducing burnout. We believe individuals can be coached to reduce risk for burnout and to build resiliency to improve their overall well-being, but this can be useless if the culture/work environment is unhealthy. Shanafelt outlined nine system approaches to combating burnout for physicians, but none have been adequately research. So our questions are these: Who or what is the underlying cause of an unhealthy culture/work environment? How does it develop? Who is accountable for the culture? What measures are used to assess it? Who do physicians hold accountable for assuring a safe work environment that builds resiliency and reduces burnout? Is it the state, government, national or other world health organizations? And lastly, how do we as physicians go about changing an institutional culture? In this session we pose possible solutions but look to the greater audience for answers that reach across borders to all practicing physicians.

Jen-feng Liang, Taipei University, Taipei, Taiwan

Presenter: Geeta Singhal, Baylor College of Medicine, Houston, USA

Background: The concept of "second victim" refers to a care provider who directly or indirectly contributes to the occurrence of an adverse event which leads to psychological effects that disrupt the provider's professional and personal life, and the ability to deliver high-quality, safe care. Anxiety, depression, sleep disturbance, fear and worry are reported have been reported as well as shame, guilt, loss of self confidence, and feelings of incompetence and worthlessness. The severity of these effects is related to the degree of patient harm and the clinician's experience of the investigation process; they are more pronounced with more serious incidents. Stress, anxiety and sleep disturbance may affect clinical decision making, job performance and peer relationships. This point of view aims to address these concepts and offer strategies to mitigate negative feelings that care providers may experience after an adverse event. This interactive and fast paced point off view will offer: personal experiences from the moderator; encourage reflection from participants; and review state-of-the–art programs globally to support care providers and, finally, review strategies for participants to help themselves and others when they are feeling that they are a "second victim."

Learning Objectives:
- Participants will be apprised of the "second victim" concept.
- We will cover the concept via large group discussion, review of the literature and reflection. Outcome will be raised awareness of these concepts.
- Reflect upon how second victim has impacted the participants on a personal level.
- Outcomes are enhanced personal awareness of this concept. This will be covered in a facilitated small group format.
- Review of national initiatives across US hospitals to address the needs of second victim.
- The outcome will be to update participants about national initiatives and programs to address the concept. The objective will be met via interactive discussion and showcasing of national programs.

Care, learning and assessment by the patient. Can they go together in a longitudinal relationship with a junior doctor?

Authors
Duncan MacKinnon Australian National University Medical School Canberra Australia
Katrina Anderson Australian National University Medical School Canberra Australia

Presenter: Duncan MacKinnon, Australian National University Medical School, Canberra, Australia

Background: In junior doctor training whether at resident or more senior levels patients have traditionally not been considered an important contributor to learning and assessment. The paternalistic nature of the doctor patient relationship has not acknowledged patients as part of the teaching team. With recent developments in work place based assessments patients have started to be involved in structured feedback but in a de-identified way.
In the hospital environment where patients are acutely unwell junior doctors conventionally do not have ongoing relationships with patients. In this environment patients tend to be very sick and therefore compliant, often passive and even submissive. In the community environment the balance of power can be quite different and patients are active participants in the doctor patient relationship.
In 2018 we have implemented a pilot trial of allocating patients with complex chronic disease to a conditionally registered junior doctor for 6 months. This is taking place in a supervised General Practice environment where we have asked the patient to be both patient and assessor. This is a new and novel approach that seeks to measure if this is a valid and acceptable model as part of training. The discussion in this "point of view" will explore the concept of patients having a formal role in the assessment of junior doctor performance. We would like to get opinions around the ethics, pitfalls and validity of this concept and hear form others who may have already implemented similar models**.**

Using prescription stimulants to combat fatigue: How did we end up here?

Authors
Taryn Taylor, Centre for Education Research & Innovation, London, Canada

Presenter: Taryn Taylor, Centre for Education Research & Innovation, London, Canada

Background: Existing efforts to address trainee fatigue have fallen perilously short of our expectations. Duty hour restrictions have proven insufficient, partly because they represent an over-simplified solution to a complex problem. This complexity is compounded by our collective reluctance to talk openly about fatigue, especially fatigue-related impairment from sleep deprivation. Embracing our own personal vulnerability lies outside the professional ethos. We have created the perfect storm, leading some trainees to rely on prescription stimulant use to cope with their exhaustion or maintain productivity. Often this is done discretely, perhaps even shamefully, making it difficult to empirically study the frequency of this practice. What little evidence we do have likely underestimates its prevalence, owing to social desirability bias.
While it is tempting to dismiss prescription stimulant use as an exceptional circumstance involving few trainees, we do so at our own peril. This should instead prompt us to reconsider our approach to fatigue in medical education. For too long, we have misled trainees to believe that fatigue from sleep deprivation can simply be overcome by sufficient motivation and perseverance on their part. Those who fail to do so, blame themselves. Perpetuating this flawed belief about fatigue is easier than ensuring sufficient opportunities for trainees to sleep without generating other problems such as work compression, human resource shortages, and prolonged length of training. Similarly, prescription stimulant use allows fatigue to remain an individual burden and demands nothing from the training environment. Viable solutions must acknowledge the dangers of fatigued individuals without relying solely on them to fix the problem. We are long overdue for a cultural shift in which we stop glorifying sleep deprivation in the supposed interests of patient care or education and seek out innovative, system-focused solutions. Complacency is no longer an option.

8H5 (3685)
Let me tell you about yesterday's catastrophe: the power of concrete stories of failure

Authors
Rachel Lewin, University of California Los Angeles, Los Angeles, USA

Presenter: Rachel Lewin, University of California, Los Angeles, USA

Background: Everyone fails. Doctors, patients, nurses, educators--everyone. But we never talk about it. We talk about it abstractly--endorsing the power of failure from plenary stages, tweeting about how FAIL stands for "first attempt in learning"--but it is very rare to hear someone tell a concrete story of failure. This is especially true in medicine, where failure has potentially dire consequences. Failure is a key component of learning and improving, and medicine is a field in which everyone should always be learning. Every patient is different, which means there isn't ever one "right" answer. Medicine should encourage creativity and novel ideas, but to do so, we must become comfortable with the fact that sometimes we will fail. Becoming comfortable with sometimes failing requires talking about it. It requires publicly telling stories of failure. This makes people uncomfortable, because this is not something that we've been socialized to do, but mostly it makes it possible for others to share stories about failure, feel less alone, and aim higher on their next attempt.
Each story of failure is the story of something that was tried. When we share these stories, we make group success possible. We make it possible to advance. Real change--in culture, in care, in humanity--requires becoming comfortable with failure.
We've all failed and been too embarrassed to talk about it. And we've all identified with someone else who has failed, and been comforted by stories of how others managed similar challenges. But we have not yet capitalized on the power of these individual experiences for group progress. Discussion of failure has huge implications on our astronomical rates of burnout and isolation.
This talk is a call to action: talk about your failures with your friends and colleagues. Find your way to greater confidence, creativity, and professional success through stories of failure.

Successful Failure: Building Growth Mindset, Grit, and Resilience

Authors
Teri Turner, Baylor College of Medicine, Houston, TX, USA
Melissa Carbajal, Baylor College of Medicine, Houston, TX, USA

Presenter: Teri Turner, Baylor College of Medicine, Houston, USA

Background: As a part of the interview process, I will ask trainees, "Could you tell me about a time you failed." Although failure is universal, some trainees have "never" failed and are unable (or unwilling) to describe any situation in which they were not successful. Why are people so afraid of failure? Failure is not just a part of life, it's essential to growth and success. We oftentimes learn the most from our failures. For example, Apollo 13 was termed NASA's most "successful failure" because of the experience gained in rescuing the crew despite several system failures and setbacks. But the term "successful failure" is an oxymoron and the two words are polar opposites. Can one really fail and still be successful? The question isn't whether or not we are going to fail, but how we deal with our failures. Do we accept them as opportunities to adjust our approach and try again, to risk trying to learn, to grow, to develop in new ways? Or do we take our failures as crushing blows and give up. There has recently been an interest in the concepts of a growth mindset, grit, and building resiliency. This session will describe several methods to turn failure into learning. We want to teach learners to give themselves a "second score;" (how one reacts and learns from failure) and promote behaviors such as; taking ownership (not blame) for mistakes, and setting realistic expectations. We must communicate growth in performance over time and criterion-referenced assessment instead of comparison to others. We also should role model and teach that failure is not an endpoint but instead is a "not yet." The initial evaluation is not the end of the story. It's the start of the second story about the meaning one makes of the experience in one's life.

The dilemma of residents-in-crisis: The tension between residents' psychological welfare, institutional alignments and service provision

Authors

Wen Phei Lim, Psychological Medicine, Tan Tock Seng Hospital, Singapore
Faith LA Chia, Internal Medicine Residency, National Healthcare Group, Singapore
Wee Khoon Ng, Internal Medicine Residency, National Healthcare Group, Singapore

Presenter: Wen Phei Lim, Tan Tock Seng Hospital, Singapore,

Background: Doctors-in-training now practice in a challenging era in healthcare. With rising healthcare costs, limited residency opportunities, and a competitive employment climate, doctors struggle to stay afloat in a system that demands safe care, yet puts them at risk of sleep deprivation, burnout, substance abuse, depression and suicide.

Medicine itself is a hotbed for the development of psychological issues in doctors. Doctors are often second victims in sentinel events, which are associated with feelings of guilt, disillusionment and trauma. The process of medical litigation places doctors under scrutiny, and at the expense of the court of public opinion. Those who eventually need mental health support hesitate to do so, for fear of lack of confidentiality, stigma and its influence on career development, and the risk of losing medical licensure.

To help academic institutions recognise and assess psychological distress in residents, mental healthcare providers like counsellors, psychologists and psychiatrists are sometimes nominated as faculty members of residency programmes – but even then, a litany of other challenges arise:

- In a faculty member who is also a mental healthcare provider – when does one wear the faculty hat, and what other circumstances require them to don the clinician's hat?
- Is it ethical to perform a mental state assessment on residents, without providing due disclosure of the faculty's intent, and obtaining explicit consent?
- How do institutions manage information on a resident's psychological state, without compromising the accountability and standards of training, yet protect the resident's medical confidentiality?
- In residents who require psychological intervention, should the institution bear responsibility in providing the relevant resources as part of staff welfare?

The authors would like to invite the audience to a discourse on the above issues, as they reflect the current challenges faced in their institution. Deidentified case studies will be presented to guide the discussion.

The Good, the Bad and the Ugly in CPD Programs

Authors

Helena P Filipe, International Council of Ophthalmology, Hospital das Forças Armadas/PL-EMGFA, Hospital dos SAMS, Lisboa, Portugal
Heather G Mack, International Council of Ophthalmology, University of Melbourne, Melbourne, Australia

Presenter: Helena Filipe, International Council of Ophthalmology, Hospital das Forças Armadas/PL-EMGFA, Hospital dos SAMS, Lisboa, Portugal

Background: Though generally accepted as professionally necessary there is still wide diversity in how continuing professional development (CPD) is being led. There are regions where the concept is emerging and others where sophisticated structured systems regularly steer program refinement. CPD is evolving to build upon medical education research and integrate continuing education informed by epidemiology data beyond individual gap analysis. Evaluation anchors CPD system self-regulation, appropriate continuing education, and guides CPD educators to meet the educational needs of the healthcare workforce and systems.

Within such complex framework how should physicians consistently demonstrate their lifelong learning and professional accountability? What will be the best strategies to consider their needs and aspirations so they can feel fit to the job?

Both externally regulated, credit-based programs and individual reflective-portfolio-based CPD systems are currently run with both sides having passionate defenders and opponents.

We recommend a CPD model combining the best of both. The regulated system with spent learning hour equivalent to one credit acts as a universal currency and facilitates systems' harmonization facilitating healthcare workforce mobility and patient safety.

On the other hand, keeping an updated individual portfolio demonstrating the physician's course of action upon reflection, achievements and assessment tools' results (including the 360° evaluation and clinical audits) is intended to encourage metacognition and better prepared professionals.

To maintain the core of both methods and not falling in an intricate matrix of purposeless paperwork, we emphasize the role of professional societies and colleges. By representing healthcare professionals these, can a) interact on their behalf with healthcare authorities, universities and employers, b) inform and facilitate professionals to understand CPD requirements c) assist in developing appropriate individual needs analysis, d) deliver appropriate CPD education events and e) play a relevant role linking the patient voice to all CPD stakeholders.

Introducing KAANBAL for clinical competence assessment: A digital mobile tool

Authors

Cesar Alberto Lucio Ramírez, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Juan Pablo Nigenda Alvarez, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Silvia Lizett Olivares Olivares, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Mildred Vanessa López Cabrera, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
José Antonio Díaz Elizondo, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Jorge E. Valdez García, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Presenter:
Cesar Alberto Lucio Ramírez, Tecnologico de Monterrey, School of Medicine and Health Sciences, Monterrey, Mexico

Background: Medical schools and healthcare institutions require evidence from students' clinical competence learning and progress. A single evaluation based on one particular observation does not guarantee timely feedback for learners, faculty and authorities for continuous improvement. The objective of this project was to design and implement a mobile system to assess clinical competence progress for medical students during several clinical clerkship rotations.
Method: A mobile system was constructed with local software developers. Before starting its design, medical specialists from several disciplines were invited to participate on five focus groups to gather their impressions and needs regarding the clinical competence assessment. The most popular problems described by participants were: a) one single final grade lacking feedback for students' improvement, b) absence of objectiveness from examiners, and c) perfect scores to every student given only upon professional behavior. An app called KAANBAL was designed to be available for most devices. It includes customizable rubrics that allows real time feedback and full reports for both students and faculty. This app allows multiple assessments from different examiners across time. Student are invited to assess faculty performance.
Before implementation, a faculty development training workshop was delivered for clinical educators to instruct them about medical assessment basics and the use of the mobile tool.
Results: A total of 2,958 clinical skills assessments were done in a 12-month period to assess 157 students. Students went from receiving on average 8 assessments to 18 per year. A survey for the 250 faculty that participated showed that 88% considered KANBAAL user friendly, 73% appraised feedback, 75% reported student engagement and 87% of faculty agreed that this system helped them improve their clinical teaching.
Discussion & Conclusion: Increasing the number of clinical skill assessments improves reliability of the scores and promotes learning for better patient care. KAANBAL has the potential to encourage continuous improvement on performance applying workplace based assessments. Simplification and automatization of the clinical skills assessment process can lead to more active participation. Medical schools and health care institutions have timely information for decision making.

Does a clinical skills assessment practice session improve low achieving students' performance on the USA Medical Examination® (USMLE) Step 2 Clinical Skills (CS) Examination?

Authors

Kimberly Kirkland, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
Joy Checa, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
Robert Hecht, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
Steve Ash, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
William Behrns, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles
Julie Taylor, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles

Presenter:
Kimberly Kirkland, American University of the Caribbean School of Medicine, Sint Maarten, Netherlands Antilles

Background: Lower academic performance and lower USMLE Step 1 scores are associated with poor USMLE Step 2 CS outcomes. At American University of the Caribbean School of Medicine (AUC), passing an optional 8-station practice Clinical Skills Assessment (CSA) is predictive of passing the CS. In this study, we focus on lower achieving students to determine if their performance on the CS was positively impacted by completion of the CSA.
Method: At AUC, 1339 students between March 2014 and September 2017 were categorized as "high achieving" or "low achieving" based on their performance on the USMLE Step 1 (< or > 215) or on GPA (< or > 83.8). A logistic regression model was used. Categorical variable of interest was the CS outcome; independent variables were CSA attendance and performance, GPA, and Step 1 score.
Results: Performance on the CS of a cohort of 1339 students over a three-year period was analysed. Low academic performance and low Step 1 performance were found to be independently predictive of poor CS performance (P values: <0.001 and 0.002 respectively). Although the CSA was not found to be statistically significant for students with low achieving GPAs, it was approaching significance for students with low achieving Step 1 scores (P value 0.058). It's likely that more data could prove this effect to be statistically significant.

Clinical deans need objective guidance to drive investment of resources to improve medical students' success.

Conclusions: At our institution as at others, low academic and USMLE Step 1 performance is associated with poor outcomes on the CS. While a CSA practice session seems to have a positive impact on CS performance in low achieving Step 1 test-takers, the results were not significant. A student taking the CS soon after completing CSA may see a higher effect than a student with several months between the exams; follow-up analysis may be valuable to determine the impact of timing of the CSA on CS performance.

Further investigation is needed before resources are invested in mandating the CSA for low achieving students.

Complex Intrinsic Skill Competencies: A Fit-for-Purpose Multiple Component Assessment Tool

Authors
Debra Sibbald, Touchstone Institute, Toronto, Canada
Sandra Monteiro, Touchstone Institute, Toronto, Canada

Presenter:
Debra Sibbald, Touchstone Institute, Toronto, Canada

Background: Intrinsic skill (non-expert) competencies are important capacities for health care professionals, but they cannot be measured using traditional methods. Such interdependent abilities are often demonstrated through integrated patterns of behaviours. Interview formats are common but less reliable in predicting performance and are limited in uncovering the interplay of skills. Few studies have examined the utility of a multi-perspective approach combining validated assessment approaches to measure intrinsic skills.

Method: An innovative screening tool was designed at Touchstone Institute to evaluate non-expert CanMEDS roles in practice-ready family practitioners using multiple components of standardized performance and reflective assessments. The performance component consists of eight structured short stations. In seven, candidates respond to objective and reflective questions related to challenging scenarios assessing interpersonal, cognitive and decision-making skills. The eighth station uses an interview format. On all stations, a physician, nurse and standardized client rate each candidate using numeric global ratings for overall performance and entrustment. Raters also record written comments to capture qualitative assessments. The second component is a tablet questionnaire combining two validated instruments measuring personal reflection ability and insights: the Groningen Reflection Ability Scale (GRAS) and the Self-Reflection and Insight Scale (SRIS). A pilot test was conducted as a validation study, comparing Canadian trained family medicine practitioners to residents. Scores were evaluated for inter-rater reliability, and internal consistency.

Results: Internal consistency was high (a= 0.93) with acceptable means for overall and for entrustment scales (3.5/5). There were no meaningful differences between raters, as scores were highly correlated across all 3 raters (r > 0.7). Written comments were infrequent and primarily highlighted unprofessional behaviours. These candidates also received lower scores. The self-reflection ability score was not correlated with overall performance on the 8 stations (r = 0.039), suggesting unique constructs.

Conclusion: This design shows promise as a screening assessment, providing evidence of complex competencies derived through multiple measures and multiple perspectives.

This innovative tool of pattern-based intrinsic skills offers rich, multi-disciplinary assessments of intrinsic skills and will be implemented in the selection of practice-ready international family physicians.

8I5 (1706)
Setting conjunctive standards in performance assessments: exploring the why and the how

Authors
Matt Homer
Dave Swanson
Godfrey Pell

Presenter:
Matt Homer, University of Leeds, UK

Background: Many institutions require students to achieve a minimum number of OSCE stations passed (MNSP) in addition to the aggregate pass mark. The rationale is that such conjunctive standards prevent excessive degrees of compensation across an assessment (i.e. students doing very well on a few stations, but poorly on many others). However, in the literature, we find there is generally a lack of underpinning empirical and theoretical evidence to support this approach, and the common practice of pre-determining a MNSP arguably lacks defensibility.

Method: We have surveyed the relevant literature to consider the psychometric arguments for and against such conjunctive standards. We have also developed a methodology for the setting of a post hoc conjunctive standard (MNSP) based on assessment outcomes. To do this we have used a methodology that is similar to that used in borderline regression standard setting - we use logistic regression to predict probabilities of passing stations based on global grades, and then aggregate these for the borderline group across the OSCE.

Results: There are psychometric arguments for and against the use of conjunctive standards in OSCES, but from a pragmatic point of view it is clear that many stakeholders approve and value this approach. Our work suggests that there is some variation in an empirically set number-of-stations-passed standard, but that few students fail to reach this standard in OSCEs.

Discussion: We have shown that it is possible to develop methods for measuring levels of compensation, and for producing a defensible MNSP standard. However, we find that the prevalence of excessive compensation is low, with few students failing based on the empirically set conjunctive standard. The underlying assumptions employed, and the implications for assessment policy of these findings, will be discussed.

Conclusion: Defensibility of decision-making in high stakes assessments is an absolute necessity. Ideally, conjunctive standards need to be justified alongside other assessment polices such the minimising of false positives via SEMs. However, taking into account wider policy issues, stakeholder views and the underlying methodological assumptions are also essential when doing this.

A Study on Standard-Setting for the Application of Criterion-referenced Evaluation in Core Clinical Clerkship Summative Evaluation

Authors
Na Jin Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea
Young-Min Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea
Jaseong Koo, The Catholic University of Korea, College of Medicine, Seoul, South Korea
Sung A Lee, The Catholic University of Korea, College of Medicine, Seoul, South Korea
Younjung Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea

Presenter:
Na Jin Kim, The Catholic University of Korea, College of Medicine, Seoul, South Korea

Background: Evaluation of clinical skill performance ability conducted in medical colleges of Korea is mostly based on norm-referenced scores to give a pass/ non-pass. This study recognizes the issues with clinical skill evaluation as a form of norm-referenced evaluation, and seeks to apply criterion-referenced evaluation in core clinical clerkship summative evaluation.

Method: With 96 medical students enrolled in their third year as of end of semester in 2017 as subjects, 6 CPX and 6 OSCE stations were conducted. 6 panelists were selected and trained individually. Applying the Modified Angoff and the Hofstee methods, a cut score was calculated and the process and results were both evaluated. It was reviewed internal, external and procedural validity of the score in terms of its feasibility.

Results: The results showed that CPX cut scores for cases ranged 43.8~65.3 by Angoff or 41.0~68.0 by Hofstee. The OSCE scores ranged 69.6~77.5 by Angoff and 66.0~89.0 by Hofstee. Intrapanelist consistency showed an overall high at .75(Kappa) or higher, and Interpanelist consistency was also high at .60 or higher. Inter-method consistency was high at .70. A questionnaire conducted to evaluate the procedural criteria found that the degree of understanding theoretical concepts and principles were relatively high, as well as validity of process. Moreover, the reasonableness of cut score was rated relatively positively. Overall, cut scores were lower or of similar level when the Angoff method was used, as opposed to the Hofstee method. To compile conflicting results into one criterion, the final cut score was set to be the mean value of the two methods, and the total score of 900(CPX 600/OSCE 300) was taken into account. This led to a non-pass rate of 29.1%. Further research is needed to: 1. A study on whether the same standard setting results should be applied in every year; 2. A study on predictive validity.

Conclusion: While comparative studies on standard setting using traditional methods and compromised methods are rare, based on the findings of this study, an appropriate method for establishing criterion for the evaluation of clinical skill performance ability was suggested.

Defensible decision making in programmatic assessment for learning

Authors
Lisa Schmidt, Flinders University College of Medicine and Public Health, Adelaide, Australia
Tina Noutsos, Flinders University College of Medicine and Public Health, Adelaide, Australia

Presenter:
Lisa Schmidt, Flinders University, Adelaide, Australia

Background: Flinders University's Medical Program has recently joined a small but growing group of institutions that have implemented programmatic assessment for learning (PAL). PAL emphasises assessment for learning but also recognises that assessment needs to be used for making high-stakes decisions such as readiness for progression. PAL is a program-wide plan of assessment that moves away from traditional aggregation of assessment data based on numbers and formulae towards the arena of holistic judgements. This in turn necessitates different progression decision making processes.
Method: A PAL decision making process discussion paper was drafted inspired by Maastricht's model, the programmatic assessment approach of rich data, and the legal defensibility principle of multiple levels of review. This discussion paper went through six months of rigorous consultation. PAL was implemented for first year Doctor of Medicine students in 2017 and used for making student progression decisions twice.
Results: Key aspects of the progress decision process are: (1) that there are many assessment data points; (2) recommendations on progression come from key staff/teaching teams with knowledge of the student based on multiple meaningful encounters with the student and/or a collection of data from assessable exercises; and (3) multiple levels of review of the decision.
Of the students who failed to progress in the first year of implementation, half of them appealed the decision. However, these were not upheld as an independent reviewer found the process to be robust.
Discussion: The rich data that was visible to staff and students meant that the outcome was less likely to be a surprise to anyone and so more likely to be accepted. While some students did appeal, this may have been due to a new system being tested, but the likelihood of the decision being overturned was low as it had already been through layers of review.
Conclusion: When moving to holistic decision making such as in PAL, rich data sources, multiple perspectives and multi-level review can aid the defensibility of progression decisions.

8J2 (2373)
Implementing integrated assessment programs in an unstructured environment – from theory to practice...

Authors
Stephanie Clota, ModMed Ltd, Unley, Australia
Lambert Schuwirth, Flinders University, Bedford Park, Australia
Nyoli Valentine, ModMed Ltd, Unley, Australia
Kaye Atkinson, Royal Australian College of General Practitioners, East Melbourne, Australia
Christine Cook, GPEx Ltd, Unley, Australia

Presenter:
Stephanie Clota, ModMed Ltd, Adelaide, Australia

Background: The GP365 program, developed by ModMed Ltd in partnership with the Flinders University's Prideaux Centre, adopts a programmatic assessment for learning approach. GP365, designed for general practice training, has been in use in Australia since 2015.
The decision to move to programmatic assessment was obvious. Challenges presented in the implementation of the program, in the translation of theory into practice. Intrinsic to the notion of programmatic assessment is a successful implementation. Therefore, issues that might facilitate or hamper a successful implementation and the sustainability of programmatic assessment beyond the implementation phase were important to consider.
The primary issues we encountered were:
-programmatic assessment is radically different from the traditional approaches.
-the logistics of delivering programmatic assessment in a work based setting.
Method: A systematic approach to implementation was adopted to address the issues identified and ensure increased adoption, quality, safety and cost outcomes were achieved. The framework developed was based on the congruence model of organisational alignment. Very simply, the greater the congruence of organisational elements such as work, people, structure, and culture the higher the performance.
Discussion & Conclusions: When pursuing transformations, organisations rarely realise the benefits or retain the value they anticipated. While there are many reasons for this, studies confirm that the top contributors are related to people and organisational issues.
Further, even when an organisation is willing to accept the concept of programmatic assessment there is still a tendency to revert to more traditional approaches along the way.
Take-home message: Critical to the success of the GP365 implementation was the development of a customised system to ensure ease of use, real time monitoring, access anytime anywhere, automation and reporting.
Critical to the adoption of GP365 was the change management approach, designed to support the successful transition. It was imperative to incorporate the behavioural and cultural elements in a coordinated and transparent manner to bring about lasting change, enable continuous improvement and optimise benefit realisation.

Since implementation careful guidance and continuous support has been maintained to embed the principles of programmatic assessment.

The Highs and Lows of Setting Cut Points in Programmatic Assessment: A Validity Perspective

Authors
Kulamakan Kulasegaram, MD Program, University of Toronto, Toronto, Canada
Glendon Tait, MD Program, University of Toronto, Toronto, Canada
Richard Pittini, MD Program, University of Toronto, Toronto, Canada

Presenter:
Kulamakan Kulasegaram, MD Program, University of Toronto, Canada

Background: Programmatic assessment (PA) argues for high stakes decisions to be made by aggregated multiple low stakes assessments. While clear competency standards can be set for high stakes decisions, PA is also premised on decisions being contextualized in a holistic manner using other data sources/student context. This requires that traditional methods of setting cut points are revisited to ensure alignment with the goals of PA, stakeholder (students, faculty) acceptability, and competency standards. Using data from the first cohort of PA trainees at, we describe one method for generating cut points with adequate validity evidence and alignment with PA.
Method: First-year MD students (n=258) completed fifteen brief 20 to 30 MCQ assessments across first year; the performance was aggregated to make pass/fail decisions. We compared the previous traditional cut point of 70% against cut points derived using ability estimates from Rasch modeling. We examined validity evidence various cut points for setting with an emphasis on the predictive validity of cut points against future performance and precision of ability estimates.
Results: MCQ assessments themselves had strong validity evidence. The traditional cut point had low predictive validity and wide standard errors of measurement (SEM); less than 2% of students with subsequent academic difficulty were predicted. Increasing the cut point by 1 conditional SEM aligned ability estimates with stakeholder's perceptions of first-year competency and predicted 30% more students in subsequent academic difficulty. Other sources of validity evidence will be discussed.
A validity approach and application of measurement theory had strong utility in improving cutpoints for assessments in programmatic assessment.
Conclusion: Setting cut points in PA requires a careful balance of measurement issues with stakeholder acceptability
Take-home message: The approach described here can be employed by schools seeking to transition to a PA and ensure cut points are supported by validity evidence and aligned with PA goals.

'It's hard to feel the fear of failing' – Teacher-Learner Relationships within Programmatic Assessment

Authors
Suzanne Schut
Jan van Tartwijk
Erik Driessen
Cees van der Vleuten
Sylvia Heeneman

Presenter:
Suzanne Schut, Maastricht University, Maastricht, Netherlands

Background: Programmatic assessment attempts to optimise learning and decision-making. Creating an assessment environment that truly emphasises continuous improvement is often hindered by summative belief systems and inconducive cultures. By investigating the perceptions of the assessment process through the lens of teacher-learner relationships, we aim to unravel the mechanisms within this medical assessment culture.
Method: In an open and qualitative study we interviewed 26 learners, ranging from undergraduates to postgraduates, in five different international settings of programmatic assessment. Data were analysed using template analyses. We included several perspectives in our framework: an interpersonal perspective (the teacher-learner relationship using constructs from the model of interpersonal teacher behaviour (ITB)), a personal perceptive (constructs from learners' achievement goal orientation), and a cognitive perspective (assessment task perception). The ITB model describes and analyses supervision in terms of the relationship between teacher and learner as perceived by those being a part of the relationship (dimensions of Influence and Proximity).
Results: The study showed that learners' perceptions of teachers' 'Influence' were strongly related to their task perception, e.g. the learning value and assessment stakes. Teacher dominance was inversely related to learners' autonomy and learners' perception of stakes (Influence). Furthermore, teacher helpfulness and friendliness were related to learner safety, allowing frankness over weaknesses (Proximity). Goal achievement orientation mediated both mechanisms. Specifically, a performance orientation reversed the mechanisms; learners seemed to experience hierarchy and distance with teachers and were seeking more approval.
Discussion: A number of mechanisms were identified in the teacher-learner relationship that illuminated learner receptivity to the use of assessment for learning and the safety of being vulnerable. Learning goal orientation is an important moderating variable. The ITB model appeared to be useful for understanding how and why the role of the teacher becomes influential in programmatic assessment.
Conclusion: Understanding the mechanisms of the teacher-learner relationships is essential in reconciling learning and decision-making in programmatic assessment. The ITB model can create awareness among teachers about the impact of their behaviour and importance of their role.

Programmatic Assessment for Learning is a Threshold Concept

Authors
Anna Vnuk, Flinders University, Adelaide, Australia
Johanna Jordaan, Flinders University, Adelaide, Australia
Maxine Moore, Flinders University, Adelaide, Australia
Iris Lindemann, Flinders University, Adelaide, Australia

Presenter:
Anna Vnuk, Flinders University, Adelaide, Australia

Background: Whilst it is generally accepted that "Assessment Drives Learning", the objective of Programmatic Assessment for Learning (PAL) is to drive learning towards approaches that foster deep, long-term and retrievable learning, through different types of assessment, with multiple sampling and meaningful feedback (van der Vleuten et al., 2012).
This revolution in educational pedagogy therefore requires a significant change in curricular structure, assessment approaches, supporting infrastructure and engagement from both staff and students (van der Vleuten et al. 2015).
Method: At Flinders University School of Medicine, as part of PAL, students are required to keep a reflective portfolio to track their development as self-regulated learners and to map their progress in the eight Course Learning Outcomes. Students' portfolios are submitted to and read by their individual Learning Coach (LC) who meets with them at regular periods to discuss their progression.
Results: During 2017, the first year of implementation of PAL, LCs' anecdotal evidence suggested that students were struggling with the concept of PAL: they were "wrestling" with this new paradigm of learning and assessment.
Threshold Concepts (TCs) are "akin to a portal, opening up a new and previously inaccessible way of thinking about something" (Meyer & Land, 2006) and have the characteristics of being transformative, integrative, irreversible and troublesome.
We viewed PAL through the lens of TC by asking LCs to review their students' portfolios for evidence of these hallmark features. Students were retrospectively asked for their permission to use de-identified reflections in the analysis.
Students' reflections clearly reveal evidence of the four characteristics of TC, particularly the transformative nature of PAL.
Whilst reflection has already been identified as a TC (Joyce, 2012), the students' comments in their portfolios demonstrate that PAL is also a TC.
Conclusion: This analysis contributes the growing literature in the area of TCs, particularly in medical education (Neve, Wearn & Collett, 2016). Importantly, by identifying PAL as a TC, we can provide support for students to make this transition and to assist them to engage in their learning and assessment as self-regulated learners.

Defining a Program of Assessment to Inform Summative Entrustment Decisions in Undergraduate Medical Education Utilizing Entrustable Professional Activities

Authors
Holly Caretta-Weyer, Stanford University, USA

Presenter:
Holly Caretta-Weyer, Stanford University, USA

Background: While graduate medical education (GME) programs utilize a clinical competency committee to aggregate assessment data and report milestone achievement regarding their residents in order to track progress toward graduation and independent practice, there is not currently a comparable systematic, competency-based assessment process in undergraduate medical education (UME) to ensure readiness for the transition to residency.
Method: The Entrustment Committee (EC) at our institution was convened and tasked with developing a program of assessment for determining readiness for promotion to residency training. Using the framework of the Association of American Medical Colleges Core Entrustable Professional Activities (EPAs) for Entering Residency, we developed a program of assessment using group consensus methodology to identify the assessment data needed by the EC to render summative entrustment decisions for each student. Particular focus was placed on basing entrustment decisions on a longitudinal view of a learner's performance, emphasizing the use of daily ad hoc workplace-based supervisory and entrustment decisions, explicitly measuring attributes of trustworthiness, and gathering evidence from multiple assessors.
Results: The program of assessment developed using this process includes frequent ad hoc workplace-based entrustment decisions using a supervisory scale, narrative comments from workplace-based assessment, rotation grades, national standardized examination performance, review of reflective essays and scholarly projects, performance in the simulation and objective structured clinical examination environment, procedural skills assessments, and multi-source or 360-degree feedback. These various forms of assessment data are collated in real time into an electronic portfolio, which can be reviewed by members of the EC. Students, in consultation with their faculty coach, trigger the review for summative entrustment decisions by the EC.
Conclusion: Valid summative entrustment decisions require a program of assessment that includes multiple modes of assessment, integration of quantitative and qualitative data, and the perspectives of multiple assessors. Using this program of assessment, we will begin to render formal summative entrustment decisions after validating this system over several pilot student reviews in the coming year.
Take-home message: In order to render valid summative entrustment decisions, ECs require input from a broad program of assessment utilizing a variety of measures and perspectives.

An interactive mixed reality application for anatomical and surgical education: 3D learning in relation to spatial ability

Authors

Katerina Bogomolova, Center for Innovation of Medical Education; Dept. Surgery, Leiden University Medical Center, Netherlands

Beerend P Hierck, Center for Innovation of Medical Education; Dept. Anatomy and Embryology; Medical Center Centre for Innovation; Leiden Teachers' Academy, Leiden University Medical Center, Netherlands

Ineke CJM VanderHam, Dept. Neuropsychology, Leiden University, Netherlands

Mary EW Dankbaar, Institute for Medical Education Research Rotterdam, Rotterdam Erasmus University Medical Center, Netherlands

Steven ER Hovius, Dept. Plastic and Reconstructive Surgery and Han Surgery, Rotterdam Erasmus University Medical Center, Netherlands

Jos A VanderHage, Center for Innovation of Medical Education; Dept. Surgery, Leiden University Medical Center, Netherlands

Presenter:

Katerina Bogomolova, Leiden University Medical Center, Leiden, Netherlands

Background: Medical students mainly learn anatomy using 2D content information. Spatial ability seems to be a successful predictor of deep anatomy learning and acquisition of technical skills. Previous studies have repeatedly shown, that especially students with lower spatial ability, have difficulty with transferring 2D knowledge to the clinically relevant 3D domain. The aim of this exploratory trial was to evaluate how spatial ability relates to anatomy learning using 3D content information.
Method: We developed a fully interactive mixed reality application for Microsoft Hololens. This application represents a holographic dynamic model of the lower leg and foot, including a complete musculoskeletal system. In a double-centred randomized controlled trial, 1st and 2nd year undergraduate medical students were randomized in three groups: holographic 3D model, non-stereoscopic 3D desktop model and traditional 2D anatomical atlas. Before the tutorial, spatial ability was tested for three spatial components: mental rotation, mental transformation and mechanical reasoning. All students did the same tutorial on the anatomy of musculoskeletal system. A written posttest was administrated to evaluate the learning effect on factual, functional and spatial anatomical knowledge. The utility and usability of our developed MR application was also evaluated.
Discussion: We hypothesize that students with high spatial ability will outperform students with low spatial ability in

all three learning modalities. Moreover, we hypothesize that students with low spatial ability will benefit most from learning in 3D with the use of an interactive holographic model, compared to non-stereoscopic 3D desktop model and 2D textbook. The main learning effect is expected to be observed on the functional and spatial knowledge domains.
The final goal of our project is to design a method for personalizing learning paths and providing individual students with the most efficient learning tools. Our preliminary data of current study will be presented including a showcase of the developed mixed reality application.
Conclusion: Mixed reality provides a total new environment for three-dimensional learning. This innovative educational tool may be an ideal way to facilitate personalized learning in anatomical and surgical education.

An Exploration: Applying Cognitive Theory of Multimedia Learning to Anatomy Teaching

Authors

Keikantse Matlhagela, Faculty of Medicine, University of Botswana, Gaborone, Botswana

Mpho Mogodi, Faculty of Medicine, University of Botswana, Gaborone, Botswana

Ludo Badlangana, Faculty of Medicine, University of Botswana, Gaborone, Botswana

Masego Kebaetse, Faculty of Medicine, University of Botswana, Gaborone, Botswana

Presenter:

Keikantse Matlhagela, Faculty of Medicine, University of Botswana, Gaborone, Botswana

Background: Anatomy is a cognitively demanding subject that requires stimulation of both audio and visual channels. Didactic lectures are not sufficient to teach and/or learn it. In contrast to conventional medical training which uses cadavers, anatomy practical at the University of Botswana Faculty of Medicine (UBFOM) is through Anatomage 3D Imaging Table (Anatomage Inc.) and anatomical models. Typically, the anatomy practical is preceded by a fifty-minute plenary. Later on, they attend the first PBL tutorial where they are expected to integrate anatomical knowledge gathered from these earlier sessions. Learners enter medical school having completed one-year basic sciences including an introductory course on anatomy using a didactic approach.
Method: Two learning tasks from anatomy practical were analysed using Mayer's cognitive theory of multimedia learning (CTML). This theory is premised on promoting retention and transfer of knowledge. We reviewed materials provided by the lecturer and, did observations of students undertaking these tasks. We also conducted separate interviews for learners and the lecturer using the CTML framework. These learning tasks involved first year medical students from a five-year spiralling Problem Based learning (PBL) Bachelor of Medicine and Bachelor of Surgery (MBBS) programme at the UBFOM. The tasks were focused on learning anatomy of the lower

respiratory tract by using anatomage table and anatomical models.

Results: From the analysis, the use of auditory and visual pathways seems to be relevant to both the teaching and learning of anatomy. Both tasks fulfilled most principles of CTML. Eight out of twelve principles of CTML were fulfilled. The learning objectives of the two tasks were observed to be at a lower level in the revised Bloom's taxonomy.

Conclusion: Learners found anatomy demanding. They reported difficulties in learning new anatomical terminology as well as integrating the material covered in anatomy sessions including the PBL tutorial. The use of images and words promoted learning of anatomy.

Take-home message: We recommend that CTML should be applied in teaching anatomy to optimize learning.

Anatomy for Pharmacists: Creation of an anatomy syllabus to support the changing role of the pharmacist

Authors
Gabrielle M. Finn, Hull York Medical School, University of York, York, UK
Claire F. Smith, Brighton and Sussex Medical School, University of Sussex, UK
Catherine M. Hennessy, Brighton and Sussex Medical School, University of Sussex, UK
Geeta Hitch, Pharmacy, Dept of Life Sciences, University of Sussex, Brighton, UK
Jane Stewart, School of Pharmacy & Biomolecular Science, University of Brighton, Brighton, UK
Paul R Gard, School of Pharmacy & Biomolecular Science, University of Brighton, Brighton, UK

Presenter:
Gabrielle Finn, Hull York Medical School, York, UK

Background: This study describes the creation of a core Anatomy syllabus for Pharmacy students. The syllabus was developed to support the changing role of the pharmacist from one that was traditionally based on dispensing to one that encompasses treatment, diagnosis and acting as the first port of call for patients. With respect to this change, it is both timely and important for pharmacy graduates to have a strong anatomical foundation upon which to build their pharmacological knowledge and skills.

Method: The Delphi approach was employed to seek consensus on which learning outcomes should be included in such a syllabus. The Delphi panel was constructed to include 'experts' who were individuals from different professional backgrounds with experience of teaching pharmacy students anatomy. The Anatomical Society's council and education committee nominated the panel members. The resultant panel had 34 experts. Using existing frameworks, the research team performed an initial screen of outcomes to remove outcomes that were obviously not applicable (n=10). The experts were asked in two stages to 'accept', 'reject' or 'modify' (first stage only) each learning outcome. A final formatting was performed by the research team to standardise presentation, make changes either to correct any anatomical or minor syntax errors

Results: During stage 1, 163 outcomes were presented to the Delphi panel. Following stage 1, 53 outcomes remained and 49 after stage 2. The final syllabus contained 49 learning outcomes. Each outcome was mapped to possible teaching content within an integrated curricula. All learning outcomes achieved over 80% acceptance by the panel.

Discussion: The Delphi process offers a useful tool for creating such syllabus with the input of multiple, valued stake-holders. The new syllabus presents a basic anatomical framework upon which pharmacy educators can build the necessary clinical practice and knowledge.

Conclusion: The learning outcomes within the syllabus could be utilised to develop anatomy teaching within an integrated curriculum. At present, there are limited requirements from professional bodies, such as the General Pharmaceutical Council (GPhC) and the British Pharmacology Society, for anatomy standards – this syllabus is a first offering at filling this gap.

Learning from an interactive online platform: Anatomy in the inter-professional operation room (OR)

Authors
Johannes Grosser, Institut fuer Wissensmedien, Tuebingen, Germany
Martina Bientzle, Institut fuer Wissensmedien, Tuebingen, Germany
Thomas Shiozawa-Bayer, Institute for Clinical Anatomy and Cell Analysis, Eberhard Karls University, Tuebingen, Germany
Bernhard Hirt, Institute for Clinical Anatomy and Cell Analysis, Eberhard Karls University, Tuebingen, Germany
Joachim Kimmerle, Institut fuer Wissensmedien, Tuebingen, Germany

Presenter:
Johannes Grosser, Institut fuer Wissensmedien, Tuebingen, Germany

Background: Unfortunately, many students in medical education perceive basic subjects such as anatomy or physiology to be quite dull, as the knowledge is taught by books, lectures or in prosection courses that rarely illustrate the clinical relevance of anatomy. We assume that anatomical knowledge needs to be more linked to clinical application. Therefore, the University of Tuebingen offers the Sectio Chirurgica (SC), an online video platform where healthcare students and professionals have the opportunity to join surgical live-stream lectures that explicitly integrate pre-clinical anatomical education and clinical application.

Method: In order to examine whether SC videos are capable to support participants' learning activities by linking basic knowledge to clinical application, we conducted a randomized controlled online trial to compare this innovative format with a "classical" anatomy lecture. 168 medical students were recruited from the SC user panel and randomly assigned to one of two conditions. The experimental group watched a 15 minutes SC video about an ACL reconstruction surgery. While 2/3 of the video showed inter-professional interactions in the OR, 1/3 of the video showed a professor providing anatomical

background information. The control group was provided with a video of comparable length that showed the same professor holding a lecture about ACL reconstruction, covering identical information. Following the video, participants filled in several questionnaires.

Results: Our participants perceived SC videos as significantly more comprehensible (p>.01), more vivid (p >.01), and more entertaining (p>.01) than the lecture videos showed in the control condition, whereas no significant differences were found regarding anatomical knowledge (p = .35).

Our results show that SC videos are a promising solution to improve anatomy learning as the live presentation of clinical situations was perceived as more comprehensible and more vivid. However, short term learning results did not differ between conditions. Since participants reported that the SC video was also more entertaining, we assume that dynamic interaction of clinicians and anatomists is important for student's learning motivation.

Conclusion: Compared to classic anatomy lectures, SC videos made anatomy more attractive and especially tangible to medical students.

8K5 (2055)
Integrating the Anatomage Table into an Anatomy Curriculum: a qualitative analysis of student perception

Authors
Siobhan Moyes, PU PSMD, Plymouth, UK
Lauren Carr, PU PSMD, Plymouth, UK
Jo Erwin, PU PSMD, Plymouth, UK

Presenter:
Siobhan Moyes, Plymouth University Peninsula School of Medicine and Dentistry, Plymouth, UK

Background: The absence of cadaveric dissection or prosection in the PU PSMD course was a conscious decision to constructively align teaching to the clinical experience of patient interactions, via surface anatomy and medical imaging. The use of innovative teaching approaches has been the mainstay of this Medical School, and developing and incorporating technology into the anatomy curriculum is an aspect that yields high student satisfaction. The Anatomage virtual dissection system was purchased to offer students an additional modality to explore anatomy, with a depth of detail rivalling dissection and prosection.

The aim of this study was to understand student perception of the Anatomage system, how they use it and factors affecting their engagement with it. It aimed to inform curriculum design and self-directed learning (SDL) tools that would enable effective use of the Anatomage system.

Method: This study utilised thematic analysis directed by grounded theory. Focus groups included 6-10 year 1-2 students providing detailed narratives to be gathered for analysis. Thematic analysis began with an inductive approach, based on the focus group data, followed by a deductive approach, grounded in an understanding of the relevant literature and prior experience, which informed the coding. Reflexive diaries were kept by the researchers, to identify any biases.

Results: Factors that affected their engagement with the Anatomage Table, and, therefore, their depth of understanding, including their level of prior learning, the learning curve involved in using the system and the fear of breaking it. Students found it easier to start with surface anatomy or plastic models before progressing to the Table. The Table helped students understand how structures interrelate in 3D, and how this related to different pathologies and medical imaging.

Cognitive load affected students' engagement, as they sometimes struggled with spatial awareness when looking at an organ in isolation on the Table. This study has helped inform curriculum design and develop SDL material to help students make the most of the Anatomage system to develop their Anatomy understanding.

Conclusion: The Anatomage system helps students develop their understanding of the complexity of regional anatomy.

DynamicAnatomy, an interactive augmented reality application for higher education

Authors
Beerend Hierck, Leiden University Medical Center, Leiden, Netherlands
Thomas Hurkxkens, Leiden University Centre for Innovation, Leiden, Netherlands
Leontine van Melle, Leiden University Centre for Innovation, Leiden, Netherlands
Katerina Bogomolova, Leiden University Medical Center, Leiden, Netherlands
Marco deRuiter, Leiden University Medical Center, Leiden, Netherlands
Jos van der Hage, Leiden University Medical Center, Leiden, Netherlands

Presenter:
Beerend Hierck, Leiden University Medical Center, Leiden University Centre for Innovation, Leiden University Teachers Academy, Leiden, Netherlands

Background: Deep learning of anatomy is an essential part of medical education. Students mainly learn anatomy using 2D content information. We and others have found that students and (surgical) residents often have difficulties with transferring this knowledge to the clinically relevant 3D domain. In addition, undergraduate students have limited time and access to "tools" to practice their anatomy skills.

Method: We developed a prizewinning interactive Augmented Reality application for Microsoft HoloLens® (https://insider.windows.com/nl-nl/community-news/windows-insiders-are-using-hololens/). This application is called DynamicAnatomy and is freely available for download from the Microsoft Store. It shows a dynamic model of the lower leg and foot with functional tibiotalar and subtalar joints. It is fully interactive in showing/hiding all bones, muscles, tendons and ligaments, blood vessels and nerves, in providing online information about all selected objects, and in joint motion by means of animations, manual interaction, and by live synchronization with your own ankle movement through

motion capture. In addition, arthrodesis of the tibiotalar joint is presented as a clinical case(https://www.mr4education.com/).

Results: We integrated this innovative educational tool in the 2017-2018 Medical Curriculum in various courses and performed preliminary research to the relation between 3D cognition, 3D cognition, and learning outcomes with this Mixed Reality tool. Students report an immersive and deep learning experience which greatly adds essential 3D insights to their prior (2D) knowledge. Intrinsic motivation appears boosted, although we cannot rule out a first pass "gadget" effect at this stage. Students further report preferences compared to VR because of (1) the possibility for explorative and collaborative learning, and (2) learning comfort: they don't get dizzy because HoloLens is a look-through device. In addition, they appreciated the chance to practice anatomy in a safe and authentic setting. Quantitative data will be gathered during the first months of 2018 and will be reported on AMEE2018.

Ebb and flow of career intentions through medical school and pre-vocational training

Authors
Matthew Kent, University of Otago, Christchurch, New Zealand
Tim Wilkinson, University of Otago, Christchurch, New Zealand
Philippa Poole, University of Auckland, Auckland, New Zealand
Joy Rudland, University of Otago, Wellington, New Zealand

Presenter:
Joy Rudland, University of Otago, Wellington, New Zealand

Background: In New Zealand, the patterns underlying career intentions throughout medical school have not yet been investigated. This is an important consideration for the NZ health workforce planning due to the increased need for GPs, especially in the rural setting.
Method/Results: The aim was to quantify changes in career intention through medical school and in the early postgraduate years (PGYs) and to assess associations with, or reasons behind, the changes. Students were classified into persisters, partial persisters, mid changers, changers, inklings or undeciders depending on the stability of their career choices at 4 time-points T1 (start of medical school), T2 (end of medical school), T3(PGY1) and T4 (PGY3). 37% (n=181) of medical students starting in 2007 and 2008 completed surveys at the 4 time-points. Thirty percent (n=41) had the same intention at T2 as they had at T1. Thirty three percent (n=50) had the same career intention at T4 compared with T1. In contrast, 60% (n=104) had the same career intention at T4 as they had at T3 and 63% (n=96) the same intention at T3 as they had at T2. The careers that were least likely to change over these time periods were GP and surgery.
Eighteen percent (n=33) were undecided, 27% (n=48) were persisters, 10% (n=19) were partial persisters, 30% (n=54) were mid changers,16% (n=11) were late changers and 19% (n=16) were inklings. Career/financial prospects and vocational training availability was more important for persisters compared with undecided, and working hours less important for persisters compared with everyone else and undecided.
Discussion: Volatility in career intent occurs mainly in medical school and may point to diversity of medical student experience being important. The greater stability of intent in some careers may indicate the possibility of pre-medical school influence, selection and/or medical school experience as influencing factors. The ramifications of these findings will be influenced by the goals of medical schools in respect to career intentions.

Conclusion: Career intentions change during medical school and firm up post medical school. GP and Surgery were the most popular and 'stable' careers.

8L2 (1009)
Perceptions of community care and placement preferences in first-year nursing students: A multicentre, cross-sectional study

Authors
Margriet Van Lersel
Corine H.M. Latour
Rien De Vos
Paul A. Kirschner
Wilma J.M. Scholte op Reimer

Presenter:
Margriet Van Lersel, ACHIEVE Centre of Expertise, Faculty of Health, Amsterdam University of Applied Sciences, Amsterdam, Netherlands

Background: Despite increasing shortages of well-educated community nurses, far too few nursing students choose community care for their future profession; a strong societal problem that urgently needs resolution. This study provides a solid understanding of causes for the fields' low popularity by exploring first-year baccalaureate nursing students' perceptions of community care, and their placement preferences along with their underlying assumptions. Insights from this study can be used by educators to positively influence students' perceptions with targeted curriculum redesign strategies.
Method: A cross-sectional multicentre survey study was performed. First-year nursing students from six universities of applied sciences in Netherlands (n = 1058) participated in the study from September-December 2014. The students completed the 'Scale on Community Care Perceptions' (SCOPE), consisting of demographic data, current placement preferences, and three subscales measuring the affective component of community care perception, perceptions of a placement, and a profession in community care. Descriptive statistics were used.
For placement, 71.2% of the students prefer the general hospital, 23.4% another area, and only 5.4% choose community care. Students consider opportunities for advancement and enjoyable relationships with patients as most important for their placement. Community care is perceived as a 'low-status-field' with many elderly patients, where students expect to find little care variety and few opportunities for advancement.
Results: This study shows why few students show an interest for a career in community care. Students' perceptions of the field are at odds with aspects they regard as important for their placement. They also underestimate the complexity of community care, where specific traits are required to ensure appropriate nursing care in patients' homes.
Discussion & Conclusion: The results of this study allow for three recommendations. First, students and educators should be aware of misconceptions about career opportunities in the field of community care. Second, educators should provide students with experiences that foster an optimistic and realistic career outlook on

community care. Third, growing shortages in the community care sector urgently require representatives from the field and educators to collaborate to make community nursing an attractive career alternative.

8L3 (2672)
Do primary care placements influence career choice: What is the evidence?

Authors
Maslah Amin
Shiv Chande
Sophie Park
Joe Rosenthal
Melvyn Jones

Presenter:
Maslah Amin, Health Education England, London, UK

Background: The UK National Health Service (NHS) needs a successful primary care system but has struggled with recruitment. Junior doctors are increasingly opting for hospital specialties over general practice (GP). Health Education England (HEE) has been mandated to ensure that 50% of medical graduates enter GP training. The NHS HEE Wass Report, By Choice – Not Chance, among its various recommendations to boost GP numbers, highlighted undergraduate (UG) GP experience as an influence on career choice. The aim of this work was to explore what is known about UG influences on GP career choice.
Method: NHS HEE employed two junior doctors to produce a pragmatic rapid appraisal of the international literature on the UG influences on GP career choice for the Wass Report. The search strategy was supported by medical librarians and focused on rapidly accessing and summarising relevant literature. Databases searched included Medline, EMBASE, HMIC & grey literature in 2015 revealed 294 items. Data extraction & synthesis was pragmatic.
Results: The international evidence suggests that students who had more UG GP placements are more likely to become general practitioners. Optimised GP UG placements have been successful in increasing the number of general practitioners (e.g. in the USA and Australia). The style of UG placements is important, with longitudinal placements being more influential than traditional block placements. The UK literature is limited, but there are some consistencies with the international evidence. The analyses highlight key elements about placements. The identified reviews and primary studies are observational with a high risk of bias, but this is almost inevitable within this research context.
Discussion: An evidence-based improvement of UK UG GP placements is proposed. Longitudinal placements are compared to traditional block placements. The implications of these results for medical school curricula is discussed with particular reference to Government plans to expand medical student numbers and establish new medical schools with explicit aims to produce more GPs.
Conclusion: Primary care placements positively influence medical student's career choice towards GP.

Is finding a job stressful? How medical students, residents, and program directors perceive stress regarding medical trainees' future job prospects

Authors
Maureen Topps, University of Calgary, Calgary, Canada
Alicia Polachek, University of Calgary, Calgary, Canada
Jane Lemaire, University of Calgary, Calgary, Canada
Kent Hecker, University of Calgary, Calgary, Canada
Janet Edwards, University of Calgary, Calgary, Canada
Sean Grondin, University of Calgary, Calgary, Canada

Presenter:
Maureen Topps, University of Calgary, Canada

Background: Medical trainees' future job prospects are often a stressful element of medical education, especially with the current surplus of Canadian physicians, yet little research examines this specific stress. We explored how medical students, residents, and program directors each perceive stress regarding medical trainees' future job prospects and how it may manifest.
Method: A University of Calgary survey measuring anticipatory stress regarding future job prospects included an open-ended question asking for comments regarding job availability and stress related to future job prospects (medical trainees) or in assisting residents to find employment (program directors). We conducted an inductive thematic analysis of responses from 8 medical students, 57 residents, and 14 program directors.
Results: All three groups described factors contributing to stress regarding future job prospects, including a lack of transparent and balanced information, program and structural factors beyond their control, and trainee expectations and preferences. Medical trainees emphasized that extra requirements and higher expectations placed on them contribute to their stress. Residents reported despair, vulnerability, costs and sacrifices made for their training, and lack of staff physician understanding related to residents' stress about finding jobs. Residents and program directors identified a need for support and guidance around future employment, however, program directors underscored that this support has limits and residents are ultimately responsible for securing employment.
Discussion: Medical trainees' future job prospects are a stressful aspect of medical education, particularly for residents. Further consideration of this stress and the factors that contribute to it could help identify avenues for supporting medical trainees in finding employment.
Conclusion: The wellbeing of medical trainees is highly relevant in all medical education environments; information that demonstrates the need for resources which may assist in reducing stress for trainees is important for multiple organizations and stakeholders.

Communication Skills & Learning Disability - An Interprofessional Collaboration

Authors
Elizabeth Metcalf, Cardiff University, UK
Robert Colgate, Abertawe Bro Morgannwg University Health Board, Cardiff, UK
Jon Kidd, Hijinx Academy, Cardiff, UK
Vanessa Morse, Hijinx Academy, Cardiff, UK
Ria Bayliss, Cardiff Metropolitan Univesrsity, Cardiff, UK
Susan White, Cardiff Universtiy, Caridd, UK

Presenter:
Elizabeth Metcalf, Cardiff University, Cardiff, UK

Background: Effective communication skills are essential for health care professionals. Students must communicate sensitively with patients, regardless of age, social, cultural or ethnic backgrounds or disabilities (GMC, 2015). Specialist teaching on communicating with people with learning disabilities (LD) is often lacking- resulting in poorer healthcare and worse outcomes than the general population.
Method: We sought to provide authentic training to enable healthcare students to communicate effectively with patients of all abilities, nurturing skills and confidence to provide healthcare to vulnerable groups. We sought to challenge unconscious beliefs and anticipated training would change student attitudes.
Results: There are specific skills required when communicating with LD patients. We developed a pioneering partnership between Cardiff University, Cardiff Metropolitan University Speech and Language Therapy (SALT) faculty and Hijinx, a Welsh theatre company working with professionally trained LD actors, resulting in a new interprofessional (IP) learning experience. Students learn how various medical conditions can impact upon patients' ability to communicate. They role play with learning developmentally disabled actors and receive feedback from tutors, actors and peers. They learn to communicate effectively, when to involve other disciplines in managing patients and understand the importance of maintaining patient dignity throughout.
Discussion: A pilot workshop received strong feedback from participants. It was felt introducing an IP element would enrich the opportunities for students and improve awareness of the expertise offered by colleagues in other disciplines. As a result, the new IP session was introduced in November 2016. Evaluation data confirms that students find this rewarding and builds confidence, whilst learning more about the roles of their colleagues.
Conclusion: We have shown a significant increase in the confidence and competence of students dealing with LD patients- students find the teaching enjoyable and valuable. Through our collaboration with Hijinx we provide employment opportunities for LD actors, resulting in increased financial independence, self-esteem and wellbeing.
We provide a rare opportunity to practice and improve communication skills to meet the health needs of people with LD. We enable Hijinx actors to make a valuable, lasting contribution to society, something rarely offered to learning disabled adults.

'Sharp Scratch!' Exploring medical student perspectives on communicating with patients when doing practical procedures

Authors
Devina Raval, Barts & The London, School of Medicine and Dentistry, London, UK

Presenter:
Devina Raval, Barts & The London, School of Medicine and Dentistry, London, UK

Background: Clinical communication skills are an essential part of the undergraduate medical curriculum and are used in the explanation of procedures. Whilst integration of procedural and communication skills is presumed, and encouraged with simulation teaching using mannequins, the communication aspect can still be neglected. Patients have a growing role in medical education, including direct contact with students to integrate clinical and communication skills and develop a holistic approach.
Method: Clinical year students participated at a patient forum event and performed procedural skills on part-task trainer mannequins attached to a simulated patient, whilst observed by real patients who provided feedback to the students after the demonstrations. Aims: To explore challenges students experience whilst communicating with patients when doing practical procedures and how feedback from patients can contribute to developing effective communication. Focus groups using a semi-structured interview protocol were conducted with participating students, before and after the event.
Results: Preliminary qualitative data suggest that challenges in communication experienced when doing procedures were related to causing patient discomfort, multiple attempts, perceptions of being novice and deviating from clinical communication scripts. Feedback from patients was received positively by students and promoted their confidence in performing practical procedures. Students developed increased awareness and understanding of individuality of patients, including their varying levels of knowledge, experience and personal preferences of language used.
Discussion: The pedological aspects of procedural skills teaching are considered with the addition of patient feedback to develop the integration of clinical and communication skills. Direct feedback from patients provided depth and richer learning experiences for students, supplementing both formal and informal medical curricula. This aids the transition of practising skills in the classroom to clinical placements with improved communication, confidence and implications for patient safety.

Conclusion: Communication aspects of procedural skills teaching needs to be developed. Patient feedback can be used to increase student awareness of the individuality and variability of patients, encouraging adaptation and effective use of communication when performing practical procedures.

Integration of communication research into clinical practice: Time for a paradigm shift

Authors
Veronika Schoeb, School of Health Sciences (HESAV), University of Applied Sciences and Arts HES-SO, Lausanne, Switzerland
Liliane Staffoni, School of Health Sciences (HESAV), University of Applied Sciences and Arts HES-SO, Lausanne, Switzerland
David Gachoud, Medical Education Unit, Faculty of Biology and Medicine, UNIL; Department of Internal Medicine, CHUV – University Hospital of Canton of Vaud, Lausanne, Switzerland
Clare Delany, Department of Medical Education, Melbourne Medical School, University of Melbourne, Australia

Presenter:
Veronika Schoeb, School of Health Sciences (HESAV), University of Applied Sciences and Arts Western Switzerland HES-SO, Lausanne, Switzerland

Background: Healthcare professionals are required to develop and maintain their professional skills. Since the rise of movements promoting patient-centred care and safety, skills in communication and collaboration have been emphasised in health professional education and practice. While studies have identified features of effective communication and interprofessional collaboration, multiple barriers exist to integrate these results into practice, making innovative knowledge translation imperative.
Method: The research study conducted in ten healthcare institutions involved video-recording of team meetings, collaborative practice (i.e. co-therapy) and medical rounds, and data were analysed using a qualitative observational method. In order to integrate the study findings into practice, workshops with each participating institution were organized. Rather than delivering synthesised research findings, we used data (i.e. video clips of interprofessional practice) and invited clinicians to engage actively and reflect about their own communication and collaborative skills.
Results: The study identified verbal and embodied (e.g. gaze, posture) resources health professionals used during interprofessional activities. The video-recorded data disseminated in collaborative workshops with clinicians allow for dialogue, reflection and discussion. This presentation represents an innovative approach to skills development and involves the end user of research findings (clinicians) engaging directly with the data. The underpinning pedagogy of this approach relates to learning via constructivism and reflective practice.

A constructivist paradigm seems to be well suited for integrating knowledge into practice. The process of knowledge translation can be seen as a social interactive process, potentially able to bridge the gap between research and practice while enhancing clinicians' reflection on practice. The benefits of video-recordings for communication and collaborative skills development will also be discussed.
Discussion: This presentation highlights the importance of collaboration between clinicians and researchers to achieve successful knowledge translation. Using a constructivist approach requires a paradigm shift from positivist knowledge transfer initiatives to a more collaborative and constructivist philosophy, enabling a dynamic integration of evidence on communication and interprofessional collaboration.
Conclusion: Encouraging clinicians to incorporate research findings into their everyday practice is challenging. Building in collaborative engagement with research findings as a deliberate dissemination strategy enhances understanding and uptake of interprofessional collaboration and communication research findings.

Improving the quality of communication assessment: continuous training of raters and interrater reliability

Authors
Fred Tromp, University Medical Centre St. Radboud, Nijmegen, Netherlands
Patrick Dielissen, University Medical Centre St. Radboud, Nijmegen, Netherlands, Netherlands
Netty van Balsfort, University Medical Centre St. Radboud, Nijmegen, Netherlands

Presenter:
Fred Tromp, University Medical Centre St. Radboud, Nijmegen, Netherlands

Background: Assessments of communication skills of GP trainees is recognized as a necessary component in medical education. GP trainees hand over videotapes of real life consultations that are assessed using the Maas-Global. This instrument has an established reliability and validity. In its manual it is acknowledged that context factors play a role but it is left implicit how to incorporate contextual influences. It is known, however, that context factors may affect assessment outcomes. To achieve a satisfactory degree of agreement among raters, faculty members of our GP-training are trained intensively. After the initial training at the start, twice annually meetings are organized in order to make raters aware of the influence of context factors and they are instructed to account for these factors. This study aims to measure the interrater reliability (IRR) of the Maas-Global.
Method: Sixty-three GP-trainees provided a total of 188 videotaped consultations. The Maas-Global includes 13 communication items. Using a prospective design, we computed the IRR of the Maas-Global items rated by a panel of 24 faculty members.
Results: The percentage of poor (15.5%), sufficient (45.6%) and excellent performance (38.9%) in our sample did not differ from the total population. We found that IRR was

0.81 for all items of the Maas-Global indicating a good reliability on item level. We also examined the IRR of five items associated with patient centeredness: Shared Decision Making: 0.81, Exploration: 0.83, Transfer of Information: 0.86, Structuring: 0.84 and Showing Empathy: 0.86.

Discussion: The literature shows that implementing a training to improve reliability of an assessment instrument often shows moderate effects at best. To assess practice situations, raters received guidance on how to handle specific contextual factors. Our way of continuous training asks raters to reflect on their personal methods of evaluating performance and establishes a shared frame of reference for evaluating performance. The results of our study show that personal influences of the raters in assessment of GP trainees is minimal.

Conclusion: Our way of continuous training of the raters enables raters to assess the communication skills of GP trainees in a reliable way.

Minho Oral Scientific Communication Scale (MOSCS): A checklist to evaluate oral presentations in medical students

Authors
Ana Mónica Pereira
Filipa Pinto Ribeiro
Pedro Moreira
Manuel João Costa
Patrício Costa
José Miguel Pêgo

Presenter:
Ana Mónica Pereira, ICVS/3B's Life and Health Sciences Research Institute, School of Medicine-University of Minho, Braga, Portugal

Background: Oral presentation skills plays a significant role during medical training and in future professional life. Medical students have frequently to present projects orally in classes, discuss clinical cases and attend to conferences to present research results, being, simultaneously, evaluated. The Medicine course of School of Medicine-University of Minho, Portugal, includes curricular units (Option Project) in which students are evaluated also by their oral presentation of an experience in health and social institutions. In order to use a dichotomous checklist in real time for these oral presentations' evaluations in classrooms and to a more objective evaluation of oral presentations, we developed the Minho Oral Scientific Communication Scale (MOSCS), as to the best of our knowledge, none existing instrument fills our needs.

Method: The MOSCS was developed based on a Delphi method with a group of assessors with clinical and teaching experience. A final 17-item checklist considering verbal and nonverbal communication skills, content and organization of the presentation, iconography and time management was applied. A total of 32 senior (>4 years of experience in oral presentations evaluations) and non-senior assessors (<4 years of experience in oral presentations evaluations), evaluated 364 oral

presentations from medical students. Exploratory factor analysis (EFA) and measures of reliability were obtained to derive the factor structure and internal consistency of the MOSCS.

Results: On average, there was a percentage item agreement of 79.6% between independent assessors (SD=12.5%). Regarding to EFA findings, two to four factor solutions were examined. After the elimination of items with cross-loadings between factors, the two-factor solution was considered the most appropriate, as it provided a good discrimination between items, while being theoretically relevant and having good indices of internal consistency.

Our findings revealed that MOSCS displays adequate psychometric properties, which encourages its use in the context of oral examinations of medical students.

Conclusion: MOSCS can be used in academic context for evaluations in curricular units. In future, we consider that can be used also by peers, for self-evaluations and in research projects, being a useful tool in programs to promote oral communications skills.

Integrating an Interprofessional Collaborative Practice Experience into Physician Assistant Education

Authors
Kristin J Lindaman
Nicole Puccinelli-Ortega
Sonia J Crandall

Presenter:
Kristin Lindaman, Wake Forest School of Medicine, Winston-Salem, USA

Background: Physician Assistants (PAs) are integral members of the healthcare team in the USA. With the increasing focus on Interprofessional Education (IPE) and collaboration, the Wake Forest PA Program implemented a pilot Interprofessional Collaborative Practice (IPCP) experience for second year students completing a clinical experience in Hospital Medicine. Students were integrated into an existing IPCP environment on a large inpatient unit with medically complex patients. On this unit, an interprofessional team conducts daily Structured, Interdisciplinary Bedside Rounds (SIBR).
Method: We developed a curriculum that includes participation in SIBR; TeamSTEPPS training; and learning modules on Infection Prevention, Care Coordination and Wound Care. Modules include pre-reading, interactive one-on-one sessions with a member of each specific discipline, and a checklist completed during the interactive portion of the module. At the end of the experience, in a small group setting, students apply their learning to determine management of a complex patient case study. Students complete pre- and post-experience surveys to assess level of knowledge for each discipline. The post-survey includes a reassessment of prior knowledge compared to current knowledge.
Results: Preliminary data from 12 students show that reassessment is much lower, indicating students overestimate their level of knowledge prior to the experience. Post-assessment of knowledge is higher than either pre-surveys or reassessments. Feedback about the experience from students and preceptors is positive. This experience was designed to align with IPEC competency domains: roles and responsibilities of team members; communication; interprofessional development; and integrated knowledge. Much of IPE happens in the classroom or via simulation. The IPCP experience is unique in that learning occurs in an actual patient care setting. Based on the results thus far, the pilot project is considered a success. All parties are eager to expand the curriculum. A more comprehensive assessment will be implemented.
Conclusion: This IPCP experience adds value and breadth to PA student education and aligns with the institution's strategic goals to expand and enhance educational

programs and transform care delivery through care models, quality and team-based care. This experience will become a required component of the PA clinical curriculum.

InBetween: Interprofessional Education in multiple sectors increases learning relevance of workplaces

Authors
Marika S. Poulsen, Aarhus University Hospital, Aarhus, Denmark
Tina Kramer, Aarhus University Hospital, Aarhus, Denmark
Catrine S. Nielsen, VIA University College, Campus C, Aarhus N, Denmark
Karin R. Laugesen, Aarhus University Hospital, Aarhus, Denmark

Presenter:
Marika S. Poulsen, Aarhus University Hospital, Aarhus, Denmark

Background: Interprofessional education (IPE) in health professions focus to learn, collaborate and interact with the patient. Does IPE increase learning and transfer relevant for workplaces?
Method: We have focused IPE and crossing sectors in the project InBetween since 2012. Teams of students learned in a working setting of 2 weeks, first week in hospital and a week in a municipal setting.
InBetween as implemented study model underwent development to give frame to IPE for students from several different educations (2017). This recent Interprofessional Elective element contains 4-6 weeks of study and clinical work in Campus, Hospital and Municipality.
The Council of Education at Aarhus University Hospital has been in charge of bringing together students. An ongoing process keeps up a necessary common time schedule of educations. To teach IPE all teachers, supervisors of hospital and municipal care homes have trained interprofessional Facilitation. During the course students are given daily supervision.
Content of IPE:
1. Study of how to collaborate, learn and teach within different professions.
2. Team training of bringing in the Patient's voice
3. Clinical work 1 week in a hospital working with an admitted patient and 1 week in a care home working with citizens care and training
4. Reflection of the Patient's pathway and ressources in different settings
5. Focus on individual learning mono- and interprofessionally
6. Creation of solutions to solve problems in the patient's pathway
Results: The InBetween has taken place 8-9 times with 3-6 teams of students from nurse, physiotherapist, occupational therapist, medical science, dentist assistant, radiograph, bioanalysist and dietician educations.

Far the most of the students have been very challenged but also motivated especially when working with real patients. They experience interprofessional learning and understanding. They gain the ability to take responsibility, to listen to the patient's requests, and they become better at decision making.

Conclusion: Pregraduate students have limited interprofessional skills before they participate in InBetween. The majority of students get workplace relevant mono- and interprofessional learning, though the supervision is time consuming and the supervisors' ressources differ.

Futher research has to clear potentials of transfer and innovation in this model of education.

8N4 (2543)
Nurse-shadowing in medical education: A systematic review

Authors
Shu-Ching Yeh, Taipei Medical University Hospital, Taipei, Taiwan
Shu-Liu Guo, Taipei Medical University Hospital, Taipei, Taiwan
Chien-Yu Chen, Taipei Medical University Hospital, Taipei, Taiwan
Yi-No Kang, Taipei Medical University Hospital, Taipei, Taiwan

Presenter:
Shu-Ching Yeh, Taipei Medical University Hospital, Taipei, Taiwan

Background: Nurse-shadowing program provides a great opportunity to enhance physician-nurse collaboration and communication. Although nurse-shadowing has been discussed for a long time, no scope review was published. Therefore, the purpose of this study was to review the elements, benefits, and aims of nurse-shadowing for medical education systematically.

Method: This systematic review completed comprehensive search by using relevant terms of nurse-shadowing and medical education in Cochrane library, Embase, PubMed, and Web of Science. No language or date restrictions were set for the searches. The exclusion criteria included (i) no intervention of nurse-shadowing, or (ii) not investigating in medical students or residents.

Results: There were 186 references that were identified by comprehensive searches. Eleven articles entered full-text review after title and abstract screening. One of the 11 articles is letter to editor, and another one is general review. Two of the other nine articles are cross-sectional survey without nurse-shadowing intervention. There were seven eligible studies that investigating in nurse-shadowing program for medical education. The seven studies investigated 649 medical students, and indicated that nurse-shadowing may promote medical students in communication, team work, patient care, and inter-professional learning. Communication was mentioned mostly in improvements after nurse-shadowing activities.

Discussion: This study portrayed key elements, goals, and benefits of nurse-shadowing according to relevant trails. The studies claimed that nurse-shadowing is an effective

and important approach to medical education, despite those studies were different in study design, measurement, and nurse-shadowing activity. However, few well-structured trial of nurse-shadowing with objective measurement was developed and published. There was only one study designed as randomized controlled trial, but it measured outcomes by a self-report questionnaire.

Conclusion: Nurse-shadowing might improve communication, team work, patient care, and inter-professional capacity. However, the evidence is not sufficient. Well-structured trial of nurse-shadowing is needed in the future.

Not just a "guide by the side": Facilitation of IPE in the clinical environment to enable significant change

Authors
Kathryn Parker, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada
Maria Tassone, Centre for Interprofessional Education, Toronto, Canada
Mandy Lowe, University Health Network, Toronto, Canada
Tracy Paulenko, University Health Network, Toronto, Canada
Darlene Hubley, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada

Presenter:
Kathryn Parker, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada

Background: Students enrolled in health care education programs at the University of Toronto learn interprofessionally through the Centre for IPE-led IPE curriculum which includes interprofessional learning in both the academic environment and in practice across a range of settings. Evidence shows that collaborative, client and family-centred care is essential to patient outcomes, health care provider satisfaction and system efficiency and yet, there is still a lot to learn about how IPE, and IPE facilitation, works in the clinical setting (IOM, 2015; Reeves et al., 2016). This participatory research project examines the impact of IPE in the clinical environment of two Toronto hospitals and explores the role of the IPE facilitator.

Research Questions
1. How does IPE in the clinical environment achieve impact?
2. What is the role of the facilitator to enable this impact to occur?

Method: The first stage of this research project utilized the Most Significant Change (MSC) method (Davies & Dart, 2005). Primary data was collected in the form of participants' stories (e.g., learners, clinical supervisors, IPE facilitators) about the changes they noticed following participation in IPE. Then key stakeholders, including patients and learners, identified the most significant changes highlighted in the stories. Phase 2 involved the collection of additional qualitative and quantitative data from existing sources to create a theory of impact which answers how the most significant changes were achieved.

Finally, a thick description of the role of the facilitator in the theory of impact was generated.

Results: The theory of impact illustrates how IPE can result in 1) improved team practice, 2) enhanced interpersonal relationships and 3) deepened self awareness. The facilitator plays a crucial role by authentically engaging with students in an interprofessional learning process which reinforces and strengthens an interprofessional learning climate. The facilitator also must retain and model an interprofessional learning mindset that includes humility and curiousity.

Conclusion: More than just a "guide by the side", the facilitator is an integral part of a learning partnership with students, patients and families.

Gender and Academic Health Leadership

Authors
Anne Wong, McMaster University, Hamilton, Canada
Colleen McKey, McMaster University, Hamilton, Canada
Pamela Baxter, McMaster University, Hamilton, Canada

Presenter:
Anne Wong, McMaster University, Hamilton, Canada

Background: Women continue to be under-represented in academic health leadership attainment. Faculty development interventions may positively impact on leadership capacity building, especially in women. We explored academic leaders' perceptions of gender and leadership to inform how faculty development can better support leadership growth.
Method: We used a sequential mixed methods study design. Participants completed the Leadership Practice Inventory ® (LPI), to assess leadership beliefs and practices. Scores were compared by gender using the t-test. We interviewed a subset of participants and analysed the results using thematic analysis. Quantitative and qualitative findings were integrated.
Results: Sixty-five leaders (38 women; 27 men) participated in the survey. There were no significant demographic or statistical differences between women and men on any of the LPI® components. Five women and 5 men were interviewed. Thematic analysis revealed common leadership aspirations and values. Gender differences were noted in experiences of leadership attainment, the role of mentorship and risk-taking. While the male narratives reflected cognitive awareness of gender inequities, the female narratives also included lived experiences. Male participants emphasized meritocracy in leadership attainment, whereas the female participants highlighted the interplay of gendered social and structural barriers.
Discussion: While men and women shared many similar leadership aspirations and perceptions, they differed in their perceptions and experiences of the influence of gender on leadership attainment. The findings suggest that in addition to skills building, leadership development also needs to explicitly address the "hidden curriculum" of gender and leadership to improve gender equity. The underrepresentation of women in academic leadership results in a loss of potential to the university. An explicit gender lens needs to be applied to leadership program development to address this issue.
Conclusion: Women and men have differing perceptions and experiences of gender and leadership attainment. Faculty development that explicitly addresses gender issues may improve capacity building and contribute to closing of the gender gap in academic leadership.

8O2 (940)
Medical Leaders Identify Personal Characteristics and Experiences that Contribute to Leadership Success in Medicine

Authors
Louise Arnold, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA
Paul G. Cuddy, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA
Susan B. Hathaway, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA
Jennifer L. Quaintance, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA
Steven L. Kanter, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA

Presenter:
Paul G. Cuddy, University of Missouri-Kansas City School of Medicine, Kansas City, Missouri, USA

Background: Leadership theories stress the importance of experiences in developing leaders. Correspondingly, medical schools and organizations offer learners formal leadership experiences; and our study in Academic Medicine (February, 2018) demonstrates the power of informal experiences in preparing students for successful medical leadership. However, contemporary theories show a renewed interest in the contribution of personal characteristics to effective leadership which poses the questions we explored. What characteristics mark medical leaders? What experiences nurture those characteristics?
Method: We adopted a phenomenological, qualitative approach for our study. In August-November, 2015, we interviewed 48 medical leaders who graduated in 1976-1999 from our six-year US medical school and who met rigorous criteria for outstanding leadership. We asked the leaders an open-ended question "In your opinion, what has enabled you to become the leader in medicine that you are?" with prompts: "Experiences before, during, and after medical school? People? Personal characteristics?" We conducted a directed content analysis of their responses. Using iterative coding cycles with attention to reliability and validity, we noted the personal characteristics leaders mentioned, categorized and counted them. We coded and categorized experiences leaders discussed, counted the number of leaders who mentioned each type of experience, and noted connections leaders saw between experiences and characteristics.
Results: Characteristics mentioned most often were: intense motivation and active involvement; openness to new ideas and opportunities; and astute risk-taking. Other frequent characteristics were: people-skills; a service-orientation; capability/competence/ intelligence; and self-awareness. Experiences that nurtured these characteristics included: family traditions of community service; participation in high-school co-curricular experiences; enrollment in an innovative medical school emphasizing longitudinal clinical preparation in supportive learning communities; observation, as students and residents, of mentors modeling leadership; and opportunities to practice leadership and innovation in

authentic settings throughout their education and in the workplace.

Conclusion: Medical leaders identified characteristics paralleling those in the literature but highlighted a service-orientation. They linked family, high-school, medical school, residency, and workplace experiences to developing those characteristics.

Medical leaders' insights enrich the literature on leadership characteristics and how to prepare tomorrow's leaders.

Take-home message: Leadership programs should design longitudinal experiences promoting leadership characteristics, especially service.

8O3 (660)

Growing Your Own Leaders: Preliminary Outcomes of an Institution Based Leadership Development Program for Women Faculty

Authors

Mara Vitolins, Wake Forest School of Medicine, Winston-Salem, USA
Sonia Crandall, Wake Forest School of Medicine, Winston-Salem, USA

Presenter:

Sonia Crandall, Wake Forest School of Medicine, Winston-Salem, USA

Background: Few women aspiring to leadership roles in academic medicine can participate in leadership development programs due to expense, program competitiveness and time away from work. To respond to the demand for leadership education, we created a novel locally based medical school program, Career Development for Women Leaders (CDWL). CDWL is modeled after international programs but costs much less. CDWL consists of nine monthly sessions. Instructors are known experts, senior faculty and administrators. Acceptance into the program is a competitive process.

Method: This program evaluation of three cohorts of participants (N=47) assessed impact using a mixed methods approach. Data included focus group transcripts, and pre- and 24-month post-questionnaires. Participants responded to 63 questionnaire items via a seven-point Likert scale (strongly disagree=1; strongly agree=7). Transcripts were reviewed for themes. Matched paired t-tests were used to analyze questionnaire responses.

Results: Four focus group "program impact" themes arose: expanded networking opportunities; personal/professional benefits; provision of safe learning environment, and return on investment (ROI) for participants and their departments. Matching pre-post questionnaires resulted in 17 pairs. Participant responses significantly improved (p<.05) from pre to post on 47 of 63 items (Cohen's d range = .53-1.42, which represents medium to large effects). Examples: "Establishing a professional network outside institution" (networking); "I know my strengths as a leader" (benefit); "In the past 2 years I have been able to achieve my leadership objectives" (ROI).

Results showed that CDWL was invaluable, provided significant benefit, and offered women career enrichment.

Respondents said CDWL is an excellent faculty recruitment and retention strategy. Participants reported significantly higher levels on all 16 confidence items and better understanding of their leadership strengths/weaknesses. Networks developed were highly valued. A local program allowed more women to participate and the program proved to be cost effective.

Conclusion: Providing faculty development is vital to engaging women faculty and essential for advancing diversity at medical schools. Local economical programs can be implemented that meet the needs of women faculty. We will present how CDWL can serve as a model for other institutions desiring to provide leadership training.

Does Academic Leadership Development Make a Difference? The Evaluative Case of a Contemporary Program

Authors

Susan Lieff, Centre for Faculty Development at St Michael's, Faculty of Medicine, University of Toronto, Toronto, Canada
Claudia Barned, Centre for Faculty Development at St Michael's, Faculty of Medicine, University of Toronto, Toronto, Canada
Betty Onyura, Centre for Faculty Development at St Michael's, Faculty of Medicine, University of Toronto, Toronto, Canada

Presenter:

Susan Lieff, Centre for Faculty Development at St Michael's, Faculty of Medicine, University of Toronto, Canada

Background: The academic medicine environment is often characterized by rapid change and complexity. The demand to attend to new trends and drivers in health care and health professions education requires academic leaders to have the capacity to anticipate, influence, and be responsive to these emergent needs, in ways that strengthen their organizations. In response, academic leadership development programs have proliferated; however, rigour in their design and evaluation is still in its infancy.

Method: We report on the evaluation of the New and Evolving Academic Leaders (NEAL) program: an 8-month, three-module program based at the University of Toronto. Informed by authentic, self, collective, and complex-adaptive paradigms of leadership, the program emphasizes reflective practice and experiential learning as its primary pedagogical orientations. The curriculum is thematically mapped within intrapersonal, interpersonal, organizational, and system domains of leadership practice. To evaluate the program, we employed a contribution analysis approach to explore the role that leadership development plays in influencing individual and organizational transformation. Ergo, we engaged in in-depth, longitudinal study of 18 program participants. Data sources included 3 reflection course assignments, pre-post program leadership attributes survey, semi-structured interviews 1-3 years after program completion and interviews with program coaches.

Results: Our results support views of effective leadership development as a process of personal and organizational discovery. We found that situated and experiential leadership development provides a platform for ongoing feedback, exposure to alternative mental and leadership models, relationship building, and, reflection, thereby contributing to shifts in 'leader role' perspectives toward more interdependence, collaboration, reflectiveness, and authenticity. Furthermore, individual differences impact participant interaction with various program elements and differentially influence outcomes.

Conclusion: Leadership development can effectively influence the cognitive frameworks and leadership practices of academic leaders. Evolving leaders can grow to incorporate more authentic and collective notions of leadership in contrast to traditional approaches. Programs developers may need to attend to Individual and contextual differences that can influence program success.

8O5 (3425)
Could Executive Coaching improve the leadership potential of trainee family doctors?

Authors
Stephen Harte
Kieran McGlade

Presenter:
Kieran McGlade, Department of General Practice, Queen's University, Belfast, UK

Background: Executive coaching is well established in the industrial and financial sectors, impacting favourably on leadership and productivity, but there is scant evidence and little experience of this in health care. It is argued, such an approach might encourage the leadership needed to meet the ever increasing complex challenges of delivering effective health care efficiently. We set out to explore the potential impact executive coaching could have on trainees in family medicine.

Method: All family medicine trainees (n=46) in Northern Ireland completed a questionnaire about knowledge and experience of coaching and leadership ability. Six underwent up to six sessions of coaching by professional coaches over a 12 week period and completed a post-coaching questionnaire. Semi-structured interviews were audio recorded, transcribed and analysed for themes. Trainees had no experience of formal coaching and knew little about it. Pre-intervention they felt ill-equipped for leadership positions, but were keen to develop themselves.

Results: Themes extracted included: General experience of coaching; Leadership identity and areas of leadership development.

Post-intervention perceived self-efficacy was greater. Shifts in mind set were identified in four key areas of leadership: courage (delegation, conflict management, appropriate assertiveness, and challenging defensive medical decision-making); passion (experimental attitude, creativity, self-compassion, positivity, stress reduction, reframing 'failure', resilience); impact (time management, effectiveness, action planning, pro-activity) and vision

(understanding personal values, culture creation). An increased desire for leadership responsibilities was apparent.

Discussion: Coaching creates a safe, challenging and empowering environment, impacting working cultures. This is the first UK study of its kind in family practice. Coaching helps provide leadership 'language' and 'identity' and challenges the 'imposter phenomenon'. Coaching provided bespoke, deep, experiential learning, with transferable benefits not otherwise available in the Specialty Training programme.

Conclusion: Executive coaching is feasible, relevant and an "eye-opener" for trainee family doctors. It empowers and facilitates doctors to consider leadership roles. Incorporation within existing training schemes should be considered.

8P: Short Communications: Teaching and Learning: Problem Based Learning/Team Based Learning

Location: Darwin, Ground Floor, CCB
Date: Tuesday 28th August

8P1 (3542)
How hybrid PBL can support students to manage cognitive load: findings from an audio-diary study

Authors
Hilary Neve, PUPSMD, Plymouth, UK
Kerry Gilbert, PUPSMD, Plymouth, UK

Presenter:
Kerry Gilbert, PUPSMD, Plymouth, UK

Background: Despite increasing evidence that Problem Based Learning (PBL) benefits learners beyond knowledge acquisition, PBL has been criticised for increasing cognitive load and reducing student learning compared to 'strongly guided' instruction, particularly in the early years when students have not yet acquired major concepts and basic knowledge (Hattie, 2015). Others argue that the flexible scaffolding of PBL is compatible with human cognitive structures (Schmidt et al, 2016) and supports students to learn in complex domains which are essential for future practice.
Method: Our school incorporates hybrid PBL within the first two years of our curriculum, which has been updated to reflect recent evidence (Neve et al, 2016). This paper describes a qualitative research project using audio-diaries to better understand our learners' experience of PBL. Over an academic year, Year 1 medical students and tutors recorded, on Smart phones, relevant experiences occurring during PBL sessions. Participants were asked to describe 'aha' moments, times where learning was troublesome, and perceived enablers and barriers to their learning. Reflections were uploaded to a secure dropbox, transcribed and analysed using Nvivo software to identify key themes.
Results: 12 students and 5 tutors kept audio-diaries. We will describe, with illustrative quotes, how the PBL process enabled them to identify and address troublesome and complex learning encountered during other elements of the course. Particularly important were the use of visual tools and group discussion, to activate prior learning, make thinking visible and identify gaps in understanding. We will share data suggesting that PBL also supported students to develop metacognition, self-regulation and self-efficacy.
Discussion: Rather than increasing cognitive load, our study suggests that PBL, in the early years of a hybrid curriculum, can support students to address this load and to develop the qualities and capability (Bowden, 2004) they will need to learn effectively in future complex and unpredictable healthcare settings.
Conclusion: Student and tutor audio-diaries can offer important insights into the learner experience of PBL.

When employed within a hybrid curriculum, the PBL process can help students address complex and troublesome learning and develop important lifelong learning skills

8P2 (3459)
Experiences and emotions – examining first year medical students' transition into a PBL curriculum

Authors
Diana Stentoft

Presenter:
Diana Stentoft, Aalborg University, Aalborg, Denmark

Background: Expectations are that students come ready for learning when entering problem-based medical education. Coming prepared entails that students perform as self-directed learners when engaging with problems. Studies have however shown transitions to be uncertain and potentially stressful experiences but little is known about students' specific experiences of transition into a PBL setting.
Method: This study examines students' detailed experiences of transformation from secondary to problem-based medical education. The qualitative study is based on reflective journals written by a cohort of first semester students, N=169. As part of their journals students were required to reflect on their transformation process. Nvivo was utilised for an inductive thematic analysis first revealing overall themes which were subsequently organised in sub-themes providing rich details of students' experiences.
Results: Three significant findings emerged from the study. First, many students do not consider learning or learning strategies actively during secondary education. Instead they rely predominantly on structures provided by teachers. Second, many students express emotions, often negative, when reflecting on their transition into PBL and third, many students recognise the need to change their learning strategies shortly after entering problem-based medical education.
Discussion: Students face a comprehensive transformation when exchanging the structured confines of secondary education with the messy, emotional uncertainties of PBL. Consequently we need to consider if students are offered adequate support and guidance not only on the learning structures but also on the transition process itself. This consideration is necessary as students experience large discrepancies between experiences of learning across educational boundaries and this may ultimately impact their possibilities for a satisfactory learning outcome as well as their sense of belonging in medical education.
Conclusion: We cannot assume students come prepared for problem-based medical education. Therefore it is important to consider the way the PBL curriculum may simultaneously support and hinder the transition process. This requires a closer look at both structures and the role of facilitators engaging with students during the first crucial months of their education.

Presenter:
Mieko Ogino, International University of Health and Welfare, School of Medicine, Office of Medical Education, Narita, Japan

Background: International University of Health and Welfare is the first new medical school to be approved in Japan in 38 years, and as such has the opportunity to develop an innovative medical education never before attempted in Japan. In our medical professionalism course, we implemented a team-based teaching (TBT) approach for active learning with multiple faculty members planning and delivering the course together.
Method: First year students (140 in total) undertook an anonymous questionnaire at the end of the course (60 hours) regarding 6 active learning class activities prepared by TBT. For each activity, they were asked whether they remembered the activity, whether it was fun and whether they thought it was useful to their learning.
Teaching faculty involved with the course (7 in total) completed a Likert scale evaluation from 1 to 5 (representing negative and positive effects respectively); regarding the effects of TBT on lesson planning, content delivery and reflection. Faculty were also asked if they wanted to continue using this methodology and if they felt it should be applied to other courses.
Results: Student questionnaire results; remembered the activity 85.8% (56.4～96.4；SD15.1),
activity was fun 86.1% (79.8～93.8；SD5.7), was useful to learning 79.3% (62.1～89.8；SD12.0).
Faculty evaluation results; lesson planning took more time (2.4), was more difficult (2.3) but was also fun (4.6) and satisfying (4.9). Lessons themselves were easier (3.7), fun (4.6) and satisfying (4.9). Reviewing lessons took longer (2.1), but was easier (4.3), fun (4.6) and satisfying (5.0). Faculty responded overwhelmingly positively (5.0) with regards to continuing the TBT methodology and felt that it could be applicable to other courses (4.6).
Conclusion: TBT requires a greater investment of faculty time, but in exchange increases their level of satisfaction, allowing them to enjoy the teaching process of active leaning, as well as garnering positive student feedback. TBT allows implementation of meaningful active learning lessons while allowing the educators to enjoy the lesson preparation, delivery of the class, and team reflection.

Validation of the Knowledge Re-Consolidation Inventory: A New Rating Scale to Measure Learning During Team-Based Learning

Authors
Ying Yun Juliana Koh
Jerome I. Rotgans
Preman Rajalingam
Naomi Low-Beer, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

Presenter:
Ying Yun Juliana Koh, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

Background: Team-based learning (TBL) is an instructional approach that has been adapted by many educational institutions world-wide. Despite its growing popularity, there is a lack of instruments that can reliably measure the underlying psychological mechanism of TBL. To address this gap, a new rating scale, the Knowledge Re-Consolidation Inventory (KRCI), was devised. The instrument is based on the theoretical model proposed by Schmidt and colleagues, who explored the six psychological mechanisms underlying TBL – preparation, knowledge consolidation, retrieval practice, peer elaboration, feedback, and transfer.
Method: A construct validation study involving 197 students at a medical school in Singapore was carried out. Two independent samples were taken to explore the psychometric characteristics of the KRCI. First, an exploration sample was taken (N = 90) to conduct a preliminary Confirmatory Factor Analysis. This analysis identified how well the data fitted the hypothesised model, and which items had poor psychometric properties. These items were removed from the model. A confirmation sample was then taken (N = 107) to cross-validate the scale with reduced items. In addition, the present study also explored how well the subscales can predict outcome variables of TBL.
Results: From the original 38 items, 16 remained. The resulting model fitted the data well. The second CFA with the cross-validation sample replicated the findings of the first analysis, and supported the factorial structure of the hypothesised six-factor model. Tests of factorial invariance demonstrate that the factorial structure of the KRCI was stable across measurements. The subscales of the KRCI were also adequate predictors of TBL outcome measures. The KRCI, which consist of 16 items, is a valid and reliable instrument to measure the underlying psychological learning mechanisms of TBL.
Conclusion: While the present study constituted an internal validation procedure, it is an essential and necessary step in any survey research. Only future studies that use KRCI can provide more informative insights in the inner workings of TBL. It is also important to explore how

the sub-scales of KRCI are related to external measures and other constructs.

Team-based learning (TBL) in the medical curriculum: better than PBL?

Authors
Annette Burgess, University of Sydney, Sydney, Australia
Jane Bleasel, University of Sydney, Sydney, Australia
Inam Haq, University of Sydney, Sydney, Australia
Chris Roberts, University of Sydney, Sydney, Australia
Roger Garsia, University of Sydney, Sydney, Australia
Craig Mellis, University of Sydney, Sydney, Australia

Presenter:
Annette Burgess, The University of Sydney, Australia

Background: Internationally, medical schools have long used a variety of approaches to develop hybrid Problem based learning (PBL) curricula. However, Team-based learning (TBL) has gained recent popularity in medical education. TBL maintains the advantages of small group teaching and learning, but in contrast to PBL, does not require large numbers of tutors. In 2016, TBL was introduced to Year 1 of the Sydney Medical Program (SMP). Increasing student numbers (from 142 Year 1 students in 1997 to 332 in 2016) and limited teaching resources, had rendered our model of a hybrid PBL approach unsustainable. This study sought to compare students' perceptions of using TBL in place of PBL.
Method: Year 1 students (n=169) completed three PBL and three TBL sessions during one of the following teaching blocks: Musculoskeletal (n=56), Respiratory (n=59) or Cardiovascular (n=54). Student feedback following completion of each block of teaching was collected by questionnaire, using closed and open ended items. All students were invited to attend focus groups. Data were analysed using descriptive statistics and thematic analysis.
Results: In total, 144/169 (85%) of participants completed a questionnaire regarding PBL, and 152/169 (90%) completed a similar questionnaire regarding TBL. Additionally, 34/169 (20%) of students attended one of five focus groups. The students found positive aspects of their TBL experience to include the smaller group size, the use of readiness assurance tests, immediate feedback from senior clinicians, and time efficiency. In PBL, students reported that variable expertise of tutors; limited direction; and large group size hindered their learning.
Overwhelmingly, students preferred TBL over PBL, as the optimal teaching strategy. Students found the structure and format of the TBL sessions more conducive to learning, engagement and participation than PBL sessions. Changes in both curricula and pedagogy are needed to prepare students for the demands of increasingly complex healthcare systems. Although the use of TBL required an instructional approach, needing direction from the tutor, it remained student-centred, generating a range of positive outcomes.
Conclusion: Study results provide confidence to change from PBL to TBL within Years 1 and 2 of our medical curriculum.

What is Nystagmus? Analysis of a Learning Issue Construction in a PBL Tutorial Group

Authors
Anna Cianciolo, Southern Illinois University, Springfield, USA
Timothy Koschmann, Southern Illinois University, Springfield, USA

Presenter:
Anna Cianciolo, Southern Illinois University, Springfield, USA

Background: Self-identification of learning issues—gaps in one's knowledge and understanding—is the fruit and hallmark of problem-based learning (PBL). Learning issues trigger self-directed study as part of a larger self-regulatory process that promotes comprehension and knowledge retention. With few exceptions, group discussion around learning issues has escaped the close scrutiny that could lead to novel, interactional perspectives on this putative collaborative learning method.
Method: Multi-modal, sequential analysis was applied to three fragments of videotaped conversation from one PBL tutorial group discussing a neurology patient case. The group comprised six second-year medical students and an expert PBL tutor. In the first fragment, the group names "nystagmus" a learning issue after noticing an irregular pattern of eye movements in the patient's examination and failing to articulate what they saw. In the second fragment, the student assigned to present "nystagmus" shares her self-directed learning findings with her peers while the tutor is absent. In the third fragment, the student shares her findings as part of the formal tutor-facilitated tutorial discussion. Analysis examined how the group co-constructed the boundaries of "nystagmus" in these three different conditions, exploring the practical organization of negotiated understanding in each.
Results: The construct of "nystagmus" differed in each of the three fragments, referring initially to an unfamiliar pattern of irregular eye movements, next to a certain neurological examination finding, and finally to poorly understood cranial nerve functions underlying coordinated eye movement. The group negotiated the boundaries of "nystagmus" using various topic-change techniques, which constrained the amount and depth of discussion. The tutor deftly avoided participation in boundary setting, preventing closure by using expansion techniques.
The Conversation Analytic approach used revealed the co-constructed nature of learning issues, that the boundaries of what the group took to be a learnable matter were dynamic and negotiable. Topic changes signaled the group's boundary setting process, which the tutor prolonged to avoid closure.
Conclusion: Learning issues may be seen as static labels for constantly changing, co-constructed meaning. Expert tutors may facilitate construction by recognizing learners' boundary setting activities and inserting expansions to prevent closure.

Using quality-of-care clinical data as an indicator for comparing outcomes from different Family Medicine Residency training programs in Canada: a pilot study

Authors
Keith Wycliffe-Jones, University of Calgary, Calgary, Canada
Kathleen Moncrieff, University of Calgary, Calgary, Canada

Presenter:
Keith Wycliffe-Jones, University of Calgary, Canada

Background: There is limited information about how family medicine (FM) residency training influences the quality of care provided by graduates in practice. Studies in American obstetrics have shown graduates from higher quality programs have lower maternal mortality rates. Clinical outcomes are more complex in FM, involving variables more difficult to measure than mortality and complication rates, but indicators have been developed in the UK for general practice quality-of-care data gathering and analysis.
The Canadian Primary Care Surveillance Network (CPCSSN) gathers similar quality indicator data from over 700 "sentinel" Canadian family physicians. This provides quality-improvement information to the sentinels and is also a potential source of information back to the FM residency training programs about the quality-of-care provided by their graduates.
Method: As a test of feasibility, the residency program of participating southern Alberta sentinels was identified. Quality indicator data were collected via CPCSSN for sentinels' patients with i) diabetes and ii) hypertension. Treatment targets from current Canadian practice guidelines were used to define quality benchmarks based on glycated hemoglobin (HbA1C) levels in patients with diabetes and blood pressure measurements for patients with hypertension. Data were compared based on residency training program (Calgary vs. non-Calgary).
Results: 72 sentinel physicians participated (35 Calgary and 37 non-Calgary graduates). Data from 14,808 patients were used, including 47,361 HbA1C levels and 182,875 blood-pressure measurements over a five-year period. No significant differences were found in the percentages of measurements that met the targets for the chosen quality indicators between the two groups.
Conclusion: This pilot study confirms the feasibility of using a set of clinical data in measuring quality of care based on training program. Studies in other jurisdictions and studies including other potential variables would be possible where such data are available.

8Q2 (745)
Introducing practical leadership skills into general practice placements for first year GP trainees in Scotland

Authors
Meiling Denney, RCGP, London, UK
Susan Bodgener, RCGP, London, UK
Ben Riley, RCGP, London, UK
Alan Johnstone, NHS Education for Scotland, Edinburgh, UK
Pete Churn, NHS Education for Scotland, Edinburgh, UK
Sigi Joseph, NHS Education for Scotland, Edinburgh, UK

Presenter:
Meiling Denney, RCGP, London, UK

Background: Leadership is one of the General Medical Council's generic professional capabilities for all medical specialities in the UK, but engagement in leadership activities is not currently routinely built into GP training. Assessing leadership is part of the RCGP's proposed changes in workplace-based assessment for UK GP trainees. This pilot explored whether GP trainees in their first year of speciality training could engage with a leadership activity in their practice placement.
Method: First year GP trainees were invited to take part in a voluntary pilot on leadership activities. Trainees were offered a menu of leadership activities that could be done in a GP surgery setting. Trainees and supervisors were surveyed through an electronic survey before and after their six-month GP placement.
Results: Trainees felt supported by supervisors and other team members within the practice. Most chose an educational leadership activity or a quality improvement project. Most educational supervisors led on leadership teaching, and most gave feedback, but not all trainees remembered receiving this. Not all supervisors found it easy to get trainees to engage with the process, and generally rated leadership skills as more important for general practice compared to trainees' views. Perceived barriers included lack of protected time, other training priorities, not feeling empowered, and personal issues. Both groups felt that leadership skills were important for a trainee's future career, but supervisors placed more emphasis on this than trainees.
Discussion: Practical leadership training can be translated relatively easily to the real-life setting of UK general practice. There was variable support offered by educational supervisors and differences in trainees' engagement. With a minimum of resources, trainees can take on small projects in the workplace that are of value to them in their training.
Conclusion: Practical leadership skills are essential for GPs in the UK and can be taught in a GP setting. More work needs to be done to see if these results are generalisable to trainees across demographic subgroups, and in other years of training

8Q3 (12)
Clinical decision making at fingertips for junior doctors in Emergency Medicine

Authors
Sriaswini Manjunathan, East Kent Hospitals University Foundation Trust, Ashford, Kent, UK
Rags Subramaniam, East Kent Hospitals University Foundation Trust, Ashford, Kent, UK
Prathibha Bandipalayam, East Kent Hospitals University Foundation Trust, Ashford, Kent, UK

Presenter:
Sriaswini Manjunathan, East Kent Hospitals University Foundation Trust, Kent, UK

Background: Increasingly the provision of Medical Education is supported by technology in its delivery. Previously, in EKHUFT, a DGH, clinical guidelines in Emergency department were paper based. To complement the modus operandi of our junior doctors belonging to Generation Y and Z, an App was introduced as a pilot, to assist clinical decision making.
Method/Results: As TEL lead,
• Scoping: Assessed using questionnaires for need and preference of using App, availability of off-the-shelf apps in market place, cost and compatibility with our Trust IT support infrastructure.
• Project Board was established with junior doctors and a mix of healthcare professionals in ED and the IT Professionals with Trust board buy-in
• A prototype of a Customised mobile App was designed converting the paper based clinical guidelines and was made available on different smart device platforms (including App Store, Google Store).
• The two markers of success for the pilot was using
   o   App analytics on usage
   o   Feedback from junior doctors
• Services were advised to take ownership of governance of the app content
• 73% of trainees expressed improvement in the speed of their clinical decision making using the app
• 74% said Rapid access to clinical guidelines and Enhanced their learning experience
• Patient flow enhanced and breaches reduced.
• Established a Governance board and related protocols
• Identified a gap for a technology based resource for learners in other specialities
Discussion: Are there any reasons why you wouldn't use them? There are various papers supporting and challenging some of these findings. Yet, new developments must consider viability and usefulness before investment.
Conclusion: Introduction of technology seem to have aided doctors in clinical decision making. There are positive outcomes for other specialities to consider introduction within other areas.
Take-home message: After observing the results, there seems to be a clear appetite of doctors in training, especially in generation z for technologically advanced resources like apps as an aid for clinical decision making. Technological tools are to be considered when training Generation Z doctors.

8Q4 (2380)
Postgraduate education in anaesthesiology in Johannesburg, South Africa: qualitative reflections from registrars

Authors
Saweda Cuthbert, University of the Witwatersrand, Johannesburg, South Africa
Lionel Green-Thompson, University of the Witwatersrand, Johannesburg, South Africa
Juan Scribante, University of the Witwatersrand, Johannesburg, South Africa
Helen Perrie, University of the Witwatersrand, Johannesburg, South Africa

Presenter:
Lionel Green-Thompson, University of the Witwatersrand, Johannesburg, South Africa

Background: The training of anesthesiologists is an evolving process that balances statutory education requirements, service delivery and the personal circumstances of the registrar. The literature reports negative experiences of training such as the academic pressures and the challenge of balancing personal life, study and work, as well as positive experiences.
This study explored the experiences of registrars during their specialist training in Anaesthesiology at Wits University, Johannesburg, South Africa.
Method: A qualitative design was applied to answer the research aim. Naïve sketches were invited from the registrars (100) in training to specialise in anaesthesiology. Demographic data was collected and used to assist a purposive sampling strategy to ensure all level of study were represented in the sample. The data were analysed using thematic analysis. Trustworthiness was enhanced through member checking.
Results: Forty one narratives were received from 15 junior and 26 senior registrars. 29 of these were women and 24 were married. The average age of participants was 31 years. These participants describe their learning environment as positive with an excellent academic programme. They describe the personal and systematic challenges of learning in a high service context. The rich descriptions offered by the participants facilitated the emergence of six major themes: roller coaster experience of learning, struggle for academic excellence, lack of protected teaching- a dimension of the academic struggle, of service and learning: unresolved tensions, the challenge of balance and transformation.
Discussion: These themes converged in the metaphor of an oxygen-haemoglobin dissociation curve. A flat line represents entry into the community of practice followed by an exponential increase in the learning as a result of legitimation from exam success. There is a final period of consolidation of their identity as a specialist.
Conclusion: Each registrar's experience is a unique and challenging journey. Despite this, participants experience this journey as a rewarding one that equips registrars with the skills and confidence to become an accomplished specialist.
Take-home message: Postgraduate medical education is a complex process with multiple interacting factors.

8Q5 (153)
Cross-Specialty Differences in Gender Effect on Residents' Milestones Trajectories

Authors
Kenji Yamazaki, Accreditation Council for Graduate Medical Education, Chicago, USA
Stanley Hamstra, Accreditation Council for Graduate Medical Education, Chicago, USA
Eric Holmboe, Accreditation Council for Graduate Medical Education, Chicago, USA

Presenter:
Kenji Yamazaki, Accreditation Council for Graduate Medical Education, Chicago, USA

Background: ACGME Milestone assessment data allows for longitudinal analysis of residents' professional development. Recently, Dayal et al. (2017) raised concerns about potential gender bias in Emergency Medicine (EM) by frontline faculty using a mobile, direct observation assessment tool. In eight residency programs from 2013-2015, they found that for all 23 sub-competencies, males and females were rated similarly at the beginning of residency, but males were rated higher at time of graduation. The present study investigated whether similar gender differences exist in national Milestones data reported by programs after Clinical Competency Committee's (CCC) consensus review in four specialties.
Method: This study examined Milestones data from EM, Internal Medicine (IM), Family Medicine (FM), and Pediatrics residents from 2014-2017: n=1282 (EM; male/female= 65%/35%), n=6682 (IM; 56%/44%), n=3172 (FM; male 45%/55%), n=2439 (Pediatrics; 27%/73%). For each of the sub-competencies, a spline regression model was used to see if gender was differentially predictive of Milestones rating trajectories over the course of residency. Also, gender differences in rating at time of graduation were compared.
Results: In all four specialties, we found that male and female resident trajectories were almost identical on all sub-competencies. At time of graduation, EM and IM males were rated slightly higher than females on a few sub-competencies. In contrast, FM and Pediatrics females were rated higher than males on the majority of sub-competencies.
Discussion: The present national study indicates that for the majority of sub-competencies, males and females were rated equally throughout their training in four specialties. Statistically significant but small gender effects were noted in certain sub-competencies at time of graduation, but differences varied depending on the specialty.
Conclusion: Two major differences between this study and the Dayal study were: 1) we examined data for all residents nationally across multiple specialties and 2) the ratings were the result of CCC review and not based on single faculty evaluations. The methods presented here could be applied to data from other specialties to monitor for signs of gender bias across all specialties.

8Q6 (2409)
"You are virtually on your own" - after-hours support of radiology trainees – are we putting registrars and patients at risk?

Authors
Irina Dedova
Michelle Moscova
Merribel Kyaw
Tina Hoang
Michael Hollands
Noel Young

Presenter:
Irina Dedova, University of New South Wales (Sydney), Sydney, Australia

Background: Support and clinical supervision of radiology registrars is essential for them to develop skills to become competent specialists who engages in safe clinical practice. Under the local guidelines, radiology trainees must have access to a consultant supervisor after-hours. However, how these guidelines are implemented in practice, is unknown.
Method: This study aimed to evaluate after-hours support for radiology registrars in New South Wales, Australia. We conducted a mixed methods study consisting of semi-structured interviews with 16 radiology registrars and an electronic survey of all current radiology registrars (83 respondents). Grounded theory was used to analyse qualitative data. Descriptive statistics were used for quantitative data analysis.
Results: 1 in 3 registrars reported being allowed to work after-hours before completing six months of training. 1 in 5 reported their training site did not have a process for ensuring they were competent at case reporting before they were rostered to after-hours shifts. Only 55% were comfortable calling on-call consultants for help after-hours, compared to 92% during regular hours. After-hours, 70% relied mostly on peers for help with reporting. Compared to junior colleagues, senior registrars were 12 times less comfortable reporting patient safety concerns and twice as uncomfortable calling consultants for help after-hours. Qualitative themes to explain it included: registrars' "unspoken rule"; fear of appearing incompetent; consultants discouraging calls; consultants unable to access data remotely.
Discussion: Despite guidelines, after-hours supervision of registrars is variable. Consultants should take leadership and encourage all registrars to seek help reporting cases as needed. As senior registrars act as role models for juniors, they should be encouraged to seek help after-hours when needed. Reluctance of senior registrars to report patient safety concerns and their fear of being labelled incompetent suggests hospital culture may influence safe clinical practice.
Conclusion: After-hours supervision of radiology registrars needs to improve, as it has potential to affect patient safety.
Take-home message: Culture shift is needed to improve registrar after-hours support and to encourage seeking help after-hours.

8R1 (464)
Improving student midwives' workplace learning by moving from self- to co-regulated learning

Authors
Mieke Embo
Martin Valcke

Presenter: Mieke Embo, Artevelde University College Ghent and University Ghent, Belgium

Background: Contemporary perspectives about regulated learning are moving beyond models, emphasizing individual learning (self-regulated learning) to models that positions social transactions at the core of learning (co-regulated learning). In discussing this paradigm shift, it is important to study self- and co-regulated learning in situational context but research in the context of midwifery education is scarce.
This study aimed at improving our understanding of regulating midwifery students' learning by exploring factors that promote or inhibit the capacity to independently self-regulate learning during internships.
Method: We conducted a qualitative study design involving semi-structured group discussions with final year undergraduate midwifery students (Belgium). Focus groups were audio-taped, transcribed verbatim and analysed in a thematic way.
Results: The majority of respondents didn't experience an education intended to stimulate continuous self-regulated learning. They identified many social transactions (with mentors, teachers, teams of midwives, students, peer students, personal environments, personal coaches and curriculum managers) that were instrumental in promoting or inhibiting the ability to independently self-regulate. Flexibility and resilience to cope with all the differences in practices, guidance, beliefs and behaviors of individual midwives within and between workplaces, was seen as paramount.
Conclusion: Broadening the perspective of the individual learner to the complex interplay between all the stakeholders involved with workplace learning is an essential step to move forward in the effort to improve student' midwives learning in the workplace.
Take-home message: The results of this study suggest that the co-regulated approach might be a necessary direction to enhance the quality of clinical education in practice.

8R2 (1438)
A qualitative exploration of self-regulated learning in newly graduated physiotherapists

Authors
Hwee Kuan Ong, Physiotherapy Department, Singapore General Hospital, Singapore
Shuh Shing Lee, Centre for Medical Education, Yong Loo Lin School of Medicine, Singapore
Sungwon Yoon, Programme in Health Services and Systems Research, Duke-NUS Medical School Singapore, Singapore
Emily ZF Luo, Health Services Research Unit, Singapore General Hospital, Singapore
Fred Steven, Department of Educational Development & Research, Faculty of Health, Medicine and Life Sciences, Maastricht University, Netherlands

Presenter: Hwee Kuan Ong, Physiotherapy Department, Singapore General Hospital, Singapore

Background: Ability to self-regulate learning is a critical part of health professional practice, as it ensures the provision of optimal care in tandem with the medical advances. However, research has been scarce on self-regulated learning (SRL) in Physiotherapy, especially the newly graduated physiotherapists (NGPTs) who undergo the critical transition from student to working professional.
Method: The aim of this study was to 1) understand how NGPTs interpret the meaning of SRL; 2) identify what SRL strategies were being practiced by the NGPTs while they were at college, and at workplace. Six semi-structured group interviews were conducted with 16 NGPTs and 16 supervising physiotherapists (SPTs) working in the largest academic medical centre in Singapore. Data were analyzed using conventional content analysis approach. The findings were also examined against Pintrich's social cognitive model of SRL (2004).
Results: While most interviewees correctly understood SRL, important misconceptions of SRL such as "learning in solo" or "learning as and when the learner desires" were found. There were important motivational changes - students' learning were primarily motivated by exam grade whereas the NGPTS's learning were driven by desires to improve patients' life. The learning strategies were also changed. During student time, group learning, revision of lecture notes and learning resources were the primary learning strategies. However, as the same learners transit to working professionals, the learning strategies changed to seeking supervisory support, experiential learning and time-effort management.
Discussion: Our findings suggest a need for clarifying the concept of SRL and highlight the context in which the learning strategies occurred. Analysing the SRL strategies through the lens of social cognitive SRL model revealed that the NGPTS adopted a narrow range of SRLs. There was minimal monitoring, controlling and reflection in the cognitive and behavioral self-regulation.
Conclusion: Clarifying the concept and introducing a broader range of SRL strategies may be of value for the NGPTs. The use of Pintrich's theoretical framework has enabled the investigators to examine the challenges in a

systematic manner and help to illuminate important considerations beyond a content analysis approach.

Game on: Gamification of Medical Education

Authors
Viral Thakerar, Imperial College, London, UK
Dilshani Hunukumbure, Imperial College, London, UK
Saroj Das, Imperial College, London, UK
Rohit Chitkara, Imperial College, London, UK

Presenter: Viral Thakerar, Imperial College, London, UK

Background: Why are some medical students motivated to play video games for many hours, but appear less motivated to learn how to practice clinical medicine? Video games are designed to engage the player to complete tasks, and reward the player for doing so. These tasks can be cognitively demanding, not unlike medical learning. Video games often give the player a satisfying sense of progression by testing the player to apply the skills already learn in ever more complex and challenging scenarios. This is similar to student progression through the clinical years, where students move from "learning the controls" to "playing the game".
Gamification is the process of applying game-thinking and game mechanics to solve non-game problems. A 2016 landscape review of the literature described seven possible benefits of gamification of medical education. These were increased engagement, enhanced collaboration, real-world application, clinical decision making, distance training, learning analytics and swift feedback[1]. There is evidence of a positive reaction to gamified teaching and of improved learning[2].
The question: Can we apply game mechanics to teach common acute medical conditions to improve engagement and improve learning outcomes?
Pilot study: Year 3 students were given access to an online series of interactive stories based on acute medical scenarios. The stories used game mechanics and followed different paths based on the students' choices. Student feedback and performance on applied knowledge tests before and after playing the game were recorded.

8R4 (2355)
Develop This! A Pilot Self-Directed Learning Activity for First Year Medical Students

Authors
Marika Wrzosek, Medical College of Wisconsin, Milwaukee, USA

Presenter: Marika Wrzosek, Medical College of Wisconsin, Milwaukee, WI, USA

Background: Teaching future physicians is a delicate balancing act – with enough space to foster their independent learning but enough structure to ensure they progress along critical competencies and learn to take care of people. Given the emphasis on lifelong learning, educators are challenged to stay relevant to today's students who often seek online sources of knowledge.
Method: At the Medical College of Wisconsin, a group of 264 first year medical students participated in a mandatory "self-directed learning" (SDL) activity required for their assessment in a course entitled "Foundations of Human Behavior" (FHB). This presentation delineates the details of this pilot SDL project and shares the trials and tribulations of an ultimately successful learning activity.
Results: By weaving in self-assessment, analysis and synthesis of relevant information, and appraisal of sources, this activity supplemented what the required textbook for the course only superficially covered. Requiring students to share information via the completion of a group project as part of the SDL activity solidifies the collaborative nature of modern medicine from the earliest stages of medical school while also subtly paying tribute to peer learning and teaching. Lastly, feedback from the instructor on the independent projects allows for specific input on students' critical thinking skills. Incorporating all components of the Liaison Committee on Medical Education (LCME) SDL standards, this activity was intentionally designed to have students stretch into their slightly uncomfortable independent learning zone by merging with what they naturally want to know – how something they learn in class is clinically relevant. While originally taught to 264 first year medical students, this activity can be easily adapted to wide ranges of topics and students at different stages of learning. This presentation shares this pilot project with a society of fellow scholars and educators.

8S: Workshop: Developing and Integrating a Neuroanatomy Virtual Reality Tool for Medical Education (1499)

Location: Wettstein, 2nd Floor, Swissotel
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
James Pickering, University of Leeds, UK
Panos Bamidis, Aristotle University of Thessaloniki, Greece
Panagiotis Antoniou, Aristotle University of Thessaloniki, Greece

Background: The diffusion of innovation into medical education is well known with novel technologies continuously entering our curricula. With the emergence of cutting-edge digital media, such as Augmented, Virtual, and Mixed Reality (AR/VR/MR), curriculum content can now be created with holographic visualizations that can potentially enhance the understanding of conceptual and abstract aspects of the human body. This workshop will focus on the creation of such a learning resource to support the teaching of neuroanatomy and provide participants an opportunity to interact and discuss the logistics of its development. The workshop will also provide time for open discussion on why, when and how such a resource should be integrated into medical curricula. The workshop therefore aims to provide participants with an opportunity to interact with a cutting edge resource and discuss the implications of integrating such a resource along three themes: 1) why does medical education need to utilize such resources, 2) at what stage should such a resource be utilised, and 3) how is such a resource best integrated. To support the answering of these question, approaches to evaluation will be discussed drawing on the experience of the presenting team and published TEL evaluation frameworks.
Who should attend: Medical educators/teachers; Medical innovators/technologists; Curriculum developers
Structure:
1. Presentation - Introduction to the development of VR learning tool
2. Activity - Experience the VR learning tool
3. Discussion - why, when and how integrate a VR into medical education
4. Group discussion and opportunities for networking
Intended outcomes: By the end of this workshop, participants will be able to:
1. familiarise themselves with a novel VR learning tool based in neuroanatomy as an example of the technology's potential
2. discuss and share ideas of developing such a tool that requires a diverse range of stakeholders, including educators, students, developers and project managers
3. discuss the logistics (positive and negative) of integrating a resource of this type into a medical programme
4. discuss and share approaches to its effective evaluation so meaningful decisions can be made on its implementation and future directions

5. network with likeminded colleagues and initiate interdisciplinary collaborations and future projects
Level: Introductory

8T: Workshop: Student Refugees in Europe: Barriers & Solutions to University Enrollment and Retention

Location: Helvetia 3, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Evangelos Papageorgiou, EMSA
Lara Teheux, EMSA
Aikaterini Dima, IFMSA
Marian Sedlak, IFMSA
Janusz Janczukowicz, AMEE

Background: During the last decade, wars and conflicts have resulted in large numbers of refugees and displaced persons seeking survival and better living conditions, largely in Europe. In particular, the Syrian War outbreak in 2011 resulted in substantial increase of people on the move. Among the thousands of refugees, a large portion of them represented youth: those in the age range 18–34 years accounted for slightly more than a half (51%) of the total number of applicants for asylum in EU-28 during 2017 alone. While no data exists to report the percentage of tertiary education, and in particular medical students among them, we can safely assume that many of them have had to halt their education from the country of origin in order to survive. Naturally, this leads us to ask the question: have they gotten the opportunity to resume studies once settled down in Europe?
Who should attend: The workshop should be of interest to academic staff, policy makers in education, and students.
Structure: The workshop will consist of the following 4 parts:
- Introduction to the topic, explanation of legal terminology and presentation of relevant statistics from the European Students' Union report
- Points of view from invited refugee students who are now enrolled in European institutions
- Identification of barriers to access education as well as highlighting good practices through active discussion and experience sharing
- Formulation of an action plan to support refugee students and educational institutions
Intended outcomes:
- Formulating an action plan for Integration of Refugee Medical Students in European Universities
- Developing understanding of barriers to access education faced by students
- Exchanging good practices among participants
- Understanding steps that should be taken towards the integration of student refugees
Level: Introductory

8U: Workshop: Transitioning to Competency Based Medical Education – Supporting direct observation in a non-procedural based specialty (1363)

Location: Helvetia 4, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters:
Tina Hsu, University of Ottawa, Ottawa, Canada
Sohaib Al-Asaaed, Memorial University of Newfoundland, St. John's, Canada
Sanraj Basi, University of Alberta, Edmonton, Canada
Nazik Hammad, Queen's University, Kingston, Canada
Som D. Mukherjee, McMaster University, Hamilton, Canada

Background: The transition to competency-based medical education (CBME) is rooted in frequent assessment with timely feedback based on direct observation of trainees. In procedural based specialties, such as surgery, faculty presence throughout a patient encounter is already embedded into the culture of residency education. In contrast, trainees in non-procedural based specialties are often implicitly entrusted early on with tasks such as patient assessment due to assumptions by faculty that these skills are already attained in medical school or due to competing clinical demands.
In preparation for CBME, Canadian medical oncology residency programs launched a national field test in 2016. This workshop will be based on lessons learned and our experiences with implementing direct observation as a non-procedural specialty.
Who should attend: This workshop would be of particular interest to faculty, educators, and residents who are interested in developing strategies to encourage direct observation in non-procedural specialties.
Structure of the workshop: The rationale for direct observation in workplace-based assessment will be reviewed. Participants will work in small groups to identify challenges with direct observation in non-procedural based specialties and brainstorm potential strategies to mitigate these barriers. This will be followed by an evidence-based review of the literature surrounding direct observation and CBME supplemented by relevant real-life experiences of the panel. Successes and challenges encountered, as well as successful solutions developed during the implementation of CBME by the medical oncology subspecialty committee will be central to the process and will be framed using Kotter's 8-step change model. Participants will then work in small groups to develop an individual plan for implementation of CBME and direct observation in their centre, using this model. Presenters will be present to facilitate small and whole group discussions of the application of this model.
Intended Outcomes: At the end of this workshop, the participant will be able to:
• Identify challenges and potential opportunities for direct observation of trainees in clinical practice.
• Reflect on successes and pitfalls experienced during a national field test of CMBE in Canadian medical oncology

training program to develop strategies to facilitate integration of direct observation into workplace-based assessment programs.
Level: Beginner to intermediate

8V: Workshop: Faculty Development for Interprofessional Continuing Education: Employing an Innovative, Interactive Approach

Location: Helvetia 5, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Kathy Chappell, American Nurses Credentialing Center, USA
Graham McMahon, Accreditation Council on Continuing Medical Education, USA
Lawrence Sherman, Academy for Global Interprofessional Learning and Education, USA

Objectives: Analyze a problem using an outcomes model framework; Develop interprofessional continuing education (IPCE) designed to improve collaborative practice and patient/system outcomes; Identify measures of team performance and patient/system outcomes. Continuing education in health professions has historically been conducted in silos, yet healthcare providers practice collaboratively in teams. Healthcare educators developing IPCE must plan education that improves team performance and patient/system outcomes.
As a result of participating in this session, healthcare educators will develop IPCE activities designed to improve interprofessional collaborative practice and patient/system outcomes. Participants will explore methods to measure team performance and impact on patient outcomes.
Who should attend: Faculty from all healthcare professions developing interprofessional continuing education for practicing clinicians.
Level of workshop: Intermediate

8W: Simulation Journal Club

Location: Helvetia 7, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1400-1530 hrs

Lars Konge and Debra Nestel, co-chairs of the AMEE Simulation Committee along with members of the Committee

Do you want a quick update on the most recent literature regarding the use of simulation in medical education? Please join us for the Simulation Journal Club where members of the AMEE Simulation Committee have identified the newest simulation literature and handpicked the most influential, innovative, provocative, and interesting papers. We will present these papers and where possible invite the authors to comment on their impact. The format of the Simulation Journal Club will be interactive – allowing time for questions and participant voting for the Premier Paper on Simulation in Medical Education 2017. This paper will win a £1000 award from the Copenhagen Academy for Medical Education and Simulation. This is an excellent opportunity to keep up to date with the increasing amount of research published on this very important topic in medical education.

8X: Workshop: How to use self-regulated (SRL) enhanced feedback in medical education (17)

Location: Osaka, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenter:
John Sandars, UK

Background: Feedback is an essential process for the improvement of academic and clinical performance. However, research suggests that feedback on the learner's use of self-regulated learning (SRL) is a key component of effective feedback. This requires a systematic process to identify the learner's use of SRL processes during real life performance, such as by the use of SRL microanalysis and then to provide structured feedback. This workshop is based on the recent 12 Tips on how to provide self-regulated learning (SRL) enhanced feedback on clinical performance (2017 - Heather Leggett, John Sandars, Trudie Roberts).
Who should attend: All medical educators who wish to develop their approach to using SRL enhanced feedback for academic and clinical performance
Structure of workshop: A practical mix of short presentations and interactive group work, including practical development of SRL microanalysis skills and the provision of SRL enhanced feedback.
Intended outcomes: By the end of the workshop, participants will appreciate the importance of SRL when providing feedback on academic and clinical performance, and to develop their skills in the assessment and feedback

of SRL processes through the use of microanalysis.
Level: Intermediate

8Y: Workshop: "Falling Through the Cracks": A Film and Curriculum for Teaching Teamwork Skills (500)

Location: Samarkand, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Kristin Fraser, University of Calgary, Canada
Irina Charania, Univeristy of Calgary, Canada
Marlene Donahue, University of Calgary, Canada
Ian Wishart, University of Calgary, Canada
Sandra Goldsworthy, University of Calgary, Canada
Ward Flemons, University of Calgary, Canada
Teri Price, Greg's Wings, Calgary, Canada
David Price, Greg's Wings, Calgary, Canada

Background: As complexity increases in healthcare systems, teamwork is becoming an increasingly important element for the delivery of high quality safe patient care. This is true for both healthcare providers working in well-defined care teams, as well as for more geographically distributed providers who interact as part of ad-hoc teams, specifically formed to meet the needs of each unique patient. By placing the patient at the nucleus of the healthcare team, discussions about teamwork necessarily expand to include more providers and interactions than are normally discussed when considering only well-defined teams, such as those who work in the Operating Room. Based on this premise, our university has been developing a new teamwork curriculum and framework (TeamScheme©). This is used by our Faculties of Medicine and Nursing, as well as local partnering schools for allied health professionals to help their students develop the foundational skills required for successful interprofessional collaboration in the delivery of safe patient care.
To further anchor this teamwork curriculum so it is received as meaningful and solution-oriented, a powerful and emotional film, professionally produced by Greg's Wings (gregswings.ca) is shown, and integrated into small group activities (6 hours total). Six additional teaching scenes supplement the film to further illustrate patient safety impacts of teamwork during small group sessions. Attendees will receive facilitator materials for implementing the curriculum, view the film and teaching scenes, engage in facilitated debriefing around the film and participate in a selection of small group activities. Finally, participants will reflect on the utility of the provided facilitator guides.
Who should attend: Clinicians and educators interested in patient safety, teamwork training, systems improvement and interprofessional collaboration.
Structure of workshop: 45 minutes- video and reflection/debriefing by faculty; 45 minutes – attendees will work through sample curricular; 15 minutes – General session debrief, and evaluation of tutor materials.

Intended outcomes: 1. Describe common challenges to providing safe continuing care across clinics and/or institutions. 2. From this true story: 2a, Identify specific opportunities for patient safety improvements through teamwork. 2b Use the TeamScheme to discuss potential solutions. 3. Use these materials for teaching teamwork skills at home institutions.
Level: Introductory

8Z: Workshop: 'Diagnosing' and 'Treating' learners who struggle with clinical performance and reasoning (286)

Location: Guangzhou, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenter
Debra Klamen, Southern Illinois University School of Medicine, Springfield, USA

Background: Learners fail at clinical performance/ reasoning due to a variety of factors and faculty are left with the dilemma of helping them. This dilemma is frustrating because we do not currently have any explicit guidelines for how to do so. Remediation is often haphazard, rotely applied and/or too general. The core problem ('diagnosis') behind the failure is never made clear beyond the fact that the learner did not perform up to passing standards in whatever clinical performance setting in which they find themselves (an exam, on the wards, in a clinic). Our 'treatments' need to be much more specific and targeted, based on a clear 'diagnosis'. This workshop will introduce participants to a 'diagnosis' and 'treatment' cycle for those learners who are deficient in clinical performance/reasoning. Actual learner cases (anonymized) will be presented to illustrate the process of 'diagnosis' and 'treatment', and participants will work through cases (with a tool provided) so that they may become familiarized with the process.
Who should attend: Those who work with medical students or residents in an clinical performance arena (OSCEs, standardized patients, simulations, clinical rotations) and who have had learners who struggle in these areas.
Structure of workshop: Introduction of participants and facilitators - 5 minutes
Goals and Objectives outline - 5 minutes
Presentation of clinical reasoning/clinical performance problems - 10 minutes
Presentation of tools to help diagnose deficient learners - 5 minutes
Practice 'diagnosing' and 'treating' learners with clinical performance/reasoning problems using anonymized cases - 60 minutes
Wrap up and take home messages – 5 minutes
Intended outcomes: By the end of the workshop, participants will be able to:
- Describe 3 potential deficiencies in clinical performance/reasoning

- Use a (provided) tool to diagnose a learner's difficulties, and be able to provide ideas to help with remediation
Level: All levels

8AA: Workshop: Knowledge Translation in Health Professions Education: The Start of a Conversation (2339)

Location: Nairobi, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Aliki Thomas, Canada
Tanya Horsley, Canada
Yvonne Steinert, Canada

Background: There is a growing body of health professions education (HPE) research that can be used to support educators, faculty developers, and curriculum coordinators in making decisions about teaching and assessment practices. It is not clear, however, to what extent our community is ready to embrace and adopt an evidence-informed approach to HPE (EIHPE) and what the targets of EIHPE ought to be. Knowledge Translation (KT) is an emerging field of study targeting a spectrum of activities with the potential to inform the creation, dissemination, and utilization of knowledge and research evidence in daily HPE practices. While KT may provide a useful lens through which to investigate the nature and impact of evidence-informed educational practices and policies in the health professions, HPE scholars have questioned 1) what constitutes "evidence" in HPE; 2) the relevance of educational research in the "real world"; 3) the quality and strength of available evidence; and 4) the readiness of evidence for implementation in educational settings. The goal of this workshop is to bring the notion of KT into HPE and explore how this growing field can be used to advance the EIHPE agenda.
Who should attend: All individuals interested in the creation, dissemination and utilization of educational research in the health professions including educators, researchers, students, Deans and other educational decision-makers.
Structure of workshop: The workshop will begin with a short plenary on the definition and purpose of KT and highlight how KT may be a useful lens through which to promote EIHPE. The plenary will serve to stimulate the small group discussions on whether KT is a "new" or existing paradigm in HPE and whether the HPE community is "ready" to embrace and apply KT. Participants will work in small groups to 1) discuss the challenges, opportunities and applications of KT in HPE and 2) brainstorm possible future directions for KT in HPE.
Intended Outcomes: Participants will be able to:
- Define KT and its main components and processes;
- Characterize how KT can be applied to HPE;
- Discuss avenues for advancing KT in HPE.
Level: Introductory to intermediate

8BB: Workshop: The Standards of Best Practice by the Association for Standardized Patient Educators (ASPE SOBP) (2008)

Location: Mexico, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Henrike Hölzer, Medizinische Hochschule Brandenburg, Neuruppin, Germany
Cathy Smith, Baycrest Health Sciences, Toronto, Canada
Carine Layat-Burn, Psyché-Psychiatric Centre, Neuchatel, Switzerland

Background: Increasingly, health professional educators work with simulation modalities, including human role players such as standardized/simulated patients or simulated participants (SPs). SPs are well people who are trained to portray other human beings (patients, family members, health professionals) for an array of experiential learning and assessment contexts. The Association of Standardized Patient Educators (ASPE), a global organization whose mission is to share advances in SP-based pedagogy, assessment, research, and scholarship, recently published a Standards of Best Practice (SOBP) for human role players in simulation (Advances in Simulation, June, 2017). The ASPE SOBP represents the input of many experts in SP methodology from institutions around the world. These standards provide foundational guidelines that are precise and yet flexible enough to address the diversity of varying contexts of SP practice, from novice to expert. The ASPE SOBP have five underlying values (safety, professionalism, quality, accountability, and collaboration) and address five domains (safe work environment, case development, training SPs, program management, and professional development). This workshop will orient participants to working with these standards. Particular focus will be put on safe and effective work practices and professional development. Resources for implementing the SOBP will be presented.
Who should attend: Those interested in introducing SP methodology into their program.
Intended for all learner levels
Structure of workshop: Large group discussion, small group breakout sessions, and opportunities for individual reflection.
Intended outcomes: Participants will:
- Identify key features of the ASPE SOBP
- Improve awareness of safe and effective work practices related to human simulation
- Reflect on opportunities to apply the ASPE SOBP to their contexts
- Develop strategies for professional growth and networking

8CC: ePosters: Simulation

Location: Kairo 2, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

8CC1 (3468)
Improving Patient Safety and Teamwork Through Simulation Training in Cardiopulmonary Resuscitation

Authors
Wan-Ting Wu
Hsing-Chien Wu
Ping-Hsun Yu
Kai-Ti Chang
Li-Ping Huang
Jiin-Chyr Hsu

Presenter: Wan-Ting Wu, Taipei Hospital, Ministry of Health and Welfare, New Taipei City, Taiwan

Background: In the ward, Cardiopulmonary Resuscitation(CPR) is a complex, time-critical endeavor requiring the coordinated effort of a multidisciplinary health care team. In addition to technical skills of individual rescuers, human factors such as teamwork and leadership affect adherence to algorithms and hence the outcome of CPR. In situ simulation is a voluntary safety program that collects safety data during simulation scenarios.
Method: Our training program includes Crew Resource Management (CRM) and Advanced Cardiac Life Support (ACLS). The CRM program was modified from CRM training materials of China Airlines and Team STEPPS materials. The training program was designed based on a simulation scenario of Unexpected CPR adverse event. In the scenario, a 72-year-old man suffered from long-term hemodialysis was sent to the hospital because of recent repeated gastrointestinal bleeding. 12 sessions of training were conducted in May to December, 2017. At the end of each training session, a score of the participants' overall performance was be given by the instructors. Moreover, two anonymous surveys, one about satisfaction of the program and the other about patient safety issues (The Safety Attitudes Questionnaire), were administered to the physicians and nurse practitioners participating in the training program.
Results: The results indicate that the overall performance of the participants was improved, with an increse of 15.75 % from the first session (64.44%) to the last one (80.19%). Moreover, most participants demonstrated positive attitude toward the training with the scores of satisfaction increased from 65.73% to 86.30%. Lastly, positive gains were also found in teamwork climate (63.8% to 67.3%), safety climate (64.1% to 65.7%), job satisfaction (62.6% to 62.7%), and stress recognition (63.1% to 64.4%).
Conclusion: Leadership and teamwork training have been shown to improve the subsequent team performance during CPR. In-situ simulation provides a learning opportunity for a controlled clinical practice without putting patients or others at risk. This approach may help improve the effectiveness and impact of the training programs. In the future, we will employ Kern's 6-step model to refine the training curriculum.
Take-home message: To achieve this goal, teamwork concepts should be introduced to healthcare professionals.

8CC3 (2835)
Assessing the needs for Basic Cardiac Life Support training in one hemodialysis center using Simulation

Authors
Aron Julien, AURA, Paris, France
Fabienne Chatelin, AURA, Paris, France
Sabrina Barbot, AURA, Paris, France
Blaise Belley Epesse, AURA, Paris, France
Marc Tran, Saint Joseph Hospital, Paris, France
Christophe Ridel, Paris, France

Presenter: Julien Aron, AURA, Paris, France

Background: Patients undergoing hemodialysis have a 10 to 20 times higher risk of cardiac arrest (CA) than the general population. Improving team skills in the diagnosis and initial resuscitation of CA may be a way to improve survival.
AURA Paris (Association for Artificial Kidney in Paris) take care of 1200 patients needing kidney replacement, using various techniques of dialysis. In the largest hemodialysis center of AURA, 150 health professionals treat weekly 320 patients, with 47000 hemodialysis sessions/year. A team is dedicated to staff training, using learners-centered techniques, including simulation. The objective of this study was to assess the needs of the hemodialysis staff for specific training on Basic Cardiac Life Support.
Method: A scenario of CA in the center was written, describing a 40 years old unresponsive patient during an hemodialysis session. Before the session, a questionnaire was given to participants gathering basic demographic datas, previous experience and training in CA, and level of confidence in managing CA.
After a briefing explaining the objective of the session, we exposed to each group of 2 participants the clinical case and introduced them in a room with a manikin designed for cardiopulmonary resuscitation, able to simulate various cardiac rhythms (ZOLL©, US). A semi automatic external defibrillator and a bag valve mask were available. Participants were assessed during 5 minutes by two evaluators, using a 6 items checklist with a simple grading scale ("done"-"not done"). The checklist was established in advance, based on the European Resuscitation Council recommendations, listing the basic requirements expected from any staff facing a CA.
Results & Conclusions: The study started on February 2018: preliminary results of both standardized assessment and questionnaire suggest the need of basic training in CA. The assessment is still ongoing: the target is to assess 100 staff, including nurses, practical nurses, and stretcher-bearers. The training team will keep on strengthening periodic training on CA, targeting in priority the staff in need, identified during the sessions.

Take-home message: Periodic training on CA is required for staff facing high risk cardiovascular patients in hemodialysis centers.

8CC4 (3473)
Enhancing the meaning of the feedback in learning patient care in simulations – Education for Simulated Patients

Authors
R Teuri, Turku University of Applied Sciences, Turku, Finland
T Franck, Turku University of Applied Sciences, South West Hospital District and University of Turku, Turku, Finland
R-L Lakanmaa, Turku University of Applied Sciences and South West Hospital District, Turku, Finland

Presenter: Riikka Teuri, Turku University of Applied Sciences, Turku, Finland

Background: Simulation exercises are designed to imitate healthcare situations in which students should be able to act with the patient. Simulated patients (SPs) are used like a real patient to contribute to the authenticity of the simulation. The SP means a person trained to act and give feedback as a patient in the simulation situation. The feedback in simulation is an essential part of learning and can be achieved when the SP knows the meaning of the curriculum and is educated to feedback giving.
Method: In order to increase the authenticity of the simulations Turku University of Applied Sciences has started to educate volunteers who want to act as a SP. The first course was held in 2017 and it included four study days for orientate participants for simulation pedagogy, basis of the nursing curricula and giving feedback to produce acquirements for SP roles. The course was built on basis of SP pedagogy and ASPE Standards of Best Practice. Special attention was given to the experimental feedback focusing on the learning goals of the curriculum. After the course the trained SPs (n=6) were tested in the pilot simulation exercises with nursing students.
Results: In the simulation, the SP gives feedback to the students about how they experienced interaction and how students met the learning goals from the patient´s point of view. SP provides for the student the learning experiences that allows for encounter of humanity and individuality in simulations. The students who participated to the pilot simulation exercises valued SP´s participation in the exercises and they found the learning situations more real and easy getting in.
Conclusion: In simulation exercise, where patient-centeredness is of crucial importance, the SP helps to create more authenticity and bridge the gap from simulated practice to practice with live patients. The authentic feedback based on the learning goals provided by the SP enables the students to reflect on their own actions and thus to deepen their theoretical knowledge.
Take-home message: By giving feedback focused to the learning goals SP take learning in to a new level in the simulations.

Does the team leader role affect medical students' confidence levels, in simulated shock resuscitation?

Authors
Veerapong Vattanavanit, Faculty of Medicine, Prince of Songkla University, Hat Yai, Thailand
Thanapon Nilmoje, Faculty of Medicine, Prince of Songkla University, Hat Yai, Thailand
Bodin Khwannimit, Faculty of Medicine, Prince of Songkla University, Hat Yai, Thailand

Presenter: Veerapong Vattanavanit, Faculty of Medicine, Prince of Songkla University, Hat Yai, Thailand

Background: Simulation-based team training is well recognized as an effective learning method, and as such our faculty has established a course for fifth year medical students over the last 2 years. It can improve our medical students' knowledge and their confidence levels in regards to septic shock resuscitation[1]. However, due to this program being time consuming, we cannot provide every student a chance to fulfill a leader role. Hence, we aim to compare both the knowledge and confidence levels between leaders and followers.
Method: A prospective study was conducted with fifth year medical students, during an internal medicine rotation between the periods of: May to November 2017. The simulation class was a 3-hour session consisting of 4 shock type scenarios, as well as post-training debriefing. Each group had 1 leader, with the rest filling the roles of followers. Knowledge assessment was determined by a ten-question, pre-test and post-test. At the end of the class, the students completed their 5-point Likert scale confidence level evaluation questionnaire.
Results: Of the 90 medical students, 20 students were leaders. The median scores, interquartile range (IQR) of post-test, between leaders and followers, was not different (6, IQR 6.0-7.7 vs 6, IQR 6.0-8.0, p =0.84). In addition, the student median confidence level, IQR after training, was also similar (3, IQR 3.0-4.0 vs 3, IQR 3.0-4.0, p = 0.22). Overall, medical students improved scores (5, IQR 4.0-6.0 vs 6, IQR 6.0-8.0, p < 0.001) along with confidence levels (2, IQR (2.0-3.0) vs 3, IQR (3.0-4.0), p < 0.001) after training.
Discussion & Conclusion: Both, knowledge and confidence levels were not different between either leaders or followers in simulation training in shock resuscitation. In concerns to the timing of the course, every student may not be able to fulfill the leadership role.
Take-home message: The team leader role does not affect medical students' knowledge and confidence levels in our shock resuscitation simulation training.
[1]Vattanavanit V, Kawla-Ied J, Bhurayanontachai R. High-fidelity medical simulation training improves medical students' knowledge and confidence levels in septic shock resuscitation. Open Access Emerg Med. 2017;9:1-7.

Enhancing emergency performance competency for violence response by using mnemonic phrase and simulation training among emergency workers

Authors

Yi-Chun Chen, Department of Emergency Medicine, Taipei Medical University Hospital, Taipei, Taiwan
Jen-Chieh Wu, Department of Emergency Medicine, Taipei Medical University Hospital, Taipei, Taiwan
Hui-Wen Chen, Center for Education in Medical Simulation Manager, Taipei Medical University, Taipei, Taiwan
Hao-Yu, Chen, Center for Education in Medical Simulation Manager, Taipei Medical University, Taipei, Taiwan

Presenter: Yi-Chun Chen, Department of Emergency Medicine, Taipei Medical University Hospital, Taipei, Taiwan

Background: Health workers are at high risk of violence all over the world. It is important but difficult to train health workers for these kind of rare but complex and critical circumstances. The aim of this study is to use " seven mnemonic phrases " with simulated violent scenario to enhance emergency response performance to violence of our emergency health workers.
Method: A total of 34 emergency works were included in this study. The participants were 20 nurses, 8 doctors, 3 security guards and 2 social workers who enrolled in Division of Emergency Medicine in Taipei medical university hospital. According to our hospital policies and laws, we organized violent response protocol. Based on Information Processing Theory and Motor skill Theory, the violent management steps were simplified as seven mnemonic phrases called IIUACCM including 1) Identify potential violent behavior, 2) Isolate the personnel of conflict, 3) Understand the causes of conflict, 4) Appease violator, 5) whether to Constrain the violator or not, 6) Call the response team, and 7) Maintain safety. We designed pre and post-scenario with these elements and used a self-efficacy of violent response checklist to measure the performance outcome and collected quantitative feedback from the employees on the simulation class.
Results: The result of violence scenario showed that emergency teams had better violence response after training with seven mnemonic phrases (t=8.625, p<.001). The results showed the improvement of isolate the personnel of conflict (MD=0.760, p=.027), appease violator (MD=1.060, p<.001), whether to constrain the violator or not (MD=1.360, p=.045), call the response team (t=9.222, p<.001), and maintain safety (MD=1.060, p<.001). The improvement of call the response team was higher than other violence management steps according to the result from general linear model (Lambda=.041, F<15.699, p=.009).
Conclusion: Competence of managing medical violence can be trained by simulation. Mnemonic phrases could help clinical personnel remember and perform better in a complex situation. Violent management involved nurses, doctors, security guards and social workers. Simulation training and way to help them to memorize like mnemonic phrases for above people help improving violent management competence.

Changes in the interprofessional attitudes of midwife students after hybrid-simulation

Authors
J. Berger-Estilita

Presenter: Joana Berger-Estilita, Department of Anaesthesia University Hospital Bern and University of Bern, Switzerland

Background: Team performance, communication, and leadership enhance the quality and effectiveness of interprofessional collaboration between midwifery students and anaesthesia residents in labour emergencies. The realistic setting of hybrid-simulation, where an actress plays a pregnant woman, enables practicing interprofessional competencies in a stressful environment without putting the labouring woman at risk. During video-assisted debriefing, participants discuss and share their experiences and thereby learn about each other's professions and views.
Method: We investigated how full-scale interprofessional hybrid-simulation affects the attitude of midwives towards interprofessionalism. The Inter-Professional Attitude Scale (IPAS) assesses the attitudes of students towards inter-professionalism. We translated this scale from English to German and validated the translated version before its application. The validation of the German IPAS showed high Item-CVI scores for most items, except for the subscale "Inter-professional Bias" which was similar to the original validation showing a low Cronbach's for this subscale. Midwife students filled out the German IPAS before simulation, directly after the simulation day, and 3 months after the simulation.
Results: The total IPAS-score increased significantly toward more positive interprofessional attitudes directly after the hybrid simulation. This increase did not sustain over the 3-month observation period.

Discussion & Conclusion: Inter-professional hybrid-simulation aims to improve knowledge and understanding about each other's roles and responsibilities. The more positive attitude towards inter-professionalism directly after hybrid-simulation enhances trust in one another, which provides the foundation for improved team collaboration in the handling of emergencies. Unfortunately, the improved attitude did not sustain over three months. Future research should focus on how to maintain this positive attitude over time and if improved

interprofessional attitudes lead to better healthcare and safety for the labouring woman and child.

Full-scale hybrid simulation improves interprofessional attitudes directly after hybrid simulation, but the improved attitude did not sustain over 3 months.

Residents As Teacher by Inter-Operator Observation in High-Fidelity Simulation

Authors

Yen-Yu Liu
Ching-Chung Lin
Yung-Wei Hsu
Charles Jia-Yin Hou
Yih-Jer Wu
Hung-I Yeh

Presenter: Yen-Yu Liu, MacKay Memorial Hospital, Taipei, Taiwan (ROC)

Background: Resident-As-Teacher training improves resident's clinical skills and attitudes toward medical education. We analyzed performance of fifteen ICU-naive second-year residents undergoing "first aid team work" high-fidelity simulation in last 3 years and found they had insufficient capacity in "Leadership role", "Communication", and especially "Distribute workload". It is essential for a third-year resident (R3) to integrate
Method: We organized a team-based program to recruited four R3 (named A, B, C, D), respiratory therapists and nurses. Four scenarios with critical conditions and arrhythmias were manipulated by a tutor. All residents completed a self-evaluated transcript before procedure. The program focused on stimulation and feedback. First, the R3-A practiced with medical staff and the R3-B evaluated R3-A's performance along with a tutor as inter-operator observation. Whole process was recorded. Second, by video, the R3-B gave feedback and tutor added afterwards. Thereafter, R3-A and R3-B exchanged roles and remaining residents followed. Each resident got four transcripts created by tutor, another R3, self-evaluated, and pre-ICU training. Behavior as a teacher was introduced by accuracy comparing the score R3 made with the score tutor made.
Results: We applied paired t-test to analyze the results in simulation and intraclass correlation coefficient in accuracy. All residents except R3-D practiced better than they expected and got better performance comparing with pre-ICU training ($p<0.05$). However, by inter-operator observation, a great accuracy gap between residents and tutor was still existing.
Discussion: We assume that if the resident is aware of the situations, and thus he/she should be able to score similarly to the teacher. The higher accuracy residents make, the better ability of being a teacher they get. By inter-operator observation, we found most of the gaps in scores were one point and items of difference more than two points would be especially emphasized.
Conclusion: The team-based training program associated with inter-operator observation by residents and tutor not only provides high-fidelity simulation but also assists residents to become teachers.

Take-home message: Inter-operator observation associated with video-based feedback may serve as an innovative methodology to facilitate residents as teachers.

Towards lower threshold simulation

Authors

Teemu Masalin, Faculty of Medicine, University of Helsinki, Helsinki, Finland
Maarit Raukola, Faculty of Medicine, Clinicum, University of Helsinki, Helsinki, Finland
Taru Suppula, Faculty of Medicine, Clinicum, University of Helsinki, Helsinki, Finland
Minna-Maria Mattila, Faculty of Medicine, University of Helsinki, Clinicum Helsinki & MinSim, Finland

Presenter: Teemu Masalin, Faculty of Medicine, University of Helsinki, Finland

Background: Simulation is increasingly important part of medical education. Patient simulator systems can enhance teaching, but they are often complex, expensive and require many resources. The Faculty of Medicine at the University of Helsinki is experimenting and expanding simulation teaching with lower threshold systems. Three completely different patient simulator systems has been tested and evaluated from the start of the 2018. Systems suitability for different simulation teaching, total cost of ownership and required needs for human resources has been evaluated. The project will continue during the spring, with the first phase now conducted consisting observations and discussions among the experts at the skill labs.
Results: Traditional computer-based patient simulator system includes expensive simulator mannequin, simulator software, control and patient monitor computers and AV-system. It is suitable for almost all of the simulation teaching cases, but requires planning and lots of resources, including the need of a controller working with the simulation teacher and nurse. A lighter mobile patient simulator built around two iPads and wireless router has lowered the threshold, with faster setup time and easier controls. It is flexible, with the possibility to use simulated patients and e.g. CPR mannequin depending the case. App-based solution requires only inexpensive app that can be installed on teacher's own mobile device to act as a patient monitor. No pre-programmed scenarios available, but the app-based solution is suitable to many simulations and requires minimal support.
Discussion & Conclusions: Full scale medical simulation can be achieved by using also lighter simulation systems. With lower threshold systems available, simulation teaching is accessible to more teachers. With lower learning curve, no fear of breaking expensive equipment and familiarity from mobile devices, mobile patient and app-based simulators are more suitable also for beginners and peer tutors.
Take-home message: It is important to evaluate different simulation systems to find the optimal options for different situations. More expensive and complex system is not always the best option.

8CC10 (649)
Simulation Based Learning (SBL) for Pediatrics Clerkship Medical Students: A Preparation Program for Clinical Practice

Authors
Feray Guven, Acibadem University, Istanbul, Turkey
Dilek Kitapcioglu, Acibadem University, Istanbul, Turkey
Erhan Sayali, Acibadem University, Istanbul, Turkey
Mehmet Emin Aksoy, Acibadem University, Istanbul, Turkey

Presenter: Dilek Kitapcioglu, Acibadem University, Istanbul, Turkey

Background: Simulation is a technique to replace or amplify real experiences with guided experiences that evoke or replicate substantial aspects of the real world in a fully interactive manner. Minimisation of medication related adverse events is essential for patient safety especially in pediatrics which involve high alert situations. The use of simulation based training for preparing pediatrics clerkship students for various high-stress and high-impact medical emergencies and impact of this training on student's preparedness are described.
Method: Participants were students at Acıbadem University Medical School in Turkey who had recently begun their clerkship rotations scheduled in 2017(n:84) and 2018(n:44). A 2 day simulation based training program was organized by the faculty. An e-learning module was send to the students prior to the program and also pretests were completed. The 1st day consisted of basic procedural skills trainings such as, iv cannulation, urinary and nasogastric catheterization, airway management, O2 therapy. The 2nd day consisted of history taking, physical examination and management of emergency situations. At the end of the each session a debriefing was done via video recordings. The program was evaluated by using Keller's Instructional Materials Motivation Survey (IMMS). IMMS consists of four factors (attention, confidence, satisfaction, relevance) and 36 Likert -scale. Likert Scale(1-strongly disagree, 5-strongly agree).
Results: 128 pediatrics clerkship students' perceptions for simulation based training were evaluated. Items related to satisfaction factor were 4.8 ± 0.299 and relevance factor was 4.8 ± 0.147. Items related to confidence factor was 4.2 ± 0.294. Items related to attention factor was 4.6 ± 0.336.
Discussion & Conclusions: Clinical training during clerkships is an essential stage in medical education. The transition to the clinical stage can be both exciting and worrying for students described as 'shock of practice'. Simulation based learning allows trainees to hone their skills in a risk free environment. Integrating simulation based learning into existing curriculum improves self confidence of the learners and give opportunity for practicing in emergency situations.
Take-home message: Simulation based learning allows trainees to hone their skills in a risk free environment.

8CC11 (2789)
SimPharma UAE: Using clinical simulation to support 2nd year medical students' understanding of pharmacology in the United Arab Emirates

Authors
Reem Jan, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates
Helen Henderson, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates
Ian Ballard, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates
Rajan Radhakrishnan, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates
Dave Davis, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates

Presenter: Helen Henderson, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates

Background: Teaching methods have evolved exponentially in the past three decades. Many reforms are being made across the pharmacology curricula whilst trying to identify the best teaching and learning approaches that assist medical students' learning . Simulation is a powerful teaching tool providing a bridge between didactic and observational learning to clinical practice; however, it is seldom used to teach pharmacological principles to medical students.
Method: Forty-nine second year medical students from the Mohammed Bin Rashid University of Medicine and Health Sciences in Dubai, UAE were exposed to three 10-minute simulation scenarios which were designed to encourage active learning around the taught theory that the students had already received in their Principles of Pharmacology and Therapeutics course lectures. Groups of 7-9 students observed and rotated around the three scenarios, which were focused on routes of drug administration and justification for the use of one route over another in different clinical situations. Scenarios included anaphylaxis and its management using intramuscular administration of adrenaline, an acute asthma attack and its management with a nebulized bronchodilator and hypertensive crisis and its management with an intravenous potent vasodilator. Debriefing was used to discuss the management of the scenario and relating it to the learning objectives of the session. Data was collated from the student evaluation forms.
Results: Students provided positive feedback indicating that they wanted more sessions and 100% of the students agreed that clinical simulation sessions supported taught theory. Comments from students included that it: "built up on what we learned in a live environment and we put our objectives into action"; "gives practical insights on the subject", and "experiencing real life scenarios leaves the information solid in our heads".
Conclusion: Students felt engaged in the process and evaluated the sessions positively. Further development of the integration of clinical simulation is planned for the future.
Take-home message: Clinical simulation has the potential to support the teaching and understanding of

pharmacology as it can enhance the learning of theory already taught in class.

Knowledge retention after team-based learning for cardiopulmonary resuscitation training in 6th year medical students

Authors
Ratchayakorn Limapichat
Aksorn Pulnitiporn
Achariya Polrat
Poranuch Chaichoosorn

Presenter: Ratchayakorn Limapichat, Khonkaen Hospital, Khonkaen, Thailand

Background: A two-day CPR (cardiopulmonary resuscitation) training program was provided for all 6thmedical student in KhonKaen hospital at the beginning of the year. All of them passed the written and simulation examination which done immediately after training. Moreover they still experienced lot of CPR events in real world as leader or member of the team. But most of them got very low scores from OSCE at the end of the year. So team-based learning (TBL) was introduced to improve knowledge retention.
Method: Six months after standard CPR training, all students were attended a one-day training program, started with simulated life support examination (pre-test). Score was recorded as passed or unpassed. TBL with 6 questions (BLS, VF/Pulseless VT, PEA /Asystole, Tachycardia, Bradycardia and team) in sequence was started by divided the student into 4 groups. Closed book case-based discussion were done in each group. Then one student from each group conducted group discussion under supervision of the instructor. After discussion end, all students received same examination as pre-test2 times; immediate (post-test1) and 75 days after the class. (post-test2).
Results: Thirty-four students completed this TBL course. The passing rate was increased from pre-test at 29.4% (10/34) to post-test1 and post-test2 at 88.3% (30/34) and 85.3% (29/34) respectively.
Discussion & Conclusions: Experienced real CPR events might promote retention. Before TBL course, only 14.70% (5/34) of the students experienced as a leader in real CPR more than 10 events. Passing rate at 75 days after the course was nearly the same as immediate passing rate. So knowledge retention was influenced by TBL.
Take-home messages: For effective CPR training, lecture and simulation based should be combined with TBL. TBL can improve knowledge retention. So it can be used with other strategy to make learning experience more effective.

Effects of Video Debriefing on Advanced Life Support Simulation Course

Authors
Youngjoon Kang, Jeju National University, Jeju, South Korea
Kyungwon Kang, Jeju National University, Jeju, South Korea
Sungwook Song, Jeju National University, Jeju, South Korea
Woojung Kim, Jeju National University, Jeju, South Korea
Hyunsoo Park, Jeju National University, Jeju, South Korea
Jeongho Kang, Jeju National University, Jeju, South Korea

Presenter: Youngjoon Kang, Jeju National University Medical School, Jeju, South Korea

Background: Debriefing is important in simulation education. Traditional debriefing is progressed talking with students for explanation, reminders of context, report of performance but it's reproducibility is low. We hypothesize debriefing with watching video will improve performance, communication, etc.
Method: Advanced life support is critical for healthcare provider. We present simulation about advanced life support for medical students of 4th grade. They had completed 8 hours lecture and 4 hours practice about basic life support before. 38 of students took 4 hour lecture about advanced cardiopulmonary life support (ACLS), they were divided 2 groups, traditional debriefing group vs video debriefing group. They had 2 simulations practice with monitored by camcorder. 2 evaluators who had license of ACLS instructor had assessed their performance, 8 components of team dynamics(closed loop communication, clear messages, clear role and responsibilities, know one's limitation, knowledge sharing, constructive intervention, reevaluation and summarizing, mutual respect). The took knowledge test before and after simulation
Results: There was no difference within 2 groups in rise of knowledge test score. Traditional debriefing increased from 13.61(12.44-14.78) to 15.83(14.79-16.87), video debriefing increased from 13.75(12.68-14.82) to 16.1(15.13-17.07) in performance ability during ACLS simulation. 3 components (clear role and responsibilities, know one's limitation, knowledge sharing) were increased in video debriefing group. Only reevaluation and summarizing was increased in traditional debriefing group. But these were not significant statistically.
Discussion & Conclusion: Debriefing made improvement in performance and knowledge. Video debriefing improved in more areas of team dynamics than traditional debriefing.
Take-home message: Both of traditional debriefing and debriefing with watching video improve performance, communication and team dynamics, but there is no difference.

Lessons in Medical Simulation Centre – Polish student's expectations and experience

Authors
Marcin Kaczor, Medical Simulation Center of Warsaw Medical University, Warsaw, Poland
Antonina Doroszewska, Medical University of Warsaw, Warsaw, Poland
Agnieszka Iwan, Medical University of Warsaw, Warsaw, Poland
Bartosz Kozłowski, Medical Simulation Center of Warsaw Medical University, Warsaw, Poland

Presenter: Antonina Doroszewksa, Medical Simulation Center of Warsaw Medical University, Warsaw, Poland

Background: Medical simulation has been recognized didactic tool for clinical courses. In 2017 the Medical University of Warsaw adopted simulation as a method of teaching. This allows to observe students' approach to this kind of classes

Summary of Work: The aim of the study was to describe the expectations and experiences of students participating for the first time in the MSC classes. The study group consisted of students who had never before taken classes at the MCS. After pilot study, a preliminary study was carried out (n = 70). The presentation will present results for the whole research sample (about 300). Two questionnaires were used. The first one was completed by students before the beginning of the class, the second one after completing the course. The respondents were also asked to fill in the Perceived Stress Scale and the Coping Inventory for Stressful Situations.

Summary of Results: The analysis of the preliminary results shows that almost half of the students (44.3%) feel anxiety. This anxiety is primarily due to the fact that the majority of the respondents assess their practical skills at the very low level. At the same time, students positively assess classes in the simulation center. More than half of the respondents declare that they would like to attend more such classes, that they allowed them to acquire practical skills, that they are better prepared to train practical skills.

Discussion & Conclusions: Analysis of the preliminary results shows that the classes involved the subjects emotionally, which is also manifested in the declared subjective stress perception before and after the classes. Before the classes the average stress level for the research sample (on a scale of 1 to 9) was 3.41 (SD 1.75), while after the classes 4.84 (SD 2.21).

Take-home Messages: The MCS classes give the respondents an opportunity to learn their limits, their behaviour in a specific clinical situation, role in a therapeutic team, the ability to apply knowledge during practical activities. They are therefore an important part of the practical preparation of future medics, exercising skills in coping with stress, as well as shaping their personality.

Time: 1400-1530 hrs

8DD1 (2878)
Student selective components: the way to improve community engagement in a community-based curriculum

Authors
Wasana Hongkan, Chonburi Medical Education Center, Chonburi, Thailand

Presenter:
Wasana Hongkan, Chonburi Medical Education Center, Chonburi, Thailand

Background: Community-based is the important curriculum to produce medical students to be community-oriented doctors with comfortable medical practice in the rural community. The aim of this study is to demonstrate planning for vertical integration of community-based curriculum by student selective components(SSC).
Method: During the academic year 2015-2018, Chonburi medical education center and Chulalongkorn university had planned to integrate community-based curriculum in 14 weeks duration of student selective components from total 26 weeks that divined to four weeks before clinical years, six weeks during the middle of clinical years and four weeks in the final years. Planning on the curriculum were consists of select the community and rural hospitals, planning with a rural clinician for staff development and student support systems, consider for infrastructure and manpower support and design course syllabus and lesson plan.
Results: Community-based student selective components had designed and divided into two components (management and caring). Management topics consist of Healthcare system, Health system analysis, Community health system and management, Information technology and management information system in community health service, Economics in community health care system and patient safety with risk management. Caring topics consist of Occupational medicine, Alternative medicine in the community, Chronic care in the community hospital, Stroke care in the community hospital, Palliative care, Ambulatory care in the community, Mother and child health care in the community, Cross-culture health care and medical linguistic and Emergency medicine in the community hospital. The course syllabus and lesson plan had developed by Clinician staffs of Chonburi hospital with the rural clinicians.
Discussion: Mentoring is required for medical students to select appropriate selective components because of the variety of SSC within the limit of times. The core curriculum and medical professional development program with community-based should be developed and integrate since the preclinical year.
Conclusion: Student selective components are the alternative way for medical students to develop community engagement. Evaluation of the course was needed to support this learning method.
Take-home message: Rural clinician development to be teacher and effective mentoring should be strongly considering for community-based student selective components.

Construction and Practice of Education System of Early Community-based Clinic Contact

Authors
Qiaoling Cai
Jing Gao
Hongmei Tang
Xiong Ye
Chenlei Li

Presenter:
Qiaoling Cai, School of Clinical Medicine, Shanghai University of Medicine & Health Sciences, Shanghai, People's Republic of China

Background: To implement the "Healthy China 2030" planning outline and increase the level of hierarchical medical system, according to the "Global Minimum Essential Requirements, GMER", Shanghai University of Medicine & Health Sciences (SUMHS) is committed to initiating medical educational program and building community clinic partnership to train the family doctor. Meanwhile, the early self-learning and practice has been carried out to enhance the competence of family doctor in community care.
Method: The Early Community-Based Clinical Contact (ECBCC) was established and integrated into the medical education curriculum which emphasized the family medicine concept and basic clinical skills. Two courses, "Introduction to the medicine" and "Early community practice", were introduced. The former describes the origin of medicine, doctor-patient communication, prevention and healthcare, family medicine concept, etc. Students are guided to pay close attention to healthcare through Problem-Based Learning (PBL). The later consists of several community practice modules such as general clinic observation, home bed interview and patient care. Several methods including questionnaire survey and online assessment were adopted to evaluate this curriculum. The ECBCC system was set up through the effective course and a School-Hospital-Community three-level mechanism. Four learning methods were combined closely: PBL (P) based on family medicine case, Observation (O) in the real community clinic, Interview (I) that community patient care or patient home visiting and Service(S) oriented in "Health education to patient" projects.
Results: The curriculum was highly accepted with more than 90% of students recognizing this teaching content. The ECBCC system focuses on integrating "medical liability, concept of family medicine, doctor's empathy toward patient, doctor-patient communication, and preliminary skills of community service" into the curriculum so as to foster students' professionalism in the early studying stage.

Conclusion: Through this system, students recognize their future social role and improve their capability of doctor-patient communication, professionalism and health promotion awareness. The classroom is extended to patients through exploring the narrative medical "patients' illness stories".

Take-home message: The ECBCC system based on POIS has been successfully established and utilized in student-centered progressive medical education.

8DD3 (1539)
Introduction of early clinical and community-based experiences to undergraduate medical education in Vietnam to meet evolving epidemiological and population demands

Authors

Phuc Minh Vu, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam
David B Duong, Harvard Medical School - The Partnership for Health Advancement in Vietnam, Boston, USA
Tuan Anh Nguyen, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam
Kristen Goodell, Boston University School of Medicine, Boston, MA, USA
My Hanh Thi Nguyen, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam
Lisa Cosmi, Harvard Medical School - The Partnership for Health Advancement in Vietnam, Boston, USA

Presenter:
Phuc Vu, University of Medicine and Pharmacy at Ho Chi Minh City, Ho Chi Minh City, Vietnam

Background: Early and community-based clinical exposure has become an integral component of medical training programs around the world. Most Low-and-Middle Income Countries (LMICs) still apply a traditional model of pre-clinical science taught in the classroom followed by hospital-based clinical rotations, with minimal emphasis on community-based care. Vietnam, a LMIC, has undergone an epidemiological transition towards chronic, non-communicable diseases. To address this, the University of Medicine and Pharmacy at Ho Chi Minh City (UMP) is reforming its 6-year curriculum to include early, community-based clinical experience in the pre-clinical years.

Method: We conducted a series of workshops over a two-year period, focused on course and faculty development for communication, professionalism and clinical skills, with dedicated practicums at community-based sites. UMP faculty participated in immersion trips to Harvard Medical School (HMS), and were "twinned" with HMS faculty for mentorship in curriculum development.

Results: In 2017, UMP introduced a new longitudinal clinical skills course to 400 students at 15 community based sites. The course includes an expanded emphasis on communication, professionalism, and a clinical skills practicum, exposing students to these important skills two years earlier than in the prior curriculum. UMP also implemented a faculty development course for 60 new community physician and nurse preceptors, decreasing its clinical instructor to student ratio from 15:1 to 4:1. This course was well rated by students as it allowed them to immediately practice clinical skills and brought relevancy to their education.

Conclusion: As LMIC strive for Universal Health Coverage and move beyond acute, episodic care delivery, a greater emphasis on community-based care and chronic disease management is needed. Medical training programs must adapt to ensure that graduates can meet population health demands. Our successful implementation of a new community-based clinical skills course in a LMIC serves as a model for the many schools undergoing similar reform efforts.

Take-home messages: 1) As LMIC health systems transition to chronic, longitudinal care models, medical training programs must evolve to meet the need.
2) Recent pedagogical trends of early clinical exposure can be effectively applied to LMICs.

8DD4 (3055)
Prevention of Sexually Transmitted Diseases and Pregnancy in Secondary School by Community-based Approach of Sixth Year Medical Students

Authors
Kanokrot Kovjiriyapan
Chawachai Pongpanus
Anan Malairungsakul

Presenter:
Kanokrot Kovjiriyapan, Medical Education Center Phayao Hospital, Phayao, Thailand

Background: Thailand's teenage pregnancy rate is the highest in Southeast Asia. Common medical problems among adolescent mothers include poor weight gain, pregnancy-induced hypertension, anemia, sexually transmitted diseases (STDs), and cephalopelvic disproportion. Increasing teenage knowledge of contraception and prevention of sexually transmitted infections which utilizes school sex education is very important.

Method: In community and Family subject of sixth year medical curriculum was assigned medical students to develop activities and/or tool to approach community. In 2017 they educated grade 11 students about contraception and sexually transmitted infections. Their knowledge was assessed using pre- and post 15 multiple choice questions. Results were analysed using paired t test.

Results: 20 grade 11 students in a rural secondary school, 11 were the girls. Mean age was 17.2 years old. There was a significant improvement in student's knowledge on contraception and STDs (Mean scores = 9.7 and 12.75 for pre and post learning, p<0.001). Most of them(90%) increased in post test scores.

Discussion: This learning method showed that the medical students applied three domains of educational activities or learning; Cognitive: mental skills (knowledge) Affective: growth in feelings or emotional areas (attitude or self) Psychomoto: manual or physical skills (skills) to solve a community health problem. They achieved the top categories of Bloom's Taxonomy; Creating level by integrates training from several sources to solve a problem to improve the outcome.

Conclusion: Learning which powerful and embedded in the learner must learn by doing in real life problems with team.

8DD5 (1813)
How well do students identify community health needs through rapid appraisal Community Diagnosis?

Authors
Iain Grom, University of Glasgow, UK

Presenter:
Iain Grom, University of Glasgow, UK

Background: Over two afternoons Year 1 Medical students undertake a Community Diagnosis Project in central Scotland Communities. Students work collaboratively in small group (8/9 students) learning sets, interviewing key community respondents on their community health needs using "rapid appraisal". Data obtained is triangulated with observations made during the visits and published statistics. The project aims to inform students about the social determinants of health. Many communities have a high degree of social deprivation. Students work together to produce a 15-minute presentation to peers. They also produce an individual report. Presentation and report are assessed coursework. Key elements are "Community Health Needs" and "Suggested Heath Strategies".
Method: Consent was obtained to access individual reports. The health needs and suggested strategies from student reports for each community were collated and coded for analysis. Data from twenty-four communities was available. Seven communities fell into the most deprived category determined by an on-going health and social deprivation initiative. Analysis determined the range and frequency of reported needs and strategies.
Results: 49 Student reports were available for analysis. Frequent health needs identified were employment, diet, smoking, drug and alcohol problems. Also, less expectedly found, were mental health issues that prominently as did community aesthetics and a need to advertise available services. Prominent strategies suggested were cooking classes and health education. Common ground was found with the "Deep End Report" into deprived communities. Though these Year 1 students had very little time to make observations, undertake interviews and compile reports they were able to gain an impressive amount of information about social determinants of health and to suggest strategies. In addition, they identified unexpected issues found in much more detailed community analyses.
Conclusion: The Community Diagnosis Project using rapid appraisal is an effective means of gaining understanding of social issues that affect the health of communities through active learning and engagement with these communities albeit for a short time. Students are more likely to appreciate their patients' problems.
Take-home message: Rapid appraisal of social determinants of health can be undertaken can be undertaken quickly by inexperienced junior students with good results

8DD6 (1262)
Community and Medical Student Perspectives on Community Engaged Medical Education: Impact of CEME on Learning

Authors
Pimpet Sukumalpaiboon, Department of Otolaryngology, Sawanpracharak Medical Educaton Center, Nakhon Sawan, Thailand
Praphun Somporn, Department of Neurosurgery, Hatyai Medical Education Centre, Songkhla, Thailand
Nongnuch Junsri, Department of Social Medicine, Sawanpracharak Medical Educaton Center, Nakhon Sawan, Thailand

Utit Jitngem, Institute for Innovation and Health Service System Development Regional Center, Nakhon Sawan, Thailand

Presenter:
Pimpet Sukumalpaiboon, Department of Otolaryngology, Sawanpracharak Medical Educaton Center, Nakhon Sawan, Thailand

Background: Thailand has sought any intervention to improve medical students' competencies suited to work as a primary physician after graduation. Community-engaged medical education (CEME) becomes a considerable method of learning in primary health care, that contribute to community health needs, and increases graduates' interests in living and working for primary health care in community. This study aims to explore the impacts of medical students on engaging with community members during a community/family medicine rotation.
Method: The forth-year students (the first clinical year) in Sawanpracharak Medical Education Centre (MEC) engaged with local health personnel and community members for one month during a community/family medicine rotation. Activities for community exposure were understanding local community history, geo-social mapping, community meeting participation, family hosting. After community exposure, data was collected from participants who involved with students' activities using questionnaires for quantitative analysis, and a free written report for qualitative theme analysis.
Results: 66 participants completed questionnaires. Almost all community members strongly agreed that fieldwork information students presented was consistent with local reality, and also recognized their capability of self-development, solving problems, and overcoming obstacles in their context. Most of them considered information raised enthusiasm of their health concerns. Almost all students themselves perceived that fieldwork fostered inter-personal and inter-professional teamwork through working and collaborating with social and health network. Not only understand influence of personal beliefs, community life and culture on local health care system, students also recognized the range of problems such as individual, familial, and social levels. Data from

students' reports was captured and thematically analyzed. Emerged themes included: role of community leaders and primary health care workforce in improving community health; understanding of different aspects of holistic care in community setting; dilemma after encountering poor and underprivileged concern of financial over health status.

Conclusion: CEME rotation has positive impacts on students: understanding of lives and health concerns from community members they engaged with. Students experienced local community reality through work-integrated learning with their peers, health care providers/resources, and community members i to achieve the course learning objectives.

Take-home message: Community engagement is a crucial step of delivering an effective medical course

Empowering the roles of preceptors to promote praxis in community engagement medical education program

Authors
Suthee Rattanamongkolgul
Wandee Sutthinarakorn
Taweesak Nopkesorn
Chanuantong Tanasugarn

Presenter:
Suthee Rattanamongkolgul, Department of Preventive and Social Medicine, Faculty of Medicine, Srinakharinwirot University, Nakhon Nayok, Thailand

Background: Medical students are expected to be competent in practice applicable to complexity of the real world; however, this is sometimes not the case. While medical teachers have limited real understanding with the community and the health systems in practice. Preceptors are therefore the key persons who link theory and practice in community engagement medical education. They are very keen in fieldwork but limited theoretical knowledge. Accordingly, to promote community engagement, their capacities must be strengthened. This project was aimed to examine the process to meaningfully enhance their roles and competencies for medical student's learning through praxis in the community.

Method: This participatory action research was conducted in the Department of Preventive and Social Medicine, Srinakharinwirot University in 2016-2018, consisting 9 rotations of medical students, 5 community hospitals with one main preceptor and 3-4 assistants for each hospital. Initially they were orientated to understand the learning objectives and processes, and later provided with course process and learning outcome. In each rotation, they all attended final project presentations with a number of academic commentators.

Results: The medical students were able to link theory to practice and to understand the real situations with consciousness of the medical professional. The preceptors are increasingly more competent by working with medical students using open-minded mindset, continuous assessment with reflection, dialogue for problem solving and linking with their own experiences. Preceptors also prepare communities and resource persons that

potentially facilitate professional formations. In the final project presentations, preceptors learn from experts' comments for using in the next rotations.

Discussion: Collaborations between medical lectures and preceptors are very important to students' development. Preceptors facilitate praxis through learning with medical students. Their roles are promoted by giving relevant theory and joining academic discussions on the student projects and the attempt to improve together with other hospitals.

Conclusion: Preceptors are the link between theory and practice in professional learning. The keys to strengthen to preceptors' capacities are to facilitate them to learn with medical students and the projects that link theory through practice under healthy competitions and responsiveness to the community needs.

Mobile Clinic: Connecting medical students and the community

Authors
William Verbist
Ioannis Balanos
George Sycallides
Peter McCrorie

Presenter:
Ioannis Balanos, University of Nicosia Medical School, Nicosia, Cyprus

Background: The Mobile Clinic of the University of Nicosia Medical School is a non-profit, student- and staff-run initiative that coordinates visits to cities and villages of Cyprus offering free diagnostic tests and raising awareness of a range of health issues. The clinic is run on average twice a month, its main mission being to provide complementary health checks and preventive education to the Cypriot community. The mobile clinic started operation in 2013 and so far has given medical students hands-on experience in the surrounding communities and the opportunity to interact with healthcare professionals and peers.

Method: The Mobile Clinic has provided a variety of health services to Cyprus. It has provided targeted medical examinations and general health evaluations, including ECG, BMI, spirometry, blood pressure, blood glucose, eye and skin examinations, and more specialized examinations, including cervical cancer screening. Presentations delivered by students on topics such as smoking, sexual health, and healthy eating have been given in schools and institutions to raise awareness. It has also aided in surveys and questionnaires for gathering demographic data.

Results: Over 5 years, the mobile clinic has provided free medical services to over 3,300 patients during 52 expeditions. Locals in the community have been referred to appropriate doctors for any concerning findings during the expeditions, and educated on elements of their health they had questions about. Students have gained valuable information regarding health behaviours and preventative measures. Around 400 medical students and 50 doctors

and staff have been involved in expeditions since the beginning of the initiative.

Conclusion: Communities in Cyprus have been extremely receptive to the services provided. Primary prevention given to the community through health checks and education is invaluable, particularly since these members of the Cypriot community do not have easy access to health resources nor do they normally participate in regular check-ups. The Mobile Clinic has played a significant role in developing key skills students will need as future medical professionals.

Take-home message: The Mobile Clinic has built a strong connection between the medical school and the community, which is of mutual benefit to both.

Study of learning and teaching styles in Community and Family Medicine: A course in Medical Education Center at MNST Hospital, Thailand

Authors
Sompong Karuna, Nakhon Si Thammarat, Thailand
Sontus Watchanaprapant, Nakhon Si Thammarat, Thailand
Pacharaporn Khajornwattanakul, Nakhon Si Thammarat, Thailand
Suphab Sabkaew, Nakhon Si Thammarat, Thailand

Presenter:
Sompong Karuna, Medical Education Center at MNST Hospital, Nakhon Si Thamarat, Thailand

Background: The course in Community and Family Medicine at the Medical Education Center at MNST Hospital aimed to inform students on community lifestyles and community health problems. In the 1st week, students learnt concepts and theories of Community Medicine. In the 2nd and 3rd weeks students went to villages and stayed with host families in order to investigate local health problems using the 7-tool kit theory. After assessment, they planned solutions and in the 4th week, students presented their results.This curriculum was established in 1999, thus it is necessary to improve it for the present day.

Method: Questionnaires and groups discussion were used to collect information from 31 MEC medical students regarding the curriculum, their medical adviser, host families and villages. An thorough interview with 6 host families had also been done.

Results: The results of the questionnaires showed that the curriculum of Community and Family Medicine was very satisfactory ($\bar{x}$ =4.46 SD=0.41), the stays with host families were very satisfactory ($\bar{x}$=4.64 SD=0.39), their medical adviser in selected villages was very satisfactory ($\bar{x}$ =4.57 SD=0.46), and their lecturer in the concept and theory of Community Medicine was very satisfactory ($\bar{x}$=4.44 SD=0.43).

Discussion: According to a discussion with medical students, the timing of the course was appropriate. Students developed relationships with their families and people in the villages, and deepened their understanding of local lifestyles that may affect health problems. Regarding the curriculum, students suggested that the tools for the community study should be done before

going to the villages in order to save time. Moreover, the mark for Community and Family Medicine, particularly in field practice, should be increased from 50% to 60%. With regard to the in-depth interviews of the 6 host families, Students made relationships like a child would to their mother.

Conclusion: Students were satisfied with the curriculum and each felt that they had gained in relationships with their host families and villagers. Furthermore, improvement in community health seems more attainable. The learning and teaching styles in this study are effective for improving the Community and Family Medicine curriculum.

A study of the correlation between INHOMESSS acknowledgement and application of holistic home healthcare in Family Medicine

Authors
Kullawan Chaichareonpong
Patranit Nuntasilapachai
Nutnicha Pattanadee
Pimpnipa Chaimongkonrojna

Presenter:
Kullawan Chaichareonpong, Prapokklao Hospital, Chantaburi, Thailand

Background: In the processes of holistic approach in patient care after hospital discharge, home visits play an important role in continuity of care. INHOMESSS Checklist 3, an AAFP home healthcare evaluation tool, is used by multidisciplinary team to assess patient's conditions in each visit. This study determines whether INHOMESSS Checklist acknowledgement correlates with better holistic view of home healthcare.

Method: Samples of this study include 17 4th year medical students taking family medicine course in Prapokklao hospital, Thailand. Self-assessment questionnaires were given after the 3rd home visit using INHOMESSS Checklist to determine whether understanding the evaluation tool correlates with better application in patient care in each visit. The questionnaire is based on score 1-5 rating from least to most applicable of the tool respectively and analyzed with SPSS Statistics, Version 19

Results: There are statistically significant at p-value less than .01 in two issues evaluation : N – Nutritions and M – Medication evaluation in correlation between INHOMESSS acknowledgement and application of holistic home healthcare. There are more sum scoring in application than acknowledgement.

There are more learning benefits for the medical students when they are on duty with multidisciplinary team . The coaching from the staff had given them more practical points to make them more applicable about holistic home health care approach.

Conclusion: The correlation between INHOMESSS Checklist acknowledgement and application of the tool in holistic home healthcare was statistically significant at p-value less than .01, while there was no correlation between the samples' cumulative GPA and application of the tool.

Take-home message: Home visit with multidisciplinary team using INHOMESSS helps better holistic home healthcare.

Key theme: Family Medicine ; INHOMESSS Checklist
33RUNWIN BK, JERANT AF. The Home Visit. The American Academy of Family Physicians; 1999 [4 December 2010]; Available from: http://www.aafp.org/afp/991001ap/1481.html

Using Clerkship Education Days to Standardize Learning in a Community-Based Longitudinal Integrated Clerkship/Block Hybrid

Authors

Margrit Shoemaker, Geisinger Commonwealth School of Medicine, Scranton, USA
Diana Callender, Geisinger Commonwealth School of Medicine, Scranton, USA

Presenter:
Margrit Shoemaker, Geisinger Commonwealth School of Medicine, Scranton, USA

Background: Geisinger Commonwealth School of Medicine (GCSoM), community based in semi-rural Pennsylvania, utilizes a distributed hybrid Longitudinal Integrated Clerkship (LIC)/Block model in the MD3 year.
Method: With four regional campuses and multiple sites for LIC and Block rotations, we incorporated a weekly half-day "Clerkship Education Day" (CED) to ensure exposure to core clerkship content for students across all regions and sites. Historically, some students get excellent preceptor evaluations (subjective) but have significantly lower scores on objective clerkship and national exams. GCSoM's core clerkships, Family Medicine, General Surgery, Internal Medicine (IM), Obstetrics/ Gynecology, Pediatrics and Psychiatry, rotated weekly allowing for 7-8 CEDs per clerkship with supplemental content including Radiology, Reflection and quality improvement (QI) projects. Performance on Clerkship-specific content comprised 20% of clerkship grades. IM, Family Medicine and Obstetrics/Gynecology used Team-Based Learning (TBL) exercises on preassigned readings. Surgery, Pediatrics and Psychiatry used one student presentation for the CED grade leading to limited assessment and perceived subjectivity in grading. We therefore implemented TBLs in all disciplines. This increased student workload by doubling each student's readings assignments but marginally decreasing presentations. Workload was addressed by reducing CED sessions to 5/clerkship and TBLs from 44 to 30. Supplemental CED content is scheduled during "off" weeks, shortening CED sessions and increasing engagement in activities such as QI projects.
Results: We hope that standardized assessments, decreased student workload and increased engagement will improve student outcomes in standardized testing (national subject exams) across clerkships and the national licensing exam compared with results of previous years.
Discussion & Conclusion: Cross clerkship collaborative modification of CED meets learning objectives while improving assessment and allowing dedicated time for supplemental content. Opportunity to cover core clerkship content with preparatory readings, small and large group discussions improved. Individual and group readiness assessment testing provides objective measures of content knowledge and helps offset the subjective assessments of clinical preceptors.
Take-home message: In Longitudinal Integrated Clerkships, standardized CEDs across disciplines can offset subjective preceptor evaluations in a community based setting while covering core clerkship content.

8DD12 (2032)
From single home visit to continuous family and community study: the better learning process for rural attachment

Authors

Supat Hasuwannakit, Chana Hospital, Hatyai Medical Education Center, Hatyai, Thailand
Suwat Wiriyapongsukit, Natavee Hospital, Hatyai Medical Education Center, Hatyai, Thailand
Prawit Vanichanon, La-ngu Hospital, Hatyai Medical Education Center, Hatyai, Thailand

Presenter:
Supat Hasuwannakit, Chana Hospital, Hatyai Medical Education Center, Ministry of Public Health, Hatyai, Thailand

Background: Most of the medical students come from middle class families and live in urban area, they have little understanding about rural contexts and rural experiences. Medical students have rural attachment only in family and community subject which is only snapshot learning process.
Method: Medical students in rural program started continuous family and community study (CFCS) since year 1-3 at 7 community hospitals. We develop this new learning process for 2 years. Each student was assigned one family continuously. Students have 2-3 times visiting their assigned family for 1-3 days per visit in each year. They should join the routine family activities and visit that community learning by both dialogue and observation.
Results/Discussion: Letting them learn from ultra-poor family can inspire them and getting them more understanding about rural context. After each visit, hospital staffs and medical students will have reflection session. We found that poor family who has many health problems and social determinants of health issues can stimulate students' curiosity and inspiration of rural attachment better than normal family and single home visit when compare to previous snapshot home visit. When they learn from their assigned family, they learn about community too. CFCS also can be integrated with other learning experience such as community medicine project.
Conclusion: CFCS learning process which learning continuously and directly from rural patient and family can be one of the learning process for better rural attachment and understanding rural context.
Continuous family and community study can be one of the learning process to change middle-class urban medical students mindset to be rural doctors by direct continuous learning experience to transcend the identity of their life.

8DD13 (1657)
Attitudes of last-year medical students recruited from special recruitment tracks toward working in rural hospitals

Authors
Dumratsiri Paiopree
Woottinun Punthasane

Presenter:
Dumratsiri Paiopree, Emergency Department, Buriram, Thailand

Background: Shortage and maldistribution of doctors, especially in rural areas, have been important problems for healthcare system in Thailand for decades. The Ministry of Public Health has launched various policies in order to distribute more doctors to rural areas. Significant strategies are special medical-student recruitment through the programs called 'Collaborative Project to Increase Production of Rural Doctors (CPIRD)' and 'One District One Doctor (ODOD)'. However, little is known regarding the attitudes of last-year medical students recruited through these special tracks toward working in rural areas.
Method: A cross-sectional survey was conducted in June 2017, using self-addministered questionnaires among last-year medical students recruited through special tracks studying in Buriram Hospital Medical Education Center, Thailand. Descriptive statistics were used for data analysis.
Results: There were 28 last-year medical students enrolled in the survey, 12 (42.8%) from ODOD and 16 (57.2%) from CPIRD. Rural backgrounds, early exposure to rural work of medical trainees increased positive attitudes for working in rural areas. Attitudes toward intention to fulfill undertake mandatory service in rural areas (3 years for CPIRD, 12 years for ODOD) were 12 (75%) in CPIRD and 5 (42%) in ODOD. Influencing factors for long term working in rural areas were 'close to the family' 18 (64.2%), 'rural colleagues are nice and friendly' 12 (42.8%) and 'appropriate living conditions' 11 (39.2%).
Conclusion: Majority of students have positive attitudes in special track recruitment for increasing doctors in rural workplace, especially because of the fact that they can be 'close to the family'. However, more than half of ODOD medical students have no intention to fulfill 12 years obligation.
Take-home message: Special medical-students recruitment tracks may increase short-time distribution of doctors in rural areas. However, long-term retention has remained unsuccessful.

Vertical training - leveraging the "gain, train and retain theory"

Authors
Miriam Grotowski, UONDRH, Tamworth, Australia
Jenny May, UONDRH, Tamworth, Australia
Lauren Cone, UONDRH, Tamworth, Australia

Presenter:
Miriam Grotowski, University of Newcastle, Department of Rural Health, Tamworth, Australia

Background: Rural Clinical Schools have been established in Australia for 20 years and have proven an important part of the rural pipeline in securing a health workforce for rural and remote Australia. The last 10 years of this programme has seen large numbers of medical students graduating with 12 months exposure to medicine in a non-metropolitan environment. However, discrepancies still exist in the distribution of this graduated workforce, with regional and remote Australia remaining under-supplied . Recent initiatives and associated funding have given the Rural Clinical Skills new roles to establish Regional training hubs in order to build postgraduate training (PG) pathways in non-metropolitan areas. There are 26 such Hubs funded around Australia.
Objective: The objective of the Hubs are to improve the coordination of the stages of medical training. Students will be able to complete as much of their Undergraduate and Postgraduate medical training as possible within regional areas.
Hubs are based in Rural Clinical Schools in collaboration with Area health services with allocated Commonwealth funding. These hubs provide opportunities for networking, up- skilling and collaboration, requiring a vertical model of medical education not previously seen in rural centers in Australia. The poster will review three case studies of opportunities to elongate and affirm rural training.
Regional hubs provide the opportunity to strengthen the teaching and supervision of our medical workforce. Teachers engaged in vocational training will be supported throughout this process to ensure the delivery of high quality medical education. Integrated training where 60% is based in a regional centre should be achievable in a number of specialties.
Conclusion: Establishing a critical mass of junior medical officers, integrated regional training posts, and high quality CPD are all achievable locally with three case studies providing guidance on successful models. While not all outcomes will be realised for years, the positive response from Regional providers has been encouraging. Collaboration between local health districts, Universities and the Commonwealth Government suggests this is a key initiative in providing a health workforce for the future.

How can internship doctors apply patient-centered medicine in the community hospitals?

Authors

Thanita Somton, Suratthani Medical Center, Suratthani, Thailand

Nichapat Phuakkong, Suratthani Medical Center, Suratthani, Thailand

Supak Charoenparakhun, Suratthani Medical Center, Suratthani, Thailand

Wilawut Leelapongwattana, Suratthani Medical Center, Suratthani, Thailand

Pakawat Prompetch, Suratthani Medical Center, Suratthani, Thailand

Suparat Saetun, Suratthani Medical Center, Suratthani, Thailand

Presenter:
Thanita Somton, Suratthani Medical Center, Suratthani, Thailand

Background: Patient-centered medicine emphasizes the health professional's role in caring for patients by focusing on the patients' bio-psychological and social realities. Patient-centered medicine curriculum started from 4th to 6th year of medical studies to improve qualities of patients' care. Advance in medical technology with patients' high expectations can cause communication problems, therefore the researchers want to investigate how the internship doctors apply patient-centered medicine in Thai community hospitals.

Method: A qualitative study with deep interview and observation five internship doctors at outpatient clinics in two community hospitals in Suratthani Thailand, they were interviewed during december,13 – december,27 2016.

Results: Most of the internship doctors had knowledge and good attitude of patient-centered medicine. However they applied by using doctor-centered relationship mainly. Every patients had been focus about their disease, the doctor would explore illness in poor compliance or anxious patients. All of the doctors didn't ask the questions to understand the whole person in holistic such as how they lived, how their family or social cared the patient. However many doctors made an agreement on treatment, talked empowerment for prevention and health education with patients especially in NCD clinic, but mostly they applied doctor-centered care in outpatient clinic.

The doctors didn't apply patient-centered care all every dimension. It's big barrier to make a good relationship and doctor-patient center care because there were too much patients and lack of time, the doctor spent short time caring about 3-5 minute for each. They didn't realized the important of psychological ,family and social realities would effect the disease and illness. The patient's poor self care education and health literacy also make it difficult to share their opinions, they preferred doctor's decision that caused doctor-centered care.

Conclusion: To enhance the internship doctors apply patient-centered medicine in Thai community hospitals. Undergraduated teaching and learning and Postgraduated Practice-Based Learning program in patient-center

medicine may be an important part to make a quality of holistic care.

Medical Development in Europe – ten years' experience of multinational teacher-initiated course

Authors
Hans Gyllenhammar, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden
Birgitta Björck, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden

Presenter:
Hans Gyllenhammar, Institution for Medicine Huddinge, Karolinska Institutet, Stockholm, Sweden

Background: Internationalization is a valuable part of medical education. There are several multi- or bilateral programs for this but many students remain doubtful and do not do exchange studies or just cannot be abroad for several months or at very distant locations. To offer the possibility of international experience in a compact format and to highlight the vast possibilities in Europe regarding work, research or studies we initiated this course.
Method: In 2007 we visited a number of medical universities in Europe to suggest an elective course spanning three different regions and universities, each site offering one week of studies. Two universities in eastern/central Europe (the Medical University in Kaunas, Lithuania and the Jagellonian University in Krakow, Poland) and two universities in southern Europe (the University of Florence and the University of Cagliari, both Italy) were selected. One course plan was formulated and accepted at each site with common learning objectives focusing on Internal Medicine and Public Health. The supercase method (e.g. Gyllenhammar et al, AMEE 2006) was the pedagogic method... The course had a first week at the Karolinska Institute in Stockholm and then 1 week each in two of the other universities. It has been given twice a year since May 2008.
Results: The first course had only 8 participants but was enthusiastically received. The applications increased rapidly to a maximum of 52. We found that the teachers at each site were very positive and students performed well in exams. Student evaluations were generally very positive highlighting the experience of working in multinational groups.
This model is easily reproducible and we found cooperation, logistics and administration manageable and learning outcomes very good.
Conclusion: The concentrated exposure of the students to cooperation with international students working intensely for 3 weeks in English and experiencing different European medical and social cultures and interpretations of the common course plan proved very rewarding for students and teachers alike.
Take-home message: You can achieve very good internationalization outcomes also from short intensive multinational courses.

Academic achievement and stakeholder satisfaction on expected learning outcomes of the graduates from the Srinakharinwirot University–University of Nottingham Joint Medical Programme

Authors
Tawima Sirirassamee, Srinakharinwirot University, Bangkok, Thailand
Ramida Watanapokasin, Srinakharinwirot University, Bangkok, Thailand
Narongchai Yingsakmongkol, Srinakharinwirot University, Bangkok, Thailand
Chairat Neruntarat, Srinakharinwirot University, Bangkok, Thailand

Presenter:
Tawima Sirirassamee, Srinakharinwirot University, Bangkok, Thailand

Background: The Srinakharinwirot University – University of Nottingham Joint Medical Programme is the first and only international joint medical programme in Thailand. The objective of this study is to assess the academic achievement and stakeholder satisfaction on expected learning outcomes of the graduates from this programme.
Method: All of the graduates from the Srinakharinwirot University – University of Nottingham joint medical programme in year 2015 and 2016 were included in this study. The grade point average (GPA) of the graduates was retrospectively collected from the medical education data center. Employer feedback on the graduates' performance has been assessed using the questionnaire. The expected learning outcomes of the graduates including moral, knowledge, wisdom, interpersonal relationship, mathematic, communication skill, managerial skill, and professionalism.
Results: The mean GPA of the graduates was increased from 3.0 in year 2015 to 3.23 in year 2016. Employer satisfaction on the expected learning outcomes increased in all subscales from year 2015 to year 2016. The highest score was the moral subscale (4.71 in 2015 and 4.74 in 2016) followed by communication skill (4.60 in 2015 and 4.71 in 2016) and professionalism (4.55 in 2015 and 4.69 in 2016). The lowest scores were in the managerial skill (4.32 in 2015 and 4.50 in 2016) and wisdom subscale (4.40 in 2015 and 4.56 in 2016). We did not found significant correlation between the GPA and the employer satisfaction on the expected learning outcomes of the graduates.
Conclusion: The academic achievement and employer satisfaction of the graduate from the Srinakharinwirot University – University of Nottingham joint medical programme were in the high standard level.
Take-home message: The academic achievement and employer satisfaction of the graduates from the Srinakharinwirot University – University of Nottingham joint medical programme were in the high standard level.

An Innovative Programme to Support Refugee International Medical Graduates

Authors
Ann Smalldridge, REACHE North West, Salford, UK
Ilse Burger, Salford Royal NHS Foundation Trust, Salford, UK
Clare Harrison, Salford Royal NHS Foundation Trust, Salford, UK
Maeve Keaney, REACHE North West, Salford, UK
Jouher Kallingal, REACHE NorthWest, Salford, UK
Mick Sykes, REACHE NorthWest, Salford, UK

Presenter:
Jouher Kallingal and Nicola Pugh, Salford Royal NHS Foundation Trust, Salford, UK

Background: Refugee and Asylum Seeker Centre for Healthcare Professionals Education (REACHE) North West has been supporting refugee health professionals entry into NHS work since 2003. Just under half of doctors supported by REACHE who are registered with the General Medical Council (n=196) are in specialist or GP training posts. A REACHE North West programme, Clinical Practical Training (CPT), provides 3 months adaptation to UK practice and although following this all doctors entered paid NHS employment, this was mainly in short term non-training posts in which they were unable to get their F2 competencies signed off. Without this they are unable to enter GP or specialist training in the NHS. Refugee doctors are at additional disadvantage competing with UK or International Medical Graduates for NHS training posts because:
Lack of exposure to NHS General Practice either at undergraduate or foundation level disadvantages them in the application process for GP specialist training
They may have long career gaps on their CV due to their experiences as a refugee or asylum seeker.
With the support of the Salford Royal NHS Foundation Trust (SRFT) stroke team, REACHE doctors were able to enter 1 year junior clinical fellow posts after their CPT with support to achieve F2 competencies sign off.
9 doctors achieved F2 competencies - 2 of them have started GP training and 1 has applied this year. 2 are currently applying for specialist training and 2 have unsuccessfully applied.
Barriers to specialist training still remain.This programme has been developed further- a rotational junior clinical fellow programme has been established to provide doctors with wider experience as well as to fill junior post gaps across a number of specialties within the Trust. These posts are currently filled by locums which has an impact on financial status, quality of patient care and morale of existing staff. 4 months of GP training is being incorporated into these posts.
Refugee doctors in the UK require additional training and support to increase their contribution to the NHS in specialist or GP roles.

8EE6 (3694)
Internationally Educated Healthcare Professionals: Supporting transitions to new healthcare environments

Authors
Sanjiv Sharma, Great Ormond Street Hospital NHS Trust, London, UK
Sophie Park, UCL Medical School, London, UK

Presenter:
Sanjiv Sharma, Great Ormond Street Hospital NHS Trust, London, UK

Background: 'Internationally educated healthcare professionals' (IEHP) describes multi professional healthcare workers who cross international borders in order to work within different healthcare environments. UK healthcare relies heavily on IEHPs, but in the wake of the BREXIT referendum, institutional reports highlight falling numbers of employment applications from abroad.
Method: We report a descriptive review of empirical research literature about IEHP transitions. Analysis of these publications identified a wide range of approaches to examining this topic with most reports focusing on professional experiences. Other papers reported IEHP learning resources, patient mortality, organisational experiences, licensure requirements, examination performance and success at appointments to training positions. From these we propose a model with 3 areas of focus that could inform future IEHP curriculum development programs.
Results: Our review identified 28 key papers. These varied greatly in their contribution to the discourse of IEHP transition so a 3-level traffic light classification was developed though which papers were assessed for quality: Papers were classified into 'green' high value studies, 'amber' intermediary value studies or 'red' low value studies. This was a subjective judgment based on the content of these papers (context, methodological approach and what they add). The discussions from these papers varied greatly but most explored the importance of setting-specific approaches to assisting IEHP transition. Conclusions directed towards the development of site-specific curricula for IEHP transition with focus on 3 important areas: organisational support, supported training and individual attributes.
Identified literature was used as a basis to form a traffic light system for informing three areas when considering future IEHP curricula to support transitions across international healthcare systems.
Conclusion: Empirical research examining transition of IEHP into destination healthcare environments is heterogeneous and high quality studies examining this area are lacking despite the high levels of scrutiny recently. Published literature relating to IEHP varies greatly. Results from this approach signpost to site-specific curricula supporting transition.

Medical Education in a Global Context

Authors
Michèle P. Wera, NVAO, The Hague, Netherlands

Presenter:
Michèle P. Wera, NVAO, The Hague, Netherlands

Background: The Accreditation Organisation of Netherlands and Flanders (NVAO) is the first EQAR (European Quality Assurance Register for Higher Education) registered quality assurance agency that participates in the Recognition Programme of the World Federation for Medical Education (WFME). NVAO applied for recognition upon request of the medical schools in Netherlands and Flanders.
As of 2023, physicians applying for ECFMG (the Educational Commission for Foreign Medical Graduates) certification will be required to graduate from a medical school that has been recognised as working according to the WFME standards. These standards have been endorsed by the World Health Organisation (WHO). The WFME Recognition Programme offers accreditation agencies such as NVAO the opportunity to undergo an evaluating and recognizing process. Graduates of medical programmes accredited by NVAO will meet the ECFMG criteria once NVAO is recognised by WFME.
ECFMG certification allows international medical graduates to enter US medical education. It is also a requirement to take Step 3 of the US Medical Licensing Examination (USMLE) and to obtain a license to practice medicine in the US.
The WFME Recognition Programme relates to basic medical education i.e. the bachelor and master programmes in medicine. 'Medical schools' in the WFME and ECFMG documents can be interpreted as 'medical programmes' depending on the context. For NVAO that would be the case as not the schools but the programmes are being accredited.
NVAO applied in August 2017 and is expecting the WFME recognition decision by mid 2018, in time for the AMEE conference.

Palestinian Anesthesia Teaching Mission (PATM): an ongoing academic partnership in area of conflict with deprived resources

Authors
Mohammad Obeidallah, International Medical Education Trust 2000-Palestine (IMET2000-Pal), Ramallah, Palestine
Fady Zaben, International Medical Education Trust 2000-Palestine (IMET2000-Pal), Ramallah, Palestine
Salah Halshlmoun, The Palestinian Society of Anesthesia (PSA), Hebron, Palestine
Abdulsatar Ravalia, The World Federation of Societies of Anesthesiologists (WFSA), London, UK
Colin Green, International Medical Education Trust 2000 (IMET2000), London, UK
Malik Zaben, International Medical Education Trust 2000 (IMET2000), Cardiff, UK

Presenter:
Mohammad Obeidallah, International Medical Education Trust 2000- Palestine (IMET2000-Pal), Ramallah, Palestine

Background: Anesthesia Teaching Mission has been running since 2014 as a partnership between the UK based charity IMET2000, the World Federation of Societies of Anesthesiologists (WFSA), the Palestinian Ministry of Health (MoH) and the Palestinian Society of Anesthesia (PSA). The goal of the mission is to provide educational support for anaesthesia trainees in Palestine. This article describes a strategy in capacity-building in a developing country by establishing unique partnerships between academic partners in the developed world.
Method: Volunteer teachers are recruited from anaesthesia training centres in the developed world by WFSA. IMET2000 organises the teaching activities locally and provides logistic support. PSA and MoH ensure trainees' time protection and availability for training. Volunteers typically spend one month teaching trainees both in the operating room (hands on) and in the classroom (didactic). Feedback on trainees' satisfaction was collected using a structured 10-item questionnaire.
Results: To date about 20 anaesthesiologists from 6 different countries have volunteered in East Jerusalem and the West Bank. Collecting feedback on the activities, 42 Participants have completed the questionnaire 36% are specialist ,64% are residents. 38 % and 52 % of the participants rated the covered materials and Excellent and good, respectively. Similarly, 31% of the participants rated the trainings as excellent at meeting their needs and 55% said it was good. Virtually all the participants indicated that PATM is very much needed and have reported high level of satisfaction with it.
Conclusion: The medical education and training needs in Palestine are far beyond what the Palestinian Authority can cope with. PATM is relatively cheap academically based model that helped enhance training opportunities, expanded trainees practical experience and skills and strengthen stakeholder collaboration. Further research is needed to determine the long-term impact on anaesthesia training and disease burden.
Funding:IMET2000-PAL
Contributors: IMET2000, WFSA, MoH and PAS.

8EE10 (3411)

Using a High-Fidelity Simulation Transition Course to Prepare International Doctors with Technical and Non-Technical Skills when dealing with Common Medical, Ethical and Legal Challenges in the National Health Service

Authors

Dhanya Pillai, University Hospital, Coventry, UK
Patrick Tran, University Hospital, Coventry, UK
Rebecca Darge, University Hospital, Coventry, UK
Claire Gibbons, University Hospital, Coventry, UK
Sandra Navas, University Hospital, Coventry, UK
Christine Walker, University Hospital, Coventry, UK

Presenter:
Rebecca Darge, University Hospital Coventry and Warwickshire, Coventry, UK

Background: Retrospective studies show that doctors trained outside of the UK(UK) are more likely to require General Medical Council (GMC) performance assessments than UK-trained doctors. The reasons for this discrepancy are unclear, but it reinforces the need to address staff induction and training. A high-fidelity simulation programme was accordingly created to prepare this cohort with technical and non-technical skills when dealing with common clinical and ethico-legal dilemmas.
Method: From an extensive survey of overseas doctors, five work-based challenges were identified which were not covered in local induction. These were generated into high-fidelity simulation scenarios and incorporated ethico-legal issues within a medical emergency. For example, candidates had to review escalation plans in a critically unwell patient without mental capacity.
We piloted this one-day course to ten international doctors. Evaluation was collated using a questionnaire with a mixture of open and closed questions graded on a 6-point Likert scale.
Results: The feedback received was positive with 100% of candidates stating the scenarios were clinically relevant and realistic. A common theme amongst all candidates was the appreciation of non-technical skills particularly situational awareness and task management. All candidates felt more competent in dealing with ethico-legal issues faced in emergencies. 100% candidates agreed that the course was a necessary adjunct to trust induction, and felt "more confident commencing a job in the National Healthcare Service (NHS)".
Discussion: The course highlights a gap in the training associated with the transition of overseas doctors to the NHS. A significant proportion felt under-prepared on commencing a job in the UK and emphasised cross-cultural disparities when dealing with certain medical and ethical scenarios. Post course, all candidates felt more prepared commencing their job, and agreed that simulation should supplement generic induction.
Conclusion: High-fidelity simulation empowers overseas doctors in managing difficult ethico-legal scenarios in a safe learning environment. Many candidates had no prior simulation-based training, but it proved a vital adjunct in their induction.

Take-home message: The use of high-fidelity simulation to recreate clinical scenarios complicated by ethico-legal issues can empower and aide the transition of overseas doctors working in the NHS.

Unique collaboration to involve trainees in educational policy making: EFPT and UEMS Section of Psychiatry

Authors

Howard Ryland, University of Oxford, Department of Psychiatry, Oxford, UK
Ekin Sonmez, EFPT, Istanbul, Turkey
Pavel Trancik, EFPT, Prague, Czech Republic
Tanja Svirskis, University of Helsinki, Department of Psychiatry, Finland

Presenter:
Howard Ryland, University of Oxford, Department of Psychiatry, Oxford, UK

Background: The European Federation of Psychiatric Trainees (EFPT) is an independent federation of national trainee associations formed in 1992 and now has 38 members from 36 different countries. The Union Europeenne des Medicins Specialistes (UEMS) is a non-governmental organisation representing national associations of medical specialists in the European Union and associated countries. It aims to harmonise training in different medical specialities. The UEMS Section of Psychiatry began in 1990 and includes representation from EFPT. Both organisations' primary concern is to promote the highest quality of postgraduate training in psychiatry in Europe.
The UEMS Section of Psychiatry meets twice each year, including two invited EFPT representatives, to ensure that the concerns and aspirations of trainees are incorporated in to the Section's work. Similarly, the UEMS Section of Psychiatry is invited to send representatives to attend the EFPT's annual Forum, to present the work of the Section to the trainee delegates. The two organisations work together on a range of collaborative symposia, articles and guidance documents.
EFPT and UEMS collaborate closely on multiple projects in a way that allows them to draw on each other's expertise and networks. One example is the 'Profile of a Psychiatrist' guidance document, which was co-produced by members of the UEMS Section of Psychiatry and EFPT, before being circulated to a wider group of stakeholders in Europe for further comment. EFPT and the UEMS Section of Psychiatry were also able to produce a practical tool for trainees to compare their own training with the UEMS' guidelines. The resultant 'Test Your Own Training' platform was advertised on both organisations' websites and can be accessed here: http://efpt.eu/tyot/.
The interaction between EFPT and UEMS Section of Psychiatry is an innovative example of how international organisations can work together successfully to improve education for psychiatrists across Europe.
The bidirectional collaboration between the UEMS Section of Psychiatry and EFPT represents a novel way that international organisations can bring about mutually beneficial change.

Exploring risks of international handover and training needs of healthcare professionals in a European border region

Authors
J.A. Beuken
D.M.L. Verstegen
M.E.J. Bouwmans

Presenter:
Daniëlle Verstegen, Maastricht University, School of Health Professions Education, Maastricht, Netherlands

Background: In the Euregion Meuse-Rhine (EMR) three countries meet: Germany, Belgium and Netherlands. Patients crossing borders for healthcare occurs regularly, and is expected to expand due to increased mobility of citizens and centralized expertise of healthcare professionals. This results in increased international patient handover. International patient handover is assumed to be increasingly complex compared to national handover. However, it remains unclear what major patient-safety risks of cross-border transfers and specific training needs of healthcare professionals in border areas are. The aim of this study is to investigate perceived risks and training needs of healthcare professionals regarding cross-border patient handover.
Method: We performed an exploratory survey study. A total of 846 healthcare professionals working in one of four large hospitals or for one of the regional emergency services in the EMR completed a survey about international patient handover in this border-region. Qualitative responses concerning patient-safety risks and training needs in the context of international patient handover were thematically analyzed to identify semantic themes.
Results: Of the 846 healthcare professionals who responded to the survey, 30% reported to be involved in at least one cross-border handover in the last month. Risks mentioned by healthcare professionals regarded awareness, communication, competency, facility, and information. General solutions for these risks regarded communication, facilities, shared standards, and training. When asking what training is needed to optimize international handover, language courses, training standardized processes and joint training were suggested. In the EMR, awareness, communication, competency, facility, and information are perceived as risks for patient safety during international handover. In order to overcome these risks, training aimed at standardized processes and language in joint settings is desired. This will facilitate a shared understanding of the process of cross-border handovers. It is important to further investigate training needs in settings in which frequent and/or systematic cross-border handover occurs, and eventually develop training that addresses healthcare professionals' needs.
Conclusion: If relevant, healthcare professionals should be trained for international patient handover. Training should address standardized processes and language, and should be provided in a joint setting.

8EE13 (3063)
IMPECD - Improvement of Education and Competences in Dietetics

Authors
Alexandra Kolm, University of Applied Sciences St. Pölten GmbH, St. Pölten, Austria
Koen Vanherle, Artesis Plantijn University College Antwerp, Antwerp, Belgium
Andrea M. Werkman, Hanzehogeschool Groningen, Groningen, Netherlands
Luzia Valentini, University of Applied Sciences Neubrandenburg, Neubrandenburg, Germany
Jascha de Nooijer, Maastricht University, Maastricht, Netherlands
Jeroen van Merrienboer, Maastricht University, Maastricht, Netherlands

Presenter:
Alexandra Kolm, University of Applied Sciences St. Pölten GmbH, St. Pölten, Austria

Background: Globally connected teams and an increasingly global labor market with professionals and patients on the move highlight the importance of international collaboration. The IMPECD-project funded by Erasmus+ aims to improve online international collaboration competences by offering an online course with clinical patient cases for collaboration.
Method: A pilot test with students of four European countries answered the questions how learners experience the online learning environment, and where they see potential for learning online international collaboration competences. Five clinical cases, based on real patient cases, were collaboratively solved in small groups of five undergraduate nutrition and dietetic students (N = 25). An international setting was ensured by group allocation: each group consisted of at least one student from Austria, Belgium, Germany and Netherlands. The five groups were observed and guided by researchers while the students actively solved the clinical cases. Usability and User Experience were evaluated by an online questionnaire.
Results: Students experienced the online course as exciting, motivating and innovative, 60% would like to be frequently involved in similar online courses. More than half of the participants (56%) believe that the online course will improve their international collaboration between colleagues. Collaborative tasks for dietetic diagnosis, therapy planning and monitoring, and outcome evaluation seem most beneficial for solving the clinical cases, since these tasks are very challenging for students. English as medium of instruction is challenging for 64% of the students, which could hamper the acquisition of online international collaboration competences.
The course was well received, as it identified and addressed a need for innovative ways of training online international collaboration competences. The results will be used to re-design and improve the online course, focusing on methods to acquire online international collaboration competences. The re-designed course will be tested in a second research cycle in June 2018.

Conclusion: Providing a new learning environment for international online collaboration competences was highly appreciated by students. The online course provides an excellent 'best practice' that the participating Universities can use when designing and providing innovative online learning environments for their students.

Developing a Strategy to improve the integration of International Medical Graduates into the Great Ormond Street Hospital for Children

Authors
Konstantinos Dimitriades
Emma Parish
Justin Poisson
Valentius Clarke
Cheryl Hemingway
Sanjiv Sharma

Presenter:
Konstantinos Dimitriades, UK

Background: IMG describes all foreign doctors that have qualified in a country outside the UK. IMG choose employment at Great Ormond Street Hospital for Children (GOSH) for many reasons. They have varying levels of experience and qualifications as well as individualized social and family responsibilities.
Method: IMG were identified by Human Resources and an electronic survey was distributed to this group. Seventy-two out of one-hundred-sixty-one (44.7%) doctors responded to the survey. This survey consisted of nineteen questions in the form of Likert scale answers and free text comments.
Results: Forty-six respondents were between the ages of 30 and 39 whilst fourteen were between the ages of 40 to 49. IMG's had an average of 12.6 years' experience (5 - 23 years) and for 39/60 (65%) of respondents, this was their first job within the NHS.
IMG's reported UK integration as mostly difficult (40.3%) or neutral (27.8%). Themes that make integration easy include: social factors, information packages and completion of GMC registration. Factors that make integration harder include: different culture, different hospital systems and administrative load. Integration into GOSH was considered easier for 51.4% but difficult for 30.5% of respondents. Factors considered to encourage integration include: previous NHS experience, colleagues and English proficiency. Factors that make integration harder include: administrative load, poor orientation and computerised systems.
Difficulties encountered include, correct salary level employment, finding a school, accommodation and banking. Sixty percent (36/60) reported lack of clarity around career progression to become an NHS consultant. Further exploration revealed a need for education regarding paths to consultant registration.
Conclusion: The following strategies have been identified to assist IMG integration into working at GOSH:
• Improving pre–onboarding information and communication.

• Improving the induction program and tailoring towards IMG's specific needs.
• Development of an educational package for IMG.
• Raising institutional awareness for the difficulties faced by IMG.
• Continuous monitoring through collection of data.
International medical graduates face multiple challenges when moving to the UK. A strategy to assist with integration is required and is best developed according to the particular healthcare environment

8EE15 (2485)
Development of an Advanced Pediatric Life Support (APLS) Simulation Training Program in Bhutan

Authors
Kajal Khanna, Stanford University, Stanford, USA
Tashi Choden, Khesar Gyalpo University of Medical Sciences of Bhutan, Thimphu, Bhutan

Presenter:
Kajal Khanna, Stanford University, Stanford, USA

Background: Early recognition of critically ill children is known to improve outcomes. While multiple courses have been created to improve care of seriously ill children, little is known about the impact of these in-service training courses in low and middle-income countries. World-wide, Advanced Pediatric Life Support (APLS) is considered the primary curriculum for recognition and resuscitation of emergently ill pediatric patients. Establishing a locally relevant, simulation-based Advanced Pediatric Life Support (APLS) train-the-trainer curriculum to teach healthcare providers in Bhutan to recognize and stabilize acutely ill infants and children could impact clinical outcomes in this remote and limited-resource country.
Method: This study will evaluate whether a APLS simulation train-the-trainer curriculum tailored for implementation in Bhutan will assist local healthcare providers to recognize and stabilize acutely ill infant and children, to develop a sustainable training network, and subsequently to improve pediatric resuscitative care in healthcare facilities in Bhutan. An APLS course was conducted in March 2016. Study objectives were to evaluate knowledge translation, pilot a clinical utilization tool to assess use of APLS-structured thinking, and identify course content needing revision. Pre- and post-test scores evaluated knowledge translation. Post-course surveys assessing clinical preparedness and post-course utilization of an APLS structured approach to critically ill pediatric patients are being conducted. Course quality was assessed using participant evaluations and comparison of pre-and post-test scores.
Results: Fifteen providers participated including all pediatricians and pediatric residents in Bhutan, as well as all general duty medical officers from the Jigme Dorji Wangchuck National Referral Hospital. Pre- and post-test identified knowledge gaps and improvement in APLS key-concepts. A revised APLS course will be presented with locally-trained facilitators in April 2018.
Conclusion: The APLS course prepared participants to practice using APLS structured thinking and to facilitate a regional rollout of the training course. Next steps include

developing a program for the monitoring and evaluation of regional hospital rollout trainings and a mechanism for mentoring the growth and sustainability of the training network.

Take-home message: Lessons learned from this pilot project can be used for developing effective in-service training service training programs in low and middle-income countries.

8FF: Posters: Curriculum Content including Humanities and Prescribing

Location: Hall 4.1, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

8FF1 (3315)
"Booster shots" of humanism at bedside teaching

Authors
Chi-Wan Lai, Koo Foundation Sun Yat-Sen Cancer Center, Taipei, Taiwan
Yan-Di Chang, National Defense Medical College, Taipei, Taiwan
Thy-Sheng Lin, National Cheng-Kung University Hospital, Tainan, Taiwan
Ming-Jang Chiu, National Taiwan University Hospital, Taipei, Taiwan
Yong Alison Wang, Koo Foundation Sun Yat-Sen Cancer Center, Taipei, Taiwan

Presenter:
Chi-Wan Lai, Koo Foundation Sun Yat-Sen Cancer Center, Taipei, Taiwan

Background: Studies have shown that medical students tend to show declining empathy as they advance in medical school. Part of the reasons could be less emphasis on medical humanities after entering clinical years.
For more than a decade, one of the authors (CWL) has been conducting bedside teaching in three teaching hospitals (National Taiwan University Hospital, National Cheng-Kung University Hospital, Koo Foundation Sun Yat-Sen Cancer Center where medical students from National Yang Ming Medical University rotates) for students rotating through neurology service. Efforts have been made to include not only teaching medical knowledge and skills, but also emphasizing bedside manners, sympathetic listening, and empathetic communication.
Method: We present two cases to illustrate how to enhance sensitivity to others' suffering in addition to teach neurological examination techniques, differential diagnoses and management:
1. A patient with myasthenia gravis suffering from diplopia: students were instructed to apply pressure to one eye themselves to induce double vision and appreciate the patient's suffering.
2. A patient at the end-stage of amyotrophic lateral sclerosis: students witnessed that "Even though we cannot cure the disease, we can still care for the patient." Initially students tend to recall cognitive learning, i.e. knowledge and skills, when their feedback is elicited after each round. But under prompting, they start sharing behavioral/affective aspects, e.g. empathy towards suffering patients and families.
Discussion: Attention to humanistic issues at the bedside demonstrates to students their relevance and application in individual cases and leads to a deeper appreciation of medical humanities.
Such bedside teaching can serve as "booster shots" during clinical years to enhance the humanism that medical students have learned in early years. However, it is difficult to expect lasting effects on the attitudes and behaviors of medical trainees unless such teaching can be frequently and widely practiced throughout clinical rotations. Consequently more attending physicians of teaching hospitals should be encouraged to teach humanism at the bedside.
Conclusion: It is recommended that medical schools set a high priority for clinical faculty to help students enhance sensitivity "to see the suffering" and develop empathy.

8FF2 (1681)
Need? Need not? – Medical humanities integration in problem-based learning (PBL) education

Authors
Ling-Lang Huang, Mackay Medical College, Taipei, Taiwan
Yih-Jer Wu, Mackay Medical College, Taipei, Taiwan
Tsang-En Wang, Mackay Memorial Hospital, Taipei, Taiwan
Hsu-Chao Chen, Mackay Memorial Hospital, Taipei, Taiwan
Hsiang-Kuang Tseng, Mackay Memorial Hospital, Taipei, Taiwan
Hung-I Yeh, Memorial Hospital, Taipei, Taiwan

Presenter:
Ling-Lang Huang, Mackay Medical College, Taipei, Taiwan

Background: Problem-based learning (PBL) is an important curriculum bridging basic to clinical medical sciences in our basic-clinical, double spiral, integrative course for our years-3 and -4 medics. To further integrate medical humanities (MH) education into this integrative course for a better longitudinal development of MH curriculum and a better link between "disease" and "humanities", MH teachers have been introduced into PBL case reviewer system. We compared PBL cases before the era of MH teachers in the reviewer system with those after.
Method: Our MH teacher has joined PBL case review and PBL case-writer training to enhance the integration of MH learning objectives into each PBL case since 2013. To retrospectively examine whether our PBL case-writers have become more active to bring up MH learning objectives in their cases after the era of MH teacher's participation, we randomly picked up 10 PBL cases before and after 2013. Each PBL case was evaluated by 5 aspects in MH, and each aspect was given 0-2 scores.
Results: The overall scores of PBL cases were significantly improved after MH teacher's participation (3.2+-2.3 vs. 9.2+-1.3; P<0.001). The changes of scores in each aspect of MH before and after MH teacher intervention were also substantially improved as shown below:
1. "Describing perception of the illness, in addition to symptoms" (0.9+- 0.7 vs. 2.0+-0.0; P<0.001)
2. "Containing descriptions pertaining to patients per se, in addition to physical signs or characters" (1.2+-0.6 vs. 2.0+-0.0; P<0.001)
3. "Describing physician's actions or behaviors, which do not pertain to therapy" (0.1+-0.3 vs. 1.6+-0.5; P<0.001)
4. "Containing not only aspect of objective knowledge but also aspect of subjective feeling" (0.6+-0.7 vs. 1.8+-0.4; P<0.001)
5. "Involving medical humanities issues" (0.4 +- 0.8 vs. 1.8 +- 0.6; P<0.001)

Conclusion: The appropriateness of a PBL case is determined by its final educational goal. Our goal of PBL education is not only to integrate basic with clinical medical sciences but also to well blend real world diseases with humanities.

MH teacher's participation may help steer the direction of PBL cases towards a more holistic end where medical knowledges and humanities are closely interrelated.

8FF3 (3031)
Simulated Patient Perspectives in the Assessment of Humanism

Authors

Karen Szauter, University of Texas Medical Branch, Galveston, TX, USA
Era Buck, University of Texas Medical Branch, Galveston, TX, USA
Mark Holden, University of Texas Medical Branch, Galveston, TX, USA
Majka Woods, University of Texas Medical Branch, Galveston, TX, USA

Presenter:
Era Buck, University of Texas Medical Branch, Galveston, USA

Background: Humanism is the foundation of the physician-patient relationship. Much of the research on trainees' humanistic characteristics focuses on empathy and provides data derived from self-reports. Such work offers important insight into how learners think; how they respond in actual patient care situations is more difficult to assess. Obtaining objective learner assessments from patients is complicated by limited trainee contact and patient vulnerability in actual healthcare settings. Simulated patients (SPs) offer a patient perspective and can be trained to rate learners using objective criteria.
Study Question: What does research reveal about the role of simulated patients in assessing humanistic characteristics of learners, and do ratings by SPs align with ratings from other perspectives?
Method: A systematic review of English language literature from 1996-2015 was undertaken. Search terms included humanism, integrity, empathy, compassion, altruism, respect, patient-centered care, or rapport AND standardized or simulated patients. Medline, CINHAL and a master database of SP-related articles were searched; bibliographic and forward searches identified additional citations. Inclusion criteria: research articles on learners of any healthcare discipline, data from the SP ratings of humanism constructs detailed in results. All papers were reviewed by two members of the study team.
Results: Of the initial ~1500 citations, 412 papers were reviewed; 44 met inclusion criteria. The majority of papers were from North America (84%) spanning 22 unique journals. Most described humanism in medicine (95.5%), predominantly undergraduate trainees. Empathy was the most common construct rated by SPs (38.6% of papers); global humanism was featured in 25%.   Numerous previously validated (13) or author created (24) rating scales were described. Training SPs to the rating scale was detailed in 50%. Studies comparing SP ratings with student

self-assessment or observer ratings showed SP ratings to have more variance and to be lower overall.
Discussion: Research incorporating SPs in the assessment of learner humanism is limited, mostly describing encounters with medical students. SPs offer a unique perspective, providing viewpoints on learners' humanism that differ from self- or third-person observers.
Conclusion: Our review supports the need for the development of tools and training protocols to facilitate more extensive application of SPs in humanism assessment.

8FF4 (1956)
"The Art of Medicine" Discussions: Integrating Medical Humanities into Clinical Medical Education

Authors

Yan-Di Chang, National Defense Medical Center, Taipei, Taiwan
Ging-Long Wang, Koo Foundation Sun Yat-Sen Cancer Center, Taipei, Taiwan
Chi-Wan Lai, Koo Foundation Sun Yat-Sen Cancer Center, Taipei, Taiwan

Presenter:
Yan-Di Chang, National Defense Medical Center, Taipei, Taiwan

Background: Although medicine is often regarded as both an art and a science, most medical schools in Taiwan offer medical humanities courses only during the preclinical stage. Regular discussions with students about "non-medical" problems (i.e. not concerned with technical aspects of medicine, e.g. diagnoses, tests, medical interventions) encountered during clerkship have been found to be most effective for teaching "the art of medicine" clinically.
Method: Focus group discussions were held every fortnight with six to eight students and lasted for ninety minutes on each occasion. Students submitted cases and questions they wished to discuss beforehand, and staff such as nurses and social workers knowledgeable about the relevant situations were invited to attend. Facilitators ensured that everyone had the opportunity to express his or her opinions, that differing viewpoints were considered, and sometimes provided related literature for further reading afterwards.
Results: Common issues raised included problems arising from the novice status of the students, care for dying patients, doctor-patient relationships, and patients' emotional, familial, and/or financial difficulties. Through sharing of stories and expertise, students learned what they can say or do in future situations, combined theory with practice, and battled negativity and pessimism. The discussions helped them reflect more deeply on their own experiences.
Discussion: Clinical medical humanities discussions are most productive when students present their own problems and effectively frame the questions for discussion. It is also important for facilitators to stimulate the students to appreciate different points of view, examine various aspects of a problem, and draw

connections to larger socio-political issues when appropriate.

Conclusion: These discussions help medical students think about broader issues in their clinical practice, share ideas and creative solutions to those problems, and ultimately, learn to provide patient-centered and holistic care. They are also excellent opportunities for inter-professional education. Students especially value the perspectives offered by other healthcare professionals which often shed light upon better ways of understanding and handling various situations.

Take-home message: Medical humanities education should be extended to the clinical phase and student-centered, case-based discussions are useful for teaching "the art of medicine".

8FF5 (2976)
The Asklepios Lounge Project: Creating a Room for Reflection about Medicine and Medical Education through Art

Authors
Jane Ege Møller
Lene Rybner

Presenter:
Jane Ege Møller, Aarhus University, Aarhus, Denmark

Background: Medical education must draw on both the humanities and natural sciences in order to grasp the complexity of modern medicine. Studies within the medical humanities and narrative medicine movement identify that the arts is a source for grasping this complexity. Often these studies focus on narratives and literature. As an experiment, we wished to expand the exposure of arts into medical education and medicine, by creating a space for the arts, and simultaneously activate a variety of learning styles at the 1st national medical education conference in Denmark (May 2017).

Method: We created 'The Asklepios Lounge', a library like space that exhibited posters and collages of doctors and medical education throughout history. We also displayed letters and poems, provided lists of movies and literature, showed short excerpts of movies, had playlists of music, and displayed a library of fiction – all featuring the doctors and the medical profession. In the lounge, participants could also collect "doctor" puzzles, draw or write.

Results: The lounge was created for the three days national medical education conference attended by 270 participants. It was established in a corner of the main conference hall used during breaks. Most participants enjoyed the lounge area, however, only a few collected puzzles, read, listened to music, and none drew nor wrote. Through different art forms, we created an opportunity for reflecting about medical education and medicine. The lounge contained stimuli that spoke to different learning styles and senses: auditive, visual, tactile, kinesthetic. As such, the experiment of a room for reflection at a medical conference succeeded. Even though many participants visited the lounge, few engaged in listening to music, drawing etc. This indicates that in order to fulfil the lounge potential, more out-reaching and workshop-like activities should be incorporated.

Conclusion: Different art forms are a source for reflecting about medicine and medical education, and give access to a variety of learning styles. However, out-reach activities are necessary in order to engage participants in all potential learning opportunities.

What did Behavior Sciences bring to first year students in Okayama Medical School, Japan?

Authors
Tomoko Miyoshi, Center for the Development of Medical and Health Care Education, Okayama University, Okayama, Japan
Masaomi Yamane, Renovation Center, Okayama University, Okayama, Japan
Atsuyoshi Iida, Center for the Development of Medical and Health Care Education, Okayama University, Okayama, Japan
Yasuhiro Mandai, Center for the Development of Medical and Health Care Education, Okayama University, Okayama, Japan
Akihiro Matsukawa, Renovation Center, Okayama University, Okayama, Japan
Yasutomo Nasu, Center for the Development of Medical and Health Care Education, Okayama University, Okayama, Japan

Presenter:
Tomoko Miyoshi, Okayama University, Okayama, Japan

Background: Behavior sciences is introduced systematically into a curriculum in medical schools in Japan however medical education in Japan focused to knowledge and skills previously. Many students enter in medical schools from their high schools directly and most of them had gone to cram schools for extra-study. High school students made their communication skills with their friends, teachers and families but not through volunteer activities and social activities.
Medical students during their medical school days previously developed their communication skills and social skills at the club activity, part-time job and so on.

Method: Okayama University started behavior sciences in first year medical school in 2016. Students learned communication skills in lectures for two days first and worked using the communication skills in various office and institutions, nursing homes, kindergartens, pharmacies, law offices, and hotels for five days. Students had a small group discussion and shared each experiences in the discussion in the last day. Students reflected about their communication in the office using e-portfolio every day. Evaluation includes an examination of knowledge of communication, the reflection skill about communication in e-portfolio, their behavior in the office by office person and communication skills in small group discussions.

Results: Few students struggled in communication with unknown person. Some students could reflect their behavior deeply however some students did not. Some students had gaps between a self-assessment to the assessment of office person.
Behavior in the office is not interrelated with knowledge or reflection skills. In other word students had different strengths in communications.

Conclusion: Behavior is not changed easily. Medical schools may prepare a spiral curriculum for better

communication of students before the clinical clerkship in Japan. Our medical schools just started behavior sciences in first year curriculum and developed every year as a spiral curriculum.

Take-home message: Behavior develops in practice, practice and practice!

8FF8 (1955)
Healthcare student competence and confidence with prescribing: a mixed methods study

Authors
Cassandra Woit, University of Alberta, Edmonton, Canada
Theresa L. Charrois, University of Alberta, Edmonton, Canada
Nese Yuksel, University of Alberta, Edmonton, Canada

Presenter:
Cassandra Woit, University of Alberta, Edmonton, Canada

Background: Previous research has been conducted showing that prescribing competence is poorly correlated with prescribing confidence, and questions whether undergraduate programs adequately prepare interns and junior practitioners for safe and rational prescribing. Understandably, medical students are often the population this research focuses on, however with prescribing becoming a common activity for pharmacists in Alberta, Canada, there is a need for similar research for pharmacy students.
Method: The goal of this project is to assess prescribing competence and perceived prescribing confidence of fourth year pharmacy and medicine students at the University of Alberta to determine if prescribing competence and confidence are correlated. This will be a mixed method design where students will complete a competence assessment based off previous research published by Dr. David Brinkman. Following the competence assessment, students will complete a confidence survey tool, which will evaluate how confident they were that they answered each case of the competence assessment correctly. A 4-point Likert-scale will be used to evaluate confidence.
Currently there are no results to disseminate, however preliminary results are expected by July 2018. To assess the internal consistency of competence scores and self-perceived confidence ratings, cronbach's alpha will be used. The Spearman correlation coefficient (r) will be used to determine the correlation between prescribing competence and confidence for both cohorts independently. A significance level of $P < 0.05$ will be used. The overall level of prescribing competence and self-perceived confidence will be calculated and compared between the two cohorts of students. Possible regressions for prescribing competence and confidence will also be calculated for both cohorts of participants. Open-ended survey questions will be evaluated using thematic analysis. This project will help gauge the level of confidence and competence of future prescribers graduating from the faculties of pharmacy and medicine from the University of Alberta, which may guide curriculum changes and/or improvements.

Presenter:
Rungsima Tinmanee, Division of Ambulatory Medicine, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand

Background: Prescribing skills are complex tasks for medical students and their errors are common. Tutorial courses are settled to solve the problems every 4 months (three times a year). Final-year medical students are rotating to the sessions prior to general hospital services. Effect of rotation timing on prescribing skills is still unclear.
Method: This study retrospectively assess the prescribing skills in three common short-stay ward scenarios; upper gastrointestinal bleeding (UGIB), acute pyelonephritis and community acquired pneumonia (CAP) among final-year medical students in Siriraj Hospital, Mahidol University. Rotation timing effects throughout academic year are evaluated.
Results: A total of 368 students' prescriptions during 2 years (127, 110, and 131 in the first, second, and third rotation, respectively) were reviewed. The total scores were statistically significant increase in order of rotations as 55.5, 63.2, and 66.2 out of 100 ($p<0.001$). Mean of UGIB scores were 35.5, 49.1, and 50.8, respectively ($p<0.001$ and 0.06). Proton pump inhibitor usages were 52%, 84.5%, and 85.5% ($p<0.001$ and 0.84). Serial of hematocrit were 32.3%, 54.5%, and 74.8% ($p<0.001$). Mean of acute pyelonephritis scores were 67.9, 72.6, and 77.0, respectively (p 0.01). Appropriate antibiotic used in acute pyelonephritis were 58.3%, 81.8%, and 90.8% ($p<0.001$ and 0.04). Mean of CAP scores were 63.2, 67.9, and 70.8, respectively (p 0.01 and 0.11). Appropriate antibiotic used in CAP were 15%, 22.7%, and 38.2% ($p=0.13$ and <0.001). Baseline internal medicine scores were not different among rotations. Average scores evaluated by general hospital staffs were significant higher in the third rotation (71.6, 71.2, and 73.5, respectively ($p=0.86$ and 0.01).

The prescribing skills are generally gained throughout the year. Some aspects improved earlier, but some revealed later especially if clinical tools guidance required. According to comparable baseline knowledge, effect of rotation timing on prescribing skills should be concerned and may contribute to better evaluation in the third rotation.

Conclusion: Good prescriptions are troubled for trainees. Tutorial courses and other supports are necessary to promote the appropriate practices for medical students especially in early academic year. Furthermore, novel methods are needed to minimize this academic disadvantage.

Teaching Medical Students How to Safely Prescribe Opioids: Preliminary Results

Authors
Huai Cheng

Presenter:
Huai Cheng, University of Virginia, Charlottesville, USA

Background: Medication safety is one of top priority in U.S. Training young physicians on medication safety at early stage is critical. The author recognized recent opioid epidemic in U.S., but lack of preparing medical students and residents on prescribing opioids and developed a curriculum on teaching medical students how to safely prescribe opioid. The goal of this curriculum was to test whether this curriculum could improve MS4' knowledge on safely prescribing opioids.

Method: This curriculum was unfolded in the following: 1) Preparation of basics of safely prescribing opioids. The basics of safely prescribing opioids was presented to MS4 of Class 2016 by the author or posted on online via PowerPoint slides for MS4 from Class 2017. In either way, the author performed pretests in the classroom; 2) In the classroom, students reviewed and discussed the six cases in paired (2-3 MS4) and then in big group (6-7 MS4) with the author as moderator; 3) The posttests were conducted at the end of geriatrics clerkship. Kirkpatrick criteria were used to measure outcomes for MS4 from Class 2017.

Results: Total of 305 MS4 were enrolled. Among MS4 from Class 2017, only 57.6% (76/132) students had written a prescription. The classroom teaching was highly perceived by MS4 and graded as 4.26 on the scale of 1-5 (1=poor, 5=excellent). Students' comfortable level in prescribing opioids was significantly improved (1.88 up to 3.17 on a scale 1-5. 1=extremely uncomfortable, 5-completely comfortable). Knowing MEDD (up from 14.7% to 86.2%), the most common side effect associated with opioids (up from 80.1% to 93.2%), and renal friendly opioids (up from 12.6% to 19.5% and liver friendly opioids (up from 18.8% to 22.8%) was significantly improved.

Conclusion: A simple curriculum for MS4 could significantly improve their comfortable level and knowledge on safely prescribing opioids. However, it is unknown whether MS4 can safely prescribe opioids for real patients.

Take-home message: A simple curriculum can be offered for MS4 to help them prepare how to safely prescribe opioids.

8FF11 (1694)
Exercise Physiology as a Preclinical Elective Course in Medical Education

Authors
Phunphen Napradit
Panadda Hatthachote

Presenter:
Phunphen Napradit, Department of Physiology, Phramongkutklao College of Medicine, Bangkok, Thailand

Background: Preclinical elective courses play an important role in medical education by increasing medical student knowledge and useful skills in field of special interest outside of the traditional curriculum. Exercise physiology course is one of the elective courses in Phramongkutklao College of Medicine's medical curriculum. Department of Physiology provides exercise physiology course for the third year medical student at the first time in academic year 2016. The course objectives are to acquire knowledge of physiological changes that occur in body response to exercise and experience in clinical exercise physiology for cardiovascular and pulmonary rehabilitation, physical activity and health and exercise in disease in order to use exercise and physical activity intervention as a fundamental part of patient care.

Method: In academic year 2016 (April 24 – May 5, 2017), ten medical students (6 males and 4 females) selected elective courses to participate in exercise physiology course. The course was an intensive 2-week that the number of credits was 2 (1-2-3), comprised of 15 lecture hours, 16 lab hours, 19 presentation/self-study hours and 5 visit hours. It was designed for small group and active learning. All students were asked to complete an open-ended questionnaire about their learning outcome and experience in the course at the end of the course. Learning achievement was measured using in-class activities, reflections, topic presentations and performance.

Results: All medical students got grade A. They gained deeper knowledge and valuable experience and felt good satisfaction with learning in exercise physiology course. However, they gave comment that course content was tough and so much to learn. The content should be reduced and laboratory experience and visit interesting-unit such as fitness center should be more.

Conclusion: Although, physiological basis of exercise could be integrated into formal medical curriculum. Exercise physiology as an elective course provided medical student with opportunity to learn in depth of knowledge and wide experience of their interest. By developing a better course, future course designs may be improved to optimize student learning outcomes.

Take-home message: Implementing preclinical electives should be assessed in order to improve the course in future.

8FF12 (1715)
Medical Students' Attitudes toward Active Learning in Radiology

Authors
Chalakot Dejarkom, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand
Kosa Sudhorm, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Presenter:
Chalakot Dejarkom, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Background: Active learning has been applied to radiology in medical schools, and a void in the literature exists regarding the attitude of all active learning methods in radiology. The objective of this study was to evaluate medical students' attitudes toward all active learning methods in radiology.
Method: 5th year medical students in Buddhachinaraj Medical Education Center in elective course of radiology in academic year 2016 were included in this study. They were assigned to study team based learning, case conference, topic, teaching film and ultrasound practice methods. At the end of the course, they were surveyed for their attitudes toward all active learning methods by using 11 (five rating scale) questionnaire items.
Results: Fifty nine medical students completed the questionnaires, with a response rate of 100%. TBL had the highest attitude (3.37±0.82) and ultrasound practice had the lowest attitude (2.43±0.84) in overall. Case conference had the highest attitude for communication skill, coordination, responsibility, presentation skill and lifelong learning; the lowest attitude for instructor feedback. TBL had the highest attitude for teamwork, coordination, harmony and lifelong learning; the lowest attitude for duration. Teaching film had the highest attitude for instructor feedback and duration; and no the lowest attitude. Topic had the highest attitude for preparation; the lowest attitude for instructor feedback and medical professionalism. Ultrasound practice had the highest attitude for medical professionalism; the lowest attitude for teamwork, community skill, coordination, responsibility, harmony, preparation, presentation skill and lifelong learning.
Discussion: Case conference had the highest attitude in five items because the students have to be good coordination and preparation for excellent presentation. TBL had the highest attitude in teamwork that corresponding with the objective of TBL. The students had direct benefit from teacher in teaching film, therefore they had the highest attitude in instructor feedback. While ultrasound practice had the lowest attitude in eight items due to low participation and inadequate time.
Conclusion: All active learning methods in radiology have different advantages and disadvantage that we should mix all active learning methods to increase the benefits.

8FF13 (3669)
Improving radiology teaching for undergraduate medical students at Exeter University

Authors
Nazanin Nosrati, Royal Devon and Exeter Hospital, Exeter, UK
Nadin Jallad, Royal Devon and Exeter Hospital, Exeter, UK

Presenter:
Nazanin Nosrati, Royal Devon and Exeter Hospital, Exeter, UK

Background: Radiology is integral in the management of many patients. The ability to interpret basic radiological investigations is a vital skill for junior doctors to deliver safe clinical practice.
The European Society of Radiology and the Royal College of Radiologists urge on the importance of formal and structured radiology teaching delivered as a continuous thread throughout medical school curriculum. However, the lack of this is an issue frequently raised by medical students.
Our aim was to assess the impact of structured radiology teaching on medical students' confidence levels in interpreting chest and abdominal radiographs.
Method: A questionnaire was distributed to medical students at Exeter University, assessing their confidence levels when interpreting common radiographs. This was followed by junior doctors delivering case-based, interactive chest x-ray (CXR) and abdominal x-ray (AXR) sessions to 39 students on clinical placements over 4 weeks. A second questionnaire was distributed, focusing on students' confidence levels post teaching.
Results: All students reported receiving a 'moderate' amount of radiology teaching and expressed it was 'an add-on' in years 1-2 instead of being a subject of its own. Pre-teaching, 69% of students had no or little confidence in CXR interpretation and 88% in AXR interpretation. Post teaching, 94% felt relatively confident or confident in CXR interpretation, while 88% felt the same towards AXR interpretation. Furthermore, post teaching, 20% of students expressed an interest in a career in radiology, compared to 5% pre-teaching.
Conclusion: This project identified a lack of effective radiology teaching for medical students at Exeter University, affecting ability and confidence in interpreting radiographs. Based on our results, delivering regular, structured and interactive radiology teaching improves clinical skills and increases confidence significantly. This will have both short and long-term benefits, as students are more likely to perform better in clinical examinations and will ensure safe clinical practice in the longer term. Radiology is under-represented in the undergraduate medical curriculum
Take-home message: Effective undergraduate radiology teaching leads to delivery of safe clinical practice
More undergraduate radiology teaching increases interest in radiology as a career

Development of national competence-based framework for primary medical graduates in Georgia

Authors

Gaiane Simonia, Tbilisi State Medical University, Tbilisi, Georgia

Zurab Vadachkoria, Tbilisi State Medical University, Tbilisi, Georgia

Rima Berashvili, Tbilisi State Medical University, Tbilisi, Georgia

Marina Mamaladze, Tbilisi State Medical University, Tbilisi, Georgia

Salome Voronova, Tbilisi State Medical University, Tbilisi, Georgia

Presenter:

Gaiane Simonia, Tbilisi State Medical University, Tbilisi, Georgia

Background: Globalization of medical education and demand for achieving international recognition have been the main incentives for development of competence-based national framework for primary medical degree in Georgia. In 2017 National Center for Educational Quality Enhancement set Task Force for the development of competences/outcomes for MD graduates.
Method: Development of competences and outcomes was based on recommendations of MEDINE2 (2013), WFME global standards for basic medical education (2015), CanMEDS Physician Competency Framework (2015) and Tomorrow's Doctors, GMC (2015) and national peculiarities of medical education. In total 13 competences have been defined and further detailed by corresponding outcomes. Framework describes each competence and related methodology of its achievement and assessment. Such approach made it more practical and useful for medical schools and might serve as a road map for further development of MD curriculum. The document has annex with a sample of how each competence might be achieved throughout 6 years of study with description of appropriate methods of teaching and assessment.
Conclusions: Development of national competence-based framework for primary medical graduates in Georgia has been an important step towards harmonization of Georgian medical education with international standards and for enhancing quality of undergraduate medical education.
Benchmarking of MD program can be used for medical schools national accreditation as well as a tool for medical schools to improve medical curriculum.

Developing a Questionnaire to Explore Factors Influencing Clinical Teachers' Intention to Apply Emergency Medicine Milestones for Residency Training

Authors

Cheng-Ting Hsiao
Chih-Ming Hsu
Fremen Chih-Chen Chou

Presenter:

Cheng-Ting Hsiao, Chang Gung Memorial Hospital Chiayi Branch, Chiayi, Taiwan

Background: Workplace-based teaching and assessment is crucial for implementing competency-based medical education (CBME). In order to implement the CBME, Taiwan Society of Emergency Medicine(TSEM) conducted a milestone program for residency training. The clinical teachers' intention to apply emergency medicine milestones for residency training plays an important role in the success of the milestone program. Based on the Theory of Planned Behavior (TPB), we developed a questionnaire to investigate the factors influencing the clinical teachers' intention to use milestones for residency training.
Method: The participants comprise clinical teachers working in the 15 hospitals with certified emergency medicine residency training program in Taiwan. The items were developed through iterative discussions and revision by research team, survey experts, emergency content experts and clinical teachers. A total of 386 questionnaires were distributed using a random sample technique. We took descriptive, item, factor, and reliability analyses to build up the constructs of the questionnaire items.
Results: Totally 274 valid questionnaires were returned (valid response rate of 70.9%). Based on TPB, five constructs were validated through factor analysis with a good model fit. The results show that the 5 factors (i.e., attitude, subjective norms, education accreditation units, self-efficacy, and environmental resources) can be applied to predict clinical teachers' intention to use milestones. The most influential factor is self-efficacy, followed by attitude. The final model explains 56.6% of the variance for clinical teachers' intention to use milestones.
An improved understanding of these factors that influence clinical teachers' intentions to apply milestone for workplace-based assessment and teaching could potentially inform more effective approaches to faculty development and contribute to the real implementation of CBME.
Conclusion: TPB can be used as a theoretical framework to develop a questionnaire to investigate clinical teachers' intention to use milestones for Emergency Medicine residency training. Self-efficacy and attitude are the most important factors influencing their intention.
More attention should be given to these two factors (self-efficacy and attitude) within faculty development programs and the implementation of workplace-based teaching and assessment in the future.

Charting the flow of ideas in medical education: A Social Network Analysis of Entrustable Professional Activities

Authors
Lauren Maggio, Uniformed Services University, Bethesda, USA
Balder ten Cate, Google, Mountain View, USA
H. Carrie Chen, Georgetown University, Washington, USA

Presenter:
Lauren Maggio, Uniformed Services University, Bethesda, USA

Background: Researchers have responsibility to broadly disseminate their ideas, scholarship, and best practices. To understand and optimize dissemination, several fields have applied innovative methodologies, such as social network analysis (SNA) to characterize patterns in scholarly communication. We employed SNA to study the dissemination patterns of a relatively recent medical education concept: entrustable professional activities (EPAs).
Method: Using Web of Science, we identified a core set of publications on EPAs and extracted their metadata, which included references and citations. This dataset was augmented by additional subject metadata from CrossRef. We examined publications to determine relationships among publications and authors. We generated visual depictions to analyze the global structure of the networks and identify influential publications and authors. We studied different types of connections (e.g. citations, co-authorships) and various notions of centrality and influence.
Results: We identified a core set of 197 publications that referenced 10,425 articles and were themselves cited 18,212 times. Within the core set of publications, a number of articles clearly emerged as central nodes of influence. Most were specific to EPAs but some addressed peripheral topics (e.g. accreditation). We found a large community of collaborators around the originator of the EPA concept and two additional particularly influential authors. Analysis of different types of centrality identified different persons of influence.
Discussion: SNA allowed us to explicate the diffusion process of a medical education concept using EPAs as a case study. It illuminated publication and authorship patterns helpful to understanding factors that might drive the uptake of a concept. For instance, the emergence of a paper on graduate medical education accreditation in the USA as an influential node suggests it was an important context for propelling the EPA discussion in the literature. It not only identified authors who were influential through their publications but those who were influential through other means (e.g. role in connecting collaborators).
Conclusion: Social network analysis can be utilized to understand the dissemination of a medical education topic. Specifically, it can identify peripheral concepts and

person roles that help drive topic growth within the published literature.

Feasibility of EPA entrustment decisions as assessment in undergraduate medical education: one year experience in an integrated clerkship

Authors
Sibyl Geelen, University Medical Center, Utrecht, Netherlands
Charlotte Eijkelboom, University Medical Center, Utrecht, Netherlands
Bastiaan van der Klis, University Medical Center, Utrecht, Netherlands
Olle ten Cate, University Medical Center, Utrecht, Netherlands

Presenter:
Sibyl Geelen, University Medical Center, Utrecht, Netherlands

Background: Entrustable Professional Activities (EPAs) have been adopted in the competency framework of the undergraduate medical education program of the Utrecht University. In September 2016 EPAs were introduced to assess Master year 1 medical students in a new longitudinal integrated clerkship, combining gynecology, pediatrics and clinical genetics. Students follow this clerkship for 12 weeks either in the University Medical Center or in one of the 9 affiliated hospitals.
Method/Results: To complete the clerkship, students must reach entrustment at a predetermined supervision level. This study evaluates the documentation of formative assessments, which are used as a source to ground the summative entrustment decisions. Furthermore, insight is provided into factors associated with incomplete documentation.
The clerkship includes five core EPAs on medical consultation: the basic gynecologic, obstetric, pediatric, neonatal and clinical genetic medical consultation. To support entrustment decisions, students must document a minimum of 2 practice observations and 2 case-based discussions per EPA in their digital portfolio.
We evaluated the portfolios of the first 183 students in this new clerkship. Furthermore, by consulting students and supervisors, we identified factors associated with insufficient documentation.
The percentage of students with at least 2 documented observations and 2 documented case-based discussions per core EPA were: gynecology 72 and 70, obstetrics 64 and 58, pediatric 85 and 96, neonatology 84 and 61, clinical genetics 99 and 99.
Discussion: Factors associated with insufficient documentation can be divided in student-associated features (insecure, modest, disorganized, indulgent), supervisor-associated features (too busy, disagreeing with new e-portfolio system), and organization-associated features (too many forms, unclear system, technical issues, suboptimal work environment). Large differences were found regarding the documentation to support entrustment decisions. Documentation of formative assessments differed between students, disciplines and

hospitals. Initial exploration indicated that this is likely caused by multiple factors.

Conclusion: The introduction of a novel, EPA-based assessment system in undergraduate medical education requires adjustment of all stakeholders. Students, supervisors, educational board and digital teams need to cooperate to overcome the challenges and make this system feasible and successful.

8GG8 (3314)
Updated Entrustable Professional Activities for a Family Medicine Residency Training Program

Authors

Jose Francois, University of Manitoba, Winnipeg, Manitoba, Canada
Bruce Martin, University of Manitoba, Winnipeg, Manitoba, Canada
Terry McCormack, University of Manitoba, Winnipeg, Manitoba, Canada

Presenter:
Jose Francois, University of Manitoba, Winnipeg, Manitoba, Canada

Background: The College of Family Physicians of Canada (CFPC) recently released CanMEDS-FM 2017, an updated competency framework designed for all Canadian family physicians regardless of practice type, location, or populations served. Although the framework defines a set of general attributes of a good family physician, it does not define the actual activities that a competent physician performs in practice. Subsequently, the CFPC released the Family Medicine Professional Profile, which taken together with CanMEDS-FM 2017, forms an overall picture of the roles and responsibilities of Canadian family physicians along with the competencies required to support their work.

Method: Using the CanMEDS-FM 2017 framework and the CFPC's Family Medicine Professional Profile, the University of Manitoba Family Medicine Residency Program sought to refine a list of Entrustable Professional Activities (EPAs) for to guide curriculum development and resident assessment.

Results: The residency program developed an initial list of EPAs in 2015 (prior to the release of CanMEDS-FM 2017) and further refined it by integrating new concepts from the CanMEDS-FM 2017 framework and the CFPC's Family Medicine Professional Profile, as well as through input of local family medicine educators at the University of Manitoba using a modified Delphi process.

Conclusion: A list of 25 updated EPAs was developed which collectively defines the type of care that the family medicine residency graduate should be trusted to perform competently upon graduation.

Take-home message: Updated EPAs will be rolled out in the 2018-2019 academic year and the program will monitor how these EPAs perform.

8GG9 (1702)
Validation of a novel assessment tool to evaluate how well medical residents are prepared to lead Serious Illness Conversations with oncology patients based on the competency-based medical education (CBME) model – a qualitative analysis

Authors

Jenny Ko, BC Cancer - Abbotsford, Abbotsford, Canada
Amanda Roze des Ordons, Tom Baker Cancer Centre, Calgary, Canada
Tamara Shenkier, BC Cancer - Vancouver, Vancouver, Canada
Charlie Chen, University of British Columbia, Vancouver, Canada
Gillian Fyles, BC Centre for Palliative Care, Vancouver, Canada
Jessica Simon, Tom Baker Cancer Centre, Calgary, Canada

Presenter:
Jenny Ko, BC Cancer, Abbotsford, Canada

Background: The Serious Illness Conversation Guide (SICG) has emerged as an evidence-based framework for conversations with patients about a serious illness diagnosis. The objective of our study was to validate a novel assessment tool, the SIC-Evaluation Exercise (SIC-Ex), designed to facilitate assessment of resident-led conversations with oncology patients.

Method: We developed the SIC-Ex based on the Boston SICG framework and on the Royal College of Canada Medical Oncology milestones for the Entrustable Professional Activity (EPA) "Discussing serious news" and "Transitioning away from active anti-cancer therapy". Seven resident trainees and ten preceptors were recruited from three cancer centres. Each trainee conducted a SIC with a patient, which was videotaped. The preceptors watched the videos and evaluated each trainee using the novel SIC-Ex and the reference Calgary-Cambridge Guide (CCG) at months 0 and 3. Three open-ended questions from SIC-Ex included "What was done well?", "What could be improved?" and "Other comments". Two independent coders used template analysis to code the preceptors' narrative comments and identify themes.

Results: Template analysis yielded 5 themes: (a) resident behaviors related to SICG; (b) resident behaviors related to CCG; (c) resident's personal characteristics and attitudes; (d) preceptor mis-classification of comments; and (e) comments on the SIC-Ex itself. Under (a) – (c), narrative comments explored numerous verbal and non-verbal attributes essential to SIC. Some comments applied to both SICG and CCG (e.g. empathy, open-ended questions, clarity, exploration, planning), whereas others were specific to a given theme (e.g. SICG - prognosis, fears, hopes, goals, family, trade-offs).

Discussion: Narrative comments generated by SIC-Ex provided a detailed and nuanced insight into resident competency in SIC, beyond numerical ratings and general communication skills assessed by CCG. Template analysis explored themes important to a successful SIC in overlapping and unique domains of SICG and CCG. The presence of mis-classified comments suggests the need for open-ended questions designed more specifically for a single theme.

Conclusion: Qualitative analysis of preceptor comments has provided additional validity evidence for use of the SIC-Ex in the teaching and assessment of oncology resident competence in discussing serious illness with patients.

8GG10 (909)

Inter-program variance in ACGME Reportable Pediatrics Milestones. Can Residents' ACGME PM levels be compared among programs?

Authors

Kimberly Hu, University of Illinois at Chicago, Chicago, USA
Patricia Hicks, Children's Hospital of Philadelphia, Philadelphia, USA
Melissa Margolis, National Board of Medical Examiners, Philadelphia, USA
Carol Carraccio, American Board of Pediatrics, Chapel Hill, USA
Amanda Osta, University of Illinois at Chicago, Chicago, USA
Alan Schwartz, University of Illinois at Chicago and Association of Pediatric Program Directors, Chicago, USA

Presenter:
Kimberly Hu, University of Illinois at Chicago, USA

Background: Pediatrics Milestones are competency-specific behavioral descriptions of learner performance across the medical education continuum. Semiannually, U.S. Pediatrics residency programs report milestone levels for each resident to the Accreditation Council for Graduate Medical Education (ACGME). The Pediatrics Milestones Assessment Collaborative (PMAC, consisting of the National Board of Medical Examiners, American Board of Pediatrics, and Association of Pediatric Program Directors) developed workplace-based assessment tools for measuring readiness to serve as an intern in the Pediatric inpatient setting. Context experts mapped behaviors from six milestones to workplace-based assessment items, observers at residency programs collected data with those items on residents, and PMAC aggregated responses into competency scores.

Method: We examine PMAC scores and program-reported ACGME milestones of 114 interns at 8 U.S. Pediatrics residency programs. We measure relative variance in milestones and PMAC scores using random effects models with competency, learner, program, and program x competency components. For each competency, we measure association between PMAC score and milestone, accounting for the clustering of learners in programs.

Results: Program-related milestone variance was substantial (54%), both in comparison to learner milestone variance (22%), and program variance in the PMAC scores (12%). On the contrary, learner variance represented 44% of variance in PMAC scores. Within programs, PMAC scores were significantly positively correlated with milestones for all but one competency related to recognizing limitations and engaging in help-seeking behaviors, which had significantly higher mean milestones and greater program variability.

Discussion: PMAC workplace-based assessments provide scores with little program-specific variance and that are sensitive to differences in ACGME reported milestones within programs. Milestones, however, reflect greater differences by program than by learner. This finding may represent overall differences in the performance of first-year residents from program to program but also may reflect differences in how programs use the Milestones as a reporting scale.

Conclusion: All U.S. training programs must report trainees' performance to the ACGME using milestones. However, comparing individual learner milestones among programs may be challenging if there are large differences in variances by program. PMAC and similar workplace-based assessments may provide performance evidence with greater sensitivity.

8GG11 (2298)

Residents in Taiwan rate themselves lower than attending assessments on ACGME milestones

Authors

Chien-Yu Chen
Fremen Chih-Chen Chou
Kung-Pei Tang
Yi-No Kang

Presenter:
Chien-Yu Chen, Taipei Medical University Hospital, Taipei, Taiwan

Background: Recent evidence showed that most residents in the US over-estimated themselves in the ACGME Milestone assessment. (Goldflam, Bod et al. 2015, Tichter, Mulcare et al. 2016, Watson, Borgert et al. 2017) Whether such a phenomenon was the case in a non-US society, especially in a Confucian context such as Taiwan, might need to be further examined. This study aims at verifying such a hypothesis and investigating the correlation between self-assessment and evaluation by attending.

Method: Taipei Medical University Hospital has introduced the evaluation of ACGME Milestone to all 80 residents from 20 specialties since April 2017, including carrying out self-evaluation and two assessments by attending physician. The rating scale was set from 1 to 9 or 0 to 9 based on the guidance ACGME provided. The averaged mean difference, Pearson correlations and analysis of covariance (ANCOVA) between evaluates and evaluators were both analyzed.

Results: Our results showed that the means of self-rating scores were significantly lower than those rated by the attending physicians in general (MD=-0.465, F=5.379, p=0.022), as well as the domains of medical knowledge (MD=-0.610, F=8.388, p=0.004), system-based practice (MD=-0.546, F=6.551, p=0.011), problem-based learning and improvement (MD=-0.454, F=4.201, p=0.042), and inter-personal communication skills (MD=-0.456, F=4.350, p=0.039). Moreover, the correlation coefficient of average scores between evaluators and evaluates were above moderate overall (r=0.649, p<0.05), especially in the domains of medical knowledge (r=0.770) and patient care (r=0.748).

Discussion: This study overthrew the assumption that all residents might overrate their own clinical performance as those did in the US. Further studies, such as qualitative

research might be needed to bring such issue to light in the future.

Conclusion: Residents' self-report of milestone level was correlated to their clinical teachers' perspectives both in the US and Taiwan. However, unlike the American experiences, Taiwanese trainees often under-estimate their own clinical competence.

8GG12 (1563)
Stay Alert! "Generation Z" and the Teaching of Gynecology and Obstetrics in Undergraduate Medical Education Through Active Methodologies, Entrustable Professional Activities (EPAs) and Digital Medias

Authors
Andrea Mora De Marco Novellino
Izabel Cristina Meister Martins Coelho

Presenter:
Andrea Mora De Marco Novellino, Faculdades Pequeno Principe, Curitiba, Brazil

Background: Our medical students belong to the new generation of digital natives, as known as Generation Z, Centennials, iGen and more. They are constantly multi-tasking and want fast access to information. The teaching of Ob-Gyn in medical undergraduate becomes more attractive if we respect their different ways of learning, and active methodologies and EPAs keep students engaged and interested in new contents.
Method: The learning of Ob-Gyn in our medical school begins in the second year through active methodologies. Observing that our students want to get information quickly and apply the content in practice, we proposed the use of EPAs built for the teaching of Ob-Gyn in undergraduate and the previous study of the content by their own means, such as flipped classroom. To each group of six students, we gave an EPA which should have been fulfilled at the next meeting. The EPAs were about anamnesis, pelvic and clinical breast examination, prenatal care, delivery and puerperium.
Results: Students showed acquisition of learning and skills using digital media for textual, video and interview researchs about proposed themes. All the six groups were able to execute each EPA partially, occurring mistakes that were discussed at the debriefing session, based on medical literature. Each EPA stays available for the student's training as many times as needed.
Discussion: EPAs represent tasks that students might be expected to carry out without direct supervision on entering residency. EPAs operationalize the medical education results as essential professional activities that a professional should be able to perform. "Generation Z" feels comfortable and demonstrates more participation in activities in which active methodologies are associated to digital medias, bringing the learning closer to their own reality. To execute an EPA, students search the digital medias for videos, images, blogs and podcasts and associates these to the medical literature content, making the learning process dynamic and individualized.
Conclusion: Bringing the teaching of Ob-Gyn closer to the reality of the digital native student improves outcomes. Generation Z has shown preference for active

methodologies that allow both individual practice and study, favoring personal style.

8GG13 (1104)
Clinical practical assessment of Entrustable Professional Activities in undergraduate veterinary students at Vetmeduni Vienna: A pilot study

Authors
Ingrid Preusche
Petra Winter
Heinz H. Florian Buchner
Sibylle Kneissl

Presenter:
Sibylle Kneissl, Vetmeduni Vienna, Austria

Background: Entrustable professional activities (EPAs) concept allows assessment of theoretical knowledge and practical skills on the level of supervision required by trainees. At Vetmeduni Vienna an OSCE format, called KLIPP-VET, was introduced to test four EPAs in fifth year students after their clinical rotation. Summative assessment was realized by global rating scales and formative assessment by pre-defined supervision levels.
Method: Examiner workshops were installed to explain KLIPP-VET rules: a) rotation in four stations, each station testing an EPA (1, history taking; 2, clinical examination performing; 3, differential diagnoses listing; 4, therapy proposing), including a minimum of three species and four clinical experts in the field with a maximum testing time of 10 min/station; b) overall cut-off level of 60 points/100 over all stations in summative assessment; a red flag was used to demonstrate any (suggested) action that potentially harms life of animals or persons; c) formative assessment on EPAs by supervision levels was piloted for optional use.
Results: Implementation of KLIPP-VET was challenging, but successful. At the time of abstract submission 93 students were examined. Regarding summative assessment, 77 points/100 were achieved on average (range 45 to 95) over all stations and equally distributed among EPAs. In total, eleven red flags were used, leading to seven full repetitions and four single station repetitions. Concerning formative assessment, deliberate feedback on supervision level was hardly used and refused by most examiners.
Discussion & Conclusion: Practical constraints shaped the testing format, however KLIPP-VET was a feasible tool to assess EPAs in different species at various locations in acceptable time and standardised format. Since examiners reported formative assessment to be overburdened in addition to summative assessment, faculty decided to suspend the former in this pilot study. Therefore focussed training on formative assessment should be highlighted in examiner workshops and be trained in clinical rotations.
Take-home message: EPAs including their (summative and formative) assessment have to be shaped to local needs and minimum standards.

Evaluating Fam Med CPD as an Expression of CBME, Using Curriculum Mapping

Authors
Robert Parson, uOttawa, Ottawa, Canada
Paul Hendry, uOttawa, Ottawa, Canada
Heather Lochnan, uOttawa, Ottawa, Canada
Eric Wooltorton, uOttawa, Ottawa, Canada
Gary Viner, uOttawa, Ottawa, Canada
Dianne Delva, uOttawa, Ottawa, Canada

Presenter:
Robert Parson, University of Ottawa, Office of CPD, Ottawa, Canada

Background: The Office of CPD is involved in the development of numerous programs for family physicians (FPs). It is difficult to ascertain if the programming addresses the broad range of competencies needed to maintain or improve their knowledge and skills.
To evaluate our Fam Med CPD programming we analyzed it as a comprehensive curriculum and mapped it to a framework of competencies.
The goals were:
• to verify that our CPD programs met the broad range of competencies and FP needs.
• to design a competency framework that could be attached to this "curriculum".
• to demonstrate that curriculum mapping could be useful in the evaluation and design of a CPD curriculum.
Method: FP competency frameworks were analyzed to determine which would best represent the abilities of FPs and could be a useful mechanism for curriculum mapping. Team members, using a portion of the program, met three times to achieve a consensus about terms and methodology. Researchers analyzed the learning objectives for each individual course of the last two years (n=27) and mapped them to the competencies framework, using an Excel database.
Results: The research team chose a competency framework published by the College of Family Physicians of Canada, and added the CanMEDs-FM competencies. The completed curriculum map provided a visual representation of our FP curriculum, which now can be used to plan appropriate courses that will include the competencies that had not been covered previously. It also identified which CanMed FM roles could be elaborated on, aside from the ubiquitous Medical Expert role.
Conclusion: The results of mapping do enable identification of gaps and can serve as a basis for curriculum analysis.
However, researchers indicated a wish for greater of detail of the competencies. They also commented that the current mapping tool took a lot of work.
For CBME to function in CPD, a competency framework must be devised. The framework can be used in a curriculum map that is useful in evaluating a CPD program.

8GG15 (1267)
Using Eye Tracking to evaluate students' needs and usability of a visualised curriculum

Authors
Chua Min Kuan
Kwan Jia Rui
Claire Ann Canning

Presenter:
Min Kuan Chua, Nanyang Technological University, Singapore

Background: At LKCMedicine, a new curriculum map, CLUE (CurricuLUm Explorer), was developed. We aim to evaluate students' needs and usability of CLUE, using both eye tracking (ET) and traditional usability methods. To our knowledge, there are no previous studies using ET to evaluate the usability of curriculum maps. We are using this novel approach to further explore usability and functionality of curriculum visualisation.
Method: 17 medical students (11 male, 6 female) were recruited from LKCMedicine. Traditional usability methods such as pre- and post-test questionnaires were administered. Participants' eye tracking data were recorded in the form of gaze-plot videos. They were then asked to complete the System Usability Scale (SUS), and to 'retrospectively think aloud (RTA)' while their gaze-plot video was being shown. The RTA-gaze plot videos were analysed for usability problems and categorised. Visualisations of participants' gaze patterns were also obtained.
Results: Students' needs for the curriculum map were mainly centred on accessing learning outcomes and resources. The mean SUS score was 55.7 ± 16.36 (scored 'below average'). 94.1% of participants were unaware of curriculum mapping as a resource. A total of 53 usability issues were identified, and ET was used to evaluate these problems. Problems were detected either verbally (n=36), observed clicks/eye movements (n=8), or both (n=12). CLUE, although it met students' needs, requires some usability improvements. ET gave invaluable insight into the problems detected. Through this study, we were able to identify the areas for improvement to better develop CLUE to suit our users' needs. The study was able to engage various stakeholders of LKCMedicine in curriculum evaluation and development, promoting a more inclusive approach to curriculum design. We hope this study would serve as a guide for researchers interested in using ET to perform in-depth usability studies on visualised curriculum.
Conclusion: This study was able to identify recurring usability issues for incorporation into future versions of CLUE. ET was a useful tool in our usability study - it helped to prompt users to give verbal feedback, and explain user behaviour beyond traditional usability methods.

Quality improvement events as accessible, adaptable and diverse learning platforms

Authors
Rebecca Dyar, Peninsula School of Anaesthesia, Torquay, UK
Clare van Hamel, Severn Foundation School Director, Health Education England, Bristol, UK
Wai-yee Tse, Associate Postgraduate Dean, Health Education England South West, UK
Rosie Gallagher, Severn Foundation School, Bristol, UK

Presenter:
Nadine Dyar, Peninsula School of Anaesthesia, Torquay, UK

Background: "A promise to learn – a commitment to act"; in 2013, Don Berwick discussed the importance of learning in the pathway to achieving better care. In a subject as vast as 'Quality Improvement' (QI), how can this learning be achieved? Considering the pressures faced by staff in the UK National Health Service, I believe QI events are an opportunity that we should promote.
Method: In the South West of England, we have hosted multiple patient safety and QI events over the past five years. These have created an opportunity for all healthcare professionals to learn from others and share their valuable experiences.
Each year feedback is reviewed and new contributions invited to improve the events. Collaborations between QI Fellows, Peninsula and Severn Deaneries, and the Academic Health Sciences Network, generate programmes that are diverse and relevant to the patient safety issues of the time.
Each event involves keynote speeches, workshops and time for presentations from abstract submissions. The learning opportunities vary from identifying key problems, through data analysis, to the practical elements of starting, succeeding and sustaining a project.
Results & Discussion: The structure of the event appears key in establishing a learning environment. Our feedback shows that keynote speakers who engage and inspire their audience have lasting impact on attendees. The growing evidence base that greater staff engagement leads to better care for patients strengthens this feedback (2012; West).
Inviting patients, relatives and clinicians who have been involved in safety-related incidents contextualises the learning. Workshops with better feedback scores reflected more interactive sessions and relevant topics.
Listening to peers and professionals present their original work allows the attendee to improve their own presentation skills, with positive feedback reinforcing the great work accomplished.

Take-home messages: QI events are an excellent opportunity for healthcare staff to learn about patient safety and how to achieve better care
We have demonstrated that structured events generate a positive learning experience through inspiring, engaging and teaching practical applications of QI work.

Effects of a Training Program on End-of-Life Caring for ICU Nurses on their Attitudes and Care Behaviors Toward DNR Patients and Families

Authors
Luke Yang, Hsuan Chuang University, Taipei, Taiwan
Jen-Jiuan Liaw, National Defense Medical Center, Taipei, Taiwan
Ya-Chi Chen, Taoyuan Armed Forces General Hospital, Taipei, Taiwan

Presenter:
Jen-Jiuan Liaw, National Defense Medical Center, Taipei, Taiwan

Background: End-of-life (EOL) decision-making in acute care is complex. Nurses are vital to EOL care as they are the ones present at the bedside.
The purposes of this study were to: (1) examine clinicians' knowledge and attitudes toward DNR (do not resuscitation), (2) design a training program on EOL that can fits the characteristics and needs of ICU nurses; (3) evaluate the effects the training program on nurses' knowledge and attitudes toward DNR.
Method: The study adopted two groups pretest-posttest experimental design. The structured questionnaires were administered to 200 nurses who worked in the ICU for more than six months and agreed to participate in study from three hospitals. There were total 153 nurses responded to the questionnaires. Participants were randomized into the control (N=78), and experimental (N=75) group. After the pretest, the experimental group participated in a five-hour training program on caring and received a posttest assessment two weeks later.
Results: The results showed that before the training program, nurses' knowledge about DNR was insufficient, and only 62.56% correct response rate. For the attitudes toward caring DNR patients, the score of the item "discussion about DNR" was the lowest. For the DNR attitudes, the score of the item "taking care of the patients' physical needs" was the highest. After the training program, the scores of the DNR knowledge, DNR attitudes, and care for the DNR patients increased obviously (F=66.36, p< .01; F=19.65, p< .01; F=37.73, p< .01). The results suggest that the training program on EOL caring is effective on improving nurses DNR knowledge, DNR attitudes, and care behaviors for the DNR patients and families.
Conclusion: The training program on caring for ICU nurses could significantly improve their knowledge and attitudes in DNR. The ICU care is life-saving oriented, it is essential to

enroll the EOL caring concept into the ICU and guide nurses how to approach and take care for the DNR patients and families.

How to approach the DNR patients and families in a positive attitudes, and how to take care for them.

8HH4 (1668)
Scoping review on how to support "seasoned but difficult learners in medicine" to get re-trained

Authors
Harumi Gomi

Presenter:
Harumi Gomi, Mito Kyodo General Hospital, University of Tsukuba, Mito, Japan

Background: Lifelong learning is the mainstay in medical education. Insufficient training in the early stage of career in medical practice may lead some physicians to get "re-trained." This study aimed to investigate how to support "difficult learners" in re-training in medicine.
Method: Literature was searched using key words of "difficult learner," "re-training," "support in medical training," "clinical reasoning," using PubMed, Google Scholar, and Web of Science.
Results: There were very few literature on the topic. However, when searching with the term "difficult learners" with PubMed, there were 332 articles. Among them, titles and/or abstract were reviewed for screening. Then there were only few relevant articles left. One article indicated that residents in difficulty would be just slow learners, but that their performance could be positively related in their medical school performance such as the number of re-examinations, and the time to complete medical school.
Conclusion: Amendment programs for physicians with insufficient competency in medical practice should be more strategically developed and implemented to ensure patient safety. Further studies are needed to investigate how to support "difficult learner" physicians in re-training. Effective supportive strategies should be sought for physicians who require re-training in their mid-career.

8HH5 (2749)
'Learning Set' for the 'Upskilled' Multi-professional Workforce in Primary Care

Authors
Shu Li Tan, Wessex School of General Practice, Wessex Deanery, UK
Bryony Sales, Wessex School of General Practice, Wessex Deanery, UK
Samantha Scallan, Wessex School of General Practice, Wessex Deanery, UK
Rachel Elliott, Wessex School of General Practice, Wessex Deanery, UK

Presenter:
Shu Li Tan, Wessex School of General Practice, Wessex, UK

Background: There is an emergence of 'upskilled' workforce in primary care in UK due to current demands. This workforce may consist of nurses, paramedics, pharmacists and physiotherapists who have transferred their skills to undertake work that general practitioners (GPs) have historically done such as telephone triage, clinical consultations and home visits. We have identified a need to support our colleagues in their unique evolving roles.
Method: We adapted the 'learning set' model, which is used locally for GP trainees to facilitate the educational process. The sessions were facilitated by a GP and structured based on the group's learning needs, initially identified from a survey, followed by feedback and discussions. The sessions ran every 6 weeks with its frequency defined by feedback from survey and consensus from the group due to availability.
Results: Triage and same day consultations were the main themes of the sessions, aligning with the roles of the multi-professional participants. Examples of facilitated sessions include 'Making Sense of Triage', 'Putting Illness into Context' and 'MSK Examination Skills and Red Flags'. Feedback has been positive. All participants found the session to be useful with encouraging comments made about sharing ideas and experiences as well as the opportunity to discuss them.
Discussion: The multi-professional 'learning set' has the benefits of small group learning and provides a flexible way of continuously addressing specific educational needs to this emerging cohort. It contrasts other training courses which tend to be topic-based. It also enables this workforce who might be working in isolation to have peer support and share educational experience as well as clinical skills. Regular attendance of the formed group is required for participants to benefit maximally from a small group learning set. We continue to evaluate the sessions in addition to considering collaborating to developing a formal curriculum for this evolving professional group.
Conclusion: The 'learning set' model can be a platform to facilitate multi-professional education. The sessions can help participants develop their competence and confidence working in the primary care setting in a supportive environment, addressing their wider learning needs.

8HH7 (1312)
EUROPE Sim (EUropean Readiness for Pediatric Excellence using SIMulation) in Latvia

Authors
Madara Blumberga
Baiba Ziemele
Reinis Balmaks
Travis Whitfill
Marc Auerbach
Isabel T Gross

Presenter:
Madara Blumberga, Clinical University Hospital, Riga, Red Cross Medical College of Riga Stradins University, Riga, Latvia

Background: Pediatric preparedness in Latvian emergency departments (EDs) is currently unknown. In most hospitals in Latvia, pediatric emergencies are attended by general pediatrician, while more severe cases referred to adult intensivists, surgeons, or anesthesiologists.
The purpose of this study is to 1) measure pediatric emergency preparedness in Latvia using in-situ simulations and surveys of emergency departments, and 2) improving preparedness through gap analysis and action plans.
Method: This prospective multi-center cohort study will involve all 16 Latvian EDs participating in the EUROPE Sim program. This program involves 1) designation of a pediatric champion in each ED 2) assessment of performance by inter-professional teams caring for four standardized simulated pediatric patients using case specific performance checklists and a teamwork/communication assessment. Each site champion works with the study team to complete a validated survey to assess pediatric preparedness across six domains (QI, policies, safety, staffing, equipment, coordination). Two weeks after the session the pediatric champion is provided report out summarizing the hospitals performance on the assessment.
Results: To date, we have conducted the study at 6/16 sites, one pediatric emergency department (PED) with 70,000 pediatric visits/year) and one general emergency department (GED) with 2,029 pediatric visits/year (Figure 1). PED (79.3%) GED (33.7%). The lowest domain was equipment (63%) in the PED and policies/procedures (8.1%) and pediatric staffing (2.5%) in the GED (Figure 2). Performance during simulation cases in GED and PED are shown in Figure 3. The CTS teamwork and communication was 76% at the PED and 40% at the GED.
Discussion: Pediatric preparedness in the PED was higher than in the GED measured by simulations and surveys. Further PED and GED visits in other areas of the country will help further characterize this finding.
Conclusion: Pediatric preparedness in Latvia seems to differ when comparing a PED with a GED. Simulation could be a valuable method to assess pediatric preparedness.

8HH8 (3551)
The relationship between age and knowledge of core medical competencies and multi-day CPD activities

Authors
Betsy White Williams
Philip Flanders
Dillon Welindt
Michael V. Williams

Presenter:
Betsy Williams, Professional Renewal Center, Lawrence, USA

Background: Medicine is a field of ever accelerating knowledge. As such, maintaining currency becomes increasingly problematic as professional and personal responsibilities expand across the lifespan. The correlation among age, medical knowledge, and performance is of central concern to continuing professional development (CPD) efforts.
Method: Data from a series of CPD activities specifically focused on issues in the core competencies related to interpersonal and communication skills, professionalism, and systems-based practice were aggregated to explore the relationship among knowledge of the core competencies and age of the learner. The activities were conducted over several sessions and provided to physicians identified as underperforming in those core competency areas.
Results: The dataset comprised the records of 120 CPD participants. To adjust for small differences across activities, the data were aggregated into three Activity periods: Initial Activity (prior to instruction); Middle Activity (second or third instructional session); and, Late Activity (fourth, fifth, or sixth instructional session).
The data employed included a measure of knowledge of the meaning and effect of the core competencies, the Activity (when the measure was taken), and the age of the participant (ranging from 28 to 75 years).
Age of the participant as well as the Activity were significantly related to Core Competency Knowledge. The interaction between the explanatory variables was not significant.
Discussion: The Activities appear successful in increasing knowledge and skills relevant to the three core competencies and their relationship to practice. All age groups appeared to demonstrate improvement across Activities, with each Activity period's performance improving over prior performance.
Age appears to be related to knowledge about the core competency areas in a way consistent with the literature. This framework was adopted after the older cohorts had matriculated. As anticipated they performed less well on the knowledge measure. However, they benefited from the educational activity equally to the younger cohorts. This may be because the nature of the training (small group learning; intensely interactive).
Conclusion: Age does not appear to be an impediment to learning in appropriately structured learning activities. CPD interventions can benefit all ages of participant.

8HH9 (824)
Factors influencing medical specialists' situational motivation for practice

Authors
Stéphanie M.E. van der Burgt
Rashmi A. Kusurkar
Klaas Nauta
Gerda Croiset
Saskia M. Peerdeman

Presenter:
Stéphanie van der Burgt, VUmc School of Medical Sciences, Amsterdam, Netherlands

Background: Keeping up to date with rapid developments i.e., continuing professional development is required for medical specialists. When specialists cannot cope with this demand it leads to more adverse events and less patient safety. Appreciative inquiry into the basic psychological needs (autonomy, competence, relatedness) and factors important for their motivation for daily work (situational motivation), for medical practice and lifelong learning (contextual motivation) is necessary. The aim of this study was exploring what factors influence medical specialists' motivation for practice and the interplay between situational and contextual motivation.
Method: Twenty five medical specialists from several disciplines and three hospitals in Netherlands were recruited through convenience, snowball and purposive sampling until sufficiency was reached. Specialists were asked to fill out a motivation questionnaire, after which they were shadowed for two days each ending with semi-structured interviews. Transcribed data were open coded in a constant comparative manner independently by two researchers, using Self-determination theory as the framework. Through selective coding and iterative discussion consensus was reached.
Results: Specialists scored high on autonomous motivation (5.6 on a Likert scale of 7). From the six themes found to be stimulating or thwarting motivation, the combination of patientcare and teaching was the most important and stimulating one. This combination makes all three basic psychological needs come together. Several factors thwart motivation through autonomy and competence, namely: technical issues (informational or operational tools), non-cooperative colleagues, and not being in control of their own schedule (because of administrative tasks for example). The interviews show that fulfilment of relatedness ensures that motivation on the contextual level can remain high.
Conclusion: Autonomy, competence and relatedness are important for specialists' situational motivation. Fragmentation of medical practice and efficiency-mindedness of the healthcare system makes fulfilment of these needs difficult. When factors negatively influencing situational motivation continue for a long time, they can become demotivating and need thwarting for contextual motivation and hence decline the quality and safety of the delivered patientcare.
Take-home message: Fulfilment of autonomy and competence is of high importance to keep medical specialists autonomously motivated in their daily practice.

8HH10 (3415)
Science in the clinic: Positioning MD-PhDs in the everyday clinical settings

Authors
Mette K. Christensen, Centre for Health Sciences Education, Aarhus University, Aarhus, Denmark
Pernille Andreassen, Centre for Health Sciences Education, Aarhus University, Aarhus, Denmark

Presenter:
Mette K. Christensen, Centre for Health Sciences Education, Aarhus University, Aarhus, Denmark

Background: The PhD education is a form of continuing professional development (CPD). The MD-PhD is a dual degree that includes a degree in medicine (MD) and a PhD-degree. Medical doctors with a MD-PhD-degree are prepared for careers as physician-scientists. MD-PhDs have been hailed as significant to the advancement of medicine and health care. Some even argue that decrease in the number of MD-PhDs poses a threat to medical science and clinical practice. Yet when it comes to which positions MD-PhDs should hold in the clinic and the academic world, there seems to be no real consensus. To the best of our knowledge no empirical studies have been made concerning the ways in which a PhD-degree contribute to MD-PhDs' professional practice in the clinic. Hence, this study explored how MD-PhDs are positioned in the clinic and the ways in which CPD in the form of a PhD-degree contribute to medical doctors' clinical practice.
Method: The study was explorative and qualitative, based on 27 individual interviews with MD-PhDs, their physician colleagues without a PhD-degree and their leaders, supplemented with four group interviews with 36 members of appointment committees. Positioning theory was applied as a social constructivist framework for data analysis.
Results: We found two opposing positions cutting across the groups of informants. One side criticizing the MD-PhDs for not doing enough research and for using the PhD-degree to climb the career ladder, while the other side emphasized the ways in which MD-PhDs increase the clinical focus on evidence based medicine and integrate it with clinical decision making, thereby enhancing patient care.
Discussion: The central discussion is whether MD-PhDs must either pursue research (and rarely see patients in the clinic) or practice medicine (and have nominal research activity), or whether it is possible to have a career path that can unify the two positions.
Conclusion: A debate is needed to establish more clearly how we wish to position MD-PhDs in the clinic, which in turn will give us a better idea of how many to educate and how to make better use of their competencies.

8HH11 (348)
Using online simulation to improve physicians' competencies in HPV-related problems

Authors
Patricia Wade
Sam J. Daniel

Presenter:
Patricia Wade, Fédération des médecins spécialistes du Québec, Montreal, Canada

Background: The majority of sexually active Canadians will have a sexually transmitted HPV infection at some point. However, only 12% of Canadians under 30 were vaccinated in 2012. This rate is in part due to clinicians' lack of knowledge about vaccination guidelines and to their difficulty in communicating their recommendations to patients.
Method: As an accredited CPD provider, the FMSQ developed an e-CPD module designed to assess and improve physicians' competencies with HPV-related problems. An online simulation module, with interactive patients approach, was designed to address CanMeds roles—Medical Expertise and Communication.
The module uses an immersive approach where the learner interacts with a patient in the clinical setting as part of a regular visit. It includes assessment strategies where learners have to make clinical decisions and get personalized feedback. The CPD REACTION questionnaire, based on the theory of planned behaviors, is used to evaluate the impact.
Results: Based on the responses from 155 participants, Self-reported Efficacy beliefs increased by 20%; and 85% of participants planned to change their screening practice to meet the new guidelines and improve their vaccination recommendations. The most prevalent indicators of change were the influence of the social (mean of 5.82) and moral (mean of 6.44) norms related to the expected behaviors.
Discussion: Online patient simulation is an innovative approach that appears to have the potential to improve knowledge and skills of physicians. Long-term follow-up questionnaires should validate if the participants changed their practice. Providers need to consider this approach when developing competency-based CPD activities.
Conclusion: Although online CPD may not be the panacea it was originally thought to be, there are financial and educational advantages in exploring this approach in competency-based CPD.

8HH12 NOT PRESENTED

8HH13 (1704)
Developing an online case study repository for continuing medical education

Authors
Hwee Sing Khoo, National Healthcare Group, Singapore
Winnie Teo, National Healthcare Group, Singapore

Presenter:
Hwee Sing Khoo, National Healthcare Group, Singapore

Background: We explore the development of an institution-wide, online case study repository for the documentation of valuable learning experiences of healthcare educators for continuing medical education. Harnessing technology as a means of managing knowledge allows one to learn vicariously, and presents an easily accessible archive of knowledge for retrieval, future reference, and education of healthcare professionals.
Method: An online survey was disseminated to clinician educators and non-clinician trainers in National Healthcare Group, Singapore to gauge their familiarity with case studies in teaching, how likely they were to use them, and their preferred case length and topics. An existing institution-wide e-learning platform will host the repository to ensure accessibility of case materials. Potential contributors will also be able to propose suitable materials through an online form.
Results: Majority of respondents (75.9% (n=141) of clinician educators; 56.7% (n=30) of non-clinician educators) indicated that they wanted to learn how to use case studies for teaching. Half (54.6% of clinicians, 50% of non-clinicians) responded that they were very likely to use case studies in their teaching next year, and indicated communication as the most useful topic (71.6% for clinicians and 60% for non-clinicians).
A case suggestion form was created to allow contributions from respondents, who could also indicate if they wanted to be trained as casewriters. The existing portal tracks log-ins and downloads, providing information about "in-demand" topics.
Educators indicated that the case repository is a learning and teaching resource that is beneficial to them. It functions as a self-sustaining partnership between different educator groups in the institution, providing a platform for educators to develop materials that are contextualized to their specialties and institutional settings, without much additional resourcing.
Conclusion: A case study repository harnesses technology effectively and can represent a powerful tool for teaching complex but healthcare transformation issues, such as leadership, professional development, managing change, and communication, allowing individuals to learn vicariously in an organization

8HH14 (169)
Project T – boundary-spanning, innovative problem solving capabilities in medical professionals

Authors
Winnie Teo, National Healthcare Group, Singapore
Yee Lin Tang, Tan Tock Seng Hospital, Singapore
Hwee Sing Khoo, National Healthcare Group, Singapore
Yvonne Ng, National Healthcare Group, Singapore
Nicholas Chew, National Healthcare Group, Singapore
Michelle Jong, Tan Tock Seng Hospital, Singapore

Presenter:
Winnie Teo, National Healthcare Group, Singapore

Background: In a complex and dynamic healthcare environment, medical professionals are required not only to deliver high-quality clinical care but also to solve complex organizational problems which may fall outside the clinical arena. This requires the development of T-shaped medical professionals with deep clinical knowledge (the vertical bar of a "T") as well as broad, boundary-crossing competencies to enable them to innovate solutions to complex problems with multiple stakeholders (the horizontal bar of the "T"). The current study aims to identify these capabilities, and to understand their development.
Method: This was a qualitative study carried out in two phases: the first phase comprised an online survey sent to senior doctors in major acute general hospital in Singapore, asking them to nominate peers with a consistent record of solving complex, novel problems outside of clinical practice. The second phase comprised in-depth, semi-structured interviews with eighteen individuals who had received multiple nominations from the peer review process. These interviews explored their conceptions of the capabilities needed to solve complex organizational problems.
Results: In addition to cognitive capabilities (strategic thinking, systems thinking, knowledge of the organization), "soft skills" such as interpersonal and self-management skills were deemed critical to navigate organizational systems, conceptualize a working plan, corral and motivate team members. Attitudes such as empathy, being unafraid to challenge norms, and perseverance were also mentioned. Participants reflected that their development was shaped by salient experiences during their formative years. On the other hand, current experiences in healthcare, role models and mentors provided them with motivations to address system-level, organizational problems. Participants also reflected that having a supportive team or organizational culture was also critical.
Conclusion:: These capabilities and attitudes mentioned will be useful when designing continuing professional development programmes to equip physicians to take on problem-solving in non-clinical areas. They can also be incorporated into interviews for healthcare leadership roles. The importance of supportive environmental influences is also acknowledged.
Take-home message: This study identifies both individual and environmental factors needed to develop T-shaped

medical professionals needed in a complex and dynamic healthcare of the future.

8HH15 (3251)
Transforming Postgraduate Medical and Dental Education: The Creation of Overarching Governance Arrangements to Improve and Monitor the Delivery of CPD in Wales

Authors
Ian Collings
Janette Davidge
Peter Donnelly

Presenter:
Ian Collings, Wales Deanery, Cardiff, UK

Background: The Wales Deanery delivers postgraduate medical and dental education in Wales, providing approximately 3000 training grade doctors, 4500 dental professionals and 2500 general practitioners access to a range of CPD opportunities to enable them to provide effective and safe patient care and achieve career aspirations. The aim of this review was to develop a set of high level principles and governance arrangements to underpin these principles and thus improve the quality management of all CPD activity.
Method: A project was initiated and divided into four phases: (1) Scoping, (2) Collation, (3) Development and Implementation of Principles, and, (4) Creation of Governance Arrangements. Colleagues and stakeholders were asked to complete online surveys which collected data including the number and type of courses delivered and the demographics of attendees. Furthermore, discussion groups with key section leads supplemented the data collection and enabled us to gain a deeper understanding of what was delivered. Focus groups were used to consult with Deanery stakeholders.
Results: The creation of new governance arrangements to oversee CPD activities across the Wales Deanery and a set of principles to underpin future activity.
The creation of the new governance arrangements included an overarching Governance Committee and a CPD support unit. This enables us to standardise our approach to all aspects of CPD activity leading to more effective development and delivery.
Discussion: With the development of new governance arrangements we have achieved standardisation of all processes governing CPD activity. In addition there will be opportunities to collect, analyse and disseminate information around the effectiveness of CPD undertaken by Healthcare Professionals and how it enhances clinical practice. Ultimately the opportunity to drive change will enable us to establish the "quadruple aim" in the 2018 Parliamentary Review of Health and Social Care in Wales by healthcare professional education and training.
Conclusion: In order for CPD activity to be effective, robust systems must be in place to ensure it is high quality, meaningful and relevant with outcomes that are measurable and which show improvement in patient care as well as being value for money.

8HH16 (774)
The role of Journal Clubs in Continuing Professional Development

Authors
Olena Hurzhii, ophthalmological clinic Visiobood, Kyiv, Ukraine
Helena Prior Filipe, Hospital das Forças Armadas PL/EMGFA Hospital SAMS, Lisboa Colegio De Oftalmologia da Ordem dos Médicos, Portugal Internacional Council of Ophthalmology, Lisbon, Portugal

Presenter:
Inês Leal, Kyiv, Ukraine

Background: While bridging research to clinical practice, journal clubs are a learning method that stimulates critical thinking and encourages continuing professional development informed by evidence-based medicine.
We present the experience of a founding journal club conducted in Ukraine.
Summary of work: Ten Ukrainian practicing ophthalmologists, mean age 35 (SD 9.71), (3 male) held 10 journal club meetings (Jan - Nov 2017). The chairperson proposed and accepted clinical relevant topics to discuss for overall aim agreement, circulated the topic in advance by email and guided the discussions.
Meetings were structured to a) explain the clinical question that led to the literature research; b) consider the authors and journal; c) appraise if the constructed research question observed the PICO components (Population, Intervention, Control, Outcome), d) appraise standing evidence, the study design, methodology, results and the clinical practice impact. A content expert was invited for each meeting.
A satisfaction survey, (graded 1 to 5, 5 standing for full satisfaction) and a multiple choice questions pre and post-test were undertaken per session.
Summary of result: The satisfaction survey Grade 5 was chosen in 80% of all meetings.
The T Test of mean classifications comparing pre and post-tests with an average classification of 51 % (SD 19.5) and 75 % (SD 15.3) respectively showed significant statistical learning improvement (p<0.05) for all sessions. 92,4% of participants showed improvement in post-test results.
Discussion and Conclusions: This first year's experience of a Ukrainian group of ophthalmologists journal club was welcome as an engaging learning method and a) facilitated critical thinking, b) allowed to practice the formulation of a clinical question, c) improved research literacy, d) didn't require special setting facilities and e) included Internet communication tools.
The program evaluation showed learning advancement and encourages to expand the onsite group to others interested in remote Ukrainian regions, include the digital visiting professor as content expert and measure the impact of the program on clinical performance.
Take-home Messages: Journal clubs
-Can be an effective learning method
-Facilitate lifelong learning informed by evidence-based medicine
-Suit the scope of continuing professional development

Presenter:
Márcia Rosa da Costa, UNA-SUS/UFCSPA, Porto Alegre, Brazil

Background: Learning development in distance learning (EaD in Portuguese) requires unique student services and pedagogical actions. The Guideline for distance learning studies (GDLS) is a teaching material devised for guiding and facilitating studies in a virtual learning environment (Moodle). It has been validated by graduate medical students of a postgraduate course in Family Health. Its creation is the result of previous exploratory studies, which detected that distance learning requires self-regulatory and digital competencies so that students can perform well.
Method: This work presents the creation, validation and analysis processes of GDLS as a new pedagogical resource, created with the active participation of the students. The GDLS contents have been defined based on the analysis of the learning difficulties detected in previous exploratory studies. The Guideline's validation by the students occurred during an on-site activity. The analysis was put together from the answers given by 105 students when filling out an assessment for with 6 questions. Each question address a different category with regard to GDLS. The analysis carried out was based in the following categories: usefulness, appropriateness, clarity and objectiveness of the material.
Results: The analysis of each question in the form generated the following results: 87% of the students deemed the material appropriate; 79% of them found the information in the material useful; 58% of them said they received new information; 84% of them said they understood all the information; 81% of them found GDLS useful and 88% of the students said that receiving GDLS at the beginning of the program was an interesting idea.
Discussion: The analysis of all the data indicated that GDLS had a high level of acceptance among students, who evaluated all categories in a positive way. The results demonstrated the importance and relevance, as acknowledged by the students, of creating resources aiming at generating positive attitudes and motivation within the learning process, as well as encouraging students to do well and engage in self-regulatory processes.
Conclusion: The creation of guidelines for distance learning studies may provide support to self-regulatory processes and quality to teaching-learning relationships.

Optimising online tutors' support and development within a distance learning programme

Authors
*Kritchaya Ritruechai, Centre for Medical Education, School of Medicine, University of Dundee, Dundee, UK
Mandy A. D. Moffat, Centre for Medical Education, School of Medicine, University of Dundee, Dundee, UK*

Presenter:
Kritchaya Ritruechai, Centre for Medical Education, School of Medicine, University of Dundee, UK

Background: With the increase of online distance programmes, there has been an associated increase in the numbers of online tutors recruited to support the learning of students. The provision of support and development for online tutors can be challenging due to their heterogeneous nature(1). This study aimed to explore the ways to optimise online faculty support and development from the tutors' experiences from a large online programme in medical education.
Method: Qualitative methods were employed. All tutors were invited to participate (n=60). Eighteen completed the online questionnaire; four took part in a semi-structured interview, and one elite interview was conducted with a core faculty member. Thematical analysis was used to explore the data.
Results: Participants suggested ways to optimise their support and development covering five areas of 1) processes of induction, ongoing and mentoring, 2) fostering a sense of community, 3) more responsive to tutors' development needs, 4) enhancing communication between tutors and staff and 5) clearer policies to support tutors. The availability and prompt responses of ongoing support from core staff were positively highlighted. Most participants reported a limited sense of community coupled with low expectations of such a community. A number of ideas on strengthening community membership were suggested; some of which would have policy/reimbursement considerations e.g.supporting student discussion forums, engagement in broader programme activities. Mentoring by more experienced online tutors was suggested to support newer recruits in order to promote engagement and professional development.
Discussion & Conclusion: This study enhances the understanding of how to optimise the online tutors' support and development from their experiences and informs future activities for faculty support and development.
Areas to be considered in optimising online tutors' support and development include 1) processes of induction, ongoing and mentoring 2) fostering a sense of community 3) actively support tutors' development needs 4) enable

two-way communication 5) policies should underpin support for tutors.

Exploring medical students' use of internet search engines in radiology

Authors
Thipsumon Tangsiwong, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand
Kosa Sudhom, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand
Tipsuda Tangsriwong, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Presenter:
Thipsumon Tangsiwong, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Background: Nowadays use of internet search engines has become an essential part of medical students' lives due to accessibility and availability. In academic purpose, they also use a general search engine to get more information rather than consult a medical or official website. However, the usability, effectiveness and decision making of the search engine use by Thai clinical students are still questionable.
Method: A cross-sectional questionnaire-based survey was conducted among 180 medical students from 4th to 6th academic years with a response rate of 100%. The main aim of the self-administered questionnaire was to explore how students use the search engine gathering radiologic information.
Results: Almost all medical students (98.3%) had personal electronic devices and 58.3% used smartphones as a major tool to obtain radiologic information. The students frequently sought at hospital workplace (48.3%) in many purposes, particularly for clinical problem-solving (81.7%) and academic activities (70%). In the usability, most of them (83.9%) had intermediate to good searching skills by self-appraisal, 86.1% learned it themselves and 84.4% took searching time less than half an hour. They performed a search by applying a specific keyword (65.6%), many keywords (14.4%), and keywords with citing websites (15%). With regard to choosing search results, they considered on headings (40.6%), short descriptions (40%), first-page results (37.8%), well-known URLs (30.6%) and alternative images/videos (11.1%). The effective use of search engines by nearly all of the students (98.9%) was quite high; however, most of them (80%) still need to take an extracurricular course for improving their expertise. Problems of the usage included low speed of internet (87.2%), language barriers (58.9%), accessibility of medical publications (46.1%) and big data (16.1%).
Discussion: Basically, majority of all medical students have already been good searching skills to establish radiologic information in different manners; however, they constantly need to learn more. The language barriers are

intrinsically problematic in Thai medical students although otherwise problems are extrinsic.
Conclusion: Education in search engine optimization and English proficiency is crucial to individual skill improvement and lifelong learning.

8I4 (2582)
Application of an integration framework for using a Massive Open Online Course in undergraduate classroom teaching

Authors
Peter GM de Jong, Leiden University Medical Center, Leiden, Netherlands
Renée A Hendriks, Leiden University Medical Center, Leiden, Netherlands
Marlies EJ Reinders, Leiden University Medical Center, Leiden, Netherlands

Presenter:
Peter de Jong, Leiden University Medical Center, Leiden, Netherlands

Background: Massive Open Online Courses (MOOCs) are a new way of delivering interactive learning activities and the number of these courses in Medicine is increasing rapidly. The materials in a MOOC such as lectures, movies, games, interviews, quizzes, and online discussion forums, are a valuable addition to regular face-to-face teaching. However not much is known on how to effectively blend the online resources with classroom teaching.
Method: In our previous study an integration framework for applying MOOCs in face-to-face teaching has been developed. The model presents 5 settings ranging from using single assets to the entire online course. In the current study a MOOC on the topic of Clinical Kidney Transplantation has been implemented in a regular undergraduate medical school curriculum using three different designs from the framework. In setting A, small parts of the online course have been offered as additional learning materials to face-to-face teaching. In setting B, a week of teaching activities has been replaced by participation in the MOOC. In setting C, the full online course was offered as a compulsory activity for entering a face-to-face training program. In all settings clear instructions to students were provided.
Results: In all three settings the students rated the use of the MOOC resources as interesting and motivating. Over 60% of the students explored more teaching materials than was requested for by the faculty. In setting C where completion of the full MOOC was compulsory the engagement of the students with the online materials and their participation in discussion forums turned out to be much larger than in the other settings.
Conclusion: Using the designs from the framework, the MOOC has been successfully integrated into regular classroom teaching. Students rated the combination of resources and strategies positive. The use of open materials offers opportunities for reforming and innovating regular face-to-face programs with free available high quality teaching content. The frameworks proved to be a very helpful tool for integrating online resources into regular classroom teaching.

Take-home message: An integration framework is very helpful for including MOOCs into face-to-face teaching.

Internet addiction among medical students in clinical year at Nakornping Medical Education Center

Authors
Hataitip Tangngam
Thamrong Hanwongsa

Presenter:
Hataitip Tangngam, Nakornping Medical Education Center, Chingmai, Thailand

Background: Internet has become the part of life of medical students. Not only academic purpose and communication, internet is also a very effective tool to relax stress among medical students. However, excessive or inappropriate internet use can lead to internet addiction that caused psychological disturbance and social problems.
Method: Cross sectional online survey was conducted in medical students in clinical year 2017. The internet addiction test developed by Dr. Kimberly Young was used to determine the level of internet addiction.
Results: 53 of 60 medical students (88.3%) participated in the survey. All of them used internet everyday for searching medical information, social communication and entertainment and 43.4% spend time on the internet between 3-5 hours per day. 32 students (60.4%) were classified as internet addiction (mild-39.6%, moderate-20.8%). There were no association between level of internet addiction and grade point average (GPA).
Conclusions: The prevalence of internet addiction was high among medical students. We should increase awareness and prevent the problem of internet addiction to them.
Take-home message: Medical students are among high risk of internet addiction because they use internet for both academic and non-academic purposes.

The use of Moodle in medical education: Literature review

Authors
Yoshikazu Asada, Jichi Medical University, Tochigi, Japan
Machiko Saeki Yagi, Jichi Medical University, Tochigi, Japan

Presenter:
Yoshikazu Asada, Jichi Medical University, Tochigi, Japan

Background: Moodle is one of the most famous learning platforms in the world. Since it has many features such as quizzes, forums, glossaries, and assignments, Moodle can be considered as a Swiss Army knife for e-Learning. However, this abundance of features can sometimes become troublesome for new users. Case studies and research on Moodle can be helpful, but there are no review articles about the use of Moodle in medical education.
Method: This literature review aims to identify the usage of Moodle in medical education. The review was conducted using PubMed. The search term "moodle" was used. Papers were limited to those published in English between 2002 and 2017.
Results: A total of 91 papers were identified, out of which 20 were excluded because the papers were unavailable and 10 were excluded because they were not about the educational usage of Moodle. Of the remaining 61 papers, 16 (26.2%) used a single feature. Further, 27 papers (45.9%) mentioned the usage of "resources" modules such as Page, URL, Book, and File. About the "activity" modules, 25 papers (44.2%) used Forum, 18 (37.7%) used Quiz, and 7 (21.3%) used Assignment. A few papers used other activities such as Wiki, Glossary, Chat, Lesson, and Blog. Most of the Forums were used for posting and discussing tasks. Quizzes were used with feedback features so that learners were able to find why they were wrong and what they should do by themselves.
Discussion: Although some studies used Moodle effectively to provide an active, self-directed learning environment, others used only a few, simple features. This might be because of a lack of knowledge of Moodle, since most medical educators are specialists of medicine, not of Moodle or other educational technologies. Teachers and instructors should collaborate with resource developers who are familiar with educational technologies.
Conclusion: Although some studies used limited features of Moodle, it can create a more effective learning environment. A collaboration between medical and educational technology specialists may help improve the use of Moodle in medical education.

8I17 (1887)
A unique e-learning education platform for health practitioners

Authors
Bob Fonseca, St. George Hospital, Sydney, Australia
Louise Lindop, ITFC, Sydney, Australia
Christopher Elliot, St. George Hospital, Sydney, Australia

Presenter:
Bob Fonseca, St. George Hospital, Sydney, Australia

Background: The promise of exciting, interactive e-learning is yet to be realised by most health services. Our department currently uses physician time to deliver ad-hoc Induction programmes for junior staff up to 20 times per year, with limited ability to audit content, education outcomes and teaching efficacy.
Method: We developed an interactive e-learning platform allowing insertion of text, images and videos to immerse learners in relevant, interactive clinical scenarios. To test its efficacy, we piloted this platform by creating two different educational programs, including an Induction program for junior doctors.
Results: The platform enables authors to present clinical scenarios in a structured 'Situation, Question, Interaction and Feedback (SQiF)' format. Each clinical scenario unfolds in digestible 'chunks', with frequent opportunities for learner interaction and reflection. The modular design allows busy clinical staff to access the material both on- and off-site at convenient times. The format conforms to adult learning principles and manages cognitive load. The content is fully customisable and, includes built-in questionnaires for immediate feedback to learners. Each module ends with curated links to further information to be used at the learner's discretion.
Discussion: The piloted Induction programme was created by clinicians in 3 months working in association with an Instructional Designer. It uses commonly available tools such as personal smartphones and editing software.
Across 8 lesson modules (each with 5 parts) the 90 minute curriculum included:
- 40 Clinical micro-situations (video or image)
- 40 Questions and required learner interactions
- 40 Feedback segments (video or image)
 Qualitative pre- and post- evaluation of the program including comparison to the previous Induction program is underway.
Conclusion: The SQiF system is a unique platform for video-based scenarios which prioritises interactive clinical learning. It is a more efficient way of teaching roles and responsibilities to junior doctors, whilst engaging their higher order thinking. It more reliably demonstrates professional competencies than previous clinician-run didactic systems of induction and orientation.
Take-home message: This new innovative platform allows clinicians to utilise everyday tools to create highly engaging, interactive and auditable e-learning content customised for their audience.

Developing the Virtual Pathology Lab experience

Authors
Irma Elisa Eraña Rojas, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Mildred Vanessa López Cabrera, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Alvaro Barbosa Quintana, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
José Eduardo Pérez Saucedo, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Nancy de los Ángeles Segura Azuara, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Presenter:
Irma Elisa Eraña Rojas, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Background: Learning pathology is a challenge, students must develop the skills to identify microscopic abnormalities, explain the interaction of functional disorders, and its causes.
Method: This study assesses whether an online approach, that combines digital images, online slides and a learning management system, provides a practical and effective teaching method for medical students, both inside and outside the classroom. The development of the Virtual Pathology Lab experience was performed on 3 phases: design, implementation and analysis. Design phase included the search and selection of samples and material, digitalization of slides, configuration and preparation of files using DeepZoom app, and loading the material on the webserver. Implementation considered the design and operation of web page, functionality and maintenance of the slide viewer, and using the images on class. Analysis was performed to assess the results of the educational experience for continuous improvement, considering students' perception.
Results: Satisfaction of 83 students in the Pathology class was assessed with an online survey, using a Likert scale from 1 to 5 where 1 stands for total disagreement and 5 for total agreement.
Regarding the impact of virtual pathology lab experience in their academic performance, 97.6% of students believe this approach was useful to achieve learning objectives as it allows self-directed learning, easier feedback, and collaboration between peers.
Discussion: Feedback obtained in this project has been positive regarding the interest and appreciation of students towards technology. The responses indicate considerable advantages, including that all students have easy access to images and course information. It favors self-directed, as well as collaborative learning. However, there are still few limitations inherent to the format, such as less direct interaction with the teacher.
Conclusion: Teaching pathology is based on microscope observation, limited to perform group practices; however still images or slides do not provide the student with a broader panorama of morphological alterations on the examined tissue. The inclusion of technology in medical

education allows the ease of access and portability of information, favoring self-directed learning

Student-developed virtual patient application to foster students' learning and assess their clinical reasoning

Authors
Tomi Ylä-Soininmäki, University of Helsinki, Helsinki, Finland
Tuomas Lumikari, University of Helsinki, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Helsinki, Finland

Presenter:
Tomi Ylä-Soininmäki, University of Helsinki, Finland

Background: Virtual patient application was developed by two medical students to introduce an easy-to-use and cost-effective tool for self-directed learning during a pediatric course in the 5th study year. This study aimed at examining whether interactive virtual patient scenarios fostered students' learning in a clinical study module measured with an online examination.
Method: Voluntary fifth year medical students were asked to use the virtual patient application in preparation for the entrance examination of a pediatrics study module. 24 of 56 students participated in the study. We collected data on students' background, performance and user experiences in solving virtual scenarios and combined this information with their examination results. The study was reviewed by the ethics committee. We analyzed the correlation between the examination result means (M) and items indicating performance in solving the virtual scenarios.
Results: The participants' ages ranged between 23 and 32 and they had 2-7 months of clinical working-life experience. Choosing the correct diagnosis (M=17.9 out of 30 examination points, incorrect M=11.0/30) was the most distinctive predictor of a high score in examination (p=0.006). Prescribing the correct medicine (M=17.8/30, incorrect M=13.5/30) showed a tendency towards a high score but was not statistically significant (p=0.056). Being able to make 'very important' queries also showed a correlation (Pearson r=0.434, p=0.034). No similar correlation was detected with 'important' queries (r=0.227, p=0.287). 54% of the participants filled in the feedback questionnaire. They reported that the application helped them to study (M=4.6 in 5-point Likert-scale) and self-assess their skills (M=4.5).
Discussion: This pilot study shows that the students' performance in this type of simulation correlates with the performance in an examination. The study also strengthens the evidence of the value and validity of the versatile use of virtual patient scenarios in digital learning environments in medical schools. We suggest virtual patient scenarios to be integrated into the digital learning platforms and used in online assessment. When used in summative assessment, the virtual patient scenarios require validation.
Conclusion: Virtual patient scenarios provide a safe, cost-effective tool for both self-directed learning and online assessment in clinical medicine.

8II11 (3470)
Medical students' perceptions of virtual patients, using natural language processing, as a tool for developing history-taking skills

Authors
James Thomas, Keio University School of Medicine, Tokyo, Japan
Toshiaki Monkawa, Keio University School of Medicine, Tokyo, Japan
Michito Hirakata, Keio University School of Medicine, Tokyo, Japan
Rika Nakajima, Keio University School of Medicine, Tokyo, Japan

Presenter:
James Thomas, Keio University School of Medicine, Tokyo, Japan

Background: Many institutions use virtual patients to complement the teaching of clinical reasoning and patient management. Programmes that utilise natural language processing allow for the creation of virtual patients that can respond to a free choice of user inputs. Such tools have the potential to allow healthcare students, especially non-native English-speakers, to practise communication and language skills in a safe and standardised environment.
Method: We have created a series of virtual patients that allow students to develop their history-taking skills via text or speech input with online virtual patients. Photo-realistic avatars and text-to-speech software make the user interface more realistic and engaging.
Sixty third-year Japanese medical students were given access to the virtual patient simulation programme over a 2-week history-taking course. Feedback was obtained from each student via an anonymous written questionnaire asking for opinions on the system's utility, ease of use, limitations, and suggestions for improvement. The amount of time each student spent using the system was also documented.
Results: The average amount of time spent on the system by each student was 1.5 hours over the two-week course. The majority of students (87%) described the system as 'useful' or 'very useful' as an additional resource for developing skills in history taking, allowing them to practise oral communication, pronunciation, and listening in an interactive environment. Fifty eight percent of students described the programme as 'easy to use', with students citing difficulty learning to use the software as being an obstacle. Limitations given by the students included a small library of patients currently available and occasional difficulties with the programme failing to recognise certain accents.
Discussion: Natural language processing virtual patients were well received by our cohort of students and largely seen as a valuable and innovative new resource for helping them develop history-taking skills. Students cited difficulties using the software as the most common limitation with the system.
Conclusion: Virtual patients show great potential in complementing current teaching strategies in medical

education. Further research is needed to quantitatively assess their benefits and limitations in the classroom.

8II12 (1549)
The association between different learning styles and students' satisfaction with the use of virtual patients

Authors
Neja Turk, Faculty of Medicine, University of Maribor, Maribor, Slovenia
Monika Sobočan, Department of Pharmacology, Faculty of Medicine, University of Maribor, University Medical Center Maribor, Clinic for Gynecology and Perinatology, Centre for Medical Education, Faculty of Medicine, Univeristy of Maribor, Maribor, Slovenia
Marina Horvat, Faculty of Arts, Department of Psychology, University of Maribor, Maribor, Slovenia
Zalika Klemenc-Ketiš, Department of Family Medicine, Faculty of Medicine, University of Maribor, Department of Family Medicine, Faculty of Medicine, University of Ljubljana, Communit Health Centre Ljubljana, Maribor, Slovenia

Presenter:
Neja Turk, Faculty of Medicine, University of Maribor, Slovenia

Background: Virtual patients (VPs) are modern educational method for e-learning. Different VP aspects have already been examined, however, little is known on how students' different learning styles (LS) affect user satisfaction. In particular, qualitative studies show that some students show greater dissatisfaction with VPs as others. They categorize them as unrealistic, time-consuming or difficult to focus. The aim of our study was to understand possible differences in VPs satisfaction with respect to the different LS. Outcomes would then allow us to adapt teaching with VPs according to the needs and abilities of individual students.

Method: This preliminary study examined fifty-one undergraduate 3rd and 4th year medical students previously taught with VPs. Information acquired from the validated Virtual Patient Integration Rating Scale (VPIRS) questionnaire on VP satisfaction in the undergraduate curriculum was compared with responses to Kolb's Learning Style Inventory (LSI). Data analysis was done using the Spearman's rho correlations test and descriptive statistics.

Results: Forty-two of the students were female and nine students male. The students' average age was 22.3 years (SD 1.4). None of the analysed LS, which are i) assimilating, ii) converging, iii) diverging and iv) accommodating, were significantly correlated with the VPIRS domains. Especially in the VPIRS domain "inauthentic learning", where difference was expected between the converging, diverging LS and others, there was no correlation (rs=0.074, p>0.604); rs=-0.196, p>0.168; rs=0.178, p>0.211, and rs=-0.080, p>0.576; respectively).

Conclusion: Our ongoing study shows that there is no significant difference in satisfaction with the use of VPs between students with different LS. In comparison with Shinnick et al, evaluating LS impact on knowledge gain with a Human Patient Simulator, our data currently does not support the need to adapt different teaching approaches based on LS. However this study is still recruiting students and we expect a greater student group to improve the statical power and quality of evidence on LS with VPs further.

Take-home message: Students with different LS did not show any difference in satisfaction with the use of virtual patients.

8II13 (1171)
The influence of process versus outcome oriented feedback on students' behaviour while solving virtual patient scenarios

Authors
Andrzej A. Kononowicz, Jagiellonian University Medical College, Krakow, Poland
Inga Hege, University Hospital of LMU Munich, Germany
Michał Nowakowski, Jagiellonian University Medical College, Krakow, Poland

Presenter:
Andrzej Kononowicz, Jagiellonian University Medical College, Krakow, Poland

Background: Virtual patients (VP) in the form of interactive on-line scenarios are used to foster clinical reasoning. A plethora of software systems are available for this purpose, but at the same time there is a lack of clarity about the impact of individual VP features on student performance.

Method: In the academic year 2017/2018, a set of 12 VP scenarios were introduced in the fifth-year's Laboratory Training of Clinical Skills course at Jagiellonian University. The aim was to activate clinical reasoning skills in students prior to high-fidelity simulation scenarios. The VP assignment was mandatory and three new cases were presented each week for self-directed learning. The VPs were enhanced by a tool (Hege et al, JMIR Med Educ 2017;3(2):e21) to allow construction of structured concept maps while solving the case. In group O (outcome-oriented), expert concept maps were available only after students completed their case and map. In group P (process-oriented), a progressively unfolding series of expert map views was available all the time. In the last "examination" week all VPs had outcome feedback only.

Results: Seventy (n=70) students from group O and seventy-one (n=71) from group P completed all cases. The time spent accessing the VPs in the first week was similar in both groups (O/P:115±106min/111±56min;p=0.78), but the difference subsequently increased, reaching a statistically significant difference in the examination week (O/P:79±46min/106±75min;p=0.01). The number of concepts in student maps was also different between the groups: in the first week (O/P:69±25/77±19;p=0.03) and the examination week (O/P:68±29/82±27;p=0.004).

Discussion: The study is limited by a naturalistic design that does not exclude group contamination and confounding. Yet despite this, our results show differences in students' behaviour in the examination week. The study is still on-going with more data to be included until June 2018. We are working on grading and comparing the quality of maps between the groups.

Conclusion: The presence of process-oriented feedback in the learning phase resulted in more thorough construction of clinical reasoning concept maps in the examination week, when compared with groups only receiving expert map feedback at the end of the scenarios.

8II14 (2170)
Virtual reality Fully Immersive Interactive Technology. A new way to deliver a lecture?

Authors
Thomas Judd, Musgrove Park Hospital, Taunton, UK
Nicola Cook, Musgrove Park Hospital, Taunton, UK
Ian Hunter, Musgrove Park Hospital, Taunton, UK
Alexander Young, Virti, Bristol, UK

Presenter:
Thomas Judd, Musgrove Park Hospital, Taunton, UK

Background: With the birth of the smart phone there is now a rapid expansion in the use of this technology to improve and enhance medical education. A recent literature review by Valle et al. (2017) concluded "Smartphone use is clearly an effective and efficient method of enhancing patient care and medical education in the health care industry."
Recent technology advancements allow a smartphone to be converted into a virtual reality headset. We have developed a method of Virtual Reality Fully Immersive Interactive Technology Teaching (VR FIITT) where a student may be fully immersed in a virtual reality teaching session.
The aim of this project is to see if delivering teaching material in this format improves student engagement and learning compared to the standard lecture environment.
Method: 40 people attended a day of lectures and were asked to score their experience on the standard feedback sheets. Of the 40 attendees 17 were recruited who were asked to watch the same lecture online and then in a VR FIITT format. At each stage their opinion of the VR FIITT lectures was assessed. Students provided feedback across three domains, engagement with delivery, enjoyment of learning, and interactivity and learning opportunity, scoring each domain using a Likert scale.
Results: VR FIITT scored highest across all three domains when compared to a standard lecture or video lecture. Comparing VR FIITT to a standard lecture for engagement it scored 4.88 vs 4.2 (P=0.001). On enjoyment of learning VR FITT scored 4.82 vs 3.76 for the standard lecture (P<0.001), and for interactivity and learning opportunity VR FITT scored 4.53 vs 3.59 (P<0.001).
Conclusion: VR FIITT has been shown to be the preferred teaching method compared to a standard lecture or video lecture. Using this format can enhance student learning and engagement, as well as allowing it to be widely accessed to all students, due to no timetable constrains.
Take-home message: This research project highlights that in this fast-growing field, VR will have an ever more important role in being using alongside/replacing standard teaching methods.

8II15 (473)
Augmented Reality in Medical Education: A Systematic Review

Authors
Kevin S Tang
Derrick L Cheng
Paul B Greenberg

Presenter:
Kevin S Tang and Derrick L Cheng, Warren Alpert Medical School of Brown University, Providence, USA

Background: The field of augmented reality (AR) is rapidly growing with many new potential applications in medical education. We conducted a narrative literature review on the current state of AR scholarship in medical education.
Method: We conducted a PubMed literature review with the phrases "Augmented Reality Medical Education" (n=108), "Augmented Reality Surgery" (n=598), "Augmented Reality Medicine" (n=327), and "Augmented Reality Medical Training" (n=138). We conducted additional searches on Google Scholar (n=1600), Cochrane Library (n=63), and the Web of Science (n=688). Exclusion criteria included articles that were a) published prior to 1995, b) related to Virtual Reality (VR) in medicine, c) quantitative or qualitative reviews, and d) described AR outside medical education settings (e.g., surgical procedures). We categorized the studies by publication date (< 5 years ago; 5-10 years ago; > 10 years ago) and focus (anatomical visualization and imaging; knowledge acquisition; and surgical training). In addition, we assessed the quality of the studies using the Grades of Recommendation, Assessment, Development, and Evaluation (GRADE) guidelines; points (6=maximum) were assigned based on randomization, use of control groups, a sample size greater than 50, external validity, blinding, and length of follow-up. High-quality studies were defined as those scoring > 3 points.
Results: The original search yielded 38 papers. Ten studies met the inclusion criteria; 90% (9/10) were published in the last five years. Two papers focused on anatomical visualization and imaging, one on knowledge acquisition, and seven on surgical training. Common AR applications in anatomical visualization included the use of mobile devices to improve anatomical and medical imaging training. Applications of AR in knowledge acquisition included study aids and simulations designed to train students in clinical interactions. In surgical education, AR applications included modules for procedures in neurosurgery, obstetrics and diagnostic cardiology. Six papers were deemed high-quality per GRADE guidelines.
Conclusion: Augmented reality in medical education remains a young field with most original papers published in the last five years. The primary focus is in surgical training, though AR applications in anatomical visualization and knowledge acquisition are becoming increasingly prevalent. More research is needed to demonstrate the efficacy of AR in improving medical education.

Are medical students going to sea at all? The current state of clinical teaching at a university hospital

Authors

Kevin Gervin
Jennifer MacFie
Sarah McCusker
Coralie Turner

Presenter:
Kevin Gervin, University of Glasgow/ NHS Greater Glasgow & Clyde, Glasgow, UK

Background: Clinical teaching (CT) involving real patient encounters may occur within in-patient, ambulatory or community settings, and is recognised as vital to medical education. However, its usage is apparently diminishing, with various reasons being hypothesised. [1]
In this study, we seek to describe and evaluate medical students' current experiences of CT, at a tertiary, university hospital.
Method: 96 final phase medical students on their 10-week senior general internal medicine rotation were surveyed on their experiences of CT. Questionnaires included five-point Likert-type and free-response questions. Details included approximate number of encounters, setting, grade of tutor, organisation and quality indicators including enjoyment, relevance, improvement to practice. Free-response questions enquired about most/ least useful elements and suggestions for improvement.
Results: Number of sessions per student: mean= 20.759; mode= 20; range= 8-40. Volume is considered less than adequate. CT provided by all grades from first-year graduates to consultants, only 17 students received teaching from all grades.
Overall quality: mean= 4.167/5 mode= 4/5.
Bedside CT quality: mode= 4/5
Out-patient CT quality: mode= 4/5
Ward round CT quality: mode= 2/5
Enjoyability (mean= 3.967; mode=4/5)
Relevance (mean= 4/5; mode= 4/5)
Improvement to practice (mean= 4.067; mode= 4)
Themes expressed by free-text responses include value placed on real-patient exposure, and opportunities for feedback on performance. Negative comments relate to number of students present, poor ward round teaching and organisational issues. Students' suggested improvements include these issues and desire for more CT.
Conclusion: The volume of teaching in particular is concerning, with students reporting an average of only two CT sessions/week. These students are on their final general internal medicine placement. Students particularly value experience and feedback gained from CT. At our institution the quality of CT is good, without being stellar. However, students have a desire for more, better

organised CT. Ward rounds in particular appear to be a missed CT opportunity
Take-home message: The number of CT sessions taking place at our institution is concerning. Students value CT, and desire more of it. Consideration must be given to methods of improvement.

Quality Assurance Visit to Whittington Health Trust: A Model of Medical Student and Faculty Co-creation to Identify Current Reality and Desired Future

Authors

Eleanor Wilson, UCL Medical School, London, UK
Aayushi Gupta, UCL Medical School, London, UK
Grace Sutton, UCL Medical School, London, UK
Camilla Massardi, UCL Medical School, London, UK
Charlotte Perry, UCL Medical School, London, UK
Caroline Fertleman, Whittington Health Trust, London, UK

Presenter:
Caroline Fertleman, Whittington Health Trust, London, UK

Background: Whittington Health NHS Trust (the Trust) is one of three central sites providing clinical placements to UCL Medical School's students. The Trust provides a wide range of placements in the hospital and community. The Director of Undergraduate Medical Education requested a quality assurance visit to reflect on student feedback, identify the current reality of teaching and facilitate improvements to medical and surgical teaching.
Method: Current clinical students were integral to the preparation of the visit by working alongside faculty and directly liaising with the Trust's chief executive. Feedback from years 4 and 5 students for the academic years 2015-16 and 2016-2017 was reviewed, comprising of satisfaction scores and written comments related to individual modules. Data and up-to-date feedback were analysed in a series of meetings enabling immediate actions, such as upgrading the undergraduate common room's examination equipment. Specific strengths and weaknesses of each module were presented to the visiting personnel and an increase in benchmark satisfaction from 60% to 75% for 2017-18 was established.
Results: Overall, the students highly praised the Trust's friendly culture and the community placements. The feedback analysis revealed exceptional student satisfaction in paediatrics, respiratory medicine, anaesthetics and care of the older person. Lower satisfaction was mostly related to quantity rather than quality of teaching; limited numbers of inpatients in certain surgical specialties were reported. For some teaching sessions, lower satisfaction was related to lack of consultant capacity.
Discussion: The visit generated good opinions, improvement ideas and agreement from the visit team. Suggestions included introducing more case-based sessions and placements in integrated care centres to compensate for lack of patients. Tutor guides were proposed by the students to make educators more aware of the curriculum teaching, which led to the production of a template paediatric guide. Additional Clinical Training

Fellows as a cost-effective way of boosting clinical and educational capacity received considerable interest.

Conclusion: This quality assurance process, co-created by students and faculty, provides an effective and cohesive model of reflective practice. Constructive review of feedback with student involvement enables immediate actions and identification of realistic solutions.

Quality and Safety of clinical medical internships in low- and middle income countries

Authors
Tessa Noijons, IFMSA-NL, Utrecht, Netherlands,

Presenter:
Tessa Noijons, IFMSA-NL, Utrecht, Netherlands

Background: The interest of students in Global Health has been noticed at all Dutch universities; every university has adopted a form of 'Internationalization', "the growing trend to operate across national boundaries", within their areas of interests and offers Global Health educational activities. Over the past two and a half years, almost 500 medical students from Utrecht University have gone abroad for a clinical internship, with about 350 students going to a low or middle-income country (LMIC). Although a checklist provided by the International Office guides students throughout the practical and preparational procedures, there is minimal control over the students when they leave for their internship. Neither the quality of these internships nor the safety of the students are supervised in a predetermined framework. The need for a structured system for these internships came to light. This research aims to assess the views of various stakeholders on clinical internships in LMICs.

Results: The results showed that students from the UMC Utrecht mostly do their internships abroad in LMIC's and that there is a need for obligatory tropical/predeparture courses for students and a language proficiency for outgoing students. Furthermore, it showed that learning outcomes and objectives of internships abroad are held to different standards and should not be compared with internships at home. Internships at home have significantly higher learning outcomes in comparison to internships abroad, due to the learning environment. Preparation of students should exist several topics: health, ethics, cultural competence, language competence, emotional preparation, host characteristics, and pre determined specific goals (SMART). Next to this, supervision is one of the most important factors, the experts concluded that a supervisor should have experience in a western-healthcare system to successfully supervise Dutch students. To find institutions that match the required criteria, a proposed checklist is made.

This research aims to show multiple views on internships in LMICs to support the quality and safety of these internships. And shows the importance of a complete preparation of students. With input from these perspective, a change within the electives in LMICs should be made, to ensure the quality of these internships and the safety of the students.

The use of mock on-call bleep simulation sessions to provide experience and improve confidence in Year 3 Medical Students in the UK

Authors
Nur Ayne Zaharoff, Princess Alexandra Hospital, Harlow, UK
Fatima Yusuf, Princess Alexandra Hospital, Harlow, UK
Pratik Solanki, Princess Alexandra Hospital, Harlow, UK

Presenter:
Nur Ayne Zaharoff and Fatima Yusuf, Princess Alexandra Hospital, Harlow, UK

Background: In UK based medical schools, there are few teaching sessions that focus on preparing students for being on-call. This is frequently cited in the literature as being a source of anxiety for many newly qualified doctors. Thus, at Princess Alexandra Hospital, we designed mock on-call sessions for 3rd year medical students.

Method: In total, there were 5 sessions each containing between 3 and 5 medical students. Each session was specific to the module the students were studying and comprised of 5 cases located on different wards within the hospital. Each case contained mock patient briefs, relevant investigations and drug charts. Each student initially started at different cases and were given individual bleeps along with contact details for senior advice. Throughout the session, the facilitators would bleep the students with different tasks to complete and students were expected to prioritise the cases. After the simulation, all students attended a debriefing session.

Results: In total we received 19 feedback forms. The evaluation of the session was very positive. Students rated on a likert scale from 1 to 5, with 5 being strongly agree, with the following statements.
The results below are mean averages.
The cases were useful to my learning: 4.58
The session was of high quality: 4.53
I would recommend this session to other students: 4.74
Exploring confidence levels, there was an increase in confidence for being on-call by a mean average of 40% (95% CI: 30.8%-52.8%), an increase in priotising jobs by 28.4% (95% CI: 16.8%-40.2%) and an increase in prescribing medications by 32.8% (95% CI: 22.2%-43%). All these results had a p value <0.0001 on paired t-test analysis.

Conclusion: Students enjoyed the hands-on experience the mock on-call sessions provided and the ability to make decisions with senior support. Many have requested similar sessions to be organised more frequently and at later years. However, more studies are required to explore the objective and clinical impact of these types of sessions. Practical sessions that give medical students hands on experience are important to help prepare them for future on-call shifts.

Exploring Perceptions of Clinical Beginners in Teaching Clinic by Activity Systems Analysis

Authors
Pin-Yang Shih
Yeu-Jhy Chang
Kuo-Chen Liao
Chang-Hsuan Peng
Florence, Geok Hui, Yap
Chiu-Ying Chen

Presenter:
Pin-Yang Shih, Chang Gung University and Memorial Hospital, Linkou, China Medical University, Taoyuan, Taichun, Taiwan

Background: Outpatient services comprise important clinical settings in which to manage patient problems. Teaching clinics have limited time for teaching and learning due to the high volume of patients. How to deliver clinical education effectively is a question of importance. We analyzed 5th-year medical students' perceptions of these teaching clinics.
Method: Following their participating in various teaching clinics in different medical subspecialties, 12 5th-year medical students (mean age = 23.7 years; male:female =7:5) were recruited for one-to-one semi-structured interviews in 2017. Each interview lasted 60-90 minutes. We used Activity Systems Analysis (ASA) as a framework for analyses.
Results: There were instructional gaps between students' expectation and teaching clinics. Not all tutors provided the opportunities for real patients' practice in the aspect of the "division of labor". Some tutors didn't follow the "rules" to provide effective feedback. Most students could not understand the roles of the assessment "tool" (mini-CEX).
Discussion: After analyses by ASA, possible factors that hinder students' learning expectations in teaching clinics were identified. Although the clinical curriculum of teaching clinics is well established and recommended, the implementation, discrepancies in instructional methods, assessments and feedback differences in tutors may result in inconsistencies. Tutors' and students' understanding of the objectives, roles, and applied assessment tools before their teaching activities, and following them during, might produce better outcomes. Faculty development and the promotion of active learning for students could enhance effective teaching and learning in the clinical setting.
Conclusion: The expected and ideal outcomes were not completely achieved in the time-constraints of teaching clinics for novice medical students. Regular monitoring and improving clinical curriculum via learners' views and revisiting the programs of faculty development will enable learning results to be more effective.

8JJ6 (2319)
On-site Clicks to make situational learning easy and accessible

Authors
Wan-Chu Yu
Yu-Sheng Hsu
Yu-Chih Lin
Hsin-Chu Shih
Wen-Chin Hsu
Chen-Chun Kuou

Presenter:
Wan-Chu Yu, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Clinical learning is closely related to clinical context. In digital era, learning materials could become easily available for learners upon situational context while mobile devices has become so popular. The transformation and categorization of learning materials into digitalized information accessible upon clinical context would make clinical learning much easier.
Method: We first digitized and categorize our educational materials into documents or multimedia files and tag them with QR code. Students are allowed to access these materials at different sites in pharmacy department. Also, Pokémon adventure-type learning process was created to improve the flexibility and interest of self-learning.
Results: Over 15 educational films were accomplished including hand-washing, personal protective equipment, etc. Some important documents such as "LASA" list, patient education information, policy and procedures are also tag with QR code in different site to allow access by students. Students used these for self-directed learning and patient education.
Discussion: Our approach for providing educational information incorporated modern technology of mobile devices and the linkage of education to context. By the visualization of the materials, not only did the repeatable teaching contents can be replaced, but also the learning process may make sense and fun in every clinical encounter.
Conclusion: Digitalization of education information must be closing linked with clinical settings. Adding some sophisticated ideas like "on-site clicks" into situational learning environment combined the habitual use of smartphone by learner can increase the motivation and making learning everywhere and anytime.

Taking games seriously - training visual diagnostic skills in a virtual radiology department

Authors
Anouk van der Gijp, UMCU, Utrecht, Netherlands
Sander Vanheste, Utrecht University, Utrecht, Netherlands
Koen Vincken, UMCU, Utrecht, Netherlands
Josephine Huige, UMCU, Utrecht, Netherlands
Cécile Ravesloot, Radboud MC, Nijmegen, Netherlands
Marieke van der Schaaf, Utrecht University, Utrecht, Netherlands

Presenter:
Anouk van der Gijp, UMCU, Utrecht, Netherlands

Background: Acquiring visual diagnostic skills is important in many medical specialties. It requires the perception of abnormalities or normal findings, the analysis of their features, and synthesis of findings into a differential diagnosis. To acquire visual diagnostic skills, extensive training is needed. Training should be focused on specific tasks, with feedback and opportunities for repetition and improvement. Serious games can be valuable tools to facilitate these training principles by means of gaming elements that stimulate both the student's motivation and participation in learning activities. In this study, we develop a serious game for medical students to enhance their motivation for learning radiological skills. Motivated learners are expected to invest more time and effort in practicing and use deeper learning strategies. Our research question is: To what extent do game elements add to medical students` motivation and learning activities in visual diagnostic reasoning?
Method: The users of the game are undergraduate medical students. Learning objectives are: 1) recognizing and describing relevant anatomical structures on radiological images, and 2) interpreting radiological images with acute diseases. Learning objective 2 is subdivided in obtaining perception, analysis and synthesis skills.
Results: The setting of the game is that of a radiology department. The player has the role of a first-year resident. The resident has the responsibility to assess the images of critically ill patients that are referred to the radiology department for imaging. Game elements are interactive feedback, scores on speed and accuracy, levels, competition, and patient feedback.
Conclusion: The relation between game elements and students` motivation and learning activities in visual diagnostic skill training will be evaluated.
Take-home message: Serious games may have the potential to stimulate motivation and learning activities in visual diagnostic skill development.

An Evaluation of Early Undergraduate Medical Clinical Placements in Primary Care in a New Medical School in the Middle East - What are the students' perceptions?

Authors
Alison Carr, College of Medicine, Qatar University, Doha, Qatar
Ayad Al-Moslih, College of Medicine, Qatar University, Doha, Qatar
Tanya Kane, College of Medicine, Qatar University, Doha, Qatar
Nora Almutawa, Primary Health Care Corporation, Doha, Qatar

Presenter:
Alison Carr, College of Medicine, Qatar University, Doha, Qatar

Background: Early clinical placements, particularly in primary healthcare, are common in European undergraduate medical programmes. This practice is rare in the Middle East where clinical skills' practice in a laboratory with simulated patients is currently the mainstay of practical clinical exposure before Clerkships.
Method: At the College of Medicine in Qatar we introduced clinical placements in primary healthcare from the beginning of a new systems-based pre-clinical medical undergraduate programme, alongside our clinical skills programme. Uptake by some students diminished over the year. We performed a detailed evaluation (questionnaire and focus groups) to determine student satisfaction and perceived barriers to learning during the clinical placements in primary care.
Results: Evaluation completed by 39/46 students showed placements support learning about clinical care, multidisciplinary teams and the management of common clinical problems, ethical and professional dilemmas. The main perceived barriers to clinical placements were: A lack of understanding of clinical medicine at this stage (63%); clinical faculty too busy to teach (66%); and learning outcomes being unclear (50%). Currently knowledge assessment focuses on the basic sciences and students do not yet link the improvement of acquisition of skills-lab tested competences to seeing patients in the clinical environment.
Discussion: Many students benefited from early clinical placements. Some do not yet view clinical placements as a means of improving their regular clinical skills assessments. The drive to achieve medical knowledge scores for progression means clinical placements are often seen as a distraction rather than a method of improving clinical learning. Our detailed evaluation shows early clinical placements are useful alongside our clinical skills programme for clinical learning in our new College. More intense faculty and student development is needed to make benefits transparent and to support faculty in providing high quality clinical placements at this early stage.
Conclusion: Assessment drives learning. Evaluation of new programmes is vital. Students devote time to what is assessed. Our assessment of clinical learning needs better alignment to participation in clinical placements. We are

introducing a clinical logbook and portfolio reflections; alongside improved faculty and student development for our next cohort.

The improvement of abdominal X-ray describing and interpreting skills by discussing the case through an interactive feedback chat board

Authors
Surasak Aumkaew, Medical Education Center, Buriram Hospital, Buriram, Thailand
Wirayut Silakun, Medical Education Center, Buriram Hospital, Buriram, Thailand
Narin Chindavech, Medical Education Center, Buriram Hospital, Buriram, Thailand
Thanutpong Thienwuttiwong, Medical Education Center, Buriram Hospital, Buriram, Thailand
Praewphan Ruangekawit, Medical Education Center, Buriram Hospital, Buriram, Thailand

Presenter:
Surasak Aumkaew, Medical Education Center, Buriram Hospital, Buriram, Thailand

Background: It has always been a challenging task for medical students to be able to read the abdominal x-ray correctly without having sufficient experiences and skills. To be able to discuss with experienced people through an online chat boards such as "google doc" like interactive feedback may help the medical students describe and interpret the abdominal x-ray more accurately.
Method: In the period of medicine rotation, sixty five of the fourth-year and the fifth-year students were applied one of two learning model. Formative feedback model, each student was assigned to describe their patient abdominal x-ray, interpret and submit their readings by using chat boards and share with the group. Everyone in the group can see each other's interpretations. The teacher can correct the students' works through chat boards. The second model is Interactive feedback, like the previous one but the teacher can throw back question to medical students immediately. Everyone in the group can answer and share opinions. The OSCE was applied at the end of rotation.
Results: Interactive feedback model had significant higher abdominal X-ray OSCE scores than formative feedback model (66.09±14.1 vs 49.24±18.7, p=0.00) with comparable similarly resulted in both 4th year and 5th year medical students (62.33±15.8 vs 41.47±14.6, p=0.001 and 69.41±12.0 vs 41.47±14.6, p=0.04, respectively)
Discussion & Conclusion: The Interactive feedback model can gain better students' engagement and provide better abdominal x-ray reading because the students can interact and discuss with their peers and teacher immediately leading to accelerate in depth learning of x-ray interpretation skill. Interactive feedback model enhances self-inquiry learning in students. An online chat boards application also create learning atmosphere among peers to get in-depth learning in clinical context for an x-ray interpretation skill.
Take-home message: Interactive feedback between students and teachers via an online chat boards discussion

enhance students' experience in describing and interpreting the abdominal x-ray more skillfully and accurately.

Cultivating effective utilization in medical students provides cost awareness and beyond

Authors
Inchaya Sansak,Udonthani Medical Education Center, Udon Thani, Thailand

Presenter:
Inchaya Sansak, Udonthani Medical Education Center, Udon Thani, Thailand

Background: Inappropriate laboratory testings and treatment for hospitalized patients are common causing errors and costs. Efforts to reduce utilization targeted on ordering behavior which most studies intervened in postgraduate level.Medical students are hardly aware of these costs. This study aimed to assess cost awareness and perceptions of medical students after teaching effective utilization.
Method: Forty medical students in their fifth and sixth year, were asked to order laboratory tests and treatment for common diseases, then estimated the cost themselves. After learning about utilization, cost and its impact, they ordered the same case again. The costs of treatment orders were observed and their perceptions about utilization were surveyed.
Results: All students underestimated the costs of tests and treatment. After the class, the costs were reduced by 53.6%, 59.2%, 21.3%,46.5% and 31.8% in acute pyelonephritis, dengue fever, pneumonia, upper gastrointestinal bleeding (UGIB) and pancreatitis, respectively, overall average of 42.5%. The costs were saved in dengue fever, acute pyelonephritis and UGIB; the orders before class showed unnecessary serologic and septic work up tests in dengue fever and acute pyelonephritis with over blood component matching in UGIB. All students realized the importance of appropriate utilization, with 68.6%, 20.0% and 8.4% concerned most about the impact on their patients (complication, suffering, payment), cost and workload of hospital staff , respectively. The class was well received by the students. Most of them agreed that it helps them think meticulously before ordering.
Discussion: The result showed that teaching utilization in undergraduate level can cut the cost of treatment. It also made them more aware before ordering any tests. Not only did it save the cost, other aspects, particularly those concerning the patient, were in consideration. They realized the highest cost of the treatment is patients' lives.
Conclusion: Teaching utilization at undergraduate level provides a positive change in perspective of medical students concerning patients. Not only are they more aware of the cost, but also other related aspects. This should be an effective practice to cultivate professionalism for students.
Take-home message: Utilization teaching in undergraduates helps cultivate professionalism.

8JJ12 (3475)
Assessing undergraduate medical students' satisfaction regarding the clerkships in emergency departments

Authors
Ramy Azzouz, APEASEM, Lille, France
Benoit Raeckelboom, APEASEM, Lille, France
Clémence Boucly, APEASEM, Lille, France
Amélie Hemeret, APEASEM, Lille, France

Presenter:
Ramy Azzouz, APEASEM, Lille, France

Background: Assessing undergraduate medical students' satisfaction regarding the academical and the clinical teaching during clerkships in emergency departments.
Method: Retrospective descriptive multicenter observational study. Eligible undergraduate students were invited to fill-in an online questionnaire and rate their clerkships, using a web-app called « GELULES ». For this, closed-ended questions were used and rate given to the items « academic quality », « care activities », « working atmosphere » were included clinical clerkships in emergency departments accredited by a medical school, rated by undergraduate students from 1st january 2014 to 19th june 2016 on GELULES. Preclinical and residency clerkships were excluded.
Results: The study included 630 evaluations of 84 emergency departments and ambulance emergency teams, accredited by 14 medical schools. The average score given to care activities, academic quality, and working atmosphere were respectively 8.2/10, 6.9/10, 8/10. Students' goals were introduced for 61,9% reports. Clinical workload was mainly reported « heavy » or « very heavy » (63,8%). General ratings were proportional to workload and heavy ones got a better rank than ligth ones. The study also highlights the importance of dedicated sessions for medical students (courses, case reports, bibliographic meetings) which increased their clerkship satisfaction. Although, these sessions are not regularly scheduled. Moreover, students preferred being under the supervision of a medical doctor, rather than a resident. At last, 94.3% of the students recommend their clerkship to a peer. Students are willing to take profit from these clerkships. Medical students rate better clerkships implementing educational academic programs in parallel to wellsupervised clinical trainings.
Conclusion: We suggest introducing such programs with presentations, and courses designed in relevance to department theme. We also recommend to introduce students'training objectives at the beginning of the clerkship.

8JJ13 (3274)
"Role models from popular culture" - Learning the skills of medical decision making with Sherlock Holmes and Dr. House. Description of a teaching concept and qualitative evaluation

Authors
Jonathan Hiß
Jasmin Zernikow
Ralf Thalemann
Stefan Reinsch

Presenter:
Jonathan Hiss, Charité - Universitätsmedizin Berlin, Germany

Background: Over 90% of students in medical school report having professional role models. Of those, only one third are medical doctors. It has been argued that students need support in order to identify good from bad role models. In recent years, it has been shown that doctors from medical television shows have a subtle influence on medical students attitudes. On the other hand, medical television shows contain readily usable content for medical education.
Method: We designed, conducted and evaluated a seminar using the pop-cultural models of the famous detective Sherlock Holmes & his medical counterpart, Dr. House, for teaching philosophical concepts (expertise, dealing with uncertainty) and psychological pitfalls (bias, heuristics) in medical decision-making. Students had to deal with problems from real life (Firefighters, Mount Everest Expedition), criminology (Holmes) and medicine (House). Medical problems were solved by groups of students in a game-bases manner. Finally, each student analysed a case story from Sherlock Holmes and one episode from House, MD. Prior exposure to medical TV shows and existing role models was assessed at the beginning of the course.
Results: 280 students from seven consecutive years completed the course. 100 essays were separately analysed by two independent reviewers. Semi-structured interviews with ten students from two subsequent years were conducted after the students' completion of the course. During interviews, we probed about group dynamics when solving medical problems, reflection, critical thinking, decision-making, clinical reasoning strategies, and the use of role models to solve medical problems.
Discussion: We discuss the students ability to apply meta-cognition between disparate sets of logics, as witnessed by their ability to explicate problem solving strategies and their ability to highlight sources of bias in their essays. During interviews, students showed a high degree of reflexivity concerning the influence of role-models as well as their peers on their behaviour.
Conclusion: Students are able to translate problem-solving strategies between the contexts of literature, medicine and everyday life. Using the popular models of Holmes & House proved a stimulating and fruitful strategy to teach basic philosophical & psychological concepts.

Holistic Learning in Early Clinical Exposure: A Qualitative Analysis of Reflective Writings

Authors
Lim Junchen Melvin, Lee Kong Chian School of Medicine, Singapore
Tham Kum Ying, Lee Kong Chian School of Medicine, Singapore

Presenter:
Melvin Lim, Lee Kong Chian School of Medicine, Singapore

Background: Early clinical exposure (ECE) programmes evaluation has traditionally focused on assessing quantitative parameters of students' academic performance. To walk the patient's journey is a key objective of our Year 1 ECE, which takes place 4 to 6 weeks after start of medical school. Over a 5-day ECE, a pair of doctor and nurse supervisors creates patient experiences that immerse a team of 6 students. Students submit a 500-word reflection at the end of ECE.
Method: A randomised selection of anonymised reflections (n = 100) from academic years 2015-16 and 2016-17 were qualitatively analysed and coded. Grounded theory and an iterative approach were used to determine themes and subthemes.
Results: Students discussed aspects of the Patient's Journey (n=95), among other themes. They reflected on the patients' journey through the healthcare system, the impact that illness has on them and family members, the stress and uncertainty that illness brings, and most significantly, the patient's perspectives (57%).
Discussion: The immersive ECE where students put themselves in the patients' shoes allow students to experience deeply how patients process their hospital journey. This sets the stage to inculcate empathy and build good communication skills right from the beginning. With clear objectives, committed supervisors who use innovative teaching methods, students focus on understanding the patients' journey instead of accruing medical knowledge and skills: a reminder that they are first a carer before they are a care deliverer.
Conclusion: Structured learning experience in an ECE focusing on the patient's journey followed by reflective writing is helpful for students' learning of empathy and patient's perspective. ECE is the opportunity, and reflective writing the tool for students to attend to how they develop into empathetic patient-centred physicians of the future.

A comparison of case-based learning and traditional lecture in endocrine session

Authors
Krairat Komdee, Medical Education Center Phayao Hospital
Kanokrot Kovjiriyapan, Medical Education Center Phayao Hospital
Jirachat Sakuljiumjai, Medical Education Center Phayao Hospital
Anon Panyoyai, Medical Education Center Phayao Hospital
Chonthicha Chawachart, Medical Education Center Phayao Hospital

Presenter:
Krairat Komdee, Medical Education Center Phayao Hospital, Phayao, Thailand

Background: Teaching methods in medical education are now promoting active learning strategies to enhance the learning process and engage students in higher levels of learning. Case-based learning is one active learning strategy that builds on individuals' strengths by allowing them to collaborate and work as a team to achieve a common learning objective.
Method: From an endocrine class of 4th-year medical students, 20 students were divided into 2 groups. Half were participated in the sessions of traditional lecture (TDL) and case-based learning. To analyze the recent and long-term retention of knowledge, of these 2 methods, the mean MCQ scores after class 1 month and 1 year of students who underwent case-based learning method (group 1) were compared with those who undergo TDL method (group 2).
Results: Students belonging to the case-based learning group performed significantly better than the students who did not undergo case-based learning (p=0.01). The mean multiple choice question (MCQ) score after class one month of the case-based learning group was 6.8 and tradition lecture group was 4.9. One year later showed no significant difference in the scoring between groups. The mean score of the case-based learning group was 5.2 and tradition lecture group was 5.5.
Discussion: The 10 students included in the study achieved higher mean test scores on MCQ that assessed their recent knowledge of endocrine session learned using the case-based learning method compared with TDL method (p = 0.01). In long-term, one year later the mean test scores were not different. Self-direct learning needs to be implemented to promote lifelong learning and retention of knowledge.
Conclusion: Case-based learning not only improved knowledge but it promotes critical thinking, problem-solving, interpersonal and team work skills and lifelong learning for the medical student.

8KK2 (216)
Medical Students' Response to Integrating Kahoot Application Into Lecture Lessons: a Pilot Study

Authors
Sunee Neesanun
Reweewan Phromsila

Presenter:
Sunee Neesanun, Sawanpracharuk Hospital, Nakhonsawan, Thailand

Background: Lecture is a very economic way to transfer knowledge from an expert to a larger group of audience. Yet, lecturing has many downfalls. Thus, it is not the most efficient learning method. Instead, interactive activities in classroom plays an important role to improve understanding of students, but can be difficult to manage within a large classroom. This study aims to investigate the impact of implementing the Kahoot application on mobile phone - a game-base platform with questions and multiple choice (up to 4 choices) answers under time limit - in classroom on medical students' learning curve.
Method: Kahoot application on mobile phone was introduced to 4th-6th year medical students as a method to assess their understanding at the end of each lecture. The students participating in the trial of Kahoot enrolled in medical oncology, department of internal medicine, Sawanpracharuk hospital, during July 2017 until December 2107 2018. Afterwards, the students were asked to anonymously respond to a questionnaire concerning the use of Kahoot application. The answers were used to evaluate the effectiveness of integrating Kahoot application into teaching.
Results: Out of the 55 students who participated in the programme, more than 85% agree that using Kahoot application on mobile phone helps them concentrate in class, recalls more information, and eases communication between instructor and students. Most of the medical students also enjoy using Kahoot application alongside lecturing and prefer to continue using the application in the future.
Discussion: The implementation of Kahoot application in classroom, coupled with lecturing, gathers a positive response from the medical students. Using Kahoot proves to be an effective method for interactive learning, as it engages student participation, improves short-term retention of the content, and can be easily assessed.
Conclusion: From the medical students' perspective, Kahoot application on smartphone improves their understanding in lecture-based lessons and is an effective method of teaching.
Take-home message: Kahoot application on mobile phone is one example that can be incorporated in lecture to improve the efficiency of teaching in large classroom and easily to assess.

Harm Peters, Dieter Scheffner Center for Medical Education, Charité – Universitätsmedizin Berlin, Germany

Presenter:
Harm Peters, Dieter Scheffner Center for Medical Education, Charité – Universitätsmedizin Berlin, Germany

Background: The recording and dissemination of lectures as video-based podcasts has become a common practice in undergraduate medical education. However, their usage by medical students is less than anticipated. Tagging refers to a technique, used often in the internet, to annotated sections of larger videos and thereby separating them into smaller parts. Tagging of lecture podcast may have a positive effect on their usage by medical students, but has not been investigated.
Method: We conducted a randomized trial comparing the use the standard podcast lectures (standard group) with those annotated by tags (tagging group). We invited medical students of the 5th year of our competency-based, 6-year undergraduate curriculum to utilize lecture podcasts provided online in addition to the teaching in the module "diseases of the child and adolescent". The tags indicated the themes covered in the lecture and were linked to the learning objectives of the module. Students´ podcast accesses and play time of were recorded and analysed by quantitative statistics.
Results: A total of 124 students were enrolled (34% of the invited ones), 59 (48%) were randomized to the standard group and 65 (52%) to the tagging group. In the standard group, students accessed the podcasts 277 times with a total play time of 63 h, 16 min. This was significantly increased in the tagging group (750 podcast accesses and 120 h, 03 min play time, p<0.01). The mean play time per podcast was significantly lower in the tagging versus the standard group (9 min, 36 sec versus 13 min, 45 sec, p < 0,01).
Conclusion: Tagging is a relative easy to apply approach to lecture podcast as a common form of eLearning resource in medical education. This study provides empirical evidence that tagging substantially increases the access and play time of lecture podcast in an undergraduate medical education setting. The result may have been facilitated by meaningful tagging, i.e. referring to key lecture themes and module learning objectives.
Take-home message: Tagging of lecture podcast is a simple to apply approach to increase their usage by medical students.

8KK4 (374)
Controversy over the Effectiveness of the Flipped Classroom: In-class Video Blended Learning versus Out-of-class Video Flipped Classroom

Authors
Monton Wongwandee, Faculty of Medicine, Srinakharinwirot University, Nakhon Nayok, Thailand
Panwara Paritakul, Faculty of Medicine, Srinakharinwirot University, Nakhon Nayok, Thailand

Presenter:
Monton Wongwandee, Faculty of Medicine, Srinakharinwirot University, Nakhon Nayok, Thailand

Background: Key to the success of the flipped classroom is that students take responsibility to prepare before class. We tested the effectiveness of the two teaching methods regarding pre-class preparation, the in-class video watching blended learning(IN) and the out-of-class video flipped classroom(OUT).
Method: We assigned the fourth-year medical students who registered for the 'Seizures and Epilepsy' module, to attend either the IN or OUT class. The OUT students were instructed to watch a pre-class video lecture individually, while IN students had to view the video during the class time. In-class activities of both groups included case quizzes and interactive discussions. The outcomes were a post-test score and the student satisfaction.
Results: A total of 105 students were enrolled; 52 were assigned to the IN group and 53 to the OUT group. For the OUT group, 77% reported video viewing, and a mean watching duration was 71% of total video length. The mean scores on the post-test did not differ significantly between the IN group and the OUT group (7.81 vs. 7.15,p=.107). However, the subgroup analysis showed that the mean score for post-test of the IN group was significantly higher than the OUT subgroup who did not view the video (7.81 vs. 6.08,p=.024). There was no significant difference in the mean scores for overall satisfaction between the IN group and the OUT group (4.27 vs. 4.25,p=.873). Pre-class video watching was acknowledged as the strength by 42% of the OUT students; however,11% did not like the video, and 83% of the OUT who did not view the video claimed they had too many workloads.
Conclusion: Our study confirmed an essential role of students' responsibility on the successful flipped classroom being observed from the higher post-test score for the IN students over the OUT subgroup who did not watch the video. Although many OUT students praised the pre-recorded lecture, some disagreed and claimed no enough time for viewing. These reasons could lead to the non-different score on satisfaction between the IN and OUT groups.
Take-home message: Students' responsibility and the out-of-class workloads should be considered for implementation of the flipped classroom.

Using medical record review in flipped classroom to improved OB & GYN learning achievement

Authors

Benjawan Songsrisakul
Alisara kaehom
Kwanhatai Kammhuang
Pornnapa Suriyachai

Presenter:
Benjawan Songsrisakul, Medical Education Center Phayao Hospital, Phayao, Thailand

Background: Flipped classroom move students away from passive learning toward active learning by having students study on their own outside classroom and encourage them to engage in content using various in-class activities such as peer review, debate, laboratory experiment. Using medical record review as in-class activity in flipped classroom may be useful to improve students knowledge and performance. So this study was intended to assess the effectiveness of medical record review in flipped 4th year OB & GYN classroom.

Method: We used study guide to inform 4th year medical students about learning 3 OB & GYN topics (fetal assessment, pre and postoperative care, contraception) by reading textbooks or websites outside of classroom and use medical record review as in-class activity to engage 3 groups of students in content by participating in collaborative discussions that reinforce higher order clinical thinking skills such as medical problems description, analysis, diagnosis and problems solving. We carried out pretest and posttest to evaluate students' knowledge and used questionnaire to evaluate their opinion in OB & GYN learning by using medical record review.

Results: In these 3 topics, 30.1 - 80.3 % improvement of class average score was observed in posttest. 55.6% of students think medical record review is interesting and enjoyable because they were actively engaged, motivated and self evaluated. 77.8% of them gain more knowledge and all of them got better understanding of content that they can apply in clinical practice.

Conclusion: In OB & GYN learning, medical record review is an effective in-class activity in flipped classroom. It promote students engagement, motivation and self evaluation. It helps them to understand content, achieve better score in posttest and develop appropriate clinical thinking skills, besides, they get used to medical records. This activity shows medical record examples that should be or should not be followed in daily practice. It will be of great help to them in future clinical practice.

Take-home message: Medical record review is one of the effective in-class activity in Flipped classroom.

Improving the turnout: Factors affecting student attendance

Authors

Anna Stout, NHS Grampian, Aberdeen, UK
Larissa Latif, NHS Grampian, Aberdeen, UK
Jill Austin, NHS Grampian, Aberdeen, UK

Presenter:
Anna Stout, NHS Grampian, Aberdeen, UK

Background: Factors affecting medical student attendance during clinical attachments include ill health, lack of interest in the subject matter and poor teaching strategies. Poor attendance may be related to stress, burnout, and has been identified by the General Medical Council (GMC) as an area of 'low level concern' with regards to professionalism.
This quality improvement project aimed to identify factors that affect student attendance during their anaesthetics rotation, with a view to improving both attendance and the students' experience of the specialty.

Method: Student attendance was monitored for three separate groups of students during their anaesthesia clinical attachments in March, May and October of 2017. The teaching timetable and methods were adjusted, and students were reminded about the impact poor attendance has on learning opportunities and its implications for professionalism and fitness to practice. Students were then asked for specific feedback with regards to attendance and areas in which the anaesthesia rotation could be improved.

Results: Attendance improved from 37% (March) to 68% (October). Three students experiencing difficulty were identified and referred to the University for additional support. Factors improving attendance included feeling useful and receiving one-to-one teaching. Factors deterring attendance included feeling ignored, lack of mentorship and a lack of exposure to practical procedures. Students felt being assigned a trainee mentor would improve their experience. Interventions such as reminding students of their professional responsibilities and adjusting teaching timetables can improve student attendance. However, it is difficult to determine precisely what improved attendance over time given that three separate groups of students were monitored.
Monitoring attendance can identify students in difficulty, and may to help identify professionalism or fitness to practice concerns. Feedback relating specifically to attendance has revealed a desire for mentorship during the clinical attachment to anaesthesia, which may help to improve the student experience in the future.

Conclusion: More robust methods for monitoring attendance are required to ensure students who are experiencing difficulty receive access to appropriate support.

Take-home message: Focused feedback relating to attendance can uncover different aspects of the teaching curriculum which need to be adjusted.

Classroom attendance is not a marker of examination performance in pre-clinical medical students

Authors
Christine Kauffman, University of Central Florida College of Medicine, Orlando, USA
Jonathan Kibble, University of Central Florida College of Medicine, Orlando, USA
Megan Derazin, University of Central Florida College of Medicine, Orlando, USA
Abdo Asmar, University of Central Florida College of Medicine, Orlando, USA

Presenter:
Christine Kauffman, University of Central Florida College of Medicine, Orlando, USA

Background: Studies completed with undergraduate populations have shown that attendance positively correlates with academic performance. These were primarily done before the current era of the internet with online streaming of in-class sessions and multiple sources for content. We evaluated how attendance at in-class sessions affected performance on summative assessments in this modern era.
Method: The study was performed during the second-year Gastrointestinal and Renal systems module of the 2017/18 academic year. Curriculum was divided into mandatory and voluntary sessions. The mandatory sessions included team-based learning and small group case-based learning sessions. In contrast, the voluntary sessions consisted of lectures and small group application exercises of material previously covered in the curriculum. All lectures were recorded and all other materials (e.g. PowerPoint files, small group case materials and answers) were available to students online whether or not they attended in person. Attendance was recorded for all sessions using a Bluetooth enabled smart-phone application (Tealpass). Performance was determined based on the 118 multiple-choice question final examination at the end of the 6-week module covering all material presented. This study was IRB-approved and students gave informed consent.
Results: The study group consisted of 78 students (68% of 114 total). The percentage of attendance in the study group was not significantly different than that of the whole class. Attenders made up 67% of the group (3% to 92% attendance) with 33% attending none of the non-mandatory sessions. The non-attenders performed better on the final exam than the attenders group (87.4±6.2% versus 82.9±8.4, P=0.02 Student's t-¬test), which was consistent with their performance in previous modules. However, there was no correlation between the percent of classes attended and performance on the final exam (R^2=0.02, n=78).
Conclusion: We conclude that attendance at in-class sessions is no longer a good marker for those who will do well in a course. Further work is needed to characterize the nature of student engagement and effective approaches to study.

Take-home message: Examination performance is not predicted by the level of face to face classroom attendance.

8KK9 (1286)
Attendance in Medical School: Should it be Mandatory?

Authors
Amany Elshaer, Alfaisal University, Riyadh, Saudi Arabia
Mayar Helaly, Alfaisal University, Riyadh, Saudi Arabia
Dalia Sriwi, Alfaisal University, Riyadh, Saudi Arabia
Eiad Habib, Alfaisal University, Riyadh, Saudi Arabia
Mohamed Iesar Abdelaziz Mohamed, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter:
Amany Elshaer, Alfaisal University, Riyadh, Saudi Arabia

Background: Alfaisal University is known for its strict regulations regarding student attendance. Recently, the attendance policy for the College of Medicine has been changed to allow maximal 15% absenteeism. The University's mandatory raise in attendance to 85% is based on the perceived assumption that attendance contributes to improved overall students' performance.
Method: A total of 160 medical students (Years 1 to 5) were surveyed regarding their preferences and general outlook on the attendance policy. Additionally, the students' academic performance and the impact of attendance were evaluated. The aim of this study is to analyze any significant association between attendance and improved performance.
Results: After analyzing the results, a total of 81% of the students do not approve with the attendance policy. However, a significant improvement was observed in the attending students' cGPA. Those who attend the lectures have a cGPA of (3.5); whereas, those who do not attend have a cGPA of (3.3).
Discussion: The results indicate that attendance has a statistically significant effect on students' learning. Furthermore, attendance is proven to be positively correlated with the overall academic achievements. Further aspects have been examined to determine the effects of applying mandatory attendance on medical students.
In our university, no previous studies examined the inter-relationship between attendance and educational performance. Therefore, after conducting the study, we concluded that the attendance policy implemented has contributed to improved academic performance. The results indicate that students, regardless of their gender and socioeconomic status, perform exceptionally better when present.
Conclusion: Studies can examine several other factors in relation to attendance, but it all comes to the conclusion that students are required to be more academically engaged throughout the learning process to gain the utmost knowledge. It might also be indicative that certain fundamental aspects are only acquired through active attendance.

Experience first then engage learning in classroom – An Innovative learning model combined with simulation for medical students

Authors
Kai-Chun Hu, Department of Emergency of WanFang Hospital, Taipei Medical University, Taipei, Taiwan
Wei-Qi Chen, Department of Emergency/Nursing of WanFang Hospital, Center for Education in Medical Simulation, Taipei Medical University, Taipei, Taiwan
Wen-Cheng Huang, Clinical Skill Center of WanFang Hospital, Center for Education in Medical Simulation, Taipei Medical University, Taipei, Taiwan
Che-Wei Lin, Center for Education in Medical Simulation,Taipei Medical University, Taipei, Taiwan

Presenter:
Kai-Chun Hu, Department of Emergency of WanFang Hospital, Taipei Medical University, Taipei, Taiwan

Background: In the past, learning model is a process from lecturing, practicing to performing.
From the aspect of medical students, most of them have little or lower motivation of learning basic knowledge compared with after starting clinical exposure.
Therefore, unlike the traditional learning theory and model, our medical students experienced clinical scenario and learned to perform skills without any lecture before our courses called "Saving Life, Learning Safe".
We hope to stimulate greater learning motivation, to decrease the gap between medical school and clinical condition, and to lower anxiety of making decision or performing skills on real patients.
Method: The course is divided into three parts:
1.Short play of resuscitation: Let learners to know what to do
2. Resuscitation Skill stations: IV, AMBU+ENDO, BLS, DEFIBRILLATOR
3. Scenario challenges: Emphasizes tteam work, experiencing the pressure, practicing skills, and o debriefing for learner's performance
Results: Obtain positive help of the curriculum: YES (98%)
Satisfaction survey of the curriculum: total 137 medical students, 1st-4th grades, 2016/10 – 2018/01, overall satisfaction: 4.76/5
Feedback or suggestion from the learners: fun, interesting and edutainment. Unlike lectures, we wanted to experience this kind of courses and try to find the answers in classes.
Discussion & Conclusion: According to our results, our design can enhance the motivation of learning in the future, decrease the sense of anxiety of being clinician in the beginning.
In addition, learners were satisfied with faculties teaching and experiences in a resuscitation based on our questionnaire, and they suggested that series of courses can be held and edutainment get less boring, etc.
Last but not least, prospective, large samples follow-up cohort studies should be conducted in the future. A series of courses like this may enrolled into formal medical academic curriculum if evidence shows assistance in learning efficacy or clinical abilities for medical students.

Take-home message: It would be an innovative learning model for students engagement. To experience in simulation before to learn in class can significantly increase the motivation of lectures learning, decrease the anxiety of the future effectively and minimize the gap between medical school and clinical condition

The King and the Immune Warriors: Digital Storytelling for Fostering Students' Learning

Authors
Eugenie Phyu Aye Thwin, School of Health Sciences, Nanyang Polytechnic, Singapore

Presenter:
Eugenie Phyu Aye Thwin, School of Health Sciences, Nanyang Polytechnic, Singapore

Background: As there are limited teaching aids for the immune system lessons, students in my school struggle to grasp the fundamental concepts of the body's defense mechanisms by lectures alone. Therefore, there is a need to develop an additional instructional tool for the teaching of the immune system.
Method: Having a purpose to explain adaptive and innate immune defense mechanisms, I created a digital story in PowerPoint by using still images. The story was four minutes in length, and I narrated it live. In the story, I used an analogy of how the king was protected from his enemies, where the king represented a human being, the enemies were pathogens, and the soldiers were the components of immune defense mechanisms.
As I want to explore students' learning experiences with digital storytelling, I conducted an online survey. The survey consisted of five questions constructed with a 5-point Likert scale. Students' responses to each question and an average score for five-questions described how they perceived the digital storytelling.
Results: Out of 220 nursing students from School of Health Sciences, Nanyang Polytechnic, Singapore, 175 (80%) responded to the survey. Regarding students' perceptions, 96% agreed that the tool enhanced their understanding of the topic and 87% believed that they would be able to answer the immune system questions. Moreover, the digital storytelling fostered students' engagement as 94% stated that they became more interested in the topic and 92% recommended using this approach for hard-to-understand lessons. The analysis shows an average score for all five-items as 4.3, indicating that students had a positive attitude towards digital storytelling.
Discussion & Conclusion: This study indicates that the learners reacted favorably to digital storytelling (Kirkpatrick's level 1); therefore, I should move one level up to evaluate students' learning (Kirkpatrick's level 2). I would recommend the before-and-after study design to measure the extent students acquire the intended knowledge. In conclusion, the digital stories are innovative instructional tools and have potential in facilitating students' learning.
Take-home message: The digital stories can increase the interest, attention, and motivations of students in our classrooms.

'Go with the Flow' – is adopting a 'gamification' approach beneficial to the understanding of cannula choice and flow rates?

Authors
Sean Mackin, WHAT, Weston, UK
Alexander Grant WHAT, Weston, UK
Chris Barr, WHAT, Weston, UK
Bee Martin, WHAT, Weston, UK

Presenter:
Sean Mackin, Weston Area Health Trsut, Weston, UK

Background: Flow rates and intravenous cannula choice play an important role in the resuscitation of the critically unwell patient. Undergraduate teaching on the basic science of fluid dynamics, as governed by the Hagen-Poiseuille equation, is variable. Across the globe, institutions are increasingly using games to teach abstract, scientific concepts such as fluid dynamics. In this study, we aim to assess if an interactive, competitive game is of benefit when teaching the Hagen-Poiseuille equation, cannula choice and associated clinical knowledge.
Method: 24 third and fifth year medical students undertook a pre-intervention MCQ questionnaire to assess students pre-existing knowledge. Following this, an interactive multi-modal teaching package was implemented. This consisted of a didactic lecture, a live demonstration of fluid flow through cannula and culminated in an interactive 'race' where students were encouraged to alter variables such as cannula length, cannula gauge and fluid pressure in order to drain their bag the quickest. Independent, post intervention focus groups were then conducted to assess student's views on understanding gained, clinical relevance and enjoyment.
Results: A pre-intervention questionnaire showed 13% of students were correctly able rank cannula size by colour, 67% correctly identified that flow was inversely proportional to cannula length and 71% correctly identified that flow was proportional to radius4. Scores post intervention were 96% in all domains. Preliminary thematic analysis shows students felt the game based component increased interaction, understanding of core principles and retention of knowledge. Despite this, students reported that an introduction to concepts through the lecture component was essential for full engagement in the game.
Discussion & Conclusion: Although the use of an interactive, competitive game was beneficial in furthering students understanding of cannula and flow rates this must be supported by discussion of the relevant background theory in order to maximise its effectiveness. As a result of the interactive 'race' students felt that a deeper understanding was achieved, that they would retain knowledge for longer and that their clinical practice would be altered.
Take-home message: The use of games in medical education must be supported by discussion of the relevant background theory to maximise learning.

8KK14 (1692)
BMBOC-Gamification as an Innovative Tool of Medical Education in Phramongkutklao College of Medicine

Authors
Thanakrit Vichasilp, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand
Montalee Theeraapisakkun, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand
Charin Cheungsirakulvit, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand
Nattaprapa Suriyamontol, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand
Prakarn Rudeekulthamrong, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand
Unchalee Visawapoka, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand

Presenter:
Thanakrit Vichasilp, Department of Biochemistry, Phramongkutklao College of Medicine, Bangkok, Thailand

Background: Successfully integrating e-learning into traditional classroom is a major challenge for medical education because engagement in online programs is difficult to maintain. We have faced this problems in the Biochemistry and Molecular Biology Online Course (BMBOC) since 2010. Gamification is the recent trend that offers to increase engagement through the application of game elements and gaming techniques to non-game contexts. This study aimed to develop a gamification in the BMBOC and improve student's participation and engagement.
Method: The BMBOC-gamification was developed using the Moodle software. It allowed students to check their course activities, points, levels, items, and leaderboards. Students earned eXperience Point (XP) from completed activities. They had to collect the required amount of XP to level up. There were 51 activities to be completed before receiving the course certificate. All year 2 medical students (N=99) were assigned to attend this course. After the course end, the evaluation data were collected using questionnaires (5-point Likert-type items) and self-reflections (open coding scheme).
Results: The BMBOC-gamification is developed and used for the first time. The survey showed that XP and levels, virtual goods (items), challenge activities and leaderboards are the most important gamification methods ($\mu \geq 4.5$). The reflection data gathered was examined and classified into 3 categories: fun, gamification, and education. 95% of the students were satisfied with the system as a whole. 91% of them were satisfied that the system enhance student motivation and engagement. 99% of them love the formative assessment part of the system. Moreover, all students believed that the system was a beneficial revision tool to test their learning and less stressful than studying in class.
Conclusion: The evaluation results showed positive effects on the student's engagement toward the BMBOC-gamification. Moreover, students considered the gamified instance to be more motivating, interesting and easier to learn as compared to other courses, thus they strongly recommended using it in another courses.

Take-home message: The BMBOC-gamification gives a great advantage to medical education by encouraging learners to explore and learn as they move toward an end goal.

8KK15 (1651)
Mixing Things Up: Adding Gaming into the Flipped Classroom

Authors
Douglas Bovell, Weill Cornell Medicine Qatar (WCMQ), Doha, Qatar
Jamie Gray, WCMQ, Doha, Qatar
Syde Latifi, WCMQ, Doha, Qatar
Sean Holroyd, WCMQ, Doha, Qatar

Presenter:
Douglas Bovell, Weill Cornell Medicine Qatar, Doha, Qatar

Background: Evidence suggests that Millennial learners prefer more active teaching methodologies (1). Implementation of activities such as gaming have seen an increased adoption in health professions education over the last decade (2-3).
Method: A flipped classroom session was augmented with a review activity conducted using gaming. Students were assigned materials to review prior to the session, and then assigned into randomly selected small groups, each to consider one of five clinical vignettes to solve and present their findings. Based on the pre-session and in classroom activities, student groups then participated in a gamified quiz. Points were awarded based on answers chosen by the team - +2 pts for a correct answer and -1 pt for no answer within 15 seconds. The winning team members received a prize.
Results: A total of 31 students provided feedback to improve the session - 90% found the quiz game moderately to highly effective in helping them engage and understand the material. 84% reported the game as highly effective in making them feel engaged. Interestingly, among seven classroom activities problem based learning and facilitated discussion were ranked as the most beneficial for individual learning.
Conclusion: Overall, the gaming activity appeared to be an effective complement to flipped classroom pedagogy. Students reported high engagement levels while participating in both activiies. Steps to improve the quiz game for future sessions may include additional time for quiz question feedback, improved mechanisms for identification of each team during the game, and additional notification around class preparation.
Take-home message: Students find Gamification very engaging and effective in delivering the review session.

Game-Based Learning for Final-Year Medical Students in Preparation of Medical Licensing Examination

Authors
Chung-Yi Cheng, Department of Internal Medicine, Division of Nephrology, College of Medicine, Medical University/Wan Fang Hospital, Taipei Medical University, Taipei, Taiwan
Fat-Moon Suk, Department of Internal Medicine, College of Medicine, Taipei Medical University/Division of Gastroenterology, Department of Internal Medicine, Wan Fang Hospital, Taipei Medical University, Taipei, Taiwan
Wen-Cheng Huang, Department of Emergency Medicine /Clinical skill center, Division of Nephrology, Wan Fang Hospital, Taipei Medical University, Taipei, Taiwan
Che-Wei Lin, Clinical skill center, Division of Nephrology, Wan Fang Hospital, Taipei Medical University, Taipei, Taiwan

Presenter:
Chung-Yi Cheng, Department of Internal Medicine, Division of Nephrology, College of Medicine, Medical University/Wan Fang Hospital, Taipei Medical University, Taipei, Taiwan

Background: A two-steps competitive educational game is supplemented to the didactic lecture for our final-year medical student. The learning objective is to strengthen the competency in medical knowledge in our final-year medical students to prepare for their medical license exam and for future patient care.
Method/Results: A team-based game entitled, Medical Knowledge Forum, is devised for the final-year medical students using clinical cases collected from the different specialist fields. Questions are developed to demonstrate the overall medical knowledge required for final year-medical students meet for their future patient care goals. Twelve pre-competition review classes are carried out to select top-ranked students to enter the final competition. The top-ranked students are assigned to six teams, each of two students. The remaining of the class and junior students composed the audience. Overall, 55 students attended the class each year. Twenty multiple-choice questions are presented to students using PowerPoints. The incorrect answered questions are open to the audience. Each question is approximately three minutes and is followed by a two minutes immediate feedback from the faculty in the related field. The team with the most correct answered questions at the end of their session wins.
Discussion: The "Medical Knowledge Forum" program has been operating in two consecutive years in our hospital. Ninety-four and ninety-nine percent of students showed their great appreciation to attend the class in the first and second year respectively. Accurate responses to questions indicated that students had reviewed the materials previously learned. Students' willingness to reason publicly demonstrated growth in professional maturity. Junior medical students also reacted positively to the game.

Conclusion: Despite the limited evidence to support the use of educational games in medical education, it still has its potential effectiveness. Our students viewed the session as a positive learning experience, and faculty members gained insight about which elements of the game were effective. The integration of fun and excitement in the learning process is the key element to succeed our " Medical Knowledge Forum" program. A further qualitative designed study may be needed to validate the outcomes.

8KK17 (3218)
Pedagogical Game in Teaching-Learning Process of Biochemistry

Authors
Tamires Fortuna
Amanda Guimarães Azevedo
Felipe Colombelli Pacca
Tatiane Iembo

Presenter:
Tamires Fortuna, Faceres, São José do Rio Preto, Brazil

Background: The use of games as a teaching tool is a pedagogical possibility that can enhance the teaching of biochemistry for students entering the medical course.
Method: Elaboration, application and assessment of knowledge from pedagogical games about metabolism of carbohydrates, lipids and proteins. The games were developed by students of the sixth semester for first semester students and applied during pedagogical activity on the subject at a medical teaching institution in the interior of São Paulo, Brazil. A questionnaire with five objective questions of each subject was applied before and after the dynamics of the games so that the answers were compared. In addition, a gaming satisfaction verification tool was also used.
Results: Among the three topics addressed, there was an average of 11.6% increase of hits on carbohydrates, -11.2% for lipids and 6.0% for proteins. Regarding the perception of contribution to learning in the subject, on average, 72.4% of the students considered themselves satisfied with the games. Regarding the possibility of indicating the game to another colleague to learn about the subject, 89.3% of the students responded positively. Of the participants, 92.2% considered the dynamic games and 51.8%, the games as easy.
Discussion: Despite the high level of satisfaction of the participating students, there is little difference in the improvement of the verification questionnaire responses from the use of the games. It is discussed the possibility of the game, even, to disrupt the students' understanding of the subject, as in the case of the game about lipids, depending on its type. Finally, we also question the number of questions and the lack of a control group as possibilities of methodological improvement of process evaluation.
Conclusion: Playing games has a positive impact on the acceptance of first-semester students. Playful methods of impacting teaching may enable greater adherence to studies on the subject, especially in the Brazilian reality.

SESSION 9: SIMULTANEOUS SESSIONS

Tuesday 28th August
1600-1730 hrs

9A: Symposium: Managing the Tension -- From Innovation to Application

Location: Event Hall
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters:
Ara Tekian, University of Illinois at Chicago College of Medicine, Chicago, Illinois, USA

Summary: The demand for better teaching and assessment of health care professionals has led to a number of educational innovations which provide detailed guidance on improving practice. Recent decades have seen the rise of competency-based medical education, milestones, entrustable professional activities, team-based learning, and so on. However, these innovations have come at a price. Resources are not available to accomplish all that is recommended, nor does the research offer much insight into the absolute effectiveness of the various options facing educators. The symposium will describe some of these tensions as they relate to curriculum, instruction, assessment, evaluation, and faculty development. Strategies for balancing these innovations against one another and in the context of constrained resources will be discussed.
Who should participate in the symposium? This symposium might interest all the participants of the AMEE meeting, since every educator from any profession or specialty faces some problems in adjusting the magnification and attention to details of innovations in curriculum, instruction, assessment, and evaluation. This will be of interest for people working both at the undergraduate and postgraduate levels.
What will they gain from participating? The participants will have first-hand opportunity to hear from experts how they are dealing with tensions created by innovations in curriculum, instruction, assessment and evaluation when research does not offer much insight into the absolute effectiveness and resources might not be available. Additionally, they will know about some strategies to balance these innovations against one another.

9B: Symposium: Learners as Educators - Realizing Potential, Sharing Best Practices

Location: Montreal, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Organised by the AMEE Postgraduate Committee
Presenters:
Rille Pihlak, European Junior Doctors, University of Manchester, UK
Matthew J. Stull, Case Western Reserve University School of Medicine, USA
Simon Gregory, Health Education England, UK

Summary: *Docere*, the Latin word from which our professional name is derived, quite literally means to teach. Physicians are expected to teach each day, from their clinical practice to the trainee in the classroom. While this expectation tends to be ubiquitous it is rare that educator skills taught throughout the formal medical education continuum. This symposium will review the opportunities and challenges in building teacher training into postgraduate training and other ways to support young educator development around the world.
The session will introduce attendees to the need for such programs and outline initiatives from a number of continents to better incorporate this important skill set into training. Following a discussion of the "why and how," the major challenges of such programs will be discussed in a plenary (discussant) format by presenters. Challenges discussed will include the motivation underlying both deans and trainees interest in building such programs, sustainability efforts of trainee-driven efforts, where these lessons can fit into already crowded curricula, and what the most meaningful outcomes of such programs should be. Finally, the session aims to show how these programs can stimulate postgraduate medical education and research and what the postgraduate community around the globe could do to develop the next generation of clinician educators.
Who should participate in the symposium? Trainees of all levels, supervisors, programme heads, policy makers, stakeholders and all AMEE delegates interested in this topic and postgraduate education and training in general.
What will they gain from participating? For learners stimulation to develop as educators and empowerment to do so whilst in training. For learners and educators examples of good practice to support transfer of learning from "teacher programs" globally, with discussion of challenges, solutions and opportunities. All participants are invited to share their personal perspectives and challenges on this topic to learn from each other.

9C: Symposium: Are medical schools selecting students with the appropriate values for 21st century medicine?

Location: Sydney, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters:

Katrina Dima, IFMSA
Harm Peters, Germany
Sharon Peters, Canada
Trudie Roberts, UK
Val Wass, UK
Peter Dieter, Germany

Summary: Trudie Roberts raised the question at the 2017 AMSE/AMEE symposium of whether doctors will exist in the future? - Almost certainly they will. But future doctors may well need a different skills mix. We face increasing challenges through globalisation, shifts in population needs, social determinants and health inequity. Arguably the current medical workforce is failing to meet these. Other health workers and robotic technology development may increasingly subsume current responsibilities.

This symposium will explore this question from an international perspective. The views of European medical schools will be aligned with the increasingly international participant input offered by AMEE. Why are we currently focused on academic success as an entry criterion for medicine? Has this resulted in the current mismatch between medical school output and the deficit in specialties such as family medicine, psychiatry, emergency medicine? Can we foresee the future challenges doctors will need to address? If individuals with a different, more resilient and flexible skills mix were selected might we avoid the current burn out experienced by some of the clinical workforce?

A panel will be selected to offer a full international stakeholder perspective to support audience debate and identify whether these questions are valid and how they might be addressed.

Who should participate in the symposium? The symposium will be designed to maximise audience discussion fully embracing the international perspective. Each speaker will be limited to 10 minutes offering 30-40 minutes of discussion. This will be chaired by Trudie Roberts (AMEE) and an AMSE executive.

The audience (and Panel) will share views to reach a consensus of whether selection into medical schools should change from the current focus on academic ability and examination performance to embrace a different skills mix. The symposium will offer debate and conclude on what this should be.

9D: AMEE Fringe 2

Location: Singapore, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

A plea for pessimistic doctors

Authors
Menno de Bree

Presenter:
Menno de Bree, University Medical Center Groningen, Netherlands

Background: Optimism seems to be a cardinal virtue in medicine. But why? Optimists, after all, are horrible naïve people – and dangerous too.
Both optimists and pessimists value their situation negatively. Optimists then use to think that they can improve it - a mindset that leads to an endless stream of usually not very effective educational initiatives, quality improvement projects and organisational changes – often motivated by a very nice sounding, but utterly unrealistic utopian goal ('affordable high quality care for everyone'). The pessimist, however, knows that if you win at one side, you inevitable loose somewhere else, that much of our goals and plans are vain and often not worth pursuing, that much of our efforts keep us busy without necessary improving anything, and that, whatever we do, the end game will always be the same: often suffering, always death.
In this talk I therefore plea for the pessimistic doctor. Since pessimistic doctors will not engage in all kinds of fancy projects, will not blame reality if things are not going as they want, and are not primarily oriented towards the future, they have more time and energy to be in the here and now – which enables them more to look at their patients, to relate to them, and to relieve their pains and problems, within the often small limits of their possibilities.

Once Upon a Time: Storytelling in Medical Education

Authors
Meghan Treitz
J Lindsey Lane
Janice Hanson

Presenter:
Meghan Treitz, University of Colorado / Children's Hospital Colorado, Aurora, USA

Background: Humans have been dubbed the "storytelling animal" for good reason: from novels and television shows, to daydreaming while driving to work, to sales pitches heard in the office or on the radio, to accounts of our day that we share at the dinner table – our lives are filled with stories.
As medical professionals, we listen to the stories of our patients' lives and diseases. We tell our own stories of success, of despair, and of lessons learned. We tell stories of things that have happened and things we wish to change in the world.
It has been said that we cannot learn without stories. The fancy name for story, or "narrative," is from a Latin root meaning "to make known." We use stories to communicate information, but we also come to understand ourselves through them.
The fiction we read from childhood through adulthood is full of storm and strife – there is always the scary forest, the mean stepmother, the villains to conquer. There is also storm and strife in the real-life stories of our learners and colleagues. After prompting learners, pediatricians, educators, and others to tell their stories, we ended up with a wonderful collection of hurdles overcome, struggles, and growth with an unusual glimpse into the minds that are processing the nuances of medical practice and medical education.
This presentation will draw on literature (not only THE literature [medical literature], but also children's literature and classic literature) to illustrate the importance of storytelling in medical education. We will then allow the audience to sit back for story time as we share short stories written by a medical student, a resident, and a medical educator.

Is it time to get Serious about Play? How does Medical Improvisation Influence the Development of CanMEDS-FM Competencies in Family Medicine Residents?

Authors
Anne Wideman, University of Toronto, Toronto, Canada
Jeremy Rezmovitz, University of Toronto, Toronto, Canada
Hartley Jafine, McMaster University, Hamilton, Canada
Elizabeth Wooster, OISE/University of Toronto, Toronto, Canada

Presenter:
Jeremy Rezmovitz, University of Toronto, Canada

Background: Improvisational theatre ("improv") is a form of collaborative storytelling, in which actions of the performers are unscripted and created spontaneously in a reciprocal and collaborative manner. Most recently, applied improv is being adopted in health professions education and termed 'medical improv' which embraces the use of "principles and training techniques of improvisational theater […] to improve cognition, communication, and teamwork in the field of medicine". Several health professional training institutions such as Northwestern University and Johns Hopkins University have begun exploring the utility of medical improv (1). The division of Family Practice at Sunnybrook Hospital conducted a needs assessment with its current and past residents from the last 5 years, to assess knowledge of the CanMEDS roles, as well as identify which competencies may require better facilitation in order to improve their development during residency. Of the 23/70 residents that responded, there was interest for better facilitation, more role modeling and extra training for all competencies but the leader, scholar, medical expert and health advocate Roles stood out on top.

This project aims to:

1. Develop residents' knowledge, skills and attitudes related to all CanMEDS-FM Roles through an arts-informed intervention.

2. Provide opportunities to reflect on intrinsic CanMEDS-FM Roles and how it relates to their clinical practice.

3. Use interviews and existing data collection processes (Satisfaction surveys, Field Notes) to assess residents' knowledge, skills and attitudes towards CanMEDS-FM Roles.

For the fringe presentation, a short improv scenario will be undertaken. The participants in the improv scenario will then be asked to share their feelings regarding the experience. The facilitator of the session will lead a discussion about how this sort of session can be implemented and help to inform medical education and the training continuum.

Neuroscience Ghost Stories: Applying supernatural and scientific perspectives to metaphysical experience

Authors
Tan Chay Hoon
Derek Soon

Presenter:
Derek Soon and Tan Chay Hoon, National University of Singapore, Singapore

Background: Current theories of cognitive neuroscience remain limited in their capacity to provide a comprehensive explanation for the entire gamut of human experience. A range of recurring reported phenomena still defy scientific explanation. Such experiences fall within the purview of what is popularly termed "supernatural". In short, there is much that modern science cannot explain. However, an increasing number of experiences which would otherwise be explained in supernatural terms have been observed in organic brain illnesses. Such experiences are profound and often influence perception, consciousness and identity. Discussing such experiences with medical undergraduates provides a fresh perspective into neuroscience, altered brain states and their role in constructing consciousness and human existence. In this session I explore the interface between the supernatural and neuroscience through theatrical story-telling and audience participation.

Activity

We tell a series of stories from personal experience which may have scientific or supernatural underpinnings. The audience cast votes through an anonymous public polling (www.polleverywhere.com) system on whether they think the experiences are best explained in scientific or supernatural terms. The audience are then invited to provide explanations through the same platform. Explanations will be explored before we present my own explanation of the experience, rooted in science and (sometimes) in the supernatural.

Medical students at St Elsewhere's

Authors

Sandra Petty, University of Melbourne, Australia
Kate Taylor, Oculo, Melbourne, Australia
Jayne Lysk, University of Melbourne, Australia

Presenter:

Sandra Petty, University of Melbourne, Australia

Background: We wanted our first year medical students to start their course by thinking about the experience of being a patient. The Ormond Hospital Experience was written to highlight potential adverse issues in the delivery of healthcare and the clinical environment. Scenarios were written. Actors would play the parts of clinicians, some patients, and hospital staff. An appropriate venue was selected. Signage, props and even a PA system were procured to create a hospital environment set where students become "patients" and "carers" then would proceed through a series of stations as observers and experience behaviour in essentially an Objective Structured Clinical Exam format. This fringe session offers you the opportunity to hear the story of how two very busy clinicians and passionate educators came together to write and orchestrate the introduction to the MD course at the University of Melbourne. A story and a play which has now been successfully running for seven years. You will hear about the scenarios, the behaviours witnessed, the student experience and the way the group debriefing sessions places the experience in context. The experience was created to foster an understanding of the concepts of empathy and compassion in an overcrowded simulated clinical environment. When the story ends we will ask the audience for their reactions, their thoughts and how they would create their own Ormond Hospital Experience if given the chance.

Saad Chahine, Schulich School of Medicine & Dentistry, University of Western Ontario, London, Ontario, Canada

Presenter:
Mark Goldszmidt, Schulich School of Medicine & Dentistry, University of Western Ontario, London, Ontario, Canada

Introduction: Socialization theories of professional identity formation consider clinical rotations to be critically intense transformative experiences. However, few studies have explored what trainees grapple with during these transformative experiences or their influence on performance. Applying a Threshold Concepts (TC) lens, this study investigates and documents "Troublesome" and "Transformative" concepts that junior trainees may encounter during a clinical rotation. Insights gained are essential for supporting trainee development.
Methods: Constructivist grounded theory was used to guide the collection and analysis of data for this two-phase study. Phase 1 involved direct observation and field interviews with seventeen junior trainees over two observation periods during a clinical rotation on the inpatient medical team and phase 2 involved in-depth interviews with thirteen attending physicians who work with trainees on those teams. The theory of TC was used as a sensitizing concept.
Results: In total, nine TC were identified and thematically grouped under the headings: Developing as a Professional, Providing Patient Care and Working Collectively. Across the interviewed attendings, there appeared to be a shared understanding of TC strong trainees had crossed and weaker trainees struggled with. Observational and field interview data suggested that individual trainee actions were strongly influenced by the identified TC and whether or not the trainee appeared to have crossed any given threshold. Moreover, individual clinical practices could be influenced by more than one TC. Trainees were also observed to vary in the thresholds they had already crossed or struggled with.
Discussion & Conclusions: Our identification of TC in the context of an internal medicine inpatient rotation provides new insights into the type of identity work that trainees may need to struggle with during clinical rotations. Our findings suggest that the way a trainee views their role is fundamental to doing clinical tasks effectively and may be intricately linked with aspects of identity development. The identified TC can therefore support educators to: 1) pro-actively share typical challenges with trainees and help them to work through them and 2) identify particular trainee behaviors that are less effective and offer insights into potential troublesome concepts that may be underpinning these. Similarly, TC may also serve to guide and support the development of novel methods of assessment.

Tension between Individual Identity and Collective Identity in Medical Trainees: An 8-year, Longitudinal Qualitative Case Study

Authors
Dorene Balmer, University of Pennsylvania, Philadelphia, PA, USA
Boyd Richards, University of Utah, Salt Lake City, UT, USA

Presenter:
Dorene Balmer, University of Pennsylvania, Philadelphia, USA

Background: From the perspective of social constructionism, identity construction is both an individual undertaking and a collective activity. Tension between "who I am" (individual identity) and "who we are" as members of highly specialized medical professions (collective identity) may emerge as medical training progresses, but is seldom studied through time. We analyzed a subset of longitudinal qualitative data to answer the question "What can we learn about identity construction through time if we consider identity work as both an individual activity and a collective activity?"
Methods: We (the authors) conducted serial, in-depth interviews with 6 trainees: 3 interviews in preclinical and 2 in clinical phases of medical school; 2 in internship and 1 at the end of 2nd and 3rd year residency (n=50 interviews in total). After general inductive analysis of the full dataset, we used the Listening Guide (1), a form of narrative analysis, for an in-depth examination of the voices we heard in a subset of data to which identity-related codes were attached. Both of us are PhD educators and have been conversational partners with the trainees since 2010.
Results: Expressions of individual identity and collective identity were more frequent in residency compared to medical school, and changed in focus, e.g., students spoke of "doing" a doctor's work whereas residents spoke of "being" a doctor. Individual identity was expressed in 1st-person voice, whereas collective identity typically was expressed in 2nd-person voice: (e.g., "I was one watching her saturations drop"; "I was the one who documented time of death"; "You can't allow yourself to feel both at the same time"). Tension was evident in narrative analysis of all 6 cases, but most salient in 2 cases whose individual identity seemed radically different from the collective identity of the specialty in which they were training. For example, Zoey was raised in a family dedicated to helping underserved populations. She obtained a business degree to prepare her to improve systems of care for these

populations. She chose to pursue a surgical specialty because she was "good with her hands"; but in time she "fought" this decision because the specialty was not known for system-orientation. Consequently, as 2nd year resident, Zoey feared that conflict between her individual identity and collective identity would leave her without purpose: "I get scared that because my interests are so far apart from each other, I am going to come out of residency in the middle, which is nothing." Unlike the other 4 cases, the 2 cases where tension was most salient had completed a dual degree and were in minority groups by virtue of their gender or sexual orientation.

Discussion: Expressions of individual identity and collective identity increase in frequency and change in focus through time. Schwalbe's model of identity work (2), defined as anything people do individually or collectively to give meaning to themselves or to others, helped explain the tension voiced in our data. In our longitudinal case study, trainees perceived a costly dichotomy: either they were not true to their individual identity or they were not true to the collective.

Conclusion: While future research should investigate the process of how medical trainees actually do identity work, our study highlights an immediate need for residency programs to provide safe spaces for trainees to navigate the tension between individual identity and collective identity.

Scenes, symbols and social roles: raising the curtain on OSCE performances

Authors
Gerard Gormley, Queen's University Belfast, Belfast, Northern Ireland
Mairead Corrigan, Queen's University Belfast, Belfast, Northern Ireland
Kathy Cullen, Queen's University Belfast, Belfast, Northern Ireland
Jennifer Johnston, Queen's University Belfast, Belfast, Northern Ireland

Presenter:
Gerard Gormley, Queen's University Belfast, Northern Ireland

Background:
Introduction: OSCEs are a widely used form of assessment in health profession education. The dominant psychometric discourse in OSCE related research has conferred many insights into this form of assessment. However such a positivist discourse does not paint an entire picture of their contextual and social dimensions [1].They are socially situated activities where candidates interact with SPs, in the presence of examiners – i.e. the OSCE triad. Social environments impact on the way individuals present themselves and interact with others.

With OSCEs becoming more sophisticated and scrutinised, there is an imperative, and the aim of our study, to explore in-depth the social roles and interactions that occur within them. Such information has potential to reframe our thinking about OSCEs and their future development.
Methods: Analysis was sensitised by symbolic interactionism, particularly Goffman's dramaturgy metaphor [2]. Senior medical students, examiners and SPs were invited by email to participate. A matrix of willing participants was used to select a maximal variation sample of 18 OSCE station encounters. Consenting subjects in the study were allocated to one OSCE circuit that already had unobtrusive ceiling mounted videocameras. Candidates were not aware of which OSCE station was being recorded and each examiner/SP combination did not know which candidate was being recorded. Footage of all 18 triadic encounters (128 mins) was transcribed. Using transcripts / video footage, analysis was inductive and iterative, focusing on the social roles and interactions within the OSCE triad. Consensus on themes across all triads - was reached by the research team – with constant reflexivity checks.
Results: Four themes were identified:
'Creating the right impression?'
On entering the station (front stage), candidates focussed on impression management with a desire to conform to examiners' expectations and 'play the OSCE game'. However, performances were often formulaic with a digitised questioning style and an absence of the natural to-and-fro of normal conversation.
'A performance of contradictions'
Contradictions occurred that were in direct opposition to assumptions about OSCEs. Competency and compassion are key tenets of what make a good doctor. However within the framework of OSCEs, the pursuit of displaying competency was often placed in opposition to displaying compassion to 'patients'.
'Simulated patients: instrumentalised and industrialised'
OSCEs induced dehumanization behaviour. Despite SPs providing a 'human face' to their role candidates interacted with SPs as if they were more a prop than a person.
'Examiners hold the power: hierarchy within OSCEs'.
OSCEs bring about social order and hierarchy within the triad. Examiners, as the primary audience, hold the greatest power which is mediated by possessing of the OSCE checklist.
Discussion and Conclusions: OSCEs are a complex form of drama that do not necessarily reflect the true social interactions of clinical practice. They promote a contrived reality, with a concerning shift from patient-centric to checklist-centric behaviours. Whilst checklists provide objectivity, they also encourage a presentation of self that is not entirely in keeping with the qualities of being a good doctor. Assessment drives learning but could OSCEs be distorting learning in the wrong direction. Rooted in empirical and contextually (i.e. summative setting) rich data, the findings of this study open up new ways of thinking about OSCEs. This unique study challenges us to reframe future assessment practices – for example by informing OSCE station design, examiner / SP training and external regulatory organisations that shape OSCE practice.

Normal and abnormal: a phenomenological study of family physicians' experiences of physical examination

Authors
Martina Kelly, University of Calgary, Calgary, Canada
Lisa Freeman, Nova Scotia Health Authority, Nova Scotia, Canada
Tim Dornan, Queen's University Belfast, Belfast, Northern Ireland

Presenter:
Martina Kelly, University of Calgary, Canada

Background:
Introduction: Medicine is the study of the human body. Early medical education focuses on the body as a site of objective learning through dissection of cadavers and microscopic examination of the tissues. These objective practices are re-enforced through repeated performance of physical examination skills, assessed in objective standardized exams. The physician's body is neutral and objective, rarely the focus of specific attention. Yet the body is inherently subjective, all experience is mediated via the body, through sight, smell, and touch. The physician's body is the site of subjective interpretation, through which physical findings, normal and abnormal are constituted. In this study, we wanted to explore physical examination as experienced through the physician's body by asking 'what is the lived experience of physical examination?'
Methods: This is an interpretative phenomenological study, set in family medicine. A purposive sample of family physicians, with a range of experiences, male, female, in urban or rural practice with varying levels of clinical experience, described in detail their experiences of physical examination. Interviews were recorded, transcribed verbatim, and field notes recorded. Data were analyzed using template analysis, and reflective writing. The team engaged in a process of dialectic questioning, moving back and forth between the data, emerging interpretations, paying explicit attention to how prejudgments impacted our analysis[1]. Findings were situated within the phenomenological writings of Husserl, Sartre and Merleau-Ponty[2], amongst others. Data collection stopped when we had sufficiently rich exemplars to deeply inform the phenomenon of performing physical examination.
Results: Sixteen family doctors participated, 8 women. 5 participants worked in rural practice; 5 were recent graduates.
Study participants described physical examination as core to practice, to diagnose and to communicate, a fundamental part of being a doctor. Routine examination affords a way for for physicians to evaluate working diagnoses and to reassure, through touch, patients' concerns and expectations, through 'doing something, which only takes a moment'. Performance of physical examination became automatic over time but a disruption to the expected caused physicians to pause. Participants described this as a slowing of time where they became conscious of the body of the patient and their own body, intertwined in a moment. Physicians experienced affective, intellectual, and physical phenomena, which integrated to guide their behavior, diagnosis, and management of the patient. The role of physical examination was to not only diagnosis as an evidence-based medical expert, but was experienced as a form of embodied, nonverbal communication, which expressed care.
Discussion: Merleau-Ponty's 'body-subject'[2] is used to examine these findings. He proposed that through habits of practice, the body is develops schema of performance, which are enacted pre-reflectively. Body schema integrate experience to inform future practice. On a day-to-day basis these schema direct our bodies as the 'lived body'. Encountering the unexpected disrupts the habitual body, and brings time, body, and mind into play demonstrating the embodied nature of physical examination.
Conclusion: Physical examination plays an important role to reassure and communicate trust in the doctor-patient relationship, enacted through the body of the physician. Complimenting diagnosis, the laying on of hands remains an essential element of patient care. Promoting a more conscious awareness of embodied experience, through the development of body pedagogics in medicine, offers a novel way to unite the objective, subjective dichotomy that pervades current discourses in medical education.

Patient involvement in medical students' communication skills training

Authors
Anne Marie Rieffestahl
Anne Mette Morcke
Hanne O. Mogensen
Susanne Reventlow

Presenter:
Anne Marie Rieffestahl, CAMES - Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Background: One of the most common issues patients complain about is communication, which suggests that patient-centered communication training needs to be developed further. Therefore, the communication training community now looks towards the patient involvement movement for inspiration and begins to involve patients with chronic diseases in communication skills training for medical student as a supplement to simulated patients. However, little is known about how this involvement of 'real' patients prepares the medical students to respond to the patients' unique needs and challenges.
Method: This study is based on qualitative methods. Following a well-established communication skills course that involves patients with chronic diseases, we conducted 11 individual semi-structured interviews and 3 focus groups. In all 33 medical students participated in the interviews. The interviews were transcribed. Emergent themes were found by multiple readings and codings organized with the use of the qualitative data administration software NVivo.
Results: The students described that the 'real' patients' added real emotions and expressed unique needs and challenges due to their personal diagnosis and life condition. This created unpredictability in the conversation. Even though, the students found the unpredictability rather frustrating, they additionally described it as an authentic learning experience, which felt reassuring and relevant to their forthcoming clinical work. Furthermore, when training with 'real' patients, as opposed to simulated patients, the students felt that they truly had to balance the skills of providing biomedical information and empathy in the conversation with the patient.
Discussion: Patient involvement in communication skills training generates awareness of the emotional complexity that serve to patients' complaint about poor doctor-patient communication. Medical students must not only require skills in biomedicine or empathy to enhance patient-centered communication. They have to start learning the art of balancing both skills to strive for professionalism.

Conclusions: Patient involvement in communication skills training is valuable for medical students to develop their ability to balance the skills of providing biomedical information and responding to patients' emotions in patient-centered communication.

Engaging Patients in Health Professions Education Admissions: A Scoping Review of Best Practices, Policies and Research

Authors
Mark D. Hanson, Hospital for Sick Children, University of Toronto, Toronto, Canada
Celeste Pang, Hospital for Sick Children, Toronto, Canada
Justine McLeod, Hospital for Sick Children, Toronto, Canada
Elena Springall, Gerstein Science Information Centre, University of Toronto Libraries, Toronto, Canada
Kulamakan Kulasegaram, Department of Family & Community Medicine and MD Program and Wilson Centre; Faculty of Medicine, University of Toronto, Toronto, Canada
Kevin Eva, Centre for Health Education Scholarship Professor and Director of Education Research and Scholarship, Department of Medicine Faculty of Medicine, University of British Columbia, Vancouver, Canada

Presenter:
Mark D. Hanson, Hospital for Sick Children, University of Toronto, Canada

Background: Patient engagement (PE) in Health Professions Education (HPE) is important at all educational levels. To investigate best practices for PE in HPE admissions, we conducted a scoping review describing admissions practices, policies, and research.
Method: Subject headings and key words were used to retrieve abstracts in Ovid MEDLINE (1946-present) relevant to patient, consumer and public admissions participation across health professions. Using an iterative screening strategy, reviewers conducted full text and bibliography review of abstracts potentially relevant to PE in HPE admissions. Included abstracts described studies of PE practices, relevant policies and research associated with HPE admissions. Excluded abstracts included studies of admissions practices involving standardized patients and non-English citations.
Results: Of 2969 abstracts identified, 11 articles were found suitable for inclusion. The majority of analyses were published between 2000-2016 and focused on UK and US examples. The adoption of and arguments for PE in these two jurisdictions are linked to key government and health profession policies. In the UK, federal policy has driven increased PE across health and social service education planning and delivery. In the US, the Association of American Medical Colleges (AAMC) Holistic Review Project has propelled efforts to develop admissions tools promoting diversity in medical schools. Compliance with US federal disability legislation has also formed the basis of an argument for PE in HPE admissions. Our review identified these policies with the potential to advance PE in HPE admissions, yet PE practices in HPE admissions have only been selectively implemented. Examples include UK social work programs and one US medical school. Few

models for effective integrative PE in HPE admissions exist and research examining performance-based outcomes is absent.

Discussion: Our scoping review reports government and health profession policies conducive to PE in HPE admissions across jurisdictions, yet limited examples of PE practice and research in HPE admissions exist.

Conclusions: PE in HPE admissions presents a mixed picture. The findings of this literature synthesis lay the groundwork for a research agenda that examines the facilitators and barriers to integrative PE across all HPE admissions, to ensure transformational implementation.

'I will never ever go back': Patients' narratives of healthcare communication interactions

Authors

Charlotte Denniston, The University of Melbourne, Melbourne, Australia
Elizabeth Molloy, The University of Melbourne, Melbourne, Australia
Charlotte Rees, Monash University, Melbourne, Australia

Presenter:
Charlotte Denniston, The University of Melbourne, Australia

Background: Patient engagement is valued, but still somewhat uncommon in the design of health professions education (HPE). Patient narratives are constructions of patients' lived realities and are one way of incorporating the patient's voice into HPE. Through focussing on positively and negatively evaluated stories of healthcare communication interactions, this research explored patients' narratives to inform communication skills teaching in the health professions.

Method: This research asked: 'what differences exist in patients' positively and negatively evaluated narratives of healthcare interactions?' This interpretivist research was underpinned by social constructionism. We employed a narrative inquiry approach to design an online questionnaire that was advertised to patients in the community. The questionnaire prompted participants to share their stories using the structure of narrative as proposed by Labov (1997): abstract, orientation, complicating actions, evaluation, most reportable event and resolution. Framework and narrative analysis techniques were conducted.

Results: This study collected 180 narratives from 124 patients about previous healthcare professional (HCP) communication interactions. Narratives were coded as having a 'positive' (n=80), 'negative' (n=97) or mixed (n=3) evaluation. Framework analysis revealed details about interpersonal factors and patient actions during and after consultations. While rich constructions of positive and negative emotions were presented within patient narratives, this emotion was often not shared with the HCP involved at the time of the interaction. For example, dissatisfaction was often followed by patients 'never going back' to that HCP and instead seeking care elsewhere.

Discussion: We explored the patient's voice, a voice underrepresented in HPE, to better understand experiences of communication in healthcare. Using narratives to gain insights into patients' experiences, emotions and current and future healthcare seeking behaviours can be a useful means by which HCPs can teach, and learn about, the patient's perspective in communication.

Conclusions: The educational implications of this work include the importance of HCPs seeking and acting on patient feedback to calibrate their own interpretations of the patient experience and of their own communication practices. The use of narrative questioning, informed by models such as Labov, may facilitate the gathering of meaningful information about patients' experiences of healthcare.

The impact of patient involvement in the teaching and assessment of intimate examination skills: a randomised control trial

Authors

Rebecca Baines, Collaboration for the Advancement of Medical Education Research and Assessment (CAMERA), Plymouth University, Plymouth, UK
Daniel Zhara, Plymouth University, Plymouth, UK
Bhavna Bhalla, Plymouth University, Plymouth, UK
Jane Moore, Oxford University, Oxford, UK
Andrew Kelly, Plymouth University, Plymouth, UK
Thomas Gale, Plymouth University, Plymouth, UK

Presenter:
Rebecca Baines, Peninsula Schools of Medicine and Dentistry, Plymouth University, Plymouth, UK

Background: Patient and public involvement (PPI) is a central policy agenda across most educational programmes. However, despite repeated emphasis of its centrality to the higher education experience, research examining the impact of PPI in the assessment of undergraduate healthcare professionals is limited, particularly in the assessment of intimate examination skills using robust study designs such as randomised controlled trials.

Method: A randomised control trial design was used to assess the impact of patient involvement in the teaching and summative assessment of intimate examination skills. Volunteer fourth-year medical students participated in an OSCE scenario where they were blindly assessed by gynaecological teaching associates (GTA's) from Oxford University. Assessment scores from those who had received mannequin training only (control group) and those who received training from lay-women at the University of Plymouth (experimental group) were compared. The OSCE was repeated three months later to assess the long-term impact of each training method. Participant interviews were also conducted to provide additional insight.

Results: Students taught by the existing mannequin and GTA's achieved different assessment scores reported qualitatively different experiences. Initial findings suggest that whilst some areas benefit from PPI, others are less

affected. Participant interviews identified added value as a result of PPI in assessment including the opportunity to engage with 'real' patients, enhanced authenticity, and improved awareness of non-clinical elements. Factors influencing these effects from a student, patient assessor, and academic staff perspectives are also discussed.

This research advances existing understanding by examining the impact of PPI in the assessment of intimate examination skills using a randomised controlled trial.

Discussion: Results hold important implications for developing innovative teaching and assessment methodologies across medical schools and related disciplines internationally. An accurate understanding of PPI in assessment can help to address its acknowledged barriers including validity, authenticity, and objectivity. Patient involvement in summative assessment is valuable and achievable.

Conclusions: Patient variability should not be used as a deterrent, but as an opportunity to enhance assessment authenticity helping to prepare students for the complexity and reality of clinical practice.

Take-home message: PPI should be considered at a minimum, complementary to existing assessment methods.

Building a Culture of Accreditation Awareness

Authors
Tanis Adey
Taryn Hearn
Heidi Coombs-Thorne

Presenter:
Tanis Adey, Memorial University, St. John's, Canada

Background: Accreditation is a process by which educational programs voluntarily undergo extensive peer evaluation of compliance with accepted standards of educational quality. Research suggests that the level of stakeholder engagement with the accreditation process has a direct impact on the success of a review. In 2016, we surveyed faculty, staff, and students about their knowledge of the accreditation process. The majority of respondents (78.6%) felt that they were not involved in accreditation despite the fact that 53% reported participating in specific aspects of the process. Approximately half of participants were not familiar with undergraduate medical education requirements. Based on this survey, we developed a communication strategy to build awareness of accreditation. This project explores the potential of this strategy to enhance the accreditation process.
Method: This project involved a series of presentations to 12 disciplines and undergraduate students. The presentations highlighted the Interim Review Process (IRP) as a means of encouraging a culture of continuous quality improvement. They also included a knowledge test and a feedback form for participants to complete. In addition, as part of our communication strategy, information on the IRP was posted on the Faculty of Medicine website.
Results: 201 faculty, staff, and students answered the knowledge-test (12.2%) and 214 completed feedback forms (13%). The majority (86%) of knowledge-test participants did not know that accreditation constitutes peer evaluation and 73% were not familiar with the IRP. 57.7% of participants who completed the feedback forms reported that the presentations increased their interest in participating in accreditation-related activities. Finally, 50% of participants felt that a culture of change is important to the accreditation process.
Discussion: In the knowledge-tests, participants demonstrated limited knowledge of accreditation requirements, the accreditation process, or the IRP. However, they felt that accreditation and the IRP are important to medical education. They also found the presentations engaging and informative and served to increase their interest in being involved in the accreditation process.

Conclusion: Based on the results of this project, we argue that a communication strategy can create a culture of accreditation awareness and positively impact the accreditation process.

Presence of medical students in the visiting team of accreditation - we approved

Authors
Milton Martins, Faculty of Medicine of University of Sao Paulo, Sao Paulo, Brazil
Sigisfredo Brenelli, Faculty of Medicine of State University of Campinas, Campinas, Brazil
Fernanda Arantes-Costa, Faculty of Medicine of University of Sao Paulo, Sao Paulo, Brazil
Carlos Silva-Filho, Faculty of Medicine of Marilia, Marilia, Brazil
Luciene Conterno, Faculty of Medicine of Marilia, Marilia, Brazil
Patricia Tempski, Faculty of Medicine of University of Sao Paulo, Sao Paulo, Brazil

Presenter:
Milton Martins, Faculty of Medicine of University of Sao Paulo, Brazil

Background: Accreditation of medical schools has been performed in an increasing number of countries. A new system of accreditation of medical schools was created in 2015 in Brazil by the Brazilian Nacional Medical Council and the Brazilian Association of Medical Education, following the standards of the World Federation of Medical Education (WFME). A medical student was included in the visiting team of this new system of accreditation (System of Accreditation of Medical Schools – SAEME).
Method: We analyzed the results of the first 16 medical schools that were visited with a medical student included in the visiting team and compared the preliminary report of the self-report instrument performed by the medical students and the other members of the visiting team. Our self-report instrument has five domains: educational program, educational environment, faculty affairs, student affairs and medical school governance. We also compared the evaluation of the members of the visiting team performed by the medical school visited.
Results: There was a good agreement between the evaluation of medical students and the other members of the visiting team in three domains: academic staff/faculty, educational resources and educational governance. Students tended to be more rigorous in the evaluation of student affairs and less rigorous when evaluated educational program domains compared to faculty members of the visiting team. Deans of medical schools visited considered the participation of medical students in the visiting teams satisfactory or very satisfactory in, respectively 26.5% and 70.3% of the items, considering all items of the evaluation form of the visit.
Discussion: The evaluation of the visit reports showed high agreement of results comparing medical students and other members of the visit team. Deans of medical students approved the presence of medical students in the visiting team.

Conclusion: The inclusion of medical students in the visiting team results in an increase in the quality of the accreditation process of medical schools.

Rethinking Accreditation: New National Standards for Canadian Residency Education in a CBME Era

Authors
Jason R Frank, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada
Bailie McGurn, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada
Sarah Taber, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada
Tara Phillips, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada
Ric Almond, College of Family Physicians of Canada, Toronto, Canada
Anne-Marie MacLellan, Colège des médecins du Québec, Montreal, Canada

Presenter:
Jason Frank, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Background: The current Canadian residency education accreditation system has evolved into a system with many manual procedures and process-oriented standards. Three Canadian accrediting colleges came together, forming CanRAC, to develop a new conjoint residency accreditation system that is aligned with the principles of competency-based medical education (CBME), and comprises 10 components.
Method: Interviews with Canadian postgraduate deans highlighted strengths and challenges of the current accreditation system. Current accreditation standards were felt to be process-heavy, unclear, and not reflective of best practice. CanRAC created a governance structure to develop new accreditation standards, with key stakeholders, by consensus, using a multi-year, iterative development process.
Results: : Following several years of development, consultation and testing, CanRAC has created a blueprint for a 21st century accreditation system; two components are new standards for residency programs and institutions, and a new framework by which these standards are evaluated. The standards include six new content domains (Institution Governance, Program Organization; Education Program; Learners, Teachers, and Administrative Personnel; Resources; and, Continuous Quality Improvement) and are aligned with CBME, and place greater emphasis on the learning environment, continuous quality improvement, and program outcomes. The Canadian residency accreditation system had not undergone a comprehensive review and reform in more than 20 years, and required work to be aligned with CBME and an increased focus on outcomes. The new Canadian accreditation standards set new expectations and drive ongoing quality improvement of residency education, and ultimately, enhanced patient care.
Conclusion: As health professions education moves towards CBME, accrediting bodies are increasingly looking

to improve and enhance their standards. The new CanRAC standards and process by which they were developed provide an example for other accrediting bodies looking to reform their accreditation standards for residency education.

The Regulator and the Medical School – a collegiate approach to approval processes

Authors
Hannah Wisdom, Plymouth University Peninsula Schools of Medicine and Dentistry, Plymouth, UK
Emily Saldana, General Medical Council, London, UK

Presenter:
Hannah Wisdom, Plymouth University Peninsula Schools of Medicine and Dentistry, Plymouth, UK

Background: The General Medical Council (GMC) is responsible for setting the standards for training of medical students in the UK. These include the standards medical schools must meet in teaching and assessing students and the skills and behaviour students must demonstrate to complete the course. The GMC regularly monitors medical schools to ensure these standards are maintained, and decides if new medical schools should be allowed to issue medical degrees.
Plymouth University Peninsula Schools of Medicine and Dentistry is a new medical school based in the South West of England. Established in 2012, it accepted its first students in 2013. It has just successfully completed the intensive five-year process of rigorous annual 'new school' quality assurance inspections by the GMC, and final approval is due to be ratified in February 2018.
Summary
The poster will describe the process for:
• Assurance of Quality by the GMC, and how the school interprets requirements and recommendations;
• The school's approach to preparing for GMC visits, management of evidential documentation and links to university quality assurance processes;
• The school's demonstration of compliance with GMC Standards, and how the regulator assesses this;
• How the school and the GMC work together to develop a good working relationship, including responsiveness and flow of information.
An open, honest and candid approach by the school, which thoughtfully considers the work process from the point of view of the regulator, will aid the approval process and help develop good working relationships.

9H5 (815)
Costs of undergraduate medical education: how is the money spent in hospitals?

Authors
Philip Chan

Presenter:
Philip Chan, University of Sheffield, Sheffield Teaching Hospitals, Sheffield, UK

Background: English medical education is dually funded; largely through student fees to the University, and a separate grant to clinical providers, including hospitals, through a government agency, Health Education England. The HEE undergraduate tariff in 2014 was GBP 34623 per student per year.

Method: As part of the costing exercise for this tariff, HEE surveyed every hospital trust that provided undergraduate medical education in 2013-4, asking for costs actually incurred in specific areas. There was no specification or oversight of how individual hospitals collected information for their returns, but the returns had to be signed off by their finance departments. These returns were obtained through a Freedom of Information request.

Results: For final year medical students, 155 English hospital trusts returned costs. Median total costs per student per year was GBP28705 (range 3072-1623943); 48% of this cost was attributable to staff teaching, 7% for facilities, 1% for administration and 16% for overheads. Median direct plus placement teaching costs per student do not appear credible when analysed against consultant pay.

Conclusion: There were clear deficiencies in many returns; there were zero costs entered by some trusts in every category; and some hospitals miscounted their students. There were also no data for capital spending or charges. However, unless the majority of hospitals misrepresented their costs, there is around 17% profit for undergraduate medical education, even with overstatement of direct teaching costs. It is likely that the money received for undergraduate medical education is used for other purposes within English hospitals.

Implementation of OSCE as national exam

Authors
Zalim Balkizov
Tatiana Semenova
Zhanna Sizova

Presenter:
Zalim Balkizov, ASMOK, Moscow, Russia

Background: The National exam for physicians was introduced in Russia in 2011 with delayed implementation on 2016. Before its implementation access to the medical profession was based on diploma and formal certification after residency programs. New regulation implements 3 types of accreditation - primary after graduation from the medical school, primary specialized after residency programs, and reaccreditation every 5 years of practice. To develop and run national exam we started with development of professional standarts (for each of 96 specialties), the exam itself was divided into 3 steps - MCQ, OSCE and oral examination. Federal Center for Accreditation (FMZA) was founded as structure of the Sechenov University in 2015. FMZA was responsible for development of MCQ, OSCE stations and cases for the oral exam. In 2016 two specialties - Dentistry and Pharmacists was pioneer in the primary accreditation, in 2017 all graduates of 9 undergraduate medical specialties had to pass accreitation in order to get access to the primary practice and residency. In total we had about 30 000 graduate students.
First implementation of OSCE was very limited - only 5 stations was adopted nationwide for the accreditation step 2. However, independent assessment of clinical skills became strong motivation for both - students and faculty members to improve training in clinical skills centers. Authors will present first results of the OSCE implementation in Russia.

The nationwide German licensing examinations as a benchmark for cross-institutional comparisons: How to make apples to apples comparisons possible?

Authors
Hossein Shahla, IMPP, Mainz, Germany
Jana Jünger, IMPP, Mainz, Germany
Martin Hendelmeier, IMPP, Mainz, Germany
Ilse Lorenz, IMPP, Mainz, Germany
Birgitta Kütting, IMPP, Mainz, Germany
Volker Schillings, IMPP, Mainz, Germany

Presenter:
Hossein Shahla, IMPP, Mainz, Germany

Background: The second medical state exam (M2) represents the final written licensing exam for future physicians in Germany. M2 is carried out with up to 4000-6000 participants originating from 36 medical schools twice a year (April and October) by the German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy (IMPP). Against this background there is a tremendous public and administrative interest in using the faculty-level outcomes of the nationwide licensing examinations as a benchmark for cross-institutional comparisons. Faculty-level outcome variations on IMPP licensing examinations are however multi-causal, confounded by faculty effects as well as student characteristics. There is a considerable disparity between German medical schools caused by unbalanced distribution of student characteristics among faculties. Thus adjustments for student characteristics are an indispensable requirement for fair cross-institutional comparisons.
Method: The goal of this study is to develop an adjustment procedure that allows faculties, experts, and federal government officials to make apples-to-apples comparisons among medical schools. Following the core philosophy of value added approach we adjust M2 exam outcomes at faculty level for student characteristics (covariate adjustment). Faculty-specific effects are disentangled from the population-specific effects (= effects of individual student characteristics) running statistical models with fixed faculty factors.
Results & Discussion: Students characteristics (gender, age, ethnicity, 'university entrance entitlement') are powerful determinants of individual exam outcomes (R^2 = 0.36). Estimated faculty level means controlling for student covariates are free from the effects of student characteristics. So covariate adjustments counterbalance the disparities of medical schools caused by unbalanced distributions of student characteristics among faculties and substantially change the naive ranking of faculties. Unadjusted faculty level means of German nationwide licensing examinations are ineligible ranking instruments. Particularly if they are used as standards for allocation of founds by federal governments, estimated faculty level means controlling for student covariates are, in contrast, more appropriate for ranking of German medical schools.

9I3 (3090)
Two Years' Experiences of a new Swedish National Proficiency Test for Doctors of Medicine

Authors
Magnus Hultin
Benoni Edin
Anders Själander

Presenter:
Magnus Hultin, Umeå University, Umeå, Sweden

Background: A new Swedish national proficiency test was instituted in 2016 for medical doctors trained outside EU/EES applying for a license to practice in Sweden. The test comprises a theoretical and a practical part both offered 4 times per year. Three attempts are allowed for the theoretical part, and once passed, two attempts for the practical part. As a consequence of the Sweden's right-of-access principle, all tests have to be constructed de novo without calibration questions.
Method: Theoretical knowledge is assessed by means of MCQs with one single best answer and four distractors: (i) 140 MCQs cover the complete medical curriculum (4h); (ii) 5 × 5-7 MCQs related to five clinical cases (1h); and (iii) 10-20 MCQs to probe knowledge within EBM (1h).
Pass levels are decided by modified Angoff. Quality assurance is achieved by blueprinting, a question review board, analyses of item and test statistics, and a post-examination review allowing examinees within 48h to propose alternative interpretations of questions and answers.
The practical test is implemented as OSCE: one 14-station OSCE circle with 6 min stations and one 4-station circle with 14-min stations. Pass levels are decided by consensus among the examiners.
Results & Discussion: Five theoretical tests have been completed and 379 tests taken by 284 individuals of which 75 have passed (26%). Chronbach's alpha were >0.90. Average score was 50 12% and the pass level 60-62%.
Five practical tests have been completed by 60 individuals of which 53 passed the test (88%).
One year after the first theoretical test, the first medical doctors were licensed to practice in Sweden based on the results of the proficiency test.
Only 11-23% pass the theoretical test. The examinee's preparation for the proficiency test needs to be improved, perhaps by minimizing the Dunning-Kurger effect and improving language proficiency.
Conclusion: The new Swedish national proficiency test covers the medical curriculum and its theoretical part identifies candidates that are likely to be proficient in practical medicine.

9I4 (2934)
Written Exam Performance in the Second Part of the Medical Exam: the impact of elective and outcome in oral clinical examinations on results in the written part of the second national medical licensing exam

Authors
Birgitta Kütting, IMPP, Mainz, Germany
Maren Koop, IMPP, Mainz, Germany
Ilse Lorenz, IMPP, Mainz, Germany
Hossein Shahla, IMPP, Mainz, Germany
Jana Jünger, IMPP, Mainz, Germany

Presenter:
Birgitta Kütting, IMPP, Mainz, Germany

Background: According to the amended approbation ordnance for physicians, from spring 2007 to autumn 2014, medical students in Germany had to complete both the written and the verbal-practical segment of national medical licensing exam within a view weeks. Since the timeframe between both exams was very short, the knowledge base of examinees is to be assumed identical in both exams.
The study was aimed to analyse the correspondence of written and verbal-practical exam performances in the second part of the national medical licensing exam.
Material and Method: 59,122 students have been included. The grades achieved in the verbal-practical exam were compared with the overall performance; to reduce confounding -as well as- with partial results of the written exam. The impact of the clinical-practical experience on the written exam performance was assessed in a subgroup of examinees with the six most frequent PJ-electives (n=45,029).
Results: The grade point average for the verbal-practical exam was significantly higher than the exam results of the written exam (mean: 1.6 vs. 2.9). 78.2% earned the highest grades 1 or 2 in the verbal-practical exam, whereas only 34% achieved these grades in the written exam. When comparing the written partial results with the results of the verbal-practical exam, this difference has decreased. Reviewing the written exam results of all candidates in the six most frequent PJ-electives, the candidates tended to achieve higher grades in their applicable elective subject than all others who did not have an opportunity to gain in-depth practical experience in this subject.
Discussion: The written uniform exams are proportionally more difficult for the examinees than the verbal-practical exams conducted by faculty. Clinical-practical experience in the elective subject produced better IMPP-results in this subject; therefore, the IMPP-exams seem to be a suitable surrogate for demonstrating a greater clinical knowledge base.
Conclusion: The results of the nationally uniform written exams are almost one grad lower than the university exams conducted almost simultaneously. The reason for this may be the characteristics of both exam forms, as well the different goals of the exam formats.

9I5 (2578)
The Licensing Examination for Doctors – Use of Multilingual Format in Hong Kong

Authors
So Ching Sarah Chan, The University of Hong Kong, Hong Kong SAR
Nivritti Gajanan Patil, The University of Hong Kong, Hong Kong SAR

Presenter:
So Ching Sarah Chan, The University of Hong Kong, Hong Kong

Background: All medical graduates who wish to obtain full registration as medical practitioners in Hong Kong, with the exception of graduates of the two local medical schools (the University of Hong Kong and the Chinese University of Hong Kong), have to pass the Licensing Examination of the Medical Council of Hong Kong.
The Licensing Examination consists of three parts. Part I examines the professional knowledge by multiple-choice questions. The questions are available in both English and Chinese. Part II is a proficiency test in medical English, assessing comprehension and writing skills. Part III is the clinical examinations in Medicine, Surgery, Obstetrics & Gynaecology and Paediatrics. (1) The clinical examinations are primarily conducted in English. However, candidates are given the choice to answer in Cantonese (a Chinese dialect), Mandarin or English. If necessary, interpreters can provide translation for candidates when they interact with patients during the clinical examination.
Based on the criteria of eligibility, there may be potential candidates from various parts of the world. The medium of instruction in many medical schools worldwide is primarily English. However, there are some candidates from mainland China who come from medical schools with curriculum being taught in Chinese. A proficiency test of medical English is in place to ascertain that all candidates meet the required standard of English for medical practice. The availability of Chinese multiple-choice questions facilitates the candidates from mainland China.
Although both Chinese and English are the official languages of Hong Kong, 89.1% of the population in Hong Kong are Cantonese speakers. (2) By allowing the use of Cantonese, Mandarin or English for answering during the clinical examination, this facilitates candidates from mainland China and other parts of the world. This also fulfills the need of local Cantonese-speaking patients participating in the examination. The clinical examination setting can thus mimic the actual local working environment. Knowing both Cantonese and English is deemed advantageous as additional time is not allocated for translation during the examination.
Take-home message: Multilingual format in Licensing Examination for doctors allows testing of candidates within a local context.

Sweat in Peace, Bleed not in War: Regular Cumulative Exams to Better Prepare Students for the Rigors of the National Medical Licensing Exam

Authors
Gerald R. Thrush, Western University of Health Sciences/College of Osteopathic Medicine of the Pacific, Pomona, USA
Scott Helf, Western University of Health Sciences/College of Osteopathic Medicine of the Pacific, Pomona, USA
Edward Junkins, Western University of Health Sciences/College of Osteopathic Medicine of the Pacific, Lebanon, USA
Susan Mackintosh, Western University of Health Sciences/College of Osteopathic Medicine of the Pacific, Pomona, USA
Edward Barnes, Western University of Health Sciences/College of Osteopathic Medicine of the Pacific, Pomona, USA

Presenter:
Gerald Thrush, Western University of Health Sciences, Pomona, USA

Background: Competition for post-graduate medical education in most specialties (residency) in the U.S. is increasing. Candidate scores on the national licensing exam (boards) is a significant factor in selecting who may be interviewed. Because of the increasing significance of board performance, we have implemented end-of-semester cumulative exams to assess and better prepare our students for the boards.
Method: In order to be eligible for graduation and conferral of their medical degree, students are required to pass board examinations. In efforts to stimulate retention of acquired knowledge, we require our students to take and pass cumulative semester exams which assess material taught during the current and previous semesters. We performed regression analysis to assess alignment of our cumulative exams with the national boards.
Results: We found that students retain significant knowledge from previous semesters. Additionally, the correlation between exam performance and boards is highly significant. The second-year cumulative exams showed a high Pearson correlation coefficient with boards: R = 0.71 for the third semester and R = 0.80 for the final cumulative exam, respectively. The final cumulative exam had a slightly higher correlation than that of medical school GPA and the boards (R = 0.73). The correlation between the first-year final cumulative exams and boards was modest (R = 0.58).
Conclusion: The introduction of semester cumulative exams has ensured that students are better prepared for the national boards and has helped identify at-risk students. Since the introduction of cumulative exams, our first-time pass rate for the level 1 national board exam has risen from 91.6% to 97.3%.
Take-home message: Implementing cumulative assessments has empowered us to better prepare students for the rigors of the national licensing exam,

identify at-risk students for earlier intervention, and
increase our first-time pass rate.

Putting learners in control of assessment: An innovative co-design approach for work place based assessments (WBA)

Authors
Jennifer Hallam, University of Leeds, Leeds, UK
Richard Fuller, University of Leeds, Leeds, UK
Jason Ward, University of Leeds, Leeds, UK
Jennifer Russell, University of Leeds, Leeds, UK
Bethan Spurrier, University of Leeds, Leeds, UK

Presenter:
Jennifer Hallam, University of Leeds, UK

Background: WBAs are key components of modern programmes of assessment focusing on direct observation and feedback for learners. In order to be fit for purpose, WBA feedback should ensure that students engage and find value in the assessment. With the advent of more 'just in time', technology enhanced assessment, are there opportunities to place learners truly at the heart of workplace assessment?
Method: We evaluated our existing app based WBA using a mixed methods approach with 92 medical students and 22 educators/clinicians. As a result of the evaluation we embarked on a re-design of the assessment and adopted a co-design approach involving 55 medical students and 33 educators/clinicians.
Results: The evaluation highlighted that the inherent purpose of the assessment was clear and that it was instrumental in building rapport and professional relationships, however the app design and structure was found to be confusing, limiting the capture of quality feedback. During co-design sessions, students developed their own 'success criteria' for WBA which was mapped directly onto the re-designed assessment.
The new app was presented to all students using a behaviour change model as a 'nudge', with initial evaluation showing that students are undertaking more WBAs, developing more detailed action plans and that both the feedback and action plans have vastly improved in terms of quality.
Discussion: Whilst WBAs are an essential part of medical education, this evaluation highlighted the importance of design in ensuring successful use in busy clinical environments. The adoption of a co-design approach allowed students to be owners of the assessment and develop criteria that would support their learning. We moved away from quantifying performance based, behavioral feedback and focused on rich, actionable narratives to enhance the quality of workplace learning.
Conclusion: The use of co-design has many benefits including a greater understanding of student need, ensuring that the assessment is fit for purpose and importantly it has resulted in the increased engagement and forward planning of previously poorly engaged learners.

9J2(948)
An evaluation analysis of 12 months of EPA assessments in Australian general practice trainees

Authors
Nyoli Valentine, ModMed, Adelaide, Australia
Jill Benson, ModMed, Adelaide, Australia
Kaye Atkinson, ModMed, Adelaide, Australia
Jon Wignes, ModMed, Adelaide, Australia
Stephanie Clota, ModMed, Adelaide, Australia

Presenter:
Nyoli Valentine, ModMed, Adelaide, Australia

Background: EPAs are a well-documented method of assessment used in undergraduate and postgraduate settings around the world. During 2016, 13 EPAs were developed for Australian general practice training.
Method: An evaluation of the EPAs that have been completed was undertaken. Supervisors completed an EPA assessment four times during 2017 for 131 junior trainees and 151 senior trainees. Trainees also completed an equal number of self-assessments using the same EPAs. There was an opportunity for comments after each EPA. The levels of entrustment for all EPAs were analysed and the comments for a random sample of junior and senior trainees coded.
Results: Analysis of the EPAs demonstrated supervisors utilised all levels of entrustment in marking their trainees, from needing frequent in-room review to being able to practice unsupervised. Similarly, each EPA had different distributions of entrustment indicating supervisors considered each EPA separately. Levels of entrustment for all 13 EPAs were higher for senior trainees compared to junior trainees and there was growth in level of entrustment seen over time for both senior and junior trainees. There was correlation between the level of entrustment marked by supervisors and the self-reflection analysis by the trainee.
Qualitative data analysis of the feedback narrative about each EPA by supervisors and trainees indicate the narrative covers a broad range of areas including competency, specific advice, technique, experience, specific gaps, confidence, requirement for supervision, behaviour, performance and progress. The narrative for junior trainees were more specific and of higher quality than the narrative for senior trainees.
Discussion: For the EPAs developed, supervisors were able to utilise all levels of entrustment. Growth in levels of entrustment was seen throughout the year in both junior and senior trainees. Comments written by trainees demonstrate self-reflection and supervisors provided feedback to assist with learning.
Conclusion: EPAs developed for Australian general practice training are a valuable assessment tool which are able to demonstrate growth in junior and senior trainees; and stimulate self-reflection and the provision of narrative rich feedback to the trainee from the supervisor over a broad range of areas.

A systematic review and meta-analysis on the educational impact of Mini-CEX and DOPS and its association with implementation

Authors

Andrea Lörwald
Felicitas-Maria Lahner
Christoph Berendonk
John Norcini
Robert Greif
Sören Huwendiek

Presenter:
Andrea Lörwald, Universität Bern, Institut für Medizinische Lehre, Bern, Switzerland

Background: Mini Clinical Evaluation Exercise (Mini-CEX) and Direct Observation of Procedural Skills (DOPS) are used as formative assessments worldwide. Since an up-to-date comprehensive synthesis of the educational impact of Mini-CEX and DOPS is lacking (Miller & Archer, 2010), we performed a systematic review. Moreover, as the educational impact might be influenced by characteristics of the setting in which Mini-CEX and DOPS take place or their implementation status (Durlak & DuPre, 2008), we additionally investigated these potential influences.

Method: We searched Scopus, Web of Science, and Ovid, including All Ovid Journals, Embase, ERIC, Ovid MEDLINE(R), and PsycINFO, for original research articles investigating the educational impact of Mini-CEX and DOPS on undergraduate and postgraduate trainees from all health professions, published in English or German from 1995 to 2016. Educational impact was operationalized and classified using Barr's adaptation of Kirkpatrick's four-level model (Barr, Freeth, Hammick, Koppel, & Reeves, 2000). Where applicable, outcomes were pooled in meta-analyses, separately for Mini-CEX and DOPS. To examine potential influences, we used Fisher's exact test for count data.

Results: We identified 26 articles demonstrating heterogeneous effects of Mini-CEX and DOPS on learners' reactions (Kirkpatrick Level 1) and positive effects of Mini-CEX and DOPS on trainees' performance (Kirkpatrick Level 2b; Mini-CEX: standardized mean difference (SMD)=0.26, p=0.014; DOPS: SMD=3.33, p<0.001). No studies were found on higher Kirkpatrick levels. Regarding potential influences, we found two implementation characteristics, "quality" and "participant responsiveness", to be associated with the educational impact.

Conclusions: Despite the limited evidence, the meta-analyses demonstrated positive effects of Mini-CEX and DOPS on trainee performance. Additionally, we revealed implementation characteristics to be associated with the educational impact. Hence, we assume that considering implementation characteristics could increase the educational impact of Mini-CEX and DOPS.

Take-home messages:
- Mini-CEX and DOPS demonstrate mixed effects on learners' reactions (Kirkpatrick Level 1).
- Mini-CEX and DOPS demonstrate positive effects on trainee performance (Kirkpatrick Level 2b).
- The educational impact of Mini-CEX and DOPS seems influenced by characteristics of implementation.

Clinical Encounter Assessment: A daily competency-based workplace-based assessment tool for anesthesiology trainees

Authors

Rebecca Dube, SickKids Hospital, Toronto, Canada
Clyde Matava, SickKids Hospital, Toronto, Canada
Alayne Kealey, Sunnybrook Hospital, Toronto, Canada
Lisa Bahrey, Toronto General Hospital, Toronto, Canada

Presenter:
Rebecca Dube, SickKids Hospital, Toronto, Canada

Background: Workplace-based assessment is central to outcome-based medical education. In postgraduate anesthesiology training, where residents work with different supervisors each day, a daily evaluation tool is commonly employed. Our program created the clinical encounter assessment (CEA), a daily workplace-based assessment tool designed to reflect increasing resident independence and competence. The scale of the CEA is based on the extent to which a faculty trusts a resident to independently manage various case elements. We sought to identify whether the CEA tool captured increasing independence across increasing post-graduate training years, and to identify factors that would predict high evaluations for practice independence.

Method: We retrospectively examined CEA assessment data for anesthesiology trainees of all training levels obtained from July 1, 2017 to October 1, 2017. Univariate and multivariate analyses were used to identify factors and a model predicting overall independence. A P<0.05 was taken as significant.

Results: The median overall level of independence of trainees increased from "DIRECTION: Required some guidance and/or coaching for this case" in PGY1 to "AUTONOMOUS: Did not require coaching or guidance for this case" in PGY5. Regression analysis in the CEA tool demonstrated that trainee overall level of independence was correlated with post-graduate training year (R2=0.18, p<0.05). After adjusting for site, on call status and case complexity, trainee performance in the "Patient assessment" (P=0.01) and "Critical thinking, insight and judgement" (P=0.03) domains predicted trainee overall level of independence (R2=0.87). Anesthesia plan creation (P=0.07) trended towards predicting trainee overall level of independence but was not statistically significant.

Discussion: The CEA assessment tool captures increasing anesthesia trainee independence with progression through post-graduate training years. We identified that resident performance in two domains, "Patient assessment" and "Critical thinking, insight and judgement" correlate with a trainee's overall level of independence.

Conclusions: Evaluating trainees' performance in the domains of patient assessment, and critical thinking, insight and judgement may be taken as predictors of overall level of independence. Within the context of competency-based training, assessing anesthesia residents

on a regular basis using the CEA tool may facilitate early identification of underperforming and high performing residents.

Design and implementation of a workplace-based assessment method in Anatomical Pathology: Mini Pathological Examination Exercise (Mini-PEX)

Authors

Teo Feuerhake, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Antonieta Solar, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Isabel Leiva, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Sergio González, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Ximena Triviño, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Presenter:
Teo Feuerhake, Pontificia Universidad Católica de Chile (PUC), Santiago, Chile

Background: Patient safety and quality in healthcare requires certification of specialists' clinical competence. Competency-based education models for postgraduate medical education, such as CanMEDS, aid to attain this goal. Throughout these models, emphasis is done on observation and workplace-based assessment. Moreover, formative assessment and feedback allow trainees to achieve these roles. This project therefore aimed to develop a workplace-based assessment method based on CanMEDS framework that incorporated feedback for Anatomical Pathology residents during sign-out.

Method: A mixed methodology was used. Anatomical Pathology competencies that tribute to sign-out were preselected. Then, a modified Delphi technique was used to select those assessable by observation. Faculty development workshops were carried out. The method was designed and then piloted in residents. Satisfaction was measured and results were analyzed.

Results: Medical Expert, Communicator and Professional roles were represented through the selected competencies. Competencies were clustered and a six-dimension method was developed. Rating scale was designed from 1 to 7 achievement levels, with level 4 as the minimum passing score due to context reasons. Satisfaction was high and improvement areas were identified. Results and feedback were properly received. Content validity is established due to experts' agreement based method design.

Discussion: A workplace-based assessment method based on CanMEDS framework that includes feedback for Anatomical Pathology residents is innovative in literature. Moreover, performance assessment of Communicator and Professional roles in this area is scarce. Secondly, the method structures sign-out and highlights its cognitive and attitudinal needed competencies. The main limitation of this project is that experts' agreement is based on local anatomical pathologists.

A workplace-based assessment method that includes feedback for Anatomical Pathology residents was designed. The method is based on CanMEDS framework and assess Medical Expert, Communicator and Professional roles. Content validity is established due to experts' agreement based method design.

Conclusions: Workplace-based assessment by direct observation, associated with effective and timely feedback, is an important method in assessing doctors at postgraduate medical education. Locally designed methods are helpful to assess a variety of CanMEDS roles and highlight their importance in the workplace.

From theory to practice: Operationalizing curriculum mapping in competency-based medical education

Authors
Joan Binnendyk

Presenter:
Joan Binnendyk, Western University, London, Canada

Background: While the transformation of residency training programs to competency-based medical education (CBME) progressively gains momentum throughout the world, an integral component of this shift – curriculum mapping – continues to be considered an esoteric process. Current literature on curriculum mapping provides theoretical underpinnings but little that can pragmatically assist a residency program in the evolution from traditional rotations and objectives to CBME. Within this gap there is an opportunity to consider curriculum mapping software as a stand-alone product that allows residency programs to make immediate progress in their move toward competency-based education.
Method: After researching available options, we began work with Curriculum Trak, a curriculum mapping software company traditionally focused on K-12 education. Choosing this small organization served two primary benefits: software customization and surprising affordability. Following a practical, step-wise approach, rotations and training experiences were mapped to milestones and competencies. This allowed us to graphically represent where trainees would experiences opportunities to achieve their educational outcomes.
Results: Curriculum Trak illustrated three key results: 1) training experiences that exist within each rotation; 2) milestones a resident is capable of achieving within each training experience; and 3) competencies required to achieve each milestone. The software revealed areas of alignment and misalignment between desired and existing educational outcomes, recognition of opportunities for enhanced or supplemental learning, and scheduling and service commitments to other programs.
Conclusions:: Curriculum mapping provides an opportunity to dive deeply into the intricacies of a curriculum to identify how training experiences support the development of competencies and achievement of milestones, while creating transparency for educational administrators, teachers, accreditors, and most importantly, learners. Curriculum Trak facilitated a straightforward method of collating curricular elements into a tangible roadmap that orients faculty to required training opportunities and residents to self-directed learning pathways.
Take-home message: An affordable software product coupled with a step-wise approach provides a practical curriculum mapping method that can be readily implemented in any training program.

Standardization of curriculum mapping

Authors
Simon Drees, Charité - Universitätsmedizin Berlin, Germany
Till Rech, Charité - Universitätsmedizin Berlin, Germany
Matthias Seidel, Charité - Universitätsmedizin Berlin, Germany
Firman Sugiharto, Charité - Universitätsmedizin Berlin, Germany
Olaf Ahlers, Charité - Universitätsmedizin Berlin, Germany

Presenter:
Olaf Ahlers, Charité - Universitätsmedizin Berlin, Germany

Background: Accreditation, standardization and development of medical curricula warrants mapping them to outcome frameworks. Common frameworks comprise roles of a physician (CanMEDS), entrustable professional activities (AAMC's 'core EPAs'), catalogues of learning objectives encompassing knowledge and skills or simple lists of diagnoses and symptoms. Some frameworks like the 'Principal Relevant Objectives and Framework for Integrative Learning and Education in Switzerland' (PROFILES) or the German national competency-based catalogue of learning objectives (NKLM) combine different above-mentioned aspects. Mapping curricula to outcome frameworks is often based on subjective assessments. It is therefore necessary to standardize this process in order to minimize subjectivity and increase comparability of results. We aim to assess how this can be achieved for different types of catalogues.
Method: We defined rules for mapping a medical curriculum to the NKLM, which includes a wide range of chapters defining physician's roles as well as skills, knowledge, reasons for encounter and diagnoses. A representative part of a whole medical undergraduate curriculum was mapped in a peer-mapping process according to the defined rules. Mapping was carried out using the Learning Opportunities, Objectives and Outcomes platform (LOOOP).
Results: The standardizability of different NKLM chapters varied greatly. Mapping framework chapters consisting of distinct symptoms and diagnoses showed a high inter-rater reliability, while chapters referring on the physician's roles were more difficult to standardize and resulted in varying mapping results. Defining the degree of competency that was achieved based on educational objective's taxonomy was similar between the peer-mappers regardless of the chapter.
Conclusions: Standardizing curriculum mapping using pre-defined rules is technically feasible, although usability varies for different types of frameworks. Defining rules is essential to achieve comparability, especially in cases were multiple persons conduct a mapping of different parts of the curriculum, thereby increasing inter-rater reliability. Further research is necessary to define valid and reliable mapping rules for all types of outcome frameworks.
Take-home message: Objectifying curriculum mapping is essential to ensure validity and comparability. Complex

curricula and frameworks require standardization, which may be difficult depending on their structure.

Educating curriculum mapping – a medical didactic appraisal

Authors
Eva Schönefeld, IfAS, Muenster, Germany
Helmut Ahrens, IfAS, Muenster, germany
Britta Brouwer, IfAS, Muenster, Germany
Jan Carl Becker, IfAS, Muenster, Germany
Olaf Ahlers, Charité, Berlin, Germany
Bernhard Marschall, IfAS, Muenster, Germany

Presenter:
Eva Schoenefeld, IfAS Institute of Medical Education and Students´ Affairs, Muenster, Germany

Background: To achieve curriculum mapping at the medical faculty of Muenster we established a nationally certified workshop. During the workshop faculty members and stakeholders were educated to use an electronic platform to insert their actual learning goals and their education content. This web-based tool is called LOOOP (learning objectives, opportunities and outcomes platform) to implement the NKLM, the national competency-oriented learning goals catalogue.
Method: In a two-day workshop 54 assistant professors and professors of the medical faculty were educated to elaborate and reflect learning goals, the NKLM with its Can Meds roles and to comprehend constructive alignment. All clinical departments (n=44) involved in medical education participated in March and April 2017. Besides cognitive learning goals and skills for the faculty members, we focused on the achievement a common and emotional commitment. The commitment was the affective learning goal for the participants themselves. After the workshops their post-processing task was to insert 2-3 learning goals for each educational unit (45 minutes) and to match each to the NKLM.
Results: The post-processing task was scheduled in December 2017 and first results show that LOOOP contains 3.704 learning goals. The plausibility of matching the NKLM was successful in over 90% of the inserted learning goals. Consecutively, the concept of a two-day workshop was successful and productive. The emotional commitment and identification with the project of curriculum mapping gave motivation to successful outcome.
Conclusions: To educate curriculum mapping cognitive learning goals and skills can be completed by affecting attitudes. As a side result the evaluation of the workshop was satisfying and the participants gave an average mark of 1.7 (1=best until 6=gratuitous).
Take-home message: The implementation of cognitive and affective learning goals as well as skills are helpful tools in educating faculty members.

Two worlds collide: finding ways in which constructive alignment and PBL can both work

Authors
Frank Bate, University of Notre Dame Australia, Fremantle, Australia
Effie Mangharam, University of Notre Dame Australia, Fremantle, Australia

Presenter:
Frank Bate, University of Notre Dame Australia, Fremantle, Australia

Background: In 2015, the School of Medicine Fremantle released its curriculum map, Prudentia, to students encouraging them to explore the breadth and depth of its formal curriculum. Prudentia is built upon principles of constructive alignment where learning outcomes, resources and assessment are explicitly linked and work in harmony. PBL, the primary learning and teaching approach at the School in the pre-clinical years, challenges students to identify what they need to know and develop learning outcomes accordingly. On the face of it, constructive alignment contradicts PBL by providing learning outcomes to students to guide their learning. Laying out the curriculum in a way that does not compromise principles of PBL, in particular students' capacity to develop clinical reasoning skills, has proven to be challenging.
Method: Qualitative data was collected on student perceptions of Prudentia through open-ended questions on four course surveys conducted in 2017 (n=362). In addition, a specific questionnaire was distributed electronically to students in 2018 (n=410) to unpack how students use Prudentia in practice.
Results: Initial results indicate that students value the opportunity to scrutinise the curriculum, particularly leading up to assessment times and on clinical rotations. However, there were differing opinions on how Prudentia can support, rather than diminish, the PBL process. Some students favoured a learner-centred model where students choose the point at which they become aware of learning outcomes. Others encouraged the School to use technology to "slow release" learning outcomes after each PBL.
Discussion: Students appreciate the opportunity to scrutinise the curriculum through Prudentia and use the curriculum map in a variety of ways. Currently the School encourages students not to use Prudentia in preparation for PBL as this practice is seen as potentially detrimental to the development of clinical reasoning skills. This informal approach needs to be reviewed.
Conclusions: Staging the release of learning outcomes to students in accordance with a PBL schedule may ensure that underpinning philosophies of constructive alignment and PBL are equally valued. Further research is needed to investigate if/how the practice of explicitly stating learning outcomes impacts on students' clinical reasoning skills.

Curriculum mapping to map competencies within an undergraduate dental curriculum

Authors
Ronel Maart

Presenter:
Ronel Maart, University of the Western Cape, Cape Town, South Africa

Background: The Medical and Dental Professions Board of South Africa, in collaboration with training institutions and the South African Committee of Medical and Dental Deans adapted the CanMEDS core competency framework to inform medical and dental curricula in South Africa. This AfriMEDS framework guides the accreditation process of medical and dental schools in South Africa. Following an accreditation process at the University of the Western Cape (UWC), an analysis of the undergraduate dental curriculum as it relates to the AfriMEDS core competency was completed.

Method: Curriculum mapping was used as data collection tool. Core competencies and enabling competencies (roles) as described in the AfriMeds framework was mapped against the pre-clinical years (first, second & third) module outcomes. 20 modules were included in this pilot study, all basic sciences modules were excluded.
In the first year (n= 4 modules) the following core competencies (CC) were present in the module outcomes: communicator was present in 4 modules and collaborator in 1 module and health advocate (2 modules) as enabling competency (EC). For the second year (n=6 modules) CC: communicator (1 module) and EC; health advocate (3 modules), health care professional (4 modules). Third year (n=10 modules) - CC: scholar, manager and leader, communicator were all present in one module and EC: health care practitioner (9 modules), health advocate (1 module), collaborator (1 module) and communicator (1 module).

Results: The Health care practitioner as an enabling competency was present in 70% of the modules and communicator as a core competency in 30% of the modules in the pre-clinical years. Professionalism as a core competency was absent in the pre-clinical years. It appears that the emphasis of the undergraduate dental curriculum is placed on preparing students as practitioners.

Conclusions: Curriculum mapping is valuable to evaluate competencies taught in curriculum and highlight competencies to be included. Although Professional as core competency may be included in the clinical years (year 4 & 5), it would be recommended that it is included in the pre-clinical years as well.

Online knowledge maps with automated feedback in education and assessment

Authors
Veronica Costin, UNSW, Sydney, Australia
Gary Velan, UNSW, Sydney, Australia

Presenter:
Veronica Costin, UNSW, Sydney, Australia

Background: Concept and knowledge maps have the potential to improve student learning and understanding by promoting meaningful learning and critical thinking. However, providing manual feedback on students' maps is not feasible for large classes. Accordingly, a user-friendly, valid and reliable, automated online tool for assessment and feedback of students' maps might have significant benefits for learning.

Method: Knowledge Maps is an online mapping tool, which provides automated feedback on students' attempts. 3 studies were performed: (A)Group 1 completed a mapping activity on Ischaemic Heart Disease (IHD) and was given a link to existing resources on Deep Venous Thrombosis (DVT), while Group 2 received a map on DVT and was given a link to existing resources for IHD. Groups were assessed using a quiz including questions on both topics, and completed a usability questionnaire. (B)Participants completed maps on cranial nerves, with a pre-test prior to the mapping activity and post-test following the activity. (C)The potential utility of Knowledge Maps for assessment was investigated by comparing scores generated by the software with manual grading of a modified-essay question on the same topic. A questionnaire was used to gather students' perceptions of the tool.

Results: (A)A higher perception of learning was reported after using Knowledge Maps, but no difference between groups in quiz scores. Most participants agreed that they found the activity helpful to their learning and would recommend it to others. (B)There was a significant improvement in pre-test to post-test quiz. (C)Regression analysis showed a significant correlation between map scores and MEQ scores, and questionnaire responses were overwhelmingly positive.

Discussion: These preliminary studies show that this software is readily accepted by both students and educators. Results from Study C suggest mapping provided a similar indication of students' understanding of a topic as a modified essay question, with the advantage of instant, consistent computer grading.

Conclusions: Knowledge Maps is a web-based system that can be used to create, edit & share maps, and automate feedback that could have benefits for learning, and be a useful addition to the assessment repertoire in higher education.

The influence of simulated patients on learning success in communication based examinations

Authors
Yannic Koch, Department of Surgery, University hospital Frankfurt, Frankfurt, Germany
Jasmina Sterz, Department of Trauma-, Hand- and reconstructive Surgery, University hospital Frankfurt, Frankfurt, Germany
Antonia Bien, Department of Surgery, University hospital Frankfurt, Frankfurt, Germany
Christina Stefanescu, Department of Surgery, University hospital Frankfurt, Frankfurt, Germany
Aleksandra Germanyuk, Department of Surgery, University hospital Frankfurt, Frankfurt, Germany
Miriam Ruesseler, Department of Trauma-, Hand- and reconstructive Surgery, University hospital Frankfurt, Frankfurt, Germany

Presenter:
Yannic Koch, Department of Surgery, University hospital Frankfurt, Germany

Background: Communication Skills are essential for good clinical practice and should be an important part of medical training. The use of simulated patients (SP's) can be useful to teach students the correct handling with patients. The aim of this study is to evaluate the effect of using SP's on the long-term learning success.
Method: 146 undergraduates were randomized into three groups. After a standardised teaching unit about medical communication (taking patient's history), they were given the opportunity to practice their communication skills. Group 1 was aware of the fact, that they trained with SP's, Group 2 thought, that they spoke to real patients and group 3 spoke to real patients. At the end of the semester, each student had to take part in an 10-station OSCE with 3-4 communication based stations.
Results: There were no significant differences between the three groups in the OSCE, three month after the training.
Conclusions: The use of simulated patients is a good possibility in view of learning success to allow students to practice their communication skills realistically without the need to recruit real clinical patients.

9L2 (1631)
Training method affects preclinical medical students' communication skills scores in OSCE

Authors
Silas Taylor, UNSW Medicine, Sydney, Australia
Matthew Haywood, UNSW Medicine, Sydney, Australia
Boaz Shulruf, UNSW Medicine, Sydney, Australia

Presenter:
Silas Taylor, UNSW Medicine, Sydney, Australia

Background: Effective communication skills improve patient satisfaction and outcomes and are integral to good medical practice, with the optimal method for communication skills training (CST) representing an important area of research. Student role play (RP) for CST is common, however volunteer simulated patient (SP) CST is cost neutral and provides unfamiliar and authentic interactions with intense emotional elements, as well as objective feedback. We set out to determine whether volunteer SP CST translated into improved student OSCE performance in communication skills, compared to RP.
Method: We performed a retrospective, quasi-experimental study of OSCE performance of two second year medical student cohorts. The 2014 cohort participated in RP-only CST (n = 235) and the 2016 cohort in SP-only CST (n= 257). Score data were collated on an iPad-based app and analysed using SPSS in conjunction with admission data. Estimated marginal means (EMM) compared the students' total scores for each of three assessment domains, i.e. generic communication, clinical communication (history taking) and physical examination/procedural skills, adjusted for age and grouped by cohort. T-tests were applied to assess the significance of differences between cohorts.
Results: For each of the three domains tested the difference between cohorts reached statistical significance (p < 0.01; 2-tailed t-test), the group taught using SP method being superior in each case. No significant difference was demonstrated between the two cohorts regarding medical school interview scores or Australian Tertiary Admission Rank (ATAR) scores. The magnitude of difference in Undergraduate Medicine and Health Sciences Admission Test (UMAT) scores was inconsequential.
Conclusions: Our study demonstrates that volunteer SPs are superior to RP for CST in preclinical undergraduate medical students when assessed by OSCE, as well as being cost-neutral. This refutes some of the literature which reports no difference between RP and SP or inferiority of SP to RP. The better performance of the SP cohort in the physical examination/procedural skills domain was unexpected, however we argue that most OSCE tasks require patient compliance and cooperation, with these behaviours being facilitated by good generic communication skills (including non-verbal communication skills).

9L3 (895)
Standardized/Simulated Patients (SPs) 'of the first hour' : A study exploring considerations and strategies for working with aging SPs

Authors
Claudia Schlegel
Cathy Smith

Presenter:
Claudia Schlegel and Cathy Smith

Background: Over the last 50 years, standardized/simulated patient (SP) methodology has become firmly established in heath professional education. Standards of Best Practice (SOBP) have been published by The Association of Standardized Patient Educators. Many SPs have been part of a program for several years and have contributed much through their involvement. However, as these SPs 'of the first hour' age, cognitive or physical shifts in their abilities can be observed that, in turn, affect the overall quality and effectiveness of their participation. SP educators are challenged to communicate concerns to these SPs and manage changes respectfully and effectively. The aims of this study were to ask these SPs to identify the challenges of working as they age and to offer strategies for SP educators to accommodate these changes.
Method: SPs (n=18; above 65 years old) from two countries (Switzerland and Canada) were individually interviewed using a semi structured topic guide. Questions were posed about challenges related to working as an SP related to aging and about how SP educators could accommodate these changes. The interviews were taped, and transcripts were made and analyzed.
Results: Preliminary analysis of data indicates that SPs 'of the first hour' recognize cognitive and physical changes. They prefer open communication. If their performance is not at the required standard, they want to be given specific feedback by the SP educator. The SPs also gave advice how their training and performance could be improved with simple things, such cue cards.
Conclusions: Older SPs are an important component of an SP program. This study provides valuable knowledge about the needs of older SPs from their perspective and can serve as a starting point for creating specific standards that can serve as an adjunct to current standards, thus supporting SP educators to work with this specific cohort.
Take-home message: Older SPs are valuable partners in health care education. SP educators have to anticipate challenges and consider strategies for allowing these SPs to continue to contribute in an effective and safe manner.

9L4 (1131)
The Use of Video Annotation in the Review of Simulated Patients' Feedback Giving

Authors
Vivienne Jia Zhong
Ulrich Woermann
Urs Gröhbiel

Presenter:
Vivienne Jia Zhong, University of Applied Sciences and Arts Northwestern Switzerland, Basel, Switzerland

Background: At the medical school of Bern in communication training with simulated patients (SP), students receive feedback only from the SPs. Therefore, much emphasis is put on the quality of SP's feedback giving.
So far, SPs receive feedback from their trainers by watching videos of their encounter with students. To examine if video annotation (VA) can overcome the existing trainer-centric approach and enable a more SP-centric approach involving self-reflection, we conducted a qualitative study on the use of VA in the review of feedback to students.
Method: Eight SPs were asked to use a VA tool to self-evaluate their videotaped feedback to students. A checklist was integrated into the VA tool. The SPs were free to use this checklist and/or write free text to appraise the quality of their feedback giving. After the video annotation, the SPs discussed their appraisal with their trainers in a debriefing.
Direct observations of SPs using the VA tool were conducted, followed by interviews on their user experience. The trainer was additionally interviewed to clarify results affecting the trainer.
Results: While five SPs used the checklist extensively, three SPs made less use of the checklist. The group with the extensive use of the checklist typically left their annotations at the end of the video, while the other group wrote free text comments anchored to a specific time in the video. SP reported that VA promoted self-reflection and that the checklist helped them to examine their feedback giving more specifically. Annotations, which were linked to a specific time of the video, were more helpful for the trainer when preparing the debriefing.
Conclusions: Both SPs and trainers saw much potential for improving the quality of the debriefing using VA. The results suggest a divergence in expectations of how the VA can support the feedback review process. To overcome this divergence, we propose the development of a two-dimensional framework consisting of reflection categories and structure of reflection.
Take-home message: VA involving a framework that guides the SP on what and how to reflect enables a SP-centric, self-reflective review of feedback giving.

Application of Standardized Patients on Interdisciplinary Palliative Care Education by Using Multimedia Teaching Materials

Authors
Shao-Yu Hsu, Taipei City Hospital, Taipei, Taiwan
Tzu-Ling Kuo, Taipei City Hospital, Taipei, Taiwan
Yang-Ching Chen, Taipei City Hospital, Taipei, Taiwan
Lin-Yang Chi, Taipei City Hospital, Taipei, Taiwan
Oscar K. Lee, Taipei City Hospital, Taipei, Taiwan
Li-Lin Kuo, Taipei City Hospital, Taipei, Taiwan

Presenter:
Shao-Yu Hsu, Taipei City Hospital, Taipei, Taiwan

Background: Taipei City Hospital has provided home-based palliative care with interdisciplinary health care professionals since 2015. Standardized patients (SPs) have been applied to enhance professional-patient communications and palliative care quality. We set up role-play based immersive courses, applied to enhance professional-patient communications and palliative care quality. The study aims to explore the use of SPs on the interdisciplinary palliative care training.
Method: SPs were commonly used in Objective Structured Clinical Examination (OSCE), furthermore, they can be well-trained as an actor/actress, by receiving relevant education and training in order to meet the diversity training requirements. We held drama courses, not only trained SPs about acting skills, but also taught them how enhance their body language and emotional expression. To let SPs have humanity and empathy, we also held empathy training workshop. We made two multimedia teaching materials with different learning objectives, which were based on real stories and well-trained SPs were introduced to play a role as the patient or family members. Case-based discussion education was conduct with the video and questionnaire was collected from the trainees after watching the video.
Results: In the video "Hospice Home Care at the Near-Dying Phase" and "Withdrawal Life-Sustaining Agents" ,86.3% and 85% of the trainees respond that they felt sad because of the sad reaction by the patient or family members in the film, respectively. Moreover, in providing palliative care in the future, 96.1% and 94.5% of the trainees willing to assist the patient or family members about their sad mood, respectively.
Conclusions: This study shows that SPs have positive influences on trainees' emotional responses and let them show empathy to the patient or family members whom the SPs play the role, in addition, the trainees are willing to provide palliative care. By watching multimedia teaching materials, we consider that the trainees have self-reference and projected the emotional responses to the real patient or family members on their further care.
Take-home message: Application of standardized patients on interdisciplinary palliative care education by using multimedia teaching materials has a significant and positive impact.

The Rush Hour' - When faculty steps into the shoes of standardized patient

Authors
Meghana Sudhir, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, UAE
Richard Ormonde, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, UAE
Deema Majjan, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, UAE

Presenter: Meghana Sudhir, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, United Arab Emirates

Background: Standardized patients are widely used in health professions education. How much emphasis has been given for coaching and practicing the scenario? Have we put aside enough time for preparation of standardized patients? This presentation shares the experience from Mohammed Bin Rashid University, where the faculty did the role of standardized patients as part of a workshop.
Method: The workshop had 4 simulation experiences in which each group of faculty got exposed to 1 experience. The scenario titled 'Rush Hour' had 10 participants in which 5 played to role of standardized patients and the other 5 were the candidates. It was a mass causality scenario in which the standardized patients had to play various roles – some as patients, some as relatives, some as paramedics etc. There was a confederate as media personnel. All the SPs got 30 minutes of scenario preparation time where they got the scenario for the first time and practiced the roles & logistics in running the scenario.
Results: The scenario was completed in 10 minutes at the Emergency Department of the simulation centre. Some of the comments during debriefing from the faculty who did the role of standardized patients is mentioned below
"It is not easy, SPs need lots of practice"
"It is difficult to switch roles"
"I thought it is easy to play scenario; but all the movement, make up, acting, coordination it requires training".
It was unanimously agreed that time and effort needs to be put aside for working with standardized patients with various scenarios.
Discussion & Conclusion: All Standardized Patients play roles; but SPs have also been used successfully to give feedback and evaluate student performance. Clearly, given this potential level of involvement in medical training, it is critical to recruit, train and use SPs appropriately.
Take-home message: A well written scenario with well-defined objectives & role, dedicated time for coaching & practicing the role are important in the success of standardized patient program.

9M: Short Communications: Communication Skills 2

Location: Boston 1, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Attitudes towards learning clinical communication skills: Differences in study year, gender, medical curriculum among Norwegian medical students (the STUDMED project)

Authors

Lise Tevik Løvseth, St. Olavs University Hospital, Trondheim, Norway
Tore Gude, University of Oslo, Norway
Reidar Tyssen, University of Oslo, Norway

Presenter:

Lise Løvseth, St Olav Trondheim University hospital, Trondheim, Norway

Background: In medical practice, doctor-patients communication is decisive for obtaining reliable information as a basis for correct diagnostic assessment, treatment, and patient's compliance with the treatment plan.
To obtain this level of communication it is relevant to investigate whether medical schools develop motivation among students for learning such skills as part of their professionalism.
Method: Attitudes towards learning clinical communication skills was surveyed among all students in two Norwegian medical schools with different curriculums in 2003 and 2015. In this study, investigated whether differences in attitudes between the schools, would be replicated 12 years later with emphasize on possible differences in terms study year and gender.
Results: Response rate 63.9% (N= 1044/1634). Prelimenary analyses show differences in attitudes in terms of gender, semester and curriculum where students in one school reported higher levels of positive attitudes towards learning communication skills in both surveys.
The roles of teaching models within the medical curriculum have an impact in educating medical students communication skills and attitudes that foster positive doctor-patient communication at the end of medical school.
Discussion: How students meet with medical school and teaching programs in communication skills foster positive attitudes for optimal learning in students throughout the curriculum. This is important because these attitudes at the end of medical school will be a prerequisite they bring with them in their postgraduate training.
Conclusions: Exchanging best practice between medical schools to increase level of attitudes towards learning clinical communication skills at the end of medical school is important to considering a re-design of their model for training medical students.

9M2 (296)
Difficult Conversations - why we find them tricky and how to talk about what matters most

Authors

Heather Grusauskas
Patrick Kinsella

Presenter:

Heather Grusauskas, Eastern Victoria General Practice Training (EVGPT), Melbourne, Australia

Background: Delivering negative feedback can be very challenging. Many "difficult" conversations fail because they begin with us starting the conversation from our own perspective.
Method: We developed a workshop which explores what makes conversations difficult; why we often manage them poorly and what we can do to make them more effective. Conversations are explored using a framework developed by the Harvard Law School. The model utilizes the "Three Conversations Framework"; the "What Happened Conversation", the "Feeling Conversation" and the "Identity Conversation".
These immersive workshops give participants the opportunity to practice their skills in small groups utilizing two scripted scenarios and one unscripted scenario. The participants work in groups of three in which two role play whilst the third observes and then provides feedback. The roles rotate within the group of three. Additionally participants are requested to bring to the workshop a "difficult conversation" that they are about to have or one that they have had in the past. There is also the opportunity for individual participants to feedback on their experiences to the larger group - all within a safe learning environment.
Results: These workshops have been highly evaluated by the general practitioners that have attended them (scoring 70% + on the RACGP evaluation satisfaction scale). The success of these has been such that we have been asked to roll them out to supervisors in outer metro and inner metro practices together with those in rural practice. Additionally we have been asked to develop further ones for registrars.
Conclusions: Most of us are usually reluctant to open a difficult conversation because we fear the consequences. This model gives us a framework to work with in our daily life and the opportunity to practice our skills in a safe learning environment.
Take-home message: We tend to avoid difficult conversations so there is always a role for continued learning in this area.

9M3 (2273)
Competency-based medical education in communication skills: From undergraduate curriculum to specialty training programmes

Authors
Nada Cikes, University of Zagreb School of Medicine, Croatia
Gordana Pavlekovic, University of Zagreb School of Medicine, Croatia
Marijana Bras, University of Zagreb School of Medicine, Croatia
Venija Cerovecki, University of Zagreb School of Medicine, Croatia
Mirjana Kujundzic Tipjak, University of Zagreb School of Medicine, Croatia
Ratko Matijevic, University of Zagreb School of Medicine, Croatia

Presenter:
Nada Cikes, University of Zagreb School of Medicine, Zagreb, Croatia

Background: In the past ten years at the University of Zagreb School of Medicine (UZSM) we have been paying special attention to teaching communication skills in the new undergraduate curriculum and in all new postgraduate competency based specialty training programmes.
Method: A longitudinal 6 years course "Fundamentals of Medical Skills" with an emphasis on communication skills was developed with graduate development of students' competences in a longitudinal, integrated communication approach. In all specialty training programmes, a generic postgraduate curriculum was established and the teaching of communication highlighted. Attention was paid to the selection of teachers in both undergraduate and postgraduate communication training as well as the teachers' educational development.
Results: At the UZSM, more than 2,000 graduate students and more than 900 trainees participated in communication education based on a conceptual approach depending on the educational level. As the new generations of students were involved, the number of candidate teachers increased. By now 240 young teachers (older residents or young specialists) were selected and included in the development of their educational skills in teaching medical communication from basic to specific communication associated with clinical courses in higher grades of medical studies. While leading their groups of students from the first study year to the graduation they had the opportunity to develop the mentoring skills. Fifty experienced teachers were involved in the postgraduate generic curriculum developed for trainees in various specialty training programmes. Teaching communication at all levels of medical education influences the development of a communicational environment at UZSM and academic hospitals.
Conclusions: Teaching communication skills in the continuum of medical education influences the professional development of both students and teachers. The advancement of a communication climate and professionalism in the hospital environment is noted.

Take-home message: Enhancement of acquisition of communication skills should be integrated in all levels of medical education, which is essential for the professional development.

9M4 (933)
Learning Real Life Relationships: A pilot project aimed at growing medical students' ability to relate with each other and others effectively and respectfully

Authors
Sue Walthert, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand
Martyn Williamson, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand

Presenter:
Sue Walthert, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand

Background: Professional behaviour is an essential skill for medical practice, however, intimidating behaviour has been reported to occur between medical professionals and within medical school environments. Medical schools, including the Dunedin School of Medicine, tend to concentrate on teaching doctor-patient relationship skills rather than teacher-student, peer-peer relationship skills. To redress this imbalance in the professional development curriculum, a programme was implemented with an aim to provide students with learning opportunities to understand their complex work environment and communicate respectfully in any situation.
Method: In 2017, the professional development team began a two-year pilot project with an action research approach to implement and evaluate a novel teaching program 'Real Life Relationships: Learning to work together in complex work environments'. Fourth-year medical students were taught foundation challenging communication skills in whole class and small group sessions, while their teachers and mentors were provided with advanced training. These advanced skills were then taught opportunistically and less formally to students in clinical settings and in their regular mentor group meetings during the year. Evaluation data collected included student surveys, interviews, and written feedback.
Results: Preliminary findings show that the majority of students (79%) and mentors (100%) appreciated the need for learning opportunities however, the programme was not implemented consistently. Feedback from students indicated that some of them found this type of learning difficult and even confrontational. Implementation challenges included not having knowledge about students' preferred learning approaches to personal topics and finding sufficient time in the schedules of mentors and students.
Conclusions: Despite the implementation challenges, students are receiving novel opportunities to learn about how to communicate effectively in difficult circumstances in a variety of interpersonal clinical contexts. Findings from the first year of the project are being used to inform improvements for 2018. They also contribute to research

about personal development which is a fraught and confusing topic in medical education.

Take-home message: Providing students with learning opportunities to understand their complex work environment and communicate respectfully in any situation is appreciated by students but requires careful tailoring to address its sensitive nature and teaching time constraints

Can coping-related weblog writing encourage medical students' communication skills in stressful situations?

Authors
Felix Schmitz
Daniel Stricker
Sissel Guttormsen

Presenter:
Felix Schmitz, University of Bern, Switzerland

Background: Health profession students exhibit greater clinical performance in stress-evoking situations when they have been previously provided with tools for coping with stress.

One novel and low-threshold approach to cope with stressful situations is the use of weblogs. Weblogs can be scaffolded as indicated by writing therapy, and may thus induce functional coping strategies in bloggers: both problem-focused coping as characterised by problem solving or trying to alter the source of stress, and emotion-focused coping as characterised by a reappraisal of the stressful situation. In addition, given the possibility to leave comments, weblogs can offer immediate and location-independent social support, which may exceed the value of more traditional writing-therapy approaches. The aim of this study was to determine the degree to which medical students succeed on communication tasks with simulated patients (SP) during a stress-evoking examination, based on prior coping-related weblog writing.

Method: N = 174 scholars from a fourth-year medical student cohort participated in this randomised field study. They were assigned to either of two intervention groups and tasked with: blogging about stressful situations during their internship by following coping-related writing assignments (group 1), or maintaining the coping-related weblog and additionally writing supportive comments to their peers' blogposts (group 2). A third group of participants was assigned to a non-blogging control condition. After the completion of their internship, participants demonstrated their communication skills during an 'Objective Structured Clinical Examination' (OSCE)––an examination type acknowledged to be highly stressful. The OSCE consisted of nine case-specific stations with SPs. At each station, a physician-expert assessed the students' communication skills using a standardised checklist.

Results: Students in the intervention groups achieved significantly higher communication-performance scores than students from the control group (p=0.02, Hedges'

g=0.45). Blog-based peer-feedback had no effect on communication skills performance.

Conclusions: Weblog writing can positively and meaningfully impact medical students' communication skills in stress-evoking situations. Additional blog-based peer-feedback does not seem to be critical in this respect. Stress is known to inhibit medical students' communication skills. Coping-related weblog writing can significantly counteract this negative effect.

9N: Short Communications: Interprofessional Education 2

Location: Boston 2, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

9N1 (3581)
Interprofessional day for first year students on Human Rights (HR) and the Right to Health (RtH)

Authors
Elisabet Lönnermark, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden
Lena Oxelmark, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden

Presenter:
Elisabet Lönnermark, Sahlgrenska Academy, University of Gothenburg, Sweden

Background: The Right to Health is a fundamental Human Right. According to the Swedish Higher Education Ordinance all students educated within health care sciences must fulfill learning outcomes concerning interprofessional learning as well as human rights.
Method: To organize interprofessional learning at our faculty, the Sahlgrenska Academy, Gothenburg University, Sweden, a specific committee has been established. The Committee of Interprofessional Learning (CIPL) consists of representatives from all 18 educational programmes at the faculty. One of the committee's assignments is to organize a joint educational day for all first year students, HR and RtH was chosen as a suitable theme for this day.
Students from the following undergraduate programmes are involved: Audiology, Biomedical Laboratory Science, Dental, Dental Hygiene, Dental Technology, Diagnostic Radiology Nursing, Dietetics, Medical Physics, Medicine, Nursing, Occupational Therapy, Pharmacy, Physiotherapy,Prescriptionist, Public Health Science, Speech and Language Pathology programmes. In addition physicians, nurses, biomedical scientists, and pharmacists educated outside EU/EES participate.
The day starts with lectures for all students on the theme HR and RtH.
In the afternoon students work together in interprofessional groups (20-25 students) completing:
1) "Step by step", a value exercise aiming at increased understanding of how people have different possibilities in life, how some are discriminated against and how prejudices influence how we interpret a description of a person when given very scarce information
2) case discussions including ethical dilemmas and basic understaning of RtH in smaller groups,
3) quiz and course-evaluation.
Two supervisors from different educational programs supervise each student group. All supervisors are offered a two-day training course on HR and RtH.
Discussion: Four days have been organized so far, a total of 2300 students have attended and seventy-eight teachers have been trained as supervisors. Students and teachers express the importance of interprofessional collaboration and of understanding HR and RtH.
Conclusions: To organize the day is a logistic challenge. Both students and teachers appreciate the importance of the subject and students value meeting future colleagues from other health professions.
Take-home message: HR is a suitable subject for first-year students in an interprofessional academic course.

9N2 (2135)
An Inter-Professional Education course on End of Life: Dilemmas and challenges

Authors
Adi Finkelstein, Jerusalem College of Technology, Hebrew University Faculty of Medicine Jerusalem, Israel
Freda DeKeyser Ganz, Henrietta Szold Hadassah Hebrew University School of Nursing, Jerusalem, Israel
Anna Woloski-Wruble, Henrietta Szold Hadassah Hebrew University School of Nursing, Jerusalem, Israel
Estelle Rubinstein, Dept. of Social Work Services, Hadassah Hebrew University Medical Center
Esther-Lee Marcus, Geriatric Division, Herzog medical center; Hebrew University Faculty of Medicine Jerusalem, Israel
Dorith Shahan, Hebrew University Faculty of Medicine Jerusalem, Israel

Presenter:
Adi Finkelstein, The Hebrew University-Hadassah School of Medicinel, Jerusalem, Israel

Background: The Center for a Dignified End of Life (EOL) was established to advance and coordinate EOL research and teaching. An elective Inter-Professional Education (IPE) course on EOL was developed for health care students. The aims of the course included education and interactive processing of EOL patient and the family issues as well as preparing the students for their clinical roles as members of an interdisciplinary team.
Method: The course was designed and taught by an interdisciplinary team, encouraging candid discussions and mutual appreciation. Limited to 30 students, who were selected from 45 applicants, 14 medical students, 9 graduate social work students, and 7 graduate nursing students participated. The course took place 4 hours every other week for 7 weeks and included didactic, practice, and processing components. Each session opened with a lecture followed by interactive learning in heterogeneous small groups of 10 students each facilitated by a pair of instructors from different disciplines (ex. doctor / nurse). Course content included: basic concepts of EOL and palliative care; cultural, legal and spiritual aspects of EOL; patient and family perspectives of EOL; and IPE. Course requirements included interviews with key stakeholders associated with EOL legislation and care and writing a reflective journal.
Results & Conclusions:: At the outset, students reported a lack of knowledge and reluctance to approach issues of EOL, and a desire to be better acquainted with other inter-professional team members, as the primary reasons for applying for the course. A mid-semester evaluation found a high level of satisfaction with the course content and with IPE training. Students spoke of feeling empowered to

face EOL issues. Several challenges arose including the ability to maintain the unique identity of each of the three professions while developing a shared professional understanding of EOL. The course actively promoted professional teamwork and an interdisciplinary perspective to EOL care.

The course was innovative and successful in teaching IPE and EOL care issues.

Take-home message: Although an IPE course on EOL entails logistic challenges and content-related dilemmas, it is an imperative in today's health care milieu.

Implementing an interprofessional objective structured clinical examination as an educational activity in newly graduated physicians and pharmacists

Authors

Tuan-Ya Tsai, Department of Pharmacy, Taipei Medical University-Shuang Ho Hospital, New Taipei City, Taiwan
Tzu-Tao Chen, OSCE Center, Department of Education, Division of Pulmonary, Department of Internal Medicine, Taipei Medical University - Shuang Ho Hospital, New Taipei City, Taiwan
Hsin Yu Wang, Department of Pharmacy, Taipei Medical University-Shuang Ho Hospital, New Taipei City, Taiwan
Yen-Ying Lee, Department of Pharmacy, Taipei Medical University-Shuang Ho Hospital, New Taipei City, Taiwan

Presenter:
Tuan-Ya Tsai, Department of Pharmacy, Taipei Medical University-Shuang Ho Hospital, New Taipei City, Taiwan

Background: Interprofessional collaboration is very important in medical care nowadays. However, new graduates usually lack the skills for teamwork due to limited experience. The problem could be improved through an Interprofessional education (IPE) for post-graduate year (PGY) medical residents and pharmacists.
Method: We have designed a formative interprofessional objective structured clinical examination (IP- OSCE) as an IPE activity in the medical and pharmacy post-graduate education programs. We developed 2 interprofessional scenarios, and each one with 2 senior examiners, a physician and a pharmacist. The participants received immediate oral feedback from the examiners. Quantitative and qualitative satisfaction was obtained after each exam.
Results: The IPE activity has been implemented for 2 years and we have performed 3 IP-OSCE for medical PGY resident and PGY pharmacists. A total of 20 medical residents and 20 pharmacists participated. All of the participants were satisfied (≥4 out of 5 points) with the exam. The percentage of very satisfied participants (5 out of 5 points) in the 3 exams was 17%, 25%, and 38%. The feedback from qualitative data showed they learned from other healthcare professionals, believed it can enhance their teamwork skills, and preferred it over traditional OSCE.
Discussion: The initial design was to separate the assignments for the medical residents and pharmacists in one of the OSCE scenario. We later changed it to unify

assignments for all participants in every scenario to facilitate the interprofessional collaboration, based on the feedback from the participants of the first IP-OSCE. The modification was supported by the improved satisfaction score in the later 2 IP-OSCE. The satisfaction results indicated that the IP-OSCE is an interesting and practical IPE activity. The participants can also benefit from the feedback from the examiners, who are experienced physicians and pharmacists.
Conclusions: Interprofessional education for PGY healthcare professionals is essential because teamwork is necessary in the daily practice. We are able to promote the collaborative skill for newly graduated medical residents and pharmacists through this IP-OSCE educational activity. OP- OSCE for physicians and pharmacists can improve teamwork skills and enhance clinical knowledge from different profession.

9N5 (1754)
Implement " Stroke Round" to improve health science students' Interprofessional education

Authors
Bandit Sirilert
Kanokrot Kovjiriyapan
Pornnapa Suriyachai

Presenter:
Bandit Sirilert, Medical Education Center Phayao Hospital, Phayao, Thailand

Background: Interprofessional education (IPE) has been internationally recognized and is a vital part of medical education.To develop an IPE model for under and postgraduate students at Medical Education Center Phayao Hospital, we implemented the activity of interprofessional team " Stroke Round" in internal medicine.
Method: Stroke team composed of physicians (neurologist and first year medical interns), medical science students (fourth to sixth-year medical students and nursing students), pharmacist, nurses, occupational therapists, physical therapists and nutritionists.They participated in Stroke Round and small group discussion every Thursday at Stroke unit during January - December 2017. Team's perceptions were evaluated by self assessment questionnaires after Stroke round and stroke patient outcomes were collected by Phayao Hospital Stroke Database.
Results: A total of 54 stroke team members, 50% were health science students. From the self assessment questionnaires, Stroke Round inspired them understanding in interprofessional role, professional knowledge and clinical thinking 85.2%, 79.6%, 74.1%. From Phayao Hospital Stroke Database,we found mortality rate was decreased (7% to 6.63%), r-tPA administration rate and door-to-needle(DTN) time in 60 minutes rate were increased (6.3% to 14%), (36.3% to 81%) respectively.
Conclusions: Medical science students and medical providers support that " Stroke Round" is effective to development of students' IPE competencies; the appreciation and understanding of professional role in team, knowledge of professions, the development of

effective communication skills. Stroke round provided IPE. It improve quality care and patient outcomes.

Take-home message: Stroke round promote IPE to improve student preparedness for working in health care setting.

9N6 (2315)
The Lausanne Model of Interprofessional Education and Collaborative Practice

Authors
David Gachoud
Serge Gallant
Leopoldo Lucarelli
Nadine Oberhauser
Anne-Claude Allin

Presenter:
David Gachoud, Medical Education Unit, School of Medicine, University of Lausanne, Switzerland

Background: Communication failures between healthcare providers can be identified in about two thirds of medical errors (Institute of Medicine, 2000). In addition, the quality of patient care has been shown to correlate with the quality of collaboration between healthcare providers (e.g. Manser, 2009; Mazocco et al., 2009). In such circumstances, it is not surprising that interventions to promote teamwork and collaboration are often included in patient safety programs. These interventions belong to InterProfessional Education (IPE), when they engage members of two or more professions (www.caipe.org). We aimed at developing a practical guide to help the design and implementation of IPE in the health professions.

Method: To develop our guide, we reviewed the current evidence from research, as well as the experts' recommendations and the existing models of IPE. We also drew conclusions from our own local experience of conducting IPE with students. Based on these sources, we decided to design a new model to serve as a comprehensive guide for anyone interested in setting up IPE to improve teamwork and collaboration. Our model consists in five core components: (1) the context (local, national and international) of education and clinical practice, (2) the learners, (3) the educators, (4) the training methods, and (5) the collaborative competences. The final aim of IPE appears as a superposition of the five core components: the delivery of efficient, safe and consistent patient-centred care. Our model has been published in a book called "Education interprofessionnelle et pratique collaborative: le modèle de Lausanne."

Discussion: Our guide aims to address an important issue for our clinical environments: the quality of collaboration between healthcare providers and the subsequent quality of patient care. The strength of our model consists in its foundations; it was built on research data, preexisting models of IPE and our own experience. As a new model, it still lacks the empirical evidence of its efficiency.

Conclusions: Our new model of interprofessional education and collaborative practice can serve as a useful guide to anyone interested in improving collaboration between healthcare providers.

9O1 (1574)
Bridging fields of expertise: challenges in supporting Higher Degree Research students in health professions education

Authors
Joanna Tai, Deakin University, Geelong, Australia
Charlotte Denniston, University of Melbourne, Melbourne, Australia

Presenter:
Joanna Tai, Deakin University, Geelong, Australia

Background: Many clinicians are returning to university to undertake doctoral studies in health professional education (HPE). Though candidates may meet threshold requirements or equivalents for admission into a program of doctoral study, they may also have completed their qualifying degree at a time when research and academic writing skills were not a focus. Therefore, this group of candidates may possess an alternate skillset to the standard "doctoral candidate", and standard centralised university supports may be misaligned with clinicians' learning needs.
This study aimed to address the following questions: What supports do currently we offer higher degree by research (HDR) students in HPE research, are they aware of them, and what can we do better?
Method: A discussion on this topic was facilitated in July 2017, at the Australian and New Zealand Association for Health Professional Educators (ANZAHPE) conference, as a timetabled session. Ethics approval was gained. Participants formed small groups to discuss their perspectives, which were recorded on flip-charts around the room. Discussion amongst the larger group was also audio-recorded. Written and transcribed data were collated and thematically analysed.
Results: All but one of the fourteen participants had university affiliations, with a range of roles. Four were current doctoral students; clinical backgrounds included medicine (4), psychology and nursing (2 each). Most participants (10) had some awareness of institutional supports for doctoral students, however 7 were unsure if there were specific supports for doctoral students in HPE. Challenges for support fell into three main categories: 1) managing clinical and educational disciplinary differences, 2) navigating the system and 3) connecting as a part-time student.
Discussion & Conclusion: Perceived needs for supports were largely congruent with the broader literature on student support. However, Theme 1, managing clinical and educational disciplinary differences, may be more unique to this population. These findings suggest that despite being skilled clinicians, the transition to medical education research is a challenge that could be better supported by acknowledging the disciplinary differences between clinical practice and educational research. Our presentation will propose potential strategies for HDR student support based on these findings.

9O2 (45)
Shattering the Silos of Student and Faculty Affairs: An Office of Academic Learning Environment

Authors
Nutan A Vaidya, Chicago Medical School at Rosalind Franklin University, North Chicago, USA
James R Record, Chicago Medical School, USA
William Agbor-Baiyee, USA
Mildred MG Olivier, USA

Presenter:
Nutan Vaidya, Chicago Medical school at Rosalind Franklin University, North Chicago, USA

Background: Student affairs, faculty affairs and staff support have traditionally been represented by separate offices in medical schools. Each has had its own unique mission, function, and staff which can lead to the formation of separate, sometimes competing, silos which limit learning. The context of learning is as important as content and institutions of learning need to focus on learning environment and a cohesive approach is needed to ensure an optimal learning environment..
Method: We restructured our academic offices to address these issues. A senior associate dean heads the office of academic learning environment. This office encompasses a 1) Student Learning Environment focusing on student learning communities and houses 2) Diversity 3) Global and community health 4) Faculty Talent Recognition and Enhancement and 5) Educational Research focusing on creating community of scholars.
Results: The office has identified previously unrecognized gaps in service and communication and now serves as a unifying connection throughout the school. We have initiated several student centered programs that focus on the periods of transitions within medical school and a student enhancement program that parallels that of faculty development. Programs focusing on professionalism, student treatment, wellness and resilience spread across faculty, students and staff.
Discussion: The Clinical Learning Environment Review (CLER) is initiated by graduate medical education in recognition of the importance of clinical learning environment. Recently there have calls to go beyond what is dictated by CLER. An 'ideal' academic environment is defined as one that prepares students for their future professional life and contributes towards their overall well-being. A number of diverse factors significantly influence the way students perceive and experience their education and how faculty and staff facilitate that learning. A unified office that addresses all the issues that impact the learning environment of a medical school will allow institutions to improve the whole learning environment
Conclusions: To our knowledge no US medical school has an office of academic learning environment. An Office of ALE demonstrates the ability and commitment of a medical school to enhance the environment as well as addresses accreditation standards in a systematic manner

9O3 (2817)
Making Macau Medical Education

Authors
Christopher Cottrell

Presenter:
Christopher Cottrell, University of Saint Joseph, Macau

Background: With no government sanctioned medical school, how can doctors and aspiring doctors in the Macao Special Administrative Region plan to cope with medical education to treat a population of 650,000 and with 32 million annual tourists descending on it with Chinese medical tourism demands?
This paper examines how different Faculty of Health Sciences in Macao are handling the demands of doctor training--and in particular how the Macau University of Science and Technology is on the cusp of having the city's first medical school.
This paper employs interviews with doctors and academics from Macao, Hong Kong, the People's Republic of China, Australia, the USA, and the UK for insights in how "Asia's gambling capital" can maximize its assets to improve medical education--and perhaps make its first medical school.

9O4 (390)
Developing a university-wide Centre for Academic Teaching: what to bring and what to gain for medical education

Authors
Manon Kluijtmans
Marieke van der Schaaf

Presenter:
Manon Kluijtmans, University Medical Center Utrecht, Netherlands

Background: Quality of academic teaching is crucial for students' learning. Last decades universities, worldwide, opened centers for teaching and learning to optimally support academic teachers' professional development and collaboration. Though these centers function as networks between faculties, little is known about the different positions and needs of staff from different faculties. This paper presents a one-year project that aimed to sketch the contours of a new Center for Academic Teaching at Utrecht University, Netherlands. By means of a case study we focus specifically on the relation of faculty and interfaculty offer to support development of medical education and its staff: what can be brought and gained from interfaculty collaboration.
Method: Interviews were held with stakeholders and representatives from all faculties of Utrecht University (n=52), in addition two open stakeholder meetings with academic teachers were held (n=18 and n=30 participants respectively). Three strategic areas were defined for interfaculty collaboration: teacher development, educational innovation, and scholarship of teaching and learning (SOTL).

Results: Comparison of different faculty practices shows that medical education is in many ways ahead of other faculties: especially in its culture of scholarly approach to education. Despite this up-front position, also medical education can gain from interfaculty collaboration: A) through stimulating evidence based education and theoretical enrichment of SOTL, in particular but not exclusively from social sciences. B) through high-end teacher development programme's to broaden views and create interprofessional opportunities. C) through innovation resources and support . And D) through a university wide platform function which can facilitate expertise exchange, foster a teaching community, enhance a teaching culture in research-intensive universities, and provide a teaching 'voice' in university policy discussions.
Conclusions: Medical education serves as a role model to other faculties through its long standing tradition of faculty development and scholarly approach to education. Despite this up-front position interfaculty collaboration can complement faculty activities by providing theoretical enrichment, new learning opportunities, funds, facilities and strategical support for medical education.
Take-home message: Medical education is best served by a combination of faculty-level activities and university-wide collaboration to enhance teaching and learning

9O5 (2115)
What counts as evidence? Insights from a qualitative study of Clinical Competence Committees

Authors
Rachael Pack, Western, London Canada
Sayra Cristancho, Western, London, Canada
Saad Chahine, Western, London, Canada
Chris Watling, Western, London, Canada
Lorelei Lingard, Western London, Canada

Presenter:
Sayra Cristancho, Western University, London, Canada

Background: In CBME, Clinical Competence Committees (CCC) must sift and synthesize multiple pieces of assessment data to make decisions about trainee progress. We know little about how they achieve this. We aimed to describe how CCCs characterize, interpret and use information about trainee performance to inform their decisions about progression.
Method: Our sample consisted of 7 CCC meetings in 3 postgraduate programs, selected purposively to represent a range of program size and familiarity with the CCC concept. Data were collected through nonparticipant observation of each meeting by two researchers, and individual semi-structured interviews with at least one CCC member following each meeting. Observational field notes and interview transcripts were analyzed iteratively for recurring patterns using a constant comparative method.
Results & Discussion: We observed CCCs engaging with a variety of information about trainee performance, including observational data, exam scores, comments from mentors and advisors, logbook data, personal experience and informal feedback. Much of the observed CCC discussion centered on what we came to call 'the

social construction of evidence', a process of discerning, discarding, and assigning value to pieces of performance information. Characterizing a particular piece of evidence as credible, non-credible, debatable or missing allowed CCCs to delineate a course of action for making, postponing or deferring decisions. Even in this relatively small data set, variability within and across CCCs was evident: e.g., one CCC treated personal experience of a trainee as credible evidence while another CCC treated it as non-credible; or the same CCC treated informal feedback about unprofessional behavior as non-credible evidence to support one progression decision but credible for another.

Conclusions: Faced with the multiple information sources associated with CBME, CCCs must work through a process of deciding what will count as evidence, what will not, and why. This study begins to illuminate the variety of processes CCCs use to interpret the data they're presented with and determine its credibility to support particular assessment decisions.

Take-home message: Given that CCCs are charged with the high-stakes task of judging trainees' entrustability, we require refined insight into how they transform information into evidence into decisions.

9O6 (2775)
Resident evaluation and promotion: major improvement in our tracking tools

Authors

Matthieu Touchette, Université de Sherbrooke, Sherbrooke, Canada

Julie Loignon, Université de Sherbrooke, Sherbrooke, Canada

Jean-Daniel Baillargeon, Université de Sherbrooke, Sherbrooke, Canada

Isabelle Germain, Université de Sherbrooke, Sherbrooke, Canada

Denis Bergeron, Université de Sherbrooke, Sherbrooke, Canada

Bernard Larue, Université de Sherbrooke, Sherbrooke, Canada

Presenter: Mélanie Laventure, Université de Sherbrooke, Canada

Background: The importance of a rigorous resident evaluation and promotion process is necessary to guarantee of patient safety. It's also our responsibility to intervene as soon as possible when a resident is experiencing difficulty. With a real commitment of the evaluation and promotion committee, the optimization of processes and the implementation of efficient tracking tools to monitor decisions and follow the progression of a resident are keys to the success of an accurate management of residency curriculum.

Method: Mapping the resident evaluation and promotion process. Optimization of the decision-making processes and follow-up of the decisions of the evaluation and promotion committee. Implementation of innovative tools such as:

Complete tracking Excel spreadsheet (from the first observable difficulty to the on going remediation process (at what moment an action has to be made)

LimeSurvey decision questionnaire (filled during the meeting to summarise the decision and the information that will be transferred to the program and resident)

Electronic remediation contract form (pre-set information, etc)

Developing best practices in terms of resident evaluation and promotion.

Results: The optimization of the decision-making processes and follow-up allowed us to significantly reduce the time between the decision making in resident evaluation and promotion and the implementation of remedial measures. Greater automation of the tools has also made it possible to largely improve the quality and frequency of the various follow-ups inherent to the mentoring process.

Discussion: A continuing improvement process must be at the heart of effective management of a postdoctoral evaluation and promotion committee that faces the many changing facets of resident in difficulty.

Conclusions: The development of tools allowing quick identification of a resident in difficulty, mechanisms supporting the chosen measures to guide the resident in achieving expected skills and, ultimately, effective management of the process can significantly alleviate the work of each actor and, above all, provide better supervision to residents.

Take-home message: Improvement of the decision-making process and follow-up of an evaluation and postdoctoral promotion committee offers positive spin-offs for all the actors involved.

Flipped Classrooms - Pilot study on the impact of digital technologies in the knowledge acquisition in medical students

Authors

Sérgio Teles, Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal
David Sousa, Centro de Estudos das Ciências da Visão. Lisbon, Portugal
Carlos Marques-Neves, Centro de Estudos das Ciências da Visão. Lisbon, Portugal
Luís Abegão Pinto, Centro de Estudos das Ciências da Visão. Lisbon, Portugal
Inês Leal, Centro de Estudos das Ciências da Visão. Lisbon, Portugal

Presenter:
Sérgio Teles, Faculdade de Medicina da Universidade de Lisboa, Portugal

Background: Academic teaching has been present in our society for centuries, however, its methodology hasn´t significantly changed. With the continuous technological development there´s been an increased interest in changing the teaching panorama by including new digital tools to stimulate learning. The goal of this study was to analyze the impact of the web-based tool Sli.do, which allows real time interactive questionnaires, in knowledge acquisition in medical students.
Method: A repeated measures design using the same validated questionnaire in either Sli.do and classic paper-based system was implemented before and after two separate classes of 4th year medical students. In both cases, the subject and teacher were the same. The subject was glaucoma because the baseline knowledge was basic among all students, thus more suitable to detect improvement. Our endpoints were 1) detect differences in student participation according to method, 2) determine whether knowledge improvement was particularly related to any of the methods.
Results: Results showed that the group who responded in paper had lower scores before and after class (47% and 71%, respectively) comparing with the group who responded through Sli.do (51% and 81%). Although basal scores were better with Sli.do (thus less likely to show improvement), students using this system also showed the larger improvement (26% vs. 30%).
Discussion: The baseline difference of knowledge between the two groups wasn´t very different, being slightly bigger with Sli.do, which can be due to facultative utilization of digital technologies selecting the most motivated students. However, being motivated doesn´t directly correspond with being more connoisseur of the subject. Both methods showed improvement in knowledge acquisition which demonstrates that classes, independent

of method, were effective in learning. Although both were effective, the group who responded through Sli.do showed a slightly higher improvement and final results, making it a valid method to dynamize the class.
Conclusion: The improvement in knowledge acquisition using the new web-based tool Sli.do, although small compared to a classical approach, is significant to motivate teachers in remodeling their methods in classes to increase student focus, attention and motivation, leading to a better performance in learning.

The flipped classroom is effective for medical students to learn medical interview and cognitive function test of elderly people

Authors

Eiji Kaneko, Tokyo Medical and Dental University, Tokyo, Japan
Risa Suzuki, Tokyo Medical and Dental University, Tokyo, Japan
Mari Sasaki, Tokyo Medical and Dental University, Tokyo, Japan
Yasuko Abe, Tokyo Medical and Dental University, Tokyo, Japan
Kentaro Shimokado, Tokyo Midtown Clinic, Tokyo, Japan

Presenter:
Eiji Kaneko, Tokyo Medical and Dental University, Tokyo, Japan

Background: It is important to teach medical interview and cognitive function test of the elderly patients in this aging society. In flipped classroom, students watch video materials before the class as homework and spend more time in discussion or practical training in the classroom. We made a new flipped classroom program of medical interview and cognitive function test of the elderly patients, and compared the effectiveness of the program with the traditional program.
Method: After informed consent, 14 third year medical or dental students were randomly divided into 2 groups: flipped classroom (FC) group and traditional (T) group. In FC group, students watched interactive video simulation program by internet before the class and practiced medical interview in the classroom. In T group, students read the syllabus before the class and lecture was given in the classroom. All students took pre- and post-test about the knowledge of medical interview and cognitive function test, and they performed medical interview and cognitive function test of elderly standardized patients (SPs) after the class. The performance was video-recorded and evaluated using checklists. They also answered the questionnaire. T-test was used for statistics. This study was approved by ethical committee of the university and supported by the grant from JSPS.
Results: As a result of questionnaire survey in FC group, the evaluation of the video material was high, although approximately 30% of the students regarded it as a little burden. The scores of the pre-/post-test about the knowledge were 8.4+-1.0/9.2 +-0.8 in FC group, whereas 7.1+-1.6/8.7 +-1.5 in T group (p=0.14/0.23). The scores of the

medical interview were 29.0+-2.4 in FC group and 27.4+-2.2 in T group (p=0.24).

Conclusion: Although approximately 30% of the students in FC group thought the new video material a little burden, the evaluation of the contents was high. The score of the pre-/ post-test and medical interview in FC group was little higher but it was not significant. Further improvement would be necessary in future.

Take-home message: The new flipped classroom program was effective for students to learn medical interview and cognitive function test.

9P3 (2927)
Students' motivation, learning strategy and learning outcome in the flipped learning context

Authors

Fremen Chihchen Chou
Yi-Da Sie

Presenter:

Yi-Da Sie, China Medical University Hospital, Taichung City, Taiwan

Background: Flipped learning is now widely applied in medical education. Knowing how students' motivation and self-efficacy toward this new learning model influence their learning strategies and learning outcome would be beneficial for future curriculum design.

Method: We developed and validated a motivation and a strategy questionnaire in flipped learning context. 229 pharmacy students experienced a whole semester course (pharmaceutical botany) with flipped learning model and participated this study. The students' response to the questionnaires and their test score as well as final course performance (tests, assignments, course activities) were collected to explore the relationship between motivation, strategy and outcome.

Results: The exploratory factor analysis and reliability analysis showed that the two questionnaires were valid with three factors (intrinsic motivation, extrinsic motivation, self-efficacy) in motivation questionnaire and three factors (goal management, self-assessment, metacognition) in strategy questionnaire as they were designed to be. Further analyses revealed that students with higher motivations, including self-efficacy, intrinsic motivation and extrinsic motivation, all significantly had higher perception on all three kinds of learning strategies. Nevertheless, we found that there was only week correlation between learning strategies (self-assessment and metacognition) and final course performance, but no any correlation or effect between learning strategies and test score.

Discussion: Motivation and learning strategy were key to learning behaviors in a new learning context. Extrinsic motivation and self-efficacy also played important roles on students' learning strategies in flipped learning context beside intrinsic motivation. This result implied that teachers may apply approaches such as orientation to facilitate students' self-efficacy or extrinsic motivation for developing better learning strategies. However, the phenomenon of learning-test dissociation revealed in this study need further investigation. One reason might be

that the writing test do not measure what students learned in the flipped learning appropriately.

Conclusion: When applying flipped learning in the curriculum design, approaches that are effective to facilitate students' self-efficacy and extrinsically motivate students may play as important role as students' intrinsic motivation toward the learning. We should design assessment more carefully and investigate the phenomenon of learning-test dissociation in flipped learning.

9P4 (1529)
Introduction of case-based flipped classroom model in undergraduate orthopedic surgery: expectations, evaluation and assessment of course objectives

Authors

Stephanie Herbstreit
Margarita Gestmann

Presenter:

Stephanie Herbstreit, Medizinische Fakultät Universität Duisburg-Essen, Germany

Background: Using a case-based learning strategy to assigned online teaching material, a new flipped-classroom model (FlipOrtho) was introduced into the undergraduate orthopedic education in summer 2017. Learning activity prior to the class was supported by online quizzes. Student-centered exercises enhanced the learning experience. Each session included "pair & share" activities, open questions and interactive student discussions. These provided immediate feedback to and from the instructor. Microlectures offered new material and reinforced student learning.

Method: The voluntary flipped classroom curriculum was implemented and evaluated regarding student expectations, course objectives and acquired knowledge. These were compared to the traditional course.

A seven-point Likert scale was used to compare students assigned to the new course (n=127) with a traditionally taught cohort (n=93). Satisfaction with the course and perceived gain of knowledge were evaluated. The results of the final MCQ(Multiple-Choice-Questionnaire) between the two cohorts were compared.

Using five-point Likert scales, students of the new course completed a 15-item survey prior to and after the course concerning expectations and evaluation of objectives of an inverted classroom model.

Results: Students' satisfaction was comparable between the two cohorts as was perceived gain of knowledge. Students completing the novel course showed good satisfaction (Median = 6; scale 1-7), found the course useful, achieved the learning objectives and voted for a future expansion. The objectives of an inverted classroom were evidently achieved and the students assigned to the new course achieved slightly better results in the final MCQ-Test (mean score 16,64 vs 14,78 out of 20).

Conclusion: The novel course was comparable to traditional teaching in student satisfaction, and success albeit requiring lesser time in classroom and offering greater student flexibility. Future studies are needed to assess more objective effects on knowledge and skills.

Take-home message: A voluntary case-based flipped-classroom model in undergraduate orthopedic surgery can satisfy expectations of inexperienced students regarding teaching and learning concept as well as perceived and evidently achieved gain of knowledge.

Maintaining a Standard in Medical Students by Improving the Level of Understanding

Authors
Yogesh Acharya, Avalon University School of Medicine, Willemstad, Netherland Antilles
Oluwatosin Oluwateniola Oyadiran, Avalon University School of Medicine, Willemstad, Netherland Antilles
Kashmeera Narayana Maharajan, Avalon University School of Medicine, Willemstad, Netherland Antilles

Presenter:
Yogesh Acharya, Avalon University School of Medicine (AUSOM), Willemstad, Netherlands Antilles

Background: Learning is better applied when the context and the learning environment resemble the retrieval environment (1). Basic sciences, as a theoretical background for clinical science, should be taught to engage reflective thinking and active learning (2). This study aims to identify non-traditional learning methods while comparing with contemporary forms and assessing their impact on conceptual understanding, reasoning and intellectual performance.
Method: A longitudinal cohort study and cross-sectional questionnaires survey was conducted at AUSOM to compare the academic performance of the preclinical students in regard to traditional lectures and blended teaching methods.
Results: 96 basic science students and 15 basic science faculties participated in the study. Blended medical education was shown to be more effective than traditional lectures in comparison to the overall final grades (p< 0.05). 61.2% students were satisfied with the current teaching methods and students rated the learning standard as 7.3 on a scale of 1-10, with mean satisfaction level being 5.8. 97.9 % students agreed upon the need for improvement of learning standards in medical education, with 90.6% of the students responded that adapting standard blended method (lecture + e-learning) is beneficial to improve learning environment in pre-clinical years. 78% teaching faculty found their teaching methods effective based on personal and student evaluation. 54 % of teaching faculties thought of improving their teaching methods by small group discussions, simulation and concept mapping with critical thinking.
Conclusion:: The need to analyse teaching forms are important in bridging the gap between basic and clinical science to create a more conducive learning environment in medical schools. Traditional lecture-based learning is effective but a synergistic approach to learning results with integration with other teaching modules. Students and teaching faculty recognised the combination of lectures with e-learning as more beneficial than traditional lectures alone.

Take-home messages: Blended learning as compared to traditional lecture-based teaching is predicted to enhance student performance and learning.
There is a constant need to improve learning standards with synergistic approach by incorporating diverse forms of learning in basic medical science.

Meaning making in student portfolios: the role of the learning coach

Authors
Johanna Jordaan
Anna Vnuk
Iris Lindemann
Maxine Moore

Presenter:
Julie Ash

Background: Health professions education recognises the importance of ensuring graduates are agents of their own learning in preparing them for academic success (Pintrich, 2000) and a lifetime of learning within their professional work (Levett-Jones, 2005). However, if left on their own to make meaning of their learning, students may have limited ability to optimally utilise their self-regulated learning capabilities (Dornan, 2005a). Boud (2013) suggests that students do not always know how to present "evidence" of their learning, improvement or remediation in response to feedback received.
Method: Programmatic Assessment for Learning is such a program that recognises the importance of students developing process skills, including self-regulated learning and professionalism. Flinders University Medical Course made this shift in educational pedagogy to encourage students to take ownership and "make meaning" of their learning, following constructivist perspectives (Shepard, 2000; Heeneman et al, 2015), in order to develop sustainable learning strategies for their future practice. Students use a Portfolio of Evidence to map their learning against specific course learning outcomes. Students are allocated a Learning Coach (LC) whose role it is to "coach" the students towards making meaning of their learning, however, the efficacy of the LCs in this role has not been investigated. In fact, very little work has been done to develop and evaluate coaching interventions in Health Professions Education (Lovell, 2017). Therefore, we sought permission from students to review their portfolios to develop an understanding of how LCs contribute to students' meaning-making of their learning and feedback, from a social constructivist perspective (Shepard, 2000; Heeneman et al, 2015).
Results: Review and analysis of students' portfolios clearly demonstrate the pivotal role played by LCs, particularly from a social constructivist perspective (Shepard, 2000). The role of the LC is critical to coach students towards meaning-making of feedback and developing lifelong self-regulation.
Conclusion: The use of LCs is a burgeoning concept in the health professions milieu and our evidence highlights their efficacy as "coaches" in meaning-making and the development of self-regulated learners.

9Q2 (1456)
Applying Objective Structured Mentoring Encounters with Multisource Feedback (OSME-360) for Training Mentors

Authors
Chang-Chyi Jenq, Chang Gung Memorial Hospital, Linkou, Taiwan
Jiun-Ren Lin, Chang Gung Medical Education Research Centre, Linkou, Taiwan

Lynn Valerie Monrouxe, Chang Gung Medical Education Research Centre, Linkou, Taiwan

Presenter:
Chang-Chyi Jenq, Chang Gung Memorial Hospital, Chang Gung Medical Education Research Centre, Linkou, Taiwan

Background: Mentors play crucial roles in helping mentees overcome difficulties during medical learning. It is critical to develop mentors. We designed and evaluated a mentor training programme based on the structure of objective structured teaching encounter and multisource feedback.
Method: A mixed-methods study was employed. The training programme, objective structured mentoring encounters with multisource feedback (OSME-360), included a lecture, 6-station OSME, video-feedback and multisource-feedback process. We applied statistical methods to analyse the quantitative data from pre-/post-test multiple choice questions (MCQ), and realist evaluation to analyse the context-mechanism-outcome (C-M-O) of the impact of OSME-360 from the transcripts of focus group interviews.
Results: Thirty-six mentor trainees (16 female, 20 male), comprising 23 physicians, 5 nurses, 4 pharmacists, 2 medical technologists, and 2 respiratory therapists, joined OSME-360. The post-test MCQ scores showed significantly better understanding of mentoring, confidence in mentoring, and correctness of managing mentoring scenarios (paired-t test, $p<0.05$). The mentor trainees received the highest score (89.3 ± 8.9) in the station 'handling mentor-mentee meeting', and lowest (78.9 ± 12.2) in the station 'managing mentee's emotional problems'. The preliminary C-M-O findings were: (1) highly skilled standardized students(C_1), changing the attitudes and concentrations/taking learning seriously(M_1), positive training outcome(O_1); (2) repeated practice/safe training atmosphere($C_{2/3}$), openness to learning(M_2), being relaxed/reduction in fear($O_{2/3}$); (3) skilled facilitators/feedback providers(C_4), good and constructive feedback, acceptance of feedback(O_4); (4) video feedback(C_5), reflection(M_4), recognition of improvement and change(O_5).
Discussion: The quantitative analysis of pre-/post-test MCQ scores and qualitative analysis of the interview demonstrated that OSME-360 had positive effects in mentor training to some extent. The skilled actors/actress and facilitators in OSME scenarios induced psychological

effects and affected the training outcome. The safe atmosphere in OSME let the mentor trainees to reduce fear and improved self-confidence. The video feedback drove reflection then promoted recognition. The reason for differences in mentor trainees' performances by each station requires further examination.

Conclusion: The mentor training programme, including highly simulated situation, skillful feedback providers and videoing, results in improving the confidence and ability of mentoring due to changing learning attitudes, acceptance of feedback and reflection.

9Q3 (3217)
Mentors for medical students in Canada and Norway need training and pedagogical support

Authors
Christian Brinch, University of Bergen, Norway
Elise Pauline Skjevik, UIT The Arctic University of Norway, Tromsø, Norway
Eirik Ofstad, UIT The Arctic University of Norway, Tromsø, Norway
J. Donald Boudreau, McGill University, Montreal, Canada
Edvin Schei, University of Bergen, Norway

Presenter:
Christian Brinch, University of Bergen, Norway

Background: Group-based mentoring is increasingly used in undergraduate medical education to stimulate professional identity formation and provide a safe space for student reflection. Little is known about the factors that influence the motivation and behavior of mentors, though some research indicates that mentors typically understand their role in one of three ways: as someone who can answer questions and give advice, as someone who shares what it means to be a doctor, or as someone who listens and stimulates reflection. Mentors in the first of these categories tended to actively control group dynamics, and reported less benefits from mentoring.

Method: CanNorMent is an investigation of physician-mentors' experiences and perspectives at three medical schools. Group-based mentoring has taken place since 2005 at McGill University, Canada, since 2012 at UIT The Arctic University of Norway, and since 2014 at University of Bergen, Norway. McGill invests more than the Norwegian institutions in faculty development and training of mentors.

Results: We present results from an initial survey among all mentors at the three medical schools, with a response rate of approximately 60 % at each school (N=272). At all 3 sites, respondents who enjoyed being a mentor reported a stronger tendency to listen and stimulate reflection and relationships within the group. The overall level of satisfaction was higher in Canadian than Norwegian mentors, 70 % of McGill mentors reported that mentoring made them better at what they did professionally and more proud of being a physician, as contrasted with 45 % at the Norwegian schools. McGill mentors rated the quality of training and teaching materials higher than did the Norwegians. Demographically, McGill mentors were more often

clinicians, Bergen mentors were younger, and UIT mentors older and more male-dominated.

Conclusion: Our findings suggest that mentor satisfaction, which is decisive for pedagogical quality and sustainability of mentor programs, hinges on the perceived quality of the training, instructions and support that mentors receive. Details of the programs for mentor education at the three medical schools will be discussed.

Take-home message: Mentors for medical students need substantial training and pedagogical support.

9Q4 (2159)
New Insights into the Clinical Mentoring Process

Authors
Janina Iwaszko, University of Worcester, Worcester, UK

Presenter:
Janina Iwaszko, University of Worcester, UK

Background: Clinical placements offer the student the opportunity to apply the skills and knowledge acquired in lectures in a real practice setting. The role of the clinical mentor or supervisor is central for the student to achieve their learning objectives. There is a wealth of literature and guidance for clinical mentors concerning how to improve many aspects of clinical mentoring, such as planning learning encounters, identifying student learning needs and offering constructive and effective feedback. There has been less research into the internal cognitive processes undertaken by mentors whilst carrying out this role.

Method: A simulated research project recorded and analysed simulated bedside clinical mentoring sessions for ten different healthcare professionals. The healthcare professionals then had an opportunity to describe the cognitive processes that they carried out during their mentoring session.

Results: In teaching students how to develop a patient management plan, the clinical mentors, across all professions, identified that they took in patient information re-organised it, prioritised it and constructed a management plan. However, they also realised that most of this process occurred in their heads and was not visible to the student. This meant that to the new student this process was hidden and the students did not know what questions to ask.

Discussion: These results demonstrated that most types of healthcare professionals are not fully aware of the relatively complex process that they undertake when mentoring students in a clinical setting. By vocalising their tacit cognitive processes that are hidden from the student, they offer the student an insight into the processes that make up and patient/healthcare professional encounter. This enables the student to identify more clearly relevant questions to ask in order to move forward their clinical learning more effectively. Mentors are also able to identify areas where they can also improve their skills.

Conclusion: By vocalising and recognising their own cognitive processes, mentors can accelerate the student's acquisition of clinical skills and make the best use of the teaching opportunities that arise in the necessarily time limited and opportunistic clinical learning environment.

9Q5 (2838)
The Role of Mentoring to Improve the Number of Graduate of OSCE UKMPPD Examination at Faculty of Medicine Universitas Muhammadiyah Yogyakarta Indonesia

Authors
Ahmad Ikliluddin, Faculty of Medicine UMY, Yogyakarta, Indonesia
Supriyatiningsih, Faculty of Medicine UMY, Yogyakarta, Indonesia
Winny Setyonugroho, Faculty of Medicine UMY, Yogyakarta, Indonesia
Nur Shani Meida, Faculty of Medicine UMY, Yogyakarta, Indonesia

Presenter:
Ahmad Ikliluddin, Faculty of Medicine UMY, Yogyakarta, Indonesia

Background: Uji Kompetensi Mahasiswa Program Profesi Dokter (UKMPPD) is an exit exam for medical students in Indonesia. There are two type of exam in UKMPPD, Computer Based Test (CBT) and Objective Structure Clinical Examination (OSCE). To increase the number of graduate, we conducted intensive mentoring programs for students for several weeks prior to the OSCE exams since 2015. This study aim is to assess the effectiveness of mentoring programs.
Method: In this study, we analyzed the passing score of the OSCE exam. Data from academic year 2013 – 2017 were collected. The data were classified into 2 groups, one the group that did not get the mentoring and two the group who got the mentoring before the test. Participants were also divided into 2 groups, first takers participants (first-exam group participants) and re-takers (participants who had undergone the exam and had not been graduated). Statistical analysis was performed on each of these groups to compare the passing rate of the OSCE before and after the implementation of the mentoring programs.
Results: During academic year 2013-2017 there were eight exam periods of first-taker, and six exam periods of re-taker. In each group of first-taker and re-taker, there were students who join and did not join mentoring program. In the first taker group, there was an increase in the average of graduation results in mentoring group (97.26%) compared to the non-mentoring group (88.79%) with statistically significant difference (p = 0,021). In the re-taker group, there was also an increase in the average of graduation results in the mentoring group (59.17%) than the non-mentoring group (41.04%) with no statistically significant difference (p = 0.274).
Conclusion: The intensive mentoring program at the Faculty of Medicine, Universitas Muhammadiyah Yogyakarta for several weeks before OSCE UKMPPD exam proved to improve the number of graduate of OSCE UKMPPD exam. With intensive mentoring, examinees will be encouraged to re-train the medical skills they have mastered before, in appropriate and correct ways. In addition, examinees will be more prepared with the atmosphere during the exam with a predetermined time allocation.

9Q6 (1805)
Facilitating the transition into a UK Medical School: a longitudinal study into the major challenges experienced, actions taken and gaps in support provision

Authors
Kathryn Young, School of Medicine, Liverpool, UK

Presenter:
Kathryn Young, School of Medicine, University of Liverpool, UK

Background: The transition into life and learning at University is well recognised as a major life event with additional uncertainties when studying medicine. The University of Liverpool has a commitment to providing trained mentors for all 1st Year students, to help navigate this transition.
The aim of this study was twofold: to increase the effectiveness of our mentor training and to identify shortcomings in existing support services.
Method: Around 95 students (representing approximately one third of each year group) attended the mentor training workshops. Data were collected at the end of each workshop, over a three year period, from 1st Year students, self-selecting to mentor. A self-report methodology was used to collect participants' personal experiences using post-it notes, colour-coded for each category of response. This allowed data to be analysed across individuals, within cohorts and over time. Thematic analysis was applied to the data to identify, explore and track issues emerging over time.
Results: In addition to the well-recognised tasks of becoming an independent adult, participants reported perceived ambiguity in what to learn and in what depth and the requirement to develop new learning strategies as independent learners as major challenges. Taking responsibility by asking others, particularly mentors and friends, and testing out different approaches to learning were the main actions taken. Gaps in support put forward were, for the most part, due to lack of awareness of and how to access services.
Discussion & Conclusion: These result provide feedback to inform the development of mentor training. Change in the learning culture is necessary to facilitate living with and embracing ambiguity, managing uncertainty and fostering inquisitive, life-long learners, sensitive to and able to work within the limits of their knowledge. That gaps in support reveal being uniformed, rather than absence of services, a review of how the availability of and access to services is communicated is required ensuring that those services are increasingly congruent with students' expressed needs.
Take-home message: Working more closely with trained mentors to address the expressed needs of students strengthens the support offered, thus enhancing wellbeing and promoting resilience.

"Junior Teachers in Physical and Rehabilitation Medicine": your students can't sleep in class… if they are the teachers!

Authors
Alexandre Mader, Faculty of Medicine Lyon-Est, Lyon, France
Quentin Paulik, Faculty of Medicine Lyon-Est, Lyon, France
Sophie Spillone, Faculty of Medicine Lyon-Est, Lyon, France
Sophie Jacquin-Courtois, Faculty of Medicine Lyon-Est, Lyon, France
Jérôme Etienne, Faculty of Medicine Lyon-Est, Lyon, France
Gilles Rode, Faculty of Medicine Lyon-Est, Lyon, France

Presenter:
Alexandre Mader, Faculty of Medicine Lyon-Est, Lyon, France

Background: In 2013, the Lyon-Est Faculty of Medicine introduced student engagement, inspired by ASPIRE's criteria. In five years, our practice went further: students not only participate but are themselves instigators of innovations.
Method: For two years, the teaching of Physical and Rehabilitation Medicine (PRM) to fifth year students has been completely reformed: all amphitheatre lectures have been replaced by interactive lessons in small groups, using innovative teaching material, and above all animated by volunteering fifth year students. Indeed, during their PRM internship, 16 students (called "Junior Teachers") built three learning slideshows from medical cases seen in the ward with teachers' help and proofreading. Then, students in pairs taught PRM to about 40 students of the same class, with one teacher in the classroom, if necessary to complete or rectify.
Results: This vast project has had a major impact on student learning and teachers' methods. Thanks to satisfaction surveys (100 responses), we noticed that 86% of the students had had the impression of being more active than in standard lectures. Furthermore, 70% found the Junior Teacher concept more relevant than traditional one-way teaching.
In addition, to go further, it seems that students have had better results on PRM exams since this project was set up! The blend between flipped-classroom concept, techno-pedagogy and introduction of Junior Teachers has created a whole new working atmosphere where students confessed to having a much greater freedom of expression. Combining students' way of explaining and teachers' expertise drove us from a "top-down" teaching to a more horizontal and collaborative medical practice learning.
Conclusion: Knowing that this pedagogical concept brings above all long-term knowledge for clinical practice, the aim of this project is not always well perceived by students because of an exam system based on academic skills.

You have noticed students sleeping during your lectures? Let them be the teacher and take a nap while waiting!
Take-home message: More seriously, the junior teaching concept is an opportunity for teachers to benefit from the students' proximity with their peers, so we believe it should be more widely used in medical schools.

9R3 (2638)
Combined peer and self-assessment improves medical students' performance in Human Biology course

Authors
Anna Torres, Medical University of Lublin, Lublin, Poland
Kamil Torres, Medical University of Lublin, Lublin, Poland

Presenter:
Anna Torres, Medical University of Lublin, Poland

Background: There are mixed opinions regarding the value of peer assessment (PA) and self-assessment (SA), and studies evaluating its impact in medical education on performance are lacking. The aim of the study was to investigate the influence of PA/SA on medical students' performance in the undergraduate, basic science course.
Method: The formative peer/self-assessment intervention of behaviour, work habits, knowledge and interpersonal skills was implemented in two consecutive classes of Human Biology course. Intervention used web-based questionnaires, lasted for two semesters and comprised eight PA/SA events. PA reports were confidential, faculty processed, and submitted to students a week following PA/SA events.
Results: Performance of students increased during PA/SA intervention as measured by comparison of HB points collected during 1st and 2nd semester (72%pts. vs 77%pts., p<0.001). The comparison of the study group to historical students, who completed the course during two previous academic years also revealed significant improvement in final examination scores.
Few studies reported on objective improvement in performance connected to the implementation of PA/SA. Our research reports an increase of students' academic performance as assessed by objective measures. In addition, it was found that lower scoring students improved more, what suggests that they benefited more from the intervention.
Despite mixed opinions in the literature on the value of PA or SA influence on performance, the presented study supports the hypothesis that a longitudinal intervention combining PA and SA has a positive effect on undergraduate students' performance, with lower scoring students benefiting more from it.
Conclusion: Further studies in the field of formative PA and SA are needed to confirm findings presented in our research. However, it seems that formative PA/SA can have favourable impact of performance, if it is longitudinal, well accepted by students and faculty and aligned with course learning objectives and teaching strategy.

9R4 (2943)
Learning medical ethics through ethics drama and film production by medical students

Authors
Daniel Fu-Chang Tsai
Min-fen Wang
Chih-wei Yeh

Presenter:
Daniel Fu-Chang Tsai, Graduate Institute of Medical Education and Bioethics, National Taiwan University College of Medicine, Taiwan, Taipei City, Taiwan

Background: This study explores the educational value of ethics drama and film production (EDFP) by undergraduate medical students as an innovative case-based method for teaching and learning medical ethics.
Method: Rest's Four Component Model determining moral behavior and perspectives on teamwork competencies provided the conceptual framework. Qualitative content analysis of 258 reflective essays by sixth-year medical students (2008-2010) pertaining to their learning experience with EDFP regarding medical ethics was guided by two research questions: 1) How did the students experience EDFP for medical ethics learning? 2) What did they learn from the EDFP for medical ethics?
Results: Three major themes were identified that describe the students experienced EDFP as 1) a free and safe learning environment for intensive group discussion, 2) a simulated situation providing a rich narrative context for in-depth reflection, and 3) a refreshing and accessible way of creating a digital group work product for medical ethics learning. Four major themes were identified in the students' self-reported learning outcomes: 1) the moral domain, 2) cognitive effects, 3) affective effects, and 4) experience of true teamwork. Selected quotes illustrate these themes with thick description.
Conclusion: We found that EDFP led to a rich variety of learning outcomes. Using a longitudinal approach in medical ethics education through all medical school years seems critical to facilitate students' readiness for EDFP. The fact that at least some students are very aware of how and what they learn from EDFP suggests that medical educators might usefully draw out and build upon those insights.

9S: Workshop: Assessing Assessment. ASPIRE assessment award winners discuss best practice approaches (264)

Location: Wettstein, 2nd Floor, Swissotel
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters

Debra Klamen SIUSOM, Springfield, USA
Anna Cianciolo, SIUSOM, Springfield, USA
Heeyoung Han, SIUSOM, Springfield, USA

Background: Southern Illinois University School of Medicine is one of 4 schools to be awarded that ASPIRE award for assessment. A group from SIUSOM, experts in the field of assessment, will present key ingredients for an excellent assessment program. Participants and facilitators will engage in an active discussion of barriers to excellence in assessment (using participants' real-life struggles) as well as innovations from their schools in effective, practical assessment. Attendees from medical schools looking to improve their assessment processes will benefit from this workshop, as well as those who might consider application for an ASPIRE award for excellence in this area.
Structure - 5 minutes intro of speakers and audience members
Establishment of goals and objectives for the workshop - 5 minutes
Discussion (participants and facilitators) - What makes for excellence in assessment? - (facilitators will wind in the key ingredients for excellence into the discussion) - 30 minutes (May break down into smaller groups for this, depending on size of audience and specific areas of interest among participants.)
What are some barriers to excellence in assessment? Discussion with participants and facilitators - 30 minutes
What are some practical innovations in assessment that participants are using? - 15 minutes
Final thoughts and take home messages - 5-10 minutes
Intended outcomes:
1) Appreciate the key ingredients of assessment excellence
2) Identify challenges and best practices to/from discussants' home schools
3) Be able to state one take-home message about excellence in assessment.
Level: Best for those with some prior knowledge of assessment techniques/methodologies, (intermediate/advanced) but all are welcome to attend.

9T: Workshop: Theoretical and Practical Considerations for Serious Games Development & Implementation in Medical Education Part II (423)

Location: Helvetia 3, 1st Floor, Swissotel
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters

Todd P Chang, Children's Hospital Los Angeles, USA
Martin V Pusic, New York University, New York, USA
Chaoyan Dong, SengKang Health, Singapore
Gerald Stapleton, University of Illinois at Chicago, USA
Elizabeth Kachur, Medical Education Development, New York, USA

Background: Games – whether in a digital format or board format – are frequently used as adjuncts to medical education. Theoretical frameworks of how games provide learning transfer and successful game elements have been described, though far less so within medical education and adult learners. The workshop provides both a theoretical framework of game design as it pertains to medical education, as well as a practical discussion on how to develop and implement games into a medical education curriculum.
Who should attend: Undergraduate Medical Educators, Postgraduate Medical Educators, Instructional Designers, Simulation Enthusiasts. Participants with game ideas or prior game development are encouraged to share their experiences
Structure of workshop: 10 min Lecture: Introduction and overview of Games in Medical Education. Following introductions, we present the variety of games and examples in the literature.
20 min Discussion: Theoretical Frameworks on Game Elements in Education. We present Garris' game elements and Bedwell's taxonomy of game elements and provide examples of each element
20 min Small Group Problem Solving: Design a Game to teach a difficult concept. In small groups of 3 – 4, each group is required to design a game to teach 1 of 4 difficult concepts in medicine. They will choose the most appropriate game elements and style of play, and the modality.
15 min Q & A: Authors' experiences in Implementation & Research using Games. Authors will provide a quick Q&A session on their own experiences in moving games from development to implementation, as well as the scholarly research behind game implementation.
20 min Small Group Problem Solving: Plan the Implementation of the Game. Small groups return to write an implementation plan, including intended audience, and which curricula to integrate the game, as well as an assessment plan.
5 min Discussion: Summary and Take-Home Points
Intended Outcomes:
1. Learners will list types of games and game elements used in medical education, with examples

2. Learners will design a game tailored to a concept, objective, and target audience
3. Learners will develop an implementation & evaluation plan for their game
Level: Intermediate

9U: Workshop: What DON'T we find? Exploring absences in medical education research (58)

Location: Helvetia 4, 1ˢᵗ Floor, Swissotel
Date: Tuesday 28ᵗʰ August
Time: 1600-1730 hrs

Presenters
Cynthia R Whitehead
Elise Paradis
Zac Feilchenfeld
Ayelet Kuper

Background: Much of medical education research focuses on studying things that are obviously present (e.g., aspects of curriculum or assessment) in order to understand if or how they work. While this is certainly valuable research, there are many other medical education phenomena that warrant further study. One such phenomenon is that of absence, including absence of evidence for an educational tool or intervention, absence of research to support the use of tools, or absence of content that is important in medical education. In this workshop we ask: How do we identify and study absences in our field? Are they important? What can they teach us about our field? Do other people want to know they exist? In addressing these questions we draw on our experiences as researchers who have found all of these forms of absence. Participants will discuss implications for medical education scholarship and research, including different forms of resistance to studying, presenting, and publishing work that points out absences. We also consider how to engage collegially with the productive disruption that may arise in our community if findings of absence challenge widely-held beliefs.
Who should attend: This workshop is designed for all AMEE participants who are interested in thinking about potential absences in the field of health professions education. While it may be of particular relevance to health professions education researchers, the workshop will also be of interest to educators who draw upon research findings and best practices, clinical teachers who use educational tools, and learners who are the recipients of educational practices.
Structure of workshop:
- A brief, accessible introduction to the concept of "absence research" and how it has the potential to enrich our field
- Brief examples of findings of absence from our programs of research
- Small group work on implications of absence findings
- Large group consideration of implications of findings of absence in medical education research and

scholarship and discussion of strategies to attend more explicitly to absences in our field
Intended outcomes: Examining the importance of absences in medical education
Considering the implications of absence in medical education

9V: Workshop: Longitudinal datasets in medical education: delivering evidence-based policy through tracking the educational continuum (32)

Location: Helvetia 5, 1ˢᵗ Floor, Swissotel
Date: Tuesday 28ᵗʰ August
Time: 1600-1730 hrs

Presenters:
Katie Petty-Saphon, Medical Schools Council, London, UK
Daniel Smith, General Medical Council, London, UK
Margaret Hay, Monash University, Melbourne, Australia
Tim Wilkinson, Otago University, Dunedin, New Zealand
Jennifer Cleland, Aberdeen University, Aberdeen, UK
Jon Dowell, Dundee University, Dundee, UK

Summary of theme and why it is important: Longitudinal datasets tracking doctors from application to medical school and through into their eventual careers provide unique opportunities for examining the relationships between selection, assessment and performance and how these relate to socio-demographics, specialty choice and workplace geography. Examples from the UK (UK Medical Education Database) and New Zealand (Medical Student Outcome Database (MSOD) and from the Undergraduate Medicine and Health Sciences Admission Test (UMAT) in Australia will illuminate the complexity of the different initiatives and the absolute requirement for high quality data management by appropriately trained staff not only for research but also for Quality Assurance and Quality Improvement. Attendees will be asked to share their own experiences of database construction and to describe barriers to setting them up. The workshop will explore funding arrangements and how management issues have been overcome. Results from early research studies will demonstrate the profound significance of 'big data' and the immediate impact on policy from this new and reliable evidence base. It is anticipated that the workshop will stimulate ideas about the many questions our collective databases could address.

9W: Course: RESME Course

Location: Helvetia 7, 1ˢᵗ Floor, Swissotel
Date: Tuesday 28ᵗʰ August
Time: 1600-1730 hrs

A closed session for registered participants of the RESME Course

9X: Course: ESMEA Course

Location: Osaka, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

A closed session for registered participants of the ESMEA Course

9Y: Workshop: Supporting a community of young educators through the AMEE Fellowship (1103)

Location: Samarkand, 3rd Floor, CCB
Date: Tuesday 28th August
Time: 1400-1530 hrs

Presenters
Leila Niemi-Murola, University of Helsinki, Finland
Subha Ramani, Brigham and Women's Hospital, Boston, USA
Rashmi Kusurkar, VUmc School of Medical Sciences, Amsterdam, Netherlands
Trevor Gibbs, AMEE, UK
Olanrewaju Sorinola, University of Warwick, Warwick, UK
Carmen Fuentealba, Long Island University, Long Island, USA
Jonathan Rial, Health Education England (Wessex), UK

Background: Lack of support in educational scholarship is a problem frequently encountered by novice health professions educators. Finding a mentor seems to be an obvious solution, but finding the right mentor is often challenging as senior educators themselves are frequently juggling multiple professional commitments. The traditional dyadic mentoring is only one type of mentoring: there are other types such as peer mentoring, group mentoring, distance mentoring etc. that educators can access. There are also other forms of support structures for young educators, such as local and national communities of practice. These formal or informal networks evolve through a process of sharing information and experiences with the group so that members learn from each other. In this workshop, the Associate Fellows of the AMEE share some of their examples of supportive networks for novice teachers and some ideas that could be created through the Fellowship scheme.
Who should attend: All educators interested in creating and sharing their experiences of supportive structures for novice educators.
Structure of workshop: This workshop will feature interactive discussions and group exercises, supplemented by mini-didactic reviews. After a short introduction, participants will engage in a small group exercise identifying the most common challenges in creating supportive networks, and describe key steps in creating communities of educators. The Associate Fellows will present some models of actual mentoring programs and different types of communities of practice followed by a group discussion. The workshop will conclude with a discussion about types and criteria for scholarships.
Intended outcomes: After attending this workshop, participants will:

- Gain awareness of challenges in enhancing educational scholarship and promoting career advancement among novice educators
- Understand the benefits of mentoring networks and reflect on strategies to combine a variety of mentoring approaches in their own mentoring programs
- Apply principles of communities of practice in building a supportive network for educators at their institutions

Level: Introductory

9Z: Workshop: Systematic capturing of professionalism lapses: the possible, the practical, and the preventable (389)

Location: Guangzhou, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters
Viktoria Joynes, University of Liverpool, UK
Susannah Brockbank, University of Liverpool, UK

Background: Following the seminal work of Papadakis in the early 21st Century, there have been increasing calls for all detected lapses in professionalism to be recorded. The 'Measuring Professionalism' system, introduced at the Medical School at the University of Liverpool in 2016, has been met with praise both by the General Medical Council in the United Kingdom and by fellow medical educators from around the world, for the straight forward approach to recording low-level concerns regarding professional behaviour. This workshop will outline our practical experience of transitioning to this new system, and describe the ongoing process of refining this system in order to capture concerning behaviour in a way that is fair and equitable to our students.
Who should attend: This workshop is aimed at medical educators across the career spectrum with experience of managing unprofessional behaviour, particularly in undergraduate medical students, though lessons learnt could also be extrapolated to those working in the postgraduate sphere.
Structure of workshop: In this workshop, we will briefly describe the University of Liverpool's 'Measuring Professionalism' system and explain how this easily implementable system has improved our detection of concerns related to perceived unprofessional behaviour in our students. We will then use interactive case examples to give participants an opportunity to develop their understanding of how this system could be practically operationalised in their context. These cases highlight some of the shortcomings we have identified as this system has been introduced, and participants will be invited to discuss the ongoing process of addressing these challenges. Finally, we will look to introduce a debate on whether any alert system will ever truly prevent those cases of unprofessional behaviour which are of most concern.

Learning outcomes: Participants will gain a detailed understanding of a system used to identify low-level professionalism concerns in medical students. By applying this detection framework to a worked example, they will gain insight into the utility of such a system in their own context.
Level: Intermediate

9AA: Workshop: Hot Topics in Medical Education: Cool Papers from 2018 (1096)

Location: Nairobi, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters
Gail Sullivan, Journal of Graduate Medical Education, Farmington, CT, USA
David Sklar, Academic Medicine, Albuquerque, NM, USA
Geoff Norman, Advances in Health Science Education, Hamilton, Ontario, Canada
Lynn Monrouxe, Medical Education, Taoyuan City, Taiwan
Richard Hays, Medical Teacher and MedEdPublish, Cook University and the University of Tasmania, Australia
Ingrid Philibert, Journal of Graduate Medical Education, Chicago, IL, USA

Background: Medical educators need to stay current in education research, which is challenging given other responsibilities and the proliferation of clinical and education journals. Educators also want to disseminate their scholarly work, in both discovery and teaching, to appropriate scholarly forums. Each journal or forum has a specific scope, mission, and categories for submissions. Figuring a strategy for success is sometimes a slow, painful journey for those engaged in educational scholarship. This workshop will allow educators to peek inside editors' decisions regarding relevant papers and will use "crowdsourcing" to prioritize future medical education questions.
During this workshop, editors from several medical education journals (Academic Medicine, Advances in Health Sciences Education, Journal of Graduate Medical Education, Medical Education, Medical Teacher) will briefly present one "cool" article from 2017, detail why the paper is superior, and explain why the paper is a good fit for this journal. Based on personal interests, participants at entry to the session will sit at tables labeled for specific topics in medical education, such as assessment, curriculum innovations, quality improvement and high value care, and faculty development. After the editors' presentations, participants at each table will identify and prioritize the most important, specific questions for this topic area. Editor facilitators at each table will record these questions. Each table will then present their questions to the assembly, with time for discussion. Editors will be able to comment on whether these questions, if studied, are suitable for future submission to their journals or venue.
Objectives:

1. Understand the elements of strong papers and which papers may best fit a particular medical education journal
2. Identify important, new medical education research from the past year
3. Identify and prioritize the most important medical education questions of the day
After the editors' presentation, participants at facilitated tables will discuss and prioritize critical questions for medical education research in 2018 and beyond. Tables will presents a summary; only new ideas will be presented; questions will be recorded.
Editors will react to suggestions and discuss the for their journal and audience.

9BB: Workshop: Emotions Under the Microscope: Capturing Emotions in Health Professions Education (543)

Location: Mexico, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1600-1730 hrs

Presenters
Vicki LeBlanc, University of Ottawa, Canada
Meghan McConnell, University of Ottawa, Canada
Esther Helmich, University of Groningen, Netherlands

Background: There is growing recognition of the role of emotions on learning and performance in health professions education. Educators and researchers are increasingly interested in how emotions influence learning and performance, how learners approach emotional events, as well as how to best prepare learners for - and support them during - emotional clinical situations. However, approaches to the study of emotions vary, and any particular approach will be best suited to certain circumstances rather than others. Educators and researchers new to the domain of emotions could easily be overwhelmed by the various approaches to capturing emotions. The focus of this workshop is to present a brief overview of what is known regarding emotions, learning, and performance, particularly in health professions education. This overview will form the foundation for an interactive session in which participants explore their research and educational interests regarding emotions. Various methods of capturing emotions – namely subjective, behavioural, physiological and socio-cultural - will be discussed.
Who should attend: This workshop is targeted to researchers and educators interested in capturing emotions in their education or research activities.
Structure of workshop: The workshop will begin with a brief review of literature, followed by guided generation of an educational idea or question related to emotions in health professions education. This will be followed by an interactive session, in which participants will be guided in exploring different approaches to capturing emotions and choosing the best approach for their question of interest. Through a combination of presentations and guided small group exercises, participants will develop a

research/educational question on the topic and identify approaches to best elicit and capture emotions.

Intended outcomes: By the end of this workshop, participants should:

1) have generated an educational idea/innovation/question related to emotions in health professions education

2) be able describe various approaches to capture emotions in health professions education

3) be able to describe which approach to capturing emotions is best suited to their question/goal

Level: Recommended for intermediate or advanced level.

9CC: ePosters: Transitions - new roles, workplace learning & professionalism

Location: Kairo 2, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1530-1600hrs

9CC1 (954)
The demographics and roles of Chief Medical Residents in Japan: Pilot study

Authors
Shunsuke Kosugi, Aso Iizuka Hospital General Internal Medicine, Fukuoka, Japan
Tadayuki Hashimoto, Hashimoto Municipal Hospital, Wakayama, Japan

Presenter: Shunsuke Kosugi, Aso Iizuka Hospital, Fukuoka, Japan

Background: Recently several junior residency and internal medicine senior residency programs made their own Chief Medical Resident Systems by themselves. Because they were originals, there were no standards and no networks in Japan. There are no previous surveys focused on the demographics and roles of Chief Medical Residents in Japan.
So, we sampled and gathered a pilot survey to understand the demographics and roles of the Chief Medical Resident system in Japan.
Method: To clarify the demographics of Chief Medical Residents in Japan, we created a questionnaire consisting of 7 questions sent to 40 survey responders. Survey responders were selected via "VHJ" network, which is the NPO (Nonprofit Organization) consisting of 45 hospitals in Japan. 5 hospitals of VHJ were not teaching hospitals, so we included 40 hospitals as participants.
Results: Response rate was 72.5%(29/40). This was not a comprehensive nationwide survey.
10 responders(34.5%) had Chief Medical Resident systems and 1(3.4%) of them had it in the past, but 18(62.1%) have no Chief Medical Resident systems.
Among 11 responders who have had Chief Medical Resident systems, the representing party of "Chief Medical Resident" was different, with 18.2%(2/11) being the representative of senior residents, 27.3%(3/11) being the representative of all residents and 54.5%(6/11) being the representative of junior residents.
Discussion & Conclusion: Among 18 responders who had no Chief Medical Resident systems, only 1 responder was planning to introduce that system. The most popular reason why they didn't plan to introduce it was that the number of residents is small.
We revealed the demographics of Chief Medical Residents in Japan. The Chief Medical Resident system was not so popular in Japan, so we hope Chief Medical Resident systems will spread to all of Japan. We also lack a standardized accreditation system which can organize, teach and oversee Chief Medical Residents in Japan, so we hope a system will be established. This survey was a pilot

one, so we plan to make a comprehensive nationwide survey.
Take-home message: The Chief Medical Resident system is not popular in Japan. We hope it will spread to all of Japan.

9CC2 (1050)
Evaluation of a novel leadership role for Junior Doctors within the Avon & Wiltshire NHS Partnership Trust (AWP)

Authors
Lise Paklet
Eva Bowditch
Kate Seddon
Stephen Arnott

Presenter: Lise Paklet, Avon and Wiltshire Mental Health Partnership NHS Trust, Bristol, UK

Background: Since the incorporation of the Medical Leadership Competency Framework into postgraduate training curricula, all doctors are expected to take on management and leadership responsibilities at an early stage in their career. Stepping up into these roles can be daunting for junior doctors, as employers often provide little formal training or support to facilitate the transition. AWP created the new post of Locality Trainee Lead (LTL) for core trainees interested in developing these skills. LTLs work closely with senior management to improve trainee representation and play a vital role in helping to raise trainees' concerns and in promoting junior doctor engagement across the Trust. This is a formal role within the Trust, with clear responsibilities for the trainee and support and supervision from senior clinicians and managers.
The post generated much interest from junior doctors and all eight positions were filled after a rigorous selection process.
Method: LTLs were asked to answer a detailed qualitative questionnaire at the beginning of the placement, at six months and at twelve months, to evaluate how the role contributed to their personal and professional development and benefited the organisation as a whole. We also share our experience of establishing the role, supporting trainees and developing the role over the year.
Results & Discussion: Participants report increased confidence in and acceptance of their role as medical leaders. The opportunity to work closely with managers makes them feel more valued and trusting that junior doctors can effectively and positively influence the decisions made within their organisation.
They enjoyed the opportunity to meet new colleagues and network beyond their usual working environment , which has a direct positive impact on job satisfaction and effectiveness of their clinical care. They generally felt more committed and positive about working with others with the view to improving the overall performance of the organisation.
Senior clinicians and managers commented on the value of having direct contact and input from trainees within a well-defined working relationship.

Conclusion: The LTL model brought about tangible changes, including greater engagement of junior doctors in the life and decision-making process of the Trust.

9CC3 NOT PRESENTED

9CC4 (1357)
Attitude towards classroom discipline of medical students

Authors
Pathama Leewanich
Veeravan Lekskulchai

Presenter: Pathama Leewanich, Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand

Background: Advances in technology as well as high freedom recently have large impacts on students' behaviors while classroom disciplines are applied to tightly regulate their manners. Thus, most classroom disciplines may be unpleasant for students and cause them to act against the rules. The aim of this study was to examine the students' attitude towards some main disciplines.
Method: The study was conducted with 3rd-year medical students by using a questionnaire.
Results: From distributed 179 questionnaires, 166 were responded back. All of respondents agreed with the rule of coming to the classroom in time and no talking out loud during listening to a lecture. Most (93%) agreed with the rule of uniform dressing and 71% agreed with the rule of no food in classroom. They informed that by following these rules they could show their respect to other people, to their institute, and to themselves.
Discussion: Though most of the disciplines were against their thoughts and behaviors in the modern and freedom world, the 3rd year medical students in our institute agreed that these rules were not bad or obsolete. In their opinions, these disciplines, if following, could indeed make them a decent person in the society and a professional doctor in the future.
Conclusion: The results from this survey indicate that our students were optimistic towards the classroom disciplines even though they might sometimes not follow these rules.
Take-home message: Some regulations should be revised once the global situation changes.

9CC6 (270)
To what extent has situated learning improved in the PGY1 doctors in KKH after the educational interventions?

Authors
Oh Moh Chay, KK Women's and Children's Hospital, Singapore
Raymond Goi, KK Women's and Children's Hospital, Singapore
Angeline Yong YP, KK Women's and Children's Hospital, Singapore
Alyssa Chia PC, KK Women's and Children's Hospital, Singapore
Suzanna Sulaiman, KK Women's and Children's Hospital, Singapore
Oh Jean Yin, KK Women's and Children's Hospital, Singapore

Presenter: Oh Moh Chay, KK Women's and Children's Hospital, Singapore

Background: Situated learning form the cornerstone of clinical learning for the postgraduate year one (PGY1) doctors. Their learning is driven through the experiential management of authentic patient conditions, supported by their active participation in the community of practice. It is known that the transition of a medical student to a PGY1 doctor is stressful, which can result in poor clinical learning, demotivation and medical errors. We had instituted a preparatory program, which consists of: orientation and integration, clinical supervision, case-based teaching, and mentoring. This study explored the effect of the program on the transitioning and situated learning of PGY1 doctors.
Method: The study was conducted at the KK Women's and Children's Hospital, Singapore. We adopted the constructivist approach and conducted a qualitative research, using the semi-structured interview format. An inductive and iterative process of information collection, analysis and thematic classification was used. Twelve PGY1s and eleven faculty participated in the focus-group interviews. Data collection continued until data saturation was reached. The audio-taped interviews were transcribed, analyzed, and the themes were identified.
Results: The PGY1s experienced increased stress, uncertainties and anxieties in the transition. Several interrelated factors that impacted on transitioning and situated learning negatively. These factors included high patient load and turnover, time pressures, unfamiliarity to the local clinical environment inexperience in sub-specialized work and less motivated learners and teachers.
Discussion: With a good preparatory program and supportive community of practice, situated learning was maintained. In addition, the motivated learners adopted their own coping strategies, which included self-directed learning, peer consultations, and learning from other professions. Useful strategies from our experience included (1) job shadowing, (2) identification of inexperienced doctors, (3) team-based rostering, (4) case-based presentation and discussions and (5) strong mentor-mentee support system. Instituting an open system for feedback, ensuring timely instruction and reducing the

hierarchal mentor-mentee relationship can further enhanced the learning experience of the PGY1s.

Conclusion: We analyzed the success of the preparatory program in aiding the transition of PGY1 doctors and enhancing their learning. In addition to a comprehensive preparatory program, three other factors, including constructive feedback, timely instruction and trusting mentor-mentee relationship are essential.

9CC7 (3054)
Taking to the skies -Transition to becoming an FY1 doctor. An innovative study day for post-finals assistantship (PFA) medical students exploring the transition toward becoming a qualified doctor

Authors
Fiona Coia
Terasa Broom

Presenter: Fiona Coia, Directorate of Medical Education, The Mid Yorkshire Hospitals NHS Trust, Wakefield, UK

Background: Over the last three years, the MESH team (Medical Education Simulation Hub) based at the Mid Yorkshire Hospitals NHS Trust has run an annual study day for PFA students at the Yorkshire Gliding Club. In addition to celebrating the completion of Final exams, the students explore their preparedness for the transition into their new role as FY1 junior doctors (Illing et al 2008; Wright 2017). The MESH team deliver a number of interactive teaching essions as well as session on Basic Teaching Skills which encourages the medical students to consider teaching as being integral to their future continuing professional development (CPD).

Method: Fifth Year medical students spend three weeks "shadowing" FY1 (Foundation Year One) doctors in an assistantship role. This helps them to understand what their job will involve and working alongside an FY1 allows them to learn essential skills such as time management, prioritisation and team work. The MESH team is keen that junior doctors incorporate teaching into their roles. We run a Breakfast Club which students are encouraged to attend and in which junior doctors and other Allied Health professionals deliver the teaching. Feedback is given by a senior colleague and certification is provided for CPD.

Results: Medical students are not routinely taught how to teach but after qualification are quickly made aware that this is one of their responsibilities (Cheeseman 2009). We found that many students attending the study day, in addition to feeling more prepared for their new role, felt inspired to teach. These trainees now make a significant contribution to the Faculty for our Undergraduate teaching programmes.

Discussion & Conclusions: Preparedness for transitioning from student to FY1 needs to include not only practical skills and knowledge in clinical roles but should also provide an introduction to basic teaching skills and the opportunity to develop these skills.

Take-home message: Preparedness for FY1 should include preparation for clinical and educational roles.

9CC8 (2326)
Behavioral competency for hospital pharmacists - a novel approach to non-technical skill acquisition in mixed-methods training course

Authors
Shu Fen Huang
Ping Yu Hsu
Jen Wen Chang
Hui Chen Su

Presenter: Shu Fen Huang, Chi Mei Medical Center, Tainan, Taiwan

Background: Junior pharmacists often felt anxiety and depression when start to face patients directly, although they had passed numerous written and oral exams. The reason is the amount of training focus more on knowledge and technical skills, from pharmacy school curricula to postgraduate training. The aim of this study was to evaluate the efficacy of a mixed-methods training course on non-technical skills (NTS).

Method: The course consisted of an introductory lecture, role play scenarios, group discussions and debriefings. It held once every three months in 2017, different scenario arranged for training NTS of hospital pharmacists, such as social skills, affective attributes, and error awareness. We used the cloud-based interactive response system to collect opinions from participants and facilitators.

Results: The average number of participants per time is 39. Quantitative analysis of pre- and post-course questionnaires showed a significant improvement of self-reported confidence in managing the scenarios difficult to deal with (mean improvement 53.2%; p<0.01). 96% of participants "strongly agreed" or "agreed" that they had learned the NTS available following this training course. 99% of participants willing to apply what they learned in the future. The average satisfaction score is 98%. According to questionnaire answers, the course resulted in a high degree of participant satisfaction and increased confidence in managing the trouble events. Additionally, the priority of the training course needed by survey from junior pharmacists is different from 2016. "Ability to communicate with the patient "and "Response to unusual events" appeared in the top 5 list of 2016, but disappeared in the next year.

Discussion & Conclusion: NTS is cognitive and interpersonal skills, complement an individual's professional and technical knowledge, facilitation of effective delivery of a high-quality patient care. Acquisition and retention of NTS is necessary but a challenge in postgraduate pharmacy education. We showed the positive result with the novel course focused on behavioral competence training.

Take-home message: Different types of simulation-based education should be developed and adopted as a teaching tool on NTS for hospital pharmacists. Cloud-based interactive response system could help to do more with less time.

9CC9 (874)

The Exploration of the Patient's Agenda by Medical Students in the Emergency Department (TEAM-ED)

Authors
Heng Jiun Yi Derek, National University Hospital, Singapore
Chan Wai Han Gene, National University Hospital, Singapore
Malcolm Mahadevan, National University Hospital, Singapore
Lau Tang Ching, National University Hospital, Singapore

Presenter: Jiun Yi Derek Heng, National University Hospital, Singapore

Background: Embedding medical students into healthcare teams enhances patient care and facilitates development of key competencies in students through active listening, empathy, and patient advocacy. Patient encounters by physicians in the Emergency Departments may be hurried and inadequate resulting in patients lacking a clear understanding of their diagnosis and management. We sought to address these two inadequacies by embedding students into healthcare teams to further explore the patients' concerns, understanding of their own condition and management received. The student would then proceed to address these issues with the guidance of an attending doctor.
Method: We hypothesize that this intervention would enhance embedding of students, and allow patients to understand their condition and management better through a more comprehensive conversation. If successful, we envision patients would more likely elect to have a student in their healthcare team to facilitate this process.
Standardized training was provided to all our students on their roles prior to embedding them in healthcare teams. We then randomly surveyed patients on their interaction with the students and whether they perceived any benefit from the interaction.
Results: One hundred and one patients were surveyed. Of the 51 patients who interacted with students, 44 (86%) indicated that they would like to have a student in their healthcare team; whereas 28 (56%) of the 50 patients who did not interact with students preferred to have students in their healthcare team. Furthermore, 80% of the patients who interacted with students agreed that the students explained their condition and management to them clearly, explored their concerns and worries, and contributed to their overall care.
Conclusion: Interaction with embedded students benefited patients and increased the number of patients who would like a student in their healthcare team by 30%. In this pilot project, we demonstrated that it is possible for students to be embedded effectively and fulfill an important role in the management of patients in a busy, fast-paced environment.

Challenges in Obstetric Anaesthesia procedural training, and their impact on learning and instruction

Authors
Raymond Goy, KK Women's and Children's Hospital, SingHealth, Singapore
Farida Ithnin, KK Women's and Children's Hospital, SingHealth, Singapore

Presenter: Raymond Goy, KK Women's and Children's Hospital, SingHealth, Singapore

Background: Spinal administration of anaesthetic drugs carries significant risks. Hence close instruction of the residents in training is necessary to avoid complications. Faculty instruction can be opportunistic during these procedures, leading to the concerns of incomplete situated learning. We conducted this qualitative study to explore the challenges experienced by the faculty and residents. We sought to understand the impact of these challenges on the quality of procedural training.
Method: The study was conducted at the KK Women's and Children's Hospital, Singapore from 1 December 2016 to 15 March 2017. We adopted the constructivist approach to explore the experience of the stakeholders, in the challenges of learning and instructing during obstetric regional block procedures. We conducted a qualitative research, using the semi-structured interview format. An inductive and iterative process of information collection, analysis and thematic classification was used to derive our understanding of the challenges. Five faculty participated in the individual interviews, and fourteen residents participated in the focus group and group interviews. Data collection continued until data saturation was reached. The audio-taped interviews were transcribed, analyzed, and the themes were identified.
Results: Both residents and faculty identified the gaps in learning and instruction. Their expectations of what constituted good supervision and instruction were dissimilar. Four inter-related types of challenges were identified. (1) Clinical pressures restricted the opportunities for close instruction and learning. (2) Difficulties in gauging the residents' prior clinical experience hindered the appropriate tailoring of instruction. (3) The Korthagen's ALACT learning cycle (which constitutes Action, Looking back, Awareness, Creating alternatives, Trial) was interrupted due to the reduced opportunities for coaching and feedback. (4) Reflective practice was not employed as an effective learning strategy. Coping strategies, which included operative case scheduling and negotiated orders with other stakeholders were largely ineffective. The challenges impacted on the learning, and confidence of the residents.
Conclusion: We had identified the challenges, which had impacted on the quality of learning and instruction in our context. We recommend a multi-pronged framework (including dedicated training lists, faculty-resident pairing, end-of-day feedback and the use of an obstetric anaesthesia experiential reflective diary) to improve learning and instruction.

Residents' perceptions on the impact of order sets on their learning

Authors
Vanessa Bohn, Children's Hospital of Eastern Ontario, Ottawa, Ontario, Canada
Mona Jabbour, Children's Hospital of Eastern Ontario, Ottawa, Ontario, Canada
Kaylee Eady, Children's Hospital of Eastern Ontario, Ottawa, Ontario, Canada

Presenter: Vanessa Bohn, Children's Hospital of Eastern Ontario, Ottawa, Canada

Background: Order sets are used in the emergency department, as well as other clinical areas, to ensure provision of evidence-based standardized management for a given condition (e.g. Asthma). Order sets have a positive impact on patient care. However, their influence on residents' learning has not been well explored.
Method: In this qualitative study, we conducted semi-structured interviews of 16 residents (8 paediatrics and 8 emergency medicine) during their paediatric emergency medicine rotation. The interviews explored their attitudes and experiences towards order sets, as well as the perceived influence on their learning. We used a grounded theory approach to analyze the data for recurrent themes and ideas. Relationships between themes were then identified and a concept map was created to further explore our generated theory.
Results: The impact of order sets on residents' learning is influenced by their attitudes and experiences using them in the clinical environment. Residents' perceive both positive and negative influences from the use of order sets on their learning. Regarding positive influences, residents perceive that order sets reduce cognitive burden and provide a framework for teaching. Negative influences include a decrease in critical thinking and knowledge acquisition, in addition to a lack of feedback on residents' use of order sets.
Discussion & Conclusions: Medical educators should adapt their educational approach to encourage the positive influences of order sets on learning, while developing strategies to minimize the negative influences on the resident learning experience. These negative influences have implications not only for learning but also patient safety. Educators should consider how feedback can be incorporated into the use of order sets.
Take-home messages: The increasing use of order sets reflects an emerging trend of increased standardization in healthcare. Medical educators should adapt their educational strategies to encourage the positive influences associated with order sets while mitigating the negative influences on resident learning.

Service obligations, clinical exposure and clinical department influence Post Graduate Year 1s (PGY1) perspective of training quality

Authors
Eugene Mingjin Gan, MOHH, Singapore
Swee Han Lim, Singapore Health Services, Singapore
Joseph Li, Singapore Health Services, Singapore
Daniel Yan Zheng Lim, MOHH, Singapore
Boon Leng Lim, Singapore Health Services, Singapore

Presenter: Swee Han Lim, Singapore Health Services, Singapore

Background: PGY1s rotate through 4 x 3 monthly postings to the departments of Internal Medicine (compulsory), General Surgery and/or Orthopaedics (1 compulsory surgical posting), O&G or Paediatrics. We experience fluctuation in number of PGY1s allocated to various departments throughout the year. We aimed to elucidate factors that influence PGY1s' perspective of training quality to further improve our training program.
Method: A standardized rotation evaluation questionnaire with 12 questions was routinely administered to all PGY1s via an online platform (New Innovations) at the end of each rotation from the period of May 2016 to April 2017. Domains assessed included clinical exposure, service obligations, faculty supervision, educational activities, and procedural experience. Rotation evaluation results across departments were compared. Data was analysed using IBM SPSS Statistics software.
Results: 93 PGY1 trainees were surveyed. Mean number of trainees per rotation was 15.5 (range 1 to 23). Multivariate analysis via logistic regression revealed factors that independently predicted posting satisfaction – 1. Adequacy of clinical case mix ($p = <0.01$), 2. Perception of service obligations ($p = 0.02$), and 3. Clinical department. Qualitative feedback supportive of the above include low manpower provision, compulsory PGY2 educational activities resulting in manpower constraints, conflict of scheduled teaching with clinical duties, excessive clerical work, high patient turnover, rotation to wards with a limited spectrum of cases, and being placed on night duty too early into the rotation.
Postings with the poorest evaluation also received poor feedback in terms of PGY1s' ability to participate in formal teaching sessions (50.5% rating 3 or less on a 5-point Likert scale), service obligations (48.5%), implementation of transition of care for patients (32.7%), and appropriate level of faculty supervision (26.7%). Excessive service obligations may have implications on trainee education and patient care.
Conclusion: Tackling excessive service obligations will involve targeting a combination of manpower planning, clinical and administrative support. Future work may involve assessing the relative weight of the various factors in determining perception of service obligations to aid resource allocation.
Take-home message: Perception of excessive service obligations is contributed by multiple inter-related factors and not just patient turnover alone.

How students want to see and use their workplace learning data – initial results from a co-design study

Authors

Tamsin Treasure-Jones, Leeds Institute of Medical Education, University of Leeds, Leeds, UK

Rosie Dent-Spargo, Leeds Institute of Medical Education, University of Leeds, Leeds, UK

Presenter: Tamsin Treasure-Jones, Leeds Institute of Medical Education, University of Leeds, UK

Background: The Leeds Institute of Medical Education is committed to developing innovative and effective technology enhanced learning tools to support our students. Within the myPAL (my Personalised Adaptive Learning) project we are exploring how learning analytics can provide students with different views (visualisations) onto their learning data, which will help them to review, plan and manage their ongoing learning better. We are adopting a co-design approach involving students and tutors.

Method: 5 co-design workshops were run with students and 4 with tutors. In total 26 students, 7 clinical tutors and 6 academic tutors took part representing all 5 years of the medical degree. These workshops were designed to (1) gather feedback on how they currently viewed and approached their workplace learning activities and data (2) facilitate them in drawing and discussing different visualisations of this data. The data gathered included the discussions in the workshops (audio-recorded & transcribed) and all the visualisations created.

Results: 50 visualisations were created and these were coded in terms of the visualisation type and purpose. The pathways students proposed in their visualisations generally followed a recognised pattern of overview, drill down and details on demand. The most commonly coded purpose of the visualisations related to self-regulated learning processes – views that supported students in reflecting on how they were progressing and then planning what to do next.

Discussion & Conclusions: Our research indicates that students want learning data visualisations that go beyond simple reporting of grades. They wanted visualisations they can use to review their learning progress with a focus on managing/planning their future learning. We are now developing a subset of their visualisations into paper prototypes. The next phase of the co-design work will focus on exploring and testing how students would actually use these visualisations in workplace learning contexts.

Take-home messages: Students want to have visualisations of their learning data that show progression and support their own management of their learning. Co-design (giving students the tools and support to design learning data visualisations) can help us to understand and better support their learning needs when developing Technology Enhanced Learning systems.

Presenter:
Manuel João Costa, School of Medicine, ICVS/3B's, PT Government Associate Laboratory, Braga, Portugal

Background: Worldwide, the distribution of medical specialty choices in recent graduates is often misaligned with medical workforce shortages. Understanding the dynamics of student career preferences during undergraduate medical training is important for better workforce planning. This work is part of an ongoing project to develop a comprehensive overview of the evolution of career and work preferences of Portuguese undergraduate medical students developed by the Portuguese Research Network on Medical Education (RIEM).
Method: In this study we report the Year 1 medical students career preferences and respective certainty (in a scale 0-100%) in those preferences, collected at the beginning of the academic year, in 4 of the 8 medical schools in Portugal. RIEM Researchers from the 8 medical schools developed a survey with the main purpose of understanding the dynamics of student career preferences during undergraduate medical training
Results: There were 414 respondents from 4 Medical Schools (aprox. 25% of the 1800 students from the 8 medical schools).The most preferred specialties were Pediatrics (15%) and General Surgery/Cardiology (8%) and the least were Clinical Pathology (0.6%) and Pediatrics Cardiology (0.3%). The organization of preferences by type of specialty, revealed that the highest preference fell into surgical (45.9%), followed by medical (15.9%), primary care (6.5%) and technical (5.1%). The mean level of certainty in preference is 70.88% (sd=21.3%). Students with a preference for a less frequent specialty had higher levels of certainty, such as Clinical Pathology (90%) and Pediatrics Cardiology (99%). The career preferences were overall similar across the four medical schools, except for primary

care. Preference for primary care (18.8%) was comparatively high in students attending the graduate entry school.
Year 1 students had a generalized preference for the surgical specialties. Graduate entry students reported the highest preference for primary care specialties. Data from the remaining 4 Medical Schools will offer a national perspective from Portugal.
Conclusion: The Portuguese national study can be a starting point for longitudinal, research which will contribute to understand how medical schools are contributing to the disparity of workforce demands and student preferences.

Positive correlations between the subspecialties during clinical clerkship and those as a career: results of questionnaires from graduates of Tohoku University over the past 35 years

Authors

Junichi Kameoka, Tohoku Medical and Pharmaceutical University, Sendai, Japan
Kinue Utsumi, Tohoku Medical and Pharmaceutical University, Sendai, Japan
Naoto Ishii, Tohoku University, Sendai, Japan

Presenter:
Junichi Kameoka, Center for Medical Education, Tohoku Medical and Pharmaceutical University, Sendai, Japan

Background: Rotation during clinical clerkship (CC) has been reported to be one of the most influencing factors in choosing future subspecialties. However, most studies have been based on questionnaires regarding impression, and there are few studies investigating the relationships between the rotations during CC and career subspecialties.
Method: During the CC at Tohoku University, students had to rotate through half of the subspecialties of internal medicine (3 weeks each) and surgery (4, 4, 2 weeks) before 1997, all of the subspecialties (2 weeks each) between 1998 and 2007, and half (3 weeks each) after 2008. We sent questionnaires to 2672 graduates of Tohoku University School of Medicine who graduated between 1979 and 2013 with available addresses (67.6% of 3955 graduates).
Results: There were 1052 responders (response rate 39.4%). Responses to when they decided their career subspecialties were (n=1026): before CC (11%), during CC (21%), after CC but before graduation (30%), and after graduation (30%). Responses to whether rotations during CC influenced their career subspecialties were (n=1020): highly influenced (31%), influenced (28%), did not influence (16%), and did not influence at all (14%). Among the 297 graduates whose subspecialties for both CC and career were identified, 208 (70%) chose subspecialties that they rotated in (group A), and 89 (30%) chose subspecialties that they did not (group B). In group A, 50.0% decided their career subspecialties before graduation, and in group B, it

was 32.6% (P=0.0045). Furthermore, 64.4% were influenced by CC when deciding their career subspecialties in group A, whereas 42.7% were influenced in group B (P<0.0001). The correlations between the subspecialties during CC and those as a career were significant for neurosurgery (P<0.0001), lung surgery (P=0.0006), neurology (P=0.0053), and hematology/nephrology/endocrinology (P=0.0326), but no correlations were observed for cardiology/respiratory medicine, gastroenterology medicine, or gastroenterology surgery.

Conclusion: Career choice may be influenced by the subspecialties during CC, particularly in minor departments.

When developing the CC curriculum, the influence of rotations on future subspecialty choice should be considered.

Increasing the number of pre-registration nurse placements in primary care to develop the community-based workforce

Authors
Amber Truscott, Health Education England Wessex, University of Winchester, Hampshire, UK
Sam Scallen, Southampton GP Education Unit, University Hospital Southampton, Hampshire, UK
Heidi Penrose, Mid Wessex GP Education, University of Winchester, Hampshire, UK

Presenter:
Amber Truscott, Health Education England Wessex, Hampshire, UK

Background: High numbers of nursing staff in primary care are set for retirement in the next five to ten years. The loss of these clinicians with substantial experience, presents workforce challenges for the long-term sustainability of primary care. There is a need for investment in student nurses' education to promote experience and to generate interest in careers in primary care nursing.

Method: Strategies include promoting the image of primary care at careers events and roadshows to increase the understanding of the role of general practice nursing and available career opportunities. I have been working in a specific area to increase the number of pre-registration nurse placements to attract newly-qualified nurses in to general practice, supported by preceptorship programmes.

Results: Early analysis of the data suggests that students want placements in primary care and when they have had placements have then considered general practice as a first career destination. Further data collection is under way and will gather in-depth qualitative data from student nurses and host training practices about the placement process, supervision and learning.

Discussion: Building relationships with and supporting healthcare professionals within a specific geography to lead and support the development of education for the non-medical workforce is vital in increasing the number of pre-registration nurse placements in primary care and to boost workforce numbers. Before the current generation

of GPN's start retiring, the flow of nurses in to primary care needs to increase so that expert knowledge and skills can be passed on, and the workforce sustained.

Conclusion: There is a need to transfer more care from hospital to primary and community settings and this can only be done if there are staff to deliver this care and both these settings need to be positive learning environments to nurture learning.

Maya Othman, Alfaisal University, Riyadh, Saudi Arabia
Yasin Obeidat, Alfaisal University, Riyadh, Saudi Arabia
Alawwab Dabaliz, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter:
Abdullatif Barkoumi, Alfaisal University, Riyadh, Saudi Arabia

Background: Studies report an annual decline in new trainees in psychiatry in many parts of the world. This deficiency is projected to create gaps between mental health service needs and providers. Our aim is to study factors influencing attitudes of medical students towards psychiatry as a career.

Method: An anonymous questionnaire was administered to medical students from years 1 to 5 in the College of Medicine, Alfaisal University, Riyadh, KSA. Factors assessed in the survey included some previously influential studied ones in addition to others which we hypothesize to be of significance in our study population.

Results: Positive views towards Psychiatry as a career increase linearly by year. 33% selected psychiatry as their top 3 career choices with the most significant factor being an intimate patient-doctor relationship (P<0.05). There is unanimous agreement among those who do not prefer psychiatry of the lack of instant gratification of treatment.

Discussion: This study gives insight towards both positive and negative influencing factors for psychiatry. Most of the negative factors, admittedly by the respondents as cultural based, have given Psychiatry a poor reputation in the region. Our findings give an optimistic view towards the future of psychiatry in the region, given the large number of students (33%) who consider it in their top 3 choices for a career. However, a significantly large number of students continue to have a negative view towards psychiatry.

Conclusion: The factors identified in our study to have a negative impact on students' attitude towards psychiatry should be tackled by medical schools and higher authorities, as this has shown to be of benefit in studies in other parts of the world.

Students' Preferences for Primary Care Careers Evolve Over Time: The Situation in Two Medical Schools in Switzerland and Portugal

Authors
Eva Pfarrwaller, Primary Care Unit, Faculty of Medicine, University of Geneva, Geneva, Switzerland
Milena Abbiati, UDREM, Faculty of Medicine, University of Geneva, Geneva, Switzerland
Manuel João Costa, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Braga, Portugal
Patrício Costa, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Braga, Portugal
Anne Baroffio Barbier, UDREM, Faculty of Medicine, University of Geneva, Geneva, Switzerland
Dagmar M. Haller, Primary Care Unit, Faculty of Medicine, University of Geneva, Geneva, Switzerland

Presenter:
Eva Pfarrwaller, Primary Care Unit, Faculty of Medicine, University of Geneva, Switzerland

Background: Many countries encounter an insufficient number of medical graduates choosing a primary care career. To help understand the various factors involved in students' career choice, a conceptual framework of primary care career choice was recently proposed (Pfarrwaller et al, Acad Med 2017). The objective of this study was to describe the course of students' preference for primary care over time, which is one element of this complex system.

Method: We used data from cohort studies at the Faculty of Medicine in Geneva, Switzerland and the School of Medicine of the University of Minho, Portugal, collecting career preferences throughout medical school. We grouped students' career choice at different time points according to their interest in primary care and studied how these preferences evolved. We discussed differences and similarities between the two universities and generated hypotheses about influences, using the conceptual framework as a reference.

Results: Evolution of students' primary care career preference was different in the two medical schools. In Braga, the proportion of students citing primary care among their three preferred specialties increased from under 2% at matriculation to 14% at graduation. In Geneva, the proportion of students preferring primary care was more stable, from 13% at matriculation to 19% at graduation.

Discussion: The proportion of graduates preferring primary care is insufficient in both places, but the development of students' career preferences varies depending on the context. In Geneva, the impact of a recently strengthened primary care curriculum seems not visible yet on students' career choices. In Braga, primary care teaching focused on the clinical curriculum possibly influences students' preferences. Based on the conceptual framework, we identified factors in the broader context that may influence primary care career choices differently in the two medical schools, and generated hypotheses for future research.

Conclusion: The course of students' primary care career preferences over time differs according to the context. These findings can be used as a basis for further discussions to adapt the primary care curriculum. The conceptual framework can also provide the basis for the analysis of broader influences in different contexts.

Conceptualizing clerkship experiences toward future specialty aspiration: A Framework

Authors
Sheila SL Huang

Presenter:
Sheila Shu-Ling Huang, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Clinical workplaces provides exclusive opportunities to situated learning, which ultimately shapes the identity of the medical profession. Medical students are not only socialized to their professional roles, but may also be inspired to their future specialties. Career aspirations, as point-in-time expressions of occupational goals, involve personal backgrounds, self-efficacy, expectations, and contextualized learning factors (Rojewski, 2005). The purpose of this study was to determine whether there are identifiable factors encourage individuals entering future specialties of one's choice.

Method: This IRB-approved inquiry randomly recruited 41 clerks in two major teaching hospital systems in southern Taiwan for one-on-one interviews (n=17), followed by focus-group interviews (n=24). All interviews were recorded and transcribed for qualitative data analysis via Atlas.Ti 7.5. At the time of interviews, I also made on-site visits in clinical settings to glean information about dynamics of bedside teaching and learning.

Results & Discussion: Developed from the qualitative analysis, the framework of clerkship toward career aspirations indicates that the contextualized environment in clinical workplaces exert critical influences on students' learning. Clinical education is conceived as a dynamic system consisting of areas of specialties and organizational resources. Learning resources include specialized learning tasks, physicians as clinical teachers, artifacts, and structures for learning progression. All those situated experiences enhance professional exploration in conceptualizing medicine as a committed career, and a source of satisfaction. Areas of specialties are led by physicians, and exert norms and culture on leaners. The learning paradigm shifting from textbooks to bedside learning inculcates norms, beliefs and values in students socially and professionally. This shift ultimately shapes students lived experiences, impacting how they "think, act, and feel like a physician" (Cruess, Cruess, Boudreau, Snell, & Steinert, 2015), and future specialties.

Finally, the framework represents individual, organizational and systemic levels of impacts on students' career aspirations during clerkship.

Conclusion: Being engaged and "functional" is the key to success in clinical learning; and yet, attending physicians, interactions with patients, work-life balances are defining factors for future specialty selections. Clerkship presents a defining moment for retention and motivation for advanced medical pursuits, and ultimately enhances personal identity formation for future careers.

Ban the Bash: hosting a World Cafe with Sheffield PsychSoc to challenge stigmatisation of different medical specialties

Authors

Jonathan Cunliffe, The University of Sheffield, Sheffield, UK
Gisele Infield-Solar, The University of Sheffield, Sheffield, UK
Esther Lawrence, The University of Sheffield, Sheffield, UK
Alice Duffy, The University of Sheffield, Sheffield, UK
Helen Crimlisk, The University of Sheffield, Sheffield, UK

Presenter:
Jonathan Cunliffe, The University of Sheffield, UK

Background: The stresses on the NHS workforce are vast, and recruitment proves an ongoing problem. Psychiatry and General Practice are two specialties which have struggled with chronic recruitment difficulties, but these specialties are the most common recipients of negative and disparaging comments (bad-mouthing or bashing), which have been shown to affect student and trainee career choices.

Method: We ran a World Cafe style small group discussion event attended by 22 medical students and junior doctors, all with varying career interests. We looked at their experiences of bashing and considered how we can challenge it. We explored 6 questions relating to bashing and are producing a short video about the evening. The World Cafe format provided a good opportunity for discussion and sharing experiences. Paper tablecloths allowed attendees to add to others' written notes and use them as prompts for discussion. Responses highlighted a range of negative comments that students have been exposed to, and the difficulty in challenging comments.

Results: Power dynamics between student and senior was a common theme; various attendees stated that it was difficult to find the confidence and correct tone to challenge their seniors when 'bashing' occurred on the wards. Overall, attendees reported an increased awareness of bashing at the end of the event and felt more comfortable in acknowledging and challenging it. Stereotypes of different medical specialties can be a source of amusement and camaraderie for colleagues and students, but comments can blur the lines between banter and bashing. The World Cafe provided the ideal format to enable medical students to share their experiences of bashing, and explore the best ways to challenge it. Changing tables and groups enabled varied discussion between attendees with different experiences and opinions.

Conclusion: Students and trainees are exposed to a number of negative and disparaging comments about different specialties, which have been shown to affect their career choices. Students find it difficult to challenge these comments, which can be related to a perceived power-dynamic between them and senior doctors. World Cafe events can help promote discussion and sharing of varied experience.

Motivational factors influencing medical students' intentions to practice in underserved areas: results of a multi-site cross-sectional study

Authors

Milena Abbiati, Unit of Development and Research in Medical Education (UDREM),Geneva, Switzerland
Nadia Bajwa, UDREM, Geneva, Switzerland
Anne Baroffio, UDREM, Geneva, Switzerland
Georges Salvodelli, UDREM, Geneva, Switzerland

Presenter:
Milena Abbiati, UDREM, Geneva, Switzerland

Background: In Switzerland, like in many others countries, an insufficient proportion of students choose to practice in underserved areas (UA). Definitive career decision is associated with career intention in medical school but little is known about factors influencing these intentions. We investigated both medical students' intentions to practice in UA and what specific motivational factors predicted these intentions.

Method: From 2010-2015, 1749 graduating Swiss medical students from four of the five Swiss medical schools self-reported their intentions to practice in UA (yes, undecided, no) and motives (24 items) that explained their career choice. Motives were aggregated using a principal component analysis (PCA) with Varimax rotation (KMO 0.79, $p<.001$, 49% of variance explained). Motivational factors included intellectual challenge, work variety, work conditions, and enthusiasm for the specialty. Chi-square and MANOVA were used to compare site, gender and UA intentions ; logistic regression to predict the effects of gender and motivational factors on intentions to practice in UA.

Results: The average proportion of students' intending to practice in UA was 14%, with the lowest rates found in two urban medical schools (10%). 42% of students were undecided. Work conditions and work variety positively predicted intentions to practice in UA ($\beta=.34$, $\beta=.30$, respectively; $p< .001$). Conversely, intellectual challenge negatively predicted intentions to practice in UA ($\beta=-.89$; $p< .001$). Enthusiasm for the specialty and gender did not significantly predict intention to practice in UA. At the end of their undergraduate studies, few students intended to practice in UA but a large percentage were still undecided. Interventions that affect work conditions and work variety may be potential avenues to encourage practice in UA.

Conclusion: Results at four medical schools confirm that the proportion of students interested by practice in UA is largely insufficient to meet the needs of the Swiss population. Interventions that target undecided students could potentially influence this gap. There are differences in students' motivational factors driving their career choice and notably their intentions to practice in UA. Investigating these factors for specific student groups could help identify strategies to encourage practice in UA.

To what extent can medical students predict what they'll specialize in?

Authors
Åsa Langen Westlie, UiT the Arctic University of Norway, Tromsø, Norway
Peder Halvorsen, UiT the Arctic University of Norway, Tromsø, Norway
Eirik Hugaas Ofstad, UiT the Arctic University of Norway, Tromsø, Norway

Presenter:
Åsa Langen Westlie, UiT the Arctic University of Norway, Tromsø, Norway

Background: The world's northernmost medical school, UiT the Arctic University of Norway, was founded in 1973 to ensure recruitment of doctors to the region and provide stability to the local and rural health sector of Northern Norway. A recent study found that more than half of both the general practitioners in northern Norway, and the doctors working at the University Hospital of Northern Norway, were educated at UiT. Knowledge of factors that influence young physicians' choice of specialty and geographical location is scarce, for the Scandinavian and Northern Norwegian context in particular. This follow-up study aimed to identify relevant determining factors, and explore to what extent final year medical students can predict their future medical career choice.
Method: Baseline survey administered early at the sixth/final year of medical school, to six successive graduating classes of 2012-2017. The students were asked to rank their top three future specializations and indicate a percentwise likelihood for them to a) become a general practitioner and b) to settle/work in a rural district. Students from the classes of 2012 and 2013 were followed up with semi-structured qualitative interviews in January 2018. Interviews were analysed using systematic text condensation.
Results: 107 out of 113 (95%) students responded to the questionnaire. Follow-up qualitative interviews were accomplished in 31 of 38 (82%) of the students graduating in 2012-13. Approximately 70% of the interviewed physicians were pursuing a career they predicted at their final year of medical school. Factors frequently associated with concordance between baseline survey and current specialty were "early interest to the field" and "good experiences during clinical clerkships", while the main factor associated with discordance was "work-load of specialty desired by student at baseline".
Conclusion: In our study, a majority medical students had chosen a specialty that they listed as one of three desired specialties when asked ten months before graduation. A variety of factors formed the basis of their choice of specialty.
Take-home message: Identification of national and regional factors determining choice of specialty is a necessary first step to enhance recruitment to certain specialties and geographical areas.

9DD10 (1722)
Undergraduate anaesthetics exposure and anaesthesia as a career - perspectives of medical students and specialists

Authors
Colin Hall, NHS Greater Glasgow and Clyde/University of Glasgow, Glasgow, UK
Kevin Gervin, NHS Greater Glasgow and Clyde/University of Glasgow, Glasgow, UK

Presenter:
Colin Hall, NHS Greater Glasgow and Clyde/University of Glasgow, UK

Background: Anaesthesia is the largest single hospital specialty in the UK, yet medical students receive significantly less exposure in comparison with other specialties during their undergraduate training. At University of Glasgow (UoG) this constitutes only one day of undergraduate training. We aim to evaluate medical student and specialist perspectives on undergraduate anaesthetics exposure, and anaesthesia as a career.
Method: Third and fourth year medical students rotating through surgery completed a questionnaire relating to their experience of anaesthesia as an undergraduate and their opinions of anaesthesia as a career. This questionnaire is currently being disseminated to all medical undergraduates at UoG. A modified questionnaire has also been disseminated to anaesthetists of varying levels, focussing on their experience of medical student teaching and their own undergraduate exposure to anaesthesia.
Results: 75% of students believed they should have more experience of anaesthesia during their training and 56% had considered anaesthetics as a potential career choice. 56% believed that anaesthesia is 'more complex' than other specialties, 25% 'about the same' and 0% believed it to be 'less complex'. Only 19% of students mentioned a role for anaesthetists in critical care environments, and only 6% mentioned a role in emergency response teams or retrieval medicine. Anaesthetist questionnaire results are awaited.
Discussion: Anaesthesia continues to be poorly understood amongst medical students, and perhaps overlooked when it comes to potential career options. The Royal College of Anaesthetists recently produced a framework highlighting the need for further anaesthetic and critical care input to medial student teaching, based on the interpretation that 63 out of the 106 outcomes of the GMC's Outcomes for Graduates relate to the work of anaesthetists, intensivists and perioperative physicians. Although anaesthetist results are outstanding, there is clearly a student desire for greater undergraduate anaesthetic exposure. We do not anticipate anaesthetist opinions will be averse to this.
Conclusion: There is apparent student desire for increased undergraduate anaesthetics exposure. Any such novel anaesthetic education should be based on guideline teaching programmes produced by The Royal College of Anaesthetists.

The point of departure: career goals of final year medical students in Sudan

Authors

Ahmed Hashim
Eltahir Abdelrahim
Samir Shaheen

Presenter:
Eltahir Abdelrahim, University of Khartoum, Sudan

Background: The composition of a nation's future medical workforce and framework can be linked to the career choices of the medical students. This study aims to explore the career plans of final-year medical students in Sudan.

Method: In December 2017, a survey was distributed to all final year medical students in two major universities in Khartoum, Sudan; the University of Khartoum (U of K) representing the governmental sector and the University of Medical Sciences and Technology (UMST) which belongs to the private sector. This study explores the medical exodus Sudan experiences as a result of final-year students intending to pursue their postgraduate (PG) training abroad.

Results: The survey was completed by 350 (64%) out of a total of 543 eligible students. The majority (225, 64%) entered medical school following attainment of the Sudanese National High-School Certificate. Only 74 (21%) made full decisions with regards to the specialty they would like to pursue in the future. While a considerable proportion of final year medical students will spend their internship in Sudan (214, 63%), a significant majority would like to undertake their further PG training outside the country (246, 70%). The commonest destination is the UK (118/246) followed by USA (59/246) and Republic of Ireland (23/246). Although only 118 (34%) received some form of career guidance, the majority (252, 72%) felt that they would benefit from formal career orientation programs. Half of the students (189, 54%) rated their awareness about the PG training pathways in Sudan as poor or very poor. The reasons for seeking to train abroad were related to better training opportunities in the preferred specialty, living conditions, healthcare policies and work environment. Students from UMST and those whose entry qualification to medical school was other than the Sudanese national certificate were significantly more likely to consider PG training overseas.

Conclusion: A significantly high proportion of the students would like to leave the country to train abroad. There is also lack of formal career guidance and orientation in medical schools coupled with poor awareness amongst the students on the local PG training opportunities.

Foundation Doctors' career afternoon to promote the range of different specialities and what is required to apply for them

Authors

Judith Butcher
Margaret Short
Pratik Solanki

Presenter:
Judith Butcher, Princess Alexandra Hospital NHS Trust, Harlow, UK

Background: The percentage of applicants for core and higher speciality training is at a whole time low in the UK. This is most obvious in those who have finished foundation training, the first 2 years of clinical training for UK graduates. There are numerous reasons for this including the current political climate and doctor 'burn out'. However, a number of foundation doctors remain unclear about what they would like to specialise in and how to get information about the speciality. Thus, at Princess Alexandra Hospital, we developed a careers afternoon to try to provide this service.

Method: A doodle pole was carried out for all foundation doctors within the trust asking about which specialities they were interested in. From that information, trainees from anaesthetics, core medical training, core surgical training, paediatrics, obstetrics and gynaecology, general practice, public health, accident and emergency, intensive care, oral maxillofacial surgery, orthopaedics surgery and histopathology were invited to talk about their speciality. The aim was for near-peer presenters so that they could better understand the foundation doctors needs. A speaker was also requested to talk about taking a year out between speciality training. There were 5 rooms being used with simultaneous presentations occurring at the same time. Each session was 30 minutes long and the schedule was created so that all foundation doctors were able to attend the sessions of their choice.

Results: In total we received 40 feedback forms. 100% of doctors found the afternoon useful. 95% of doctors felt that all their questions had been answered and 100% of doctors would recommend the afternoon to a peer. Doctors were asked to rate the afternoon on a scale from 1 to 5, with 5 being excellent. The mean average rating was 4.88.

Conclusion: Applications for core training remains a daunting task for many foundation doctors and career afternoons can provide a great way of providing them with information of why to apply and what they need to apply.

Take-home message: Career afternoons can be a useful way of providing information to the more junior doctors about different specialities.

9DD13 (1582)
Home or Away? A survey of career intentions among Foundation Year 1 (FY1) doctors in the UK

Authors
John McCullough, Severn Foundation School, Bristol, UK
Chris Copplestone, Severn Foundation School, Bristol, UK
Peter Lillie, Severn Foundation School, Bristol, UK
Clare van Hamel, Severn Foundation School, Bristol, UK
Tim Thorne

Presenter:
Tim Thorne, UK

Background: Public Health England highlights a growing demand for NHS doctors due to an ageing population, increasing multi-morbidity, and a drive for safer staffing following the Mid-Staffordshire Crisis. Previous studies have shown increasing rota gaps in UK hospitals with an average vacancy rate of 9.6% across all medical specialities. Therefore the career intentions of incoming doctors will have significant implications for future workforce planning.
Method: We aimed to explore career motivations and intentions among newly qualified doctors in the UK. An online survey was sent to all Foundation Year 1 (FY1) doctors during their first week of work (2017), with a response rate of 22% (n=1,699). The questionnaire included free-text comments and likert scale responses, which were then analysed using SPSS.
Results: The most commonly reported motivations for working in medicine were a varied and fulfilling career (93% of respondents), security of employment (85.8%) and earning potential (64.3%). A large proportion of FY1s declared their intention to leave medicine (13.5%), to work overseas for the majority of their career (23.7%) or for a shorter period of 1-2 years (72.1%). We also found significant differences in motivations and career intentions by age, gender and ethnicity of respondents.
Discussion: Despite citing multiple motivators to work as doctors, a surprisingly large proportion of respondents expressed their intentions to either work abroad or leave medicine altogether. Free-text comments revealed some trainees felt medicine was 'mis-sold' or had changed since they starting training, citing worse pay, working conditions and the new junior doctor contract.
• A career in medicine appeals to new FY1s for a multitude of reasons
• A large proportion of FY1s intend to work abroad temporarily or permanently
• Free-text comments reflect low morale among some FY1s, who perceive a mismatch between working conditions when they applied to study medicine and the realities of working as an NHS doctor in 2017
Conclusion: Our results have significant implications for workforce planners, who must account for the large proportion of newly qualified doctors who intend to leave medicine or work abroad either temporarily or permanently.

9DD14 (1739)
An Exploration of the Learning Environment and Career Intentions. A Mixed Methods Study of Paediatric Interns in South Africa (SA)

Authors
Kimesh L Naidoo
Jacqueline M Van Wyk
Miriam Adhikari

Presenter:
Kimesh Naidoo, Nelson R Mandela School of Medicine, Durban, South Africa

Background: Poor doctor to patient ratios in SA are exacerbated by a migration of medical practitioners to urban areas, private practice and specialised care over primary health care .Gaps in knowledge of intern career intentions in resource challenged contexts have translated to the failure by both higher education and national health authorities to include the internship period in strategies to ensure that inequities in health care are addressed.
Method: This explorative study used a mixed methodology approach to explore the factors that influence perceptions of the learning environment (LE) during internship and their influence on career intentions. Using a sequential explanatory mixed methods a locally validated version of the Postgraduate Hospital Educational Environment Measure (PHEEM) and focus group discussions were conducted amongst interns in Paediatrics in a high disease burdened province of KwaZulu-Natal in 2015.
Results: Perceptions of the LE were found to be influenced by both external (disease burden and resource constraints) and individual related contextual factors (supervisor -intern relationships, mentorship, feedback and intern demography). Both these factors acted as alienating influences that curtailed access and restricted participation within communities of practice in internship. A narrow view of the role and scope of interns was reflected in significant differences between interns and their supervisor's perceptions of the LE and gaps in assessment practices of SA interns when compared with international best practices. Poor perceptions of the LE drove interns away from SA's public health system and from caring for children .Career intentions were found to be in conflict with the national imperatives for primary health care within the public sector.
Conclusion: Contextual factors in a resource limited LE impacted on identity and career self-efficacy formation of SA interns who failed to see a future role for themselves in primary health care and child health within the public health system. Changes in policy and practice, and curricula reform to improve access to create an expansive participatory framework for SA interns have the potential to ensure a sustainable public health system and redress the inequity seen in distorted doctor patient ratios in areas of need in SA .

The Impact of Medical Careers Fairs on the Career Aspirations of Medical Students

Authors
Hassaan Waqar, Heart of England NHS Foundation Trust, Birmingham UK
Philippa James, East Midlands, UK

Presenter: Hassaan Waqar, Heart of England NHS Foundation Trust, Birmingham, UK

Background: Health Education England Specialty recruitment data shows that training programmes for specialities such as General Practice and Psychiatry have had low fill rates in past years. This data shows fill rates as low as 65.42% for Psychiatry training in 2017 and approximately 500 GP places were unfilled in England. The Foundation Programme Career Destination Report 2016 UK Summary showed that in the last 5 years there has been a 20% decline in Foundation Year 2 doctors progressing directly into speciality training from 2011 to 2016. This shows a significant medical workforce shortage within the NHS. The exact reasons for this shortage are complex, however raising awareness of specialties through careers fairs may be a way of encouraging applications to shortage specialities.

Summary of work: The aim of this study is to determine if medial careers fairs have any impact on the career choices of medial students. The study also aims to quantify this impact and broadly determine what factors influence career choices of medical students.
This was done through assessment of online pre- (n=40) and post-fair questionnaires (n=27) asking students their preferred specialities before and after the fair. Further questions aimed to ascertain the reasons behind this change and to quantify the effect of this change.

Summary of Results: Pre-and post-fair data shows that the top three reasons for choosing a speciality are patient contact, interest and length of training. Interest in the chosen field was an option suggested by participants and was very popular, with a quarter of participants in-putting it in the pre-fair questionnaire. Analysis of the data shows that 62% of respondents agreed that the fair helped to decide on their future career.

Discussion & Conclusion: This study demonstrates the underlying reasons for choosing one speciality over another and these reasons tend to be clinically based, such as patient contact, and do not appear to change post-fair. The fair appears to have had a positive impact on medical students and has helped them to decide upon their future careers.

Take-home message: Careers fairs are an effective method of introducing medical students to various specialities.

Are there common aspects in the perceptions of diversity and educational inclusion in medical students?

Authors

Olga Matus-Betancourt
Javiera Ortega-Bastidas
Cristhian Perez-Villalobos
Ivone Campos-Cerda
Peter McColl-Calvo
Nancy Navarro-Hernandez

Presenter:
Olga Matus-Betancourt, University of Concepcion, Chile

Background: Educational-inclusion considers education for all people. Throughout history, a change in socio-cultural characteristics and social-identification has been observed, causing some people to feel socially excluded by feeling they belong to a minority. In Health Sciences there is little evidence to study this phenomenon, considering new policies of educational inclusion, which is relevant in health-professionals training, because their graduates must be able to accept diversity in direct contact with people. SponsoredByFONDECYT1170525.
Method: Qualitative study, based on Strauss&Corbin Grounded Theory (2002). Participants: 10 key informants with knowledge and experiences in diversity, selected by sampling typical case, prior informed consent process. Narrative interviews were performed. Analysis plan was performed using the constant comparison method until reaching open coding level using Atlas-ti7.5.2.
Results: Dimensions of diversity: sex-gender, ethnicity, migrants, disability, religion and social vulnerability. In this regard, three categories of analysis emerge that respond to the aspects that integrate them: (a) Construction of a social identity associated with belonging to a minority; (b) Experience of perceiving and feeling social exclusion; (c) Deficiencies and inadequacies in the axes of policies and reforms in the area of health and education.
Discussion: Recent studies have focused on considering disability as the main dimension of Inclusion. However, acceptance of diversity should consider other dimensions such as those included in this study. The defined inclusion-model brought together theoretical backgrounds from various disciplines. This can be seen in the identification of 6 different dimensions, which would make it possible to re-signify the inclusion construct known so far. The results are an important contribution to medical education, since they allow us to take into consideration the variables that would define diversity, which could be considered in the training process of health-care students.
Conclusion: In a health-care area it's vitally important that experiences of people in a situation of social exclusion are taken into account when they belong to a minority. This is more urgent in educational contexts, specifically in health-programs, where training with a focus on diversity acceptance and educational inclusion is not explicitly included.
Take-home message: It is important to consider diversity in health-students learning process.

9EE2 (2478)
A qualitative study on embedding gender awareness into General Education Courses for medical students

Authors

Peih-ying Lu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan
Kuan-yeh Wu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan

Presenter:
Kuan-yeh Wu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Taiwan medical education has put attention on developing gender awareness and competence in medical curriculum; however, how to effectively implement such integration in a crowded curriculum requires further design of pedagogic strategies. This study explored if gender issue can be effectively integrated into general education courses, through deliberate development of the course framework, teaching methods and materials.
Method: Gender issues were integrated into English Reading and Medical English courses. The course materials include literary works, and PBL scenarios, involving topics like health and self-image; gender perspectives and unwanted pregnancies, working status and family etc. Medical English has specifically embedded issues into task-based learning such as folk-medicine, birth plan, and medical communication. The participants are respectively 30 first- and 150 second-year medical students taking the courses. The research employs qualitative method and collected 1. Essays, 2. PBL discussion, 3. Focus group interview, and 4. Participant researcher observation. Data were transcribed and triangulated to examine its effectiveness by using a gender competence index.
Results: 5 themes emerged from the textual and data analysis: 1. Awareness of equity issue resulted from rising female social status and expanding career choices; 2. Reflecting upon the pressure of social expectation on women's image and its impact on health; 3. Male students showing understanding of physical and psychological impact of abortion on and other cultural impacts on women's health; 4. Recognizing own bias when confronting issues concerning gender differences, such as folk medicine and LGBT patient communication; however, 5. Students tend to not challenge different perspectives and did not progress to critical thinking level.
Discussion: The findings showed that integrating gender issues through different teaching strategies into different courses in early stage of medical training provides opportunities for medical students to enhance gender literacy through discussion and reflecting. However, ways to encourage students to move to the critical reflection stage deserves further design and continuation to the clinical stage.

Conclusion: Gender issues are inevitable in medical students' future professional and personal life. Integration of such issues from the early stage and longitudinally throughout the curriculum is needed.

Current trends, future scenarios and implications for women's participation in post graduate medical education in Iran

Authors
Shima Tabatabai

Presenter:
Shima Tabatabai, Shahid Beheshti University of Medical Science, Tehran, Iran

Background: Women doctors are in the ascendant, and they will soon comprise the majority of the medical workforce as general practitioners, medical specialists, and sub-specialists. Therefore; to gain a better understanding of current and potential future challenges for women participation in Medical Education in Iran, we conducted a comprehensive national study.
Method: The expert panels' group discussions and policy survey were implemented by 7 experts. The barriers facing women in medical education and profession were detected, and then conceptually clarified. Analyzing the consequences of these challenges will lead to the exploration of implications of women participations in academic medicine and medical surgery training. At the end some key recommendations with contextual/cultural considerations presented for health and medical education policymakers.
Results: Our analysis revealed the major challenges and Implications for Iranian women participation in Medical Education. Family or personal responsibilities, need for flexible work times, lack of high-ranking female role models or mentors resulted in the limitations of the number of women in especially tenured faculty especially in surgery departments. In this context, women doctors face barriers to academic career progression and are under-represented compared to their male counterparts, at senior levels. Recognition of the high quality skills of women medical students and residents would lead to a reappraisal of the culture of a male dominated hierarchy in universities.
Discussion: This rapid growth of women doctors has implications for the medical education as a whole. Planning to meet the community care demands in a context like Iran and similar areas with high demand for same-sex doctors among women requires long-term planning and solutions. Providing equal opportunities in surgical care, education, research, and leadership would make surgery more attractive to female medical students. As the number of women in leadership positions begins to increase, an obliteration of sex disparity in the surgical fields will surely result in women contributing more to a field.
Conclusion: The result of this study would allow educational policymakers to address specific health care needs of the community and to empower women participation in medical education and academic positions.

Women medical residents´ perception of Quality of Life during training in Internal Medicine: a qualitative and quantitative analysis

Authors
Renata Kobayasi
Fernanda Magalhães Arantes-Costa
Patricia Tempski
Milton Arruda Martins

Presenter:
Renata Kobayasi, School of Medicine of University of Sao Paulo, Brazil

Background: The higher participation of women in medicine may impact in structural profession´s evolution due to gender differences perceived since graduation and residency training. Gender differences on quality of life are associated with higher states of anxiety and depression among female physicians.
Method: We aimed to assess the impact of training in internal medicine on perception of quality of life in women residents´ point of view, using qualitative and quantitative analysis. Additionally, resilience, empathy and daytime sleepiness were also scored. We performed a cross-sectional study with first-year internal medicine residents to evaluate self-reported quality of life specific for medical residents (VERAS-Q), empathy (Jefferson Scale of Empathy), resilience (Brief Resilience Scale from Wagnild and Young) and daytime sleepiness (Epworth Scale). We explored the differences between genders in all these aspects with focus group method.
Results: One hundred and nine residents accomplished the survey: 31 (28.4%) female and 78 (71.6%) male. Female residents exhibited significantly lower scores for quality of life in the domains of time management (30.3, female vs 41.1, male $p <0.001$), psychological (48.1, female vs 56.7, male $p <0.01$) and physical health (42.8, female vs 53.6, male $p <0.05$), when compared to male residents. They also scored higher in daytime sleepiness (13.0, female vs 9.0, male $p <0.001$), with pathological scores for daytime sleepiness. No significant differences were found between genders on resilience and empathy scores. The focus group assessment disclosed difficulty in concentration and knowledge acquisition, insecurity, feeling of loss, more critical perception, self-collection and difficulty in creating affective bonds to support the training period as the main factors involved in the worse perception of quality of life.
Conclusion: In conclusion female residents had lower scores of quality of life and higher scores on daytime sleepiness. Investing in mentoring to help them to better manage their time and encouraging activities that favors development of relationships are measures that can improve quality of life of female residents during this critical period of medical training.

9EE5 (2887)
Human rights issues and undergraduate health courses curricula

Authors
Maria Paula Panúncio-Pinto
Bruna Ulhoa de Carvalho
Gabriely Martins Silva
Cristine Homsi Jorge Ferreira

Presenter:
Maria Paula Panúncio-Pinto, Ribeirão Preto Medical School - University of São Paulo, Ribeirão Preto, Brazil

Background: Human rights are considered rights of all people regardless of color, race, sex, religion or nationality. Although the United Nations recommends that health professionals receive training in human rights, and despite Brazilian Federal law recommends human rights content inclusion in curricula of all levels of education, little is known about how much this has been done in the various undergraduate health courses in Brazil.
Method: This study aimed to identify the presence of themes related to human rights in 02 undergraduate courses at RPMS-USP: Speech Therapy/Audiology and Occupational Therapy. It was conducted through the analyses of public documents from 179 courses/disciplines searching for words that refer to the subject/theme and for direct references to human right content.
Results: Words that refers to human rights issues are present in 9 of the 81 courses/disciplines that make up the curriculum of Speech Therapy/Audiology undergraduate course (10%). No direct reference to the topic was found. Such words are present in 33 of the 98 disciplines (33%) of Occupational Therapy undergraduate course. Direct references were found in 04 disciplines, related to the legislation and the human rights of some vulnerable groups (children, disabled and elderly people).
Issues related to human rights are only incidentally present in some disciplines, with a general approach, when dealing with ethics, public health, reproductive rights, humanistic training, and community health. The lack of direct references to the human rights of women, transsexual, intersexual and other groups whose health care demands specific training is a concern both for the gap in the curriculum, and for the noncompliance with legal guidelines.
Conclusion: The construction of knowledge, skills and attitudes in health professionals training must be understood, beyond the classical sense of acquiring technical-scientific knowledge, also taking into account ethical and political issues. Higher Education Institutions must work to make their students become well-informed, critical and analytical citizens capable of analyzing the problems of society assuming social responsibility. Thus, the approach to human rights issues must be clearly specified in public documents (curriculum).

9EE6 (3059)
Enhancing the cross-cultural adaptation in medical education: preliminary validity evidence of the Brazilian-Portuguese version of two instruments to assess communication skills

Authors
Sheyla Rocha, Department of Medicine of Federal University of São Carlos - UFSCar, São Carlos, Brazil
Gustavo Romão, Medical Course of University of Ribeirão Preto - UNAERP, Ribeirão Preto, Brazil
Maria Silvia Vellutini, Faculty of Medical Sciences of State University of Campinas – UNICAMP, Campinas, Brazil
Carlos Collares, School of Health Professions Education of Maastricht University, Maastricht, Netherlands
Angélica Bicudo, Faculty of Medical Sciences of State University of Campinas – UNICAMP, Campinas, Brazil
Eliana Amaral, Faculty of Medical Sciences of State University of Campinas – UNICAMP, Campinas, Brazil

Presenter:
Sheyla Rocha, Department of Medicine of Federal University of São Carlos - UFSCar, São Carlos, Brazil

Background: The importance of communication skills (CS) has been widely recognized in medical education. Valid instruments for assessing CS could enhance student assessment and provide valuable information for institutional stakeholders, with practical implications for faculty development, curricular design, and quality assurance.
Method: This study aimed to obtain validity evidence for cross-culturally adapted instruments designed to assess CS in Brazil, and to discuss the strategies used in its cross-cultural adaptation. The Communication Assessment Tool (CAT) and the Analytic Global Rating Scale (AGRE) were adapted in a systematic, standardized, multi-step process based on international recommendations for cross-cultural adaptation. Ten experts in medical education and communication skills (EMC) evaluated the adapted instruments for content validity using the content validity index (CVI). The criterion for establishing an acceptable level of cultural and linguistic equivalence was the agreement of 70% of participating EMCs. EMCs supported the corrections and adjustments in items from both instruments. The scales were pretested in 28 medical postgraduates in Ob-Gyn in a two-station OSCE and adjusted accordingly. Reliability was estimated with Cronbach's alpha coefficients.
Results: During content analysis, all items in both instruments were relevant and pertinent to assess CS (CVI CAT: 0.99; CVI AGRE: 0.96). All CAT items were rated as linguistically and culturally equivalent by 70% of experts, and only one AGRE item was rated lower (60% of equivalence), and it was subsequently reformulated. Cronbach's alpha showed high internal consistency (CAT: 0.93; AGRE: 0.89).
Conclusion: The cross-cultural adaptation of both CAT and AGRE resulted in the production of two assessment tools with high levels of linguistic and cultural equivalence, content validity, and reliability. Application of the adapted instruments in a representative sample will allow obtaining additional validity evidence.

Take-home message: The Brazilian-Portuese adaptations of CAT and AGRE are promising tools to assess CS in Brazilian medical education.

9EE7 (972)
Every pregnant mother is a cultural story: The effect of narrative teaching method on Culturally Sensitive Care of midwifery students

Authors
Hoda Ahmari Tehran, Tehran University of Medical Sciences, Tehran, Iran

Ahmad Kachoie, Qom University of Medical Sciences,Qom, Iran

Mahboobeh Khabaz Mafinejad, Education Development Center, Tehran University of Medical Sciences ,Tehran, Iran

Fatemeh Bakouei, Babol University of Medical Sciences, Babol, Iran

Sareh Bakouei, Qom University of Medical Sciences, Qom, Iran

Afagh Zarei, Tehran University of Medical Sciences, Tehran, Iran

Presenter:
Hoda Ahmari Tehran, Medical Education, Tehran University of Medical Sciences, Tehran, Iran

Background: One of the essential aspects of prenatal care provision is cultural sensitivity. It is the most comprehensive concept in recognizing the knowledge related to ethnicities and religions. While Iran is a multi-ethnic society, prenatal care based on cultural sensitivity care leads to mothers' increased well being and satisfaction. This study aims to compare the effect of integration of two teaching approaches: role modeling and narration methods; with emphasis group reflection on midwifery students' culturally sensitive prenatal care in Qom University of Medical Sciences.

Method: This quasi-experimental before and after two-group study was performed during a nine-day clinical education. All midwifery students (N=36) were assigned randomly to the experiment or control groups. For the experiment group, cultural competency issues were taught by role-modeling and narrative methods. While the control group experienced only the role-modeling technique (with 6 mothers' history for narrative story that students role-played in group and end group reflection). Students' performances in cultural sensitive care in both groups were assessed before and after the instruction using a researcher-made observation checklist (score range: 0-20). Pretest assessment was performed in first three days with three observations, posttest assessment in last three days with three observation, and the intervention in the middle three days .Data were analyzed using independent t and paired t-tests.

Results: Mean scores of students' performance in control group was improved significantly in post-test (9.85±1.39) compared to the pretest (12.32±1.21) results (p<0/05). Also in the experiment group, post test scores (16.85±2.39) were significantly different from the pretest (10.16±1.24) findings (p<0/05). Independent t- test implied that the difference of post test scores in two groups was significant (P=0.01).

Conclusion: Although both methods proved effective in improving students' performance in cultural sensitive care, a blend of two methods (narration and role-modeling) was more effective than a mere role-modeling. It is recommended that role-modeling and narrative methods be used in teaching cultural issues to midwifery students. Considering every narration may contain valuable cultural teaching points. While narration is an efficient and accessible method in teaching, educators can use it for teaching cultural competence.

9EE8 (21)
Enhancing cultural competence in healthcare professions: A case study of a multicultural college in Israel

Authors
Lipaz Shamoa-Nir

Presenter:
Lipaz Shamoa-Nir, Zefat Academic College, Safed, Israel

Background: Practical knowledge is needed in order to educate healthcare professionals with cultural competence, especially in a social context in which there is ethnic and religious diversity.

Method: The purpose of this research is to examine how the multicultural reality in Israel is reflected in the curriculum and in the field training of departments of healthcare professions in a multicultural college. Both the academic goals and the training programs were analyzed in the light of the different nationalities, ethnic groups and religions within the: students, academic staff, and in the training field. The study included an analysis of interviews with several senior staff members (administrative and academic), and an analysis of contents of the curricula of two academic departments (nursing and physiotherapy) and the syllabuses of different courses. In addition, several observations were conducted in classes, workshops and social events on campus.

Results: It was found that management support in multiculturalism and dialogue processes promoted diversity in healthcare teaching programs. The departments that were investigated addressed the diversity by adjusting education models to the needs of students and the community in which they integrate, and by doing so, enhanced the cultural competence of the students.

Conclusion: The research highlights the importance of engaging in difficult dialogues that are inherent in teaching about diversity. Moreover, teachers and field supervisors who represent the cultural diversity serve as role models for ways of working effectively in cross-cultural situations. Cultural diversity should be addressed as challenge and be represented in the public sphere and among students and teachers in order to become a professional advantage.

9EE9 (2665)
A survey of cases in emergency rooms to create educational scenarios for cultural competency training

Authors
Ruri Ashida
Satoshi Takeda
Sayaka Oikawa

Presenter:
Ruri Ashida, The Jikei University School of Medicine, Tokyo, Japan

Background: As globalization increases, more patients from foreign countries are treated in hospital emergency rooms (ERs). Healthcare workers in ERs must immediately make decisions to treat such patients while caring for their cultural concerns.
Method: A questionnaire was sent to the ERs of university and residency training hospitals in Japan to identify the problems arising from cultural differences in foreign patients and how the problems are dealt with.
Results & Discussion: The language barrier was dealt with by healthcare workers who spoke the language, and by the help of translation applications on iPads (one of them developed by the government), books, or interpreters on telephone. For patients who spoke languages through which healthcare workers could not communicate, help was sought from embassies, municipal governments and local foreign-language schools. Some patients refused to be treated in a foreign country and wished to return to their home countries and be seen there by physicians: in one case a physician was called from the patient's home country, and in another case the family tried to bring the patient home, causing the patient to fall into a critical condition. Another problem was differences in healthcare systems between countries. Some patients believed that healthcare fees in Japan could be negotiated.
Healthcare workers in ERs were always concerned whether treatments had been sufficiently explained to patients. The survey showed that they were facing these problems without previous training and suggested the need to prepare them to better care for foreign patients in difficult situations. Educational scenarios based on their experiences will be useful materials for training.
Conclusion: Because treatment and decision-making are urgent in ERs, healthcare workers must be trained to understand the importance and challenges of cultural differences of foreign patients and prepare for ways to best treat these patients. Sharing their experiences with students will enable future healthcare workers to develop cultural competency.

9EE10 (1744)
The development of intercultural competence in international university environment

Authors
Nóra Faubl, University of Pécs Medical School, Pécs, Hungary
Gergő Csaba, University of Pécs Medical School, Pécs, Hungary
Zsuzsanna Füzesi, University of Pécs Medical School, Pécs, Hungary

Presenter:
Gargő Csaba, University of Pécs Medical School, Pécs, Hungary

Background: As intercultural competence will constitute an essential part of knowledge of the present and future generations, it is important to gain empiric experience of its evolution and development.
The goal of our research is to conduct long-term study of the socio-cultural adaptation of foreign medical students at the University of Pécs Medical School, as well as of the development of their intercultural competences.
Method: Since the research of the development of intercultural competence requires complex research methods, therefore we have applied several methods simultaneously for our long-term research. Firstly, we have used closed-ended questions in our self-developed questionnaires distributed altogether six times in the given cohort, also, the medical students of Pécs were canvassed by focus group interviews regarding their integration and the development of their intercultural sensitivity.
It has been established from the findings of the research (N=13084) that started in 2009, that the foreign students arriving to Hungary plan a limited residence in the country, and their primary motivating factor is to begin their medical university studies.
Results: According to the results students of our foreign language programmes gave following feedback regarding their subjective well-being on a 5-step-scale: after their arrival: 3,75; after four semesters: 3,44; in their last study year: 4,08.
Conclusion: Based on the long-term research lasting now, we can establish that the elements of the motivation system and the period of the foreign residence significantly influence the circumstances of the evolution and development of intercultural competences. Nevertheless, the intercultural experience gained during a determined period of residence could also contribute to the further development of intercultural sensitivity.
In our global world the intercultural competences will become one of the most determining building blocks in future's medical knowledge. Therefore it is crucial to adapt the empirical experiences in the practical fields for example in forms of intercultural competence developing courses and trainings in the graduate, post-graduate, medical and specialist programmes.

Is there a space for students to develop cross-cultural care competence in a crowded pre-clinical curriculum? A pilot problem-based learning course

Authors

Peih-ying Lu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan
Jer-chia Tsai, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Zen-kong Dai, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Shao-ching Wu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan

Presenter:
Jer-chia Tsai, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Educating culturally competent future doctors in caring for patients with diverse backgrounds has been set as one of goals of Taiwanese medical professionalism education. Ways to teach cultural competence in a crowded medical education curriculum have been challenging. A previous study showed that students self-perceived cross-cultural care (CCC) preparedness was low in preclinical stage.
Method: The study investigated the effectiveness of embedding CCC issues into the Problem Based Learning (PBL) in the pre-clinical Block curriculum by exploring students' perspectives. We included diversity issues identified previously as the cultural groups least prepared by the medical students into PBL scenarios of Pediatrics, Infectious Disease and Renal Blocks involving new immigrants, LGBT patients and complementary and alternative-medicine respectively for medical students of undergraduate and post-baccalaureate programs at a Taiwanese medical school. The participants are 150 and 50 medical students respectively. A post-PBL feedback survey including two semi-structured questions were conducted and data were analyzed with SPSS and content analysis.
Results: Quantitative analysis revealed students mostly agreed that such CCC integrated PBL gave them better understanding of diversity (63.9%) and preparedness for clinical learning (79.6%). Qualitative analysis further revealed students identified patients' needs of CCC including dominant decision-making pattern, own bias, language, health belief of different generation, social resources, and gender issues. However, due to the overcrowded curriculum and time limitation, students suggested that such scenarios could be made into vignettes and through role-play to facilitate learning.
Discussion: The pilot PBL embedded with CCC learning issues showed that students raised awareness of the impact of diversity on health care. This creates a space for students to discover 'differences' and health disparities, and further explore related knowledge required to provide better CCC in future clinical encountering. Such design allowed students to see communication not only limited to skills training but understanding of socio-cultural aspect would help achieve better patient care.
Conclusion: Strategically bringing CCC training into PBL scenarios in pre-clinical stage provides a milieu for students to understand the impact of diversity and the importance of CCC development, which would better prepare students for clinical learning.

9EE12 (2546)

What medical students' perceptions of Early Clinical Exposure experiences tell us about the cross-culture care and diversity issues in medical education - a mixed method study

Authors

Peih-ying Lu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan
Jer-chia Tsai, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Yen-ko Lin, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan

Presenter:
Peih-ying Lu, Kaohsiung Medical University, College of Medicine, Kaohsiung, Taiwan

Background: Diversity and cross-cultural care competence (CCC) have received increasing attention in Taiwanese medical education, and clinical exposure is generally perceived to provide opportunities to enhance CCC. This study investigates how medical students observed and reflected upon the CCC issues emerged in an early clinical exposure course "On Doctoring" in the second-year of undergraduate medical curriculum.
Method: The study was conducted at a Taiwanese medical school with 150 students who took a course that provided exposure learning through clinical observation. The students completed 8-10 hours clinical observation in different clinical settings. Pre- and post-activity questionnaires focusing on perception of educational climate were conducted. 103 valid responses were collected and analyzed with SPSS. Three focus group interviews (16 students) were also conducted and data were transcribed and analyzed with the Grounded Theory.
Results: Quantitative data revealed that respondents agreed that CCC for diverse groups should be included in the curriculum with a post-activity increase (12 items average: 4.91v.s. 5.08/6). However, lack of role modeling and guidance seen as a problem also increased(41.8% v.s. 43.7%). The qualitative data showed that 1. Clinicians' attitudes towards patients of different socio-economic classes, gender, age and using alternative medicine were different and might have bias; 2. Students' awareness of CCC for diverse groups could be varied depending if tutors had provided guidance; 3. Students recognized the importance of doctor-patient communication but only limited to skills and language.
Discussion: Early clinical exposure serves a start for forming professional identity as well as developing CCC. Students recognized the importance of doctor-patient relationship but lacked further guidance of essential

concepts. Explicit inclusion of diversity issues before early exposure course is needed to prepare student and optimize the learning outcome. As students saw clinical teachers as role models, clinicians' lack of awareness of own bias could have negative impact on learners. Therefore, faculty development for clinical teachers deserves more attention.

Take-home message: The early clinical experiential learning can provide a milieu where students develop the cross-cultural awareness; however, clinical teachers, seen as role models, require more mentoring training to provide the optimal guidance.

An institutional ethnography into how clinicians learn transgender health advocacy and systems-based practice

Authors

Kinnon Ross MacKinnon, University of Toronto, Toronto, Canada
Stella Ng, University of Toronto, Toronto, Canada
Lori. E. Ross, University of Toronto, Canada

Presenter:
Kinnon R. MacKinnon, University of Toronto, Canada

Background: Learning how to advocate alongside marginalized patients experiencing health inequities is an emerging topic within healthcare provider education (HPE). Hubinette (2017) describes health advocacy as a practice that includes improving access to care and addressing health inequities through policy change. The rationale for examining health advocacy learning within the emerging specialty area of transgender healthcare access is two-fold: First, trans people have been described as an underserved population and could thus benefit from clinicians' advocacy for transition care; and second, balancing trans patients' access to transition interventions with providers' requirements to follow standardized protocols is fraught. For these reasons, studying how providers learn to work around protocols and advocate for trans patients is an excellent exemplar through which to understand health advocacy.

Transition care protocols were developed with the intentions of instructing clinicians to assess trans patients and advocate for hormones and surgeries, when indicated. Yet these texts have been identified as a cause of mistrust and conflicted clinical relationships between patients and providers. Using institutional ethnography methodology, we analyzed these clinical texts and interviewed 22 key informants. Informants included trans patients, physicians, clinician-educators, and psychologists. Clinician-education workshops were additionally observed.

Our research illustrates how clinicians learn health advocacy informally through patient interactions, critical reflection, and resisting standardized transition assessment protocols perceived to limit trans patients' access to hormones and surgeries. Informants described strategies learned to work around assessment protocols and collaboration with other providers to advocate for improved access to care.

In the absence of exposure to trans healthcare issues in most HPE programs, clinician-learners must develop the skills and confidence to work with trans people experientially. Yet reconciling clinicians' health advocacy learning needs with trans patients' timely access to necessary treatments is challenging.

Learning techniques such as critical reflection, patient interaction, and provider collaboration are practices that engender competency and compassion in working with marginalized patients and should therefore be included in health advocacy curricula. Learning to work around standardized assessment protocol to advocate for necessary treatments is crucial for clinicians working with trans patients.

9EE14 (1751)
LGBTQ medical curriculum in Central Asia: experience of Nazarbayev University School of Medicine in Kazakhstan

Authors

Alessandra Clementi, Nazarbayev University School of Medicine, Astana, Kazakhstan
Lyazzat Toleubekova, Nazarbayev University School of Medicine, Astana, Kazakhstan
Sofiya An, Nazarbayev University School of Humanities and Social Sciences, Astana, Kazakhstan
Massimo Pignatelli, Nazarbayev University School of Medicine, Astana, Kazakhstan

Presenter:
Alessandra Clementi, Nazarbayev University, Astana, Kazakhstan

Background: Research shows that the LGBTQ population is at higher risk of specific health issues such as substance abuse, obesity, depression, high suicide risk, HIV, STDs. There is little research on the health of the LGBTQ population in post-Soviet Central Asian states. The LGBTQ population prevalence data in this geographic area are vague and partial. Moreover, there is stigmatization and prejudice toward LGBTQ people among the general public and service providers. In Kazakhstan, LGBTQ issues are only partially covered by medical curricula, and healthcare providers lack knowledge and skills for the provision of care to this population.

The aim of integrating LGBTQ health issues in the medical school curricula is to equip MD students with patient-centered skills appropriate to examine and manage LGBTQ patients focusing on their specific healthcare needs. The proposed paper discusses the introduction of the LGBTQ curriculum in the MD students' training in Kazakhstan. Established in 2015, Nazarbayev University School of Medicine is conducting its third year of the MD degree program, developed in partnership with University of Pittsburgh School of Medicine. The curriculum follows the core clinical competences of Western medicine including Patient Centered care, clinical skills, communication skills, professionalism, and medical knowledge. LGBTQ issues are integrated in the first two years of the program, including one whole session in Year 1 during the Behavioral Medicine course with lecture and small group discussion and two Simulated patient encounters in the small groups session during the course Advanced Medical Interviewing in year 2.

The introduction of the LGBTQ-sensitive module has increased students' understanding of healthcare needs of LGBTQ patients. The students well received the experience, according to courses' feedback, and had learned specific skills to provide better care to these patients.

The innovative LGBT curriculum will contribute to the strengthening of MD curricula and healthcare workforce in the country and the region.

I'm a LGBT medical student, get me out of here: The role of sexuality in medical education and how it contributes to Northern Ireland's brain drain

Authors
Michael Grant
Natalie Atalla
Padraig McGuinness

Presenter:
Natalie Atalla, Queens University Belfast, UK

Background: The intention to leave among NI students is significantly higher than comparable Northern European countries and, in the highest skilled professions, was considered by some as a "necessity"[1]. It has been suggested that factors that may have an influence on this include geographic isolation, lack of opportunity and historically high levels of mobility among young people from the island of Ireland. This trend is particularly prevalent within the ranks of medics training in Ireland as a whole, with one study finding that 88% indicated they were either definitely migrating or contemplating migrating following graduation.

An ongoing study at Queen's University Belfast – investigating LGBT medical students compared to their heterosexual peers identified a novel factor contributing to the brain drain phenomenon. This study took the form of a survey disseminated to all medical students registered at QUB and had a total of 427 responses (30.5% response rate). It found that heterosexuals from NI are 1.5 times more likely to definitely plan to stay in NI compared to non-heterosexual students, and that non-heterosexuals from NI were over 5 times as likely to state definitely that they plan to leave NI.

This is particularly poignant for QUB's medical school, wherein around 70% of its medical students are from NI originally and around 22% of respondents identified as non-heterosexual.

Why native non-heterosexuals are more likely to plan to leave than non-heterosexuals who have originated from other countries is still unclear. However, these findings reflect data collected by the annual Young Life and Times (YLT) survey of 16-year-olds in NI. This study found that non-heterosexuals had worse experiences in education, reported worse mental health and were more likely to say that they will leave NI with no intention to return. In addition, this study found that 'brain drain' did not exist in a significant way in any group other than those with same-sex attraction.

These findings point towards the critical need for strategies to improve the non-heterosexual medical student experience and working environment, in order to prevent further and potentially irreversible loss of talented young doctors to other parts of the UK and beyond.

Increasing diversity in medical school admissions: Results from an Innovative MCAT Support Program

Authors
Taraneh Tofighi, University of Toronto Faculty of Medicine, Toronto, Canada
Tal Milman, University of Toronto Faculty of Medicine, Toronto, Canada
Ike Okafor, University of Toronto Faculty of Medicine, Toronto, Canada
Mark D. Hanson, University of Toronto Faculty of Medicine, Toronto, Canada

Presenter: Ike Okafor, University of Toronto Faculty of Medicine, Toronto, Canada

Background: A diverse physician workforce is essential to meeting the health care needs of multicultural populations. The literature suggests under-representation of population groups among medical school candidates relative to national demographics, with under-representation of students from lower income groups internationally. Barriers to adequate representation include costs associated with admissions tests such as the Medical College Admissions Test (MCAT). At the University of Toronto, the Community of Support (COS) program supports students self-identifying as Indigenous, Black, or Filipino in preparing for medical school with the aim of increasing diversity in admissions. We present the implementation of, and results from a pilot program designed to assist COS members with financial need in preparing for the MCAT.

Summary of Work: We designed a ten-week MCAT course offered to prospective applicants enrolled in the COS program with financial need as assessed from student loan data. Students completed four supervised MCAT practice tests throughout the course, including baseline, midterm, and two final full-length practice tests administered by the Association of American Medical Colleges (AAMC) and preparatory companies. Paired t-tests were used to compare baseline and subsequent test scores.

Summary of Results: 31 of 33 students enrolled completed the program with two students withdrawing due to conflicting commitments. Baseline and midterm practice tests were voluntarily completed by 17/33 of students and revealed improvement in scores from 501.5 ± 4.9 to 504.3 ± 4.7 (p= 0.0032). Baseline and final practice tests were voluntary completed by 12/33 students revealed improvement from 502.8 ± 5.5 to 505.7 ± 3.6 (p=0.025). A program feedback survey was completed by 17/33 students with all students indicating the course eased the financial burden associated with the MCAT, and 88% indicated the course was financially accessible.

Discussion and Conclusion: Students reported this program eased the financial burden of the MCAT plus as a subgroup achieved a mean MCAT score surpassing the mean score of 501.8 among applicants and matriculants to US medical schools in 2016-2017 as published by AAMC.

Take-home Message: Results from the course indicate that a pilot subsidized MCAT preparation course for low-income high-potential students alleviates financial burden and improves MCAT scores.

Preparing students for research projects: Exploring the gap between expectations and experienced learning during research projects

Authors
Riitta Möller, Karolinska Institutet, Stockholm, Sweden
Maria Shoshan, Karolinska Institutet, Stockholm, Sweden

Presenter:
Riitta Möller, Karolinska Institutet, Stockholm, Sweden

Background: Although much has been written about the structure and outcomes of medical students' scholarly projects less attention has been given students' expectations on such projects. If expectations are not aligned with the reality of supervision and research practices students' attitudes towards research and future career choices may be influenced negatively. In order to optimize teaching and learning activities and foster research-based curriculum development we aimed to compare students' pre-course expectations and assess which skills the students themselves felt the course had had the greatest impact on.

Method: A prospective cross-sectional questionnaire study. All students registered on a mandatory 20-week medical school research project course between 2011-2013 were e-mailed a questionnaire before and after the course. Of 652 students, 358 (mean 26 years; range 21-49; 63% females) returned both questionnaires corresponding to a response rate of 55%.

Results: Findings suggested alignment between expectations and learning outcomes with regard to ability to carry out a scientific project, to search and appraise the literature, furthermore also oral and written scientific communication and discussion, whereas there were discrepancies regarding research ethics and interprofessional collaboration. Differences in expectations did not correlate to gender, age or previous university degree but the youngest students (< 22 years old) reported they had improved in taking responsibility for their studies, and in evaluating their own development (p<0.001). Students with a previous degree showed less interest in doing research in the future than did those without a degree (p<0.001).

Conclusions: Understanding what students expect from research projects will help teachers bridge discrepancies between expectations and actual learning outcomes. Moreover, the impact of the course on generic skills was interesting and should be taken into account by teachers planning the curriculum. This may be particularly important for mandatory research projects since the students have varying levels of experience of, as well as interest in, research. Several practical recommendations were identified.

Take-home message: Students' expectations are valuable for strategic planning and evaluation of research project courses.

9FF2 (1835)
Facilitators and barriers of extra-curriculum research among medical students in Thailand: the student perspective

Authors
Phunlerd Piyaraj
Kawin Wongthamarin
Sakarn Charoensakulchai
Paanjit Taamasri
Saovanee Leelayoova
Mathirut Mungthin

Presenter:
Phunlerd Piyaraj, Phramongkutklao College of Medicine, Bangkok, Thailand

Background: Research training is essential in a modern undergraduate medical curriculum. Undergraduate research in medicine is important to expose and encourage the students towards the newer advances and research practices. The present study aim to assess the perception of medical students towards doing extra-curriculum research, and identifying the facilitators and barriers faced by them.

Method: This cross-sectional study was conducted among 1st -6th years medical students at Phramongkutklao College of Medicine in January 2018. An anonymous online survey was designed to assess demographic data, perceptions, facilitators and barriers towards extra-curriculum research activity. Data were analyzed using STATA version 14.

Results: Of 606 students enrolled in the 2018 academic year, 486 (80.2%) responded the online survey. Of these, 11.5% had done extra-curriculum research while 58% expressed their interest in participating in research during studying in the medical school. However, a considerable proportion of students were not fully aware of the benefits of engaging in research. The student perspective were as followed; curriculum overload (51.4%), time constrain (47.1%), inadequate training/opportunities in research (46.1%), lack of interest in research experience (40.3%), lack of mentor guidance and cooperation (29.4%) and lack of motivation (27.4%). According to the students, perceived facilitators/motivation to undertake research included focus on pursuing higher degrees (52.9%), improving their potential in research skills (28.8%) and having mentor guidance/role model (27.2%).

Discussion: Thai medical students showed a significant interest in research, with a majority of the students planning to participate in extracurricular research activities during studying in the medical school, and having enthusiasm to be involved in research throughout their medical careers. Important issues have addressed by students i.e. decreasing the curriculum overload, more training workshops on research methodology, integration of research methodology into undergraduate curriculum as well as more research mentors and cooperation.

Conclusions: Medical education policies should aim to counteract the facilitators and barriers identified in this study to develop medical curriculum which is able to encourage medical students to put more enthusiastic about getting involved in research. Given the right support, medical students' interest in research can be successfully nurtured.

9FF3 (3419)
Revising an evaluation system for better impact assessment

Authors
Katherine Wang

Presenter:
Katherine Wang, IFMSA SCORE, Oslo, Norway

Background: The International Federation of Medical Students' Associations' (IFMSA's) Standing Committee on Research Exchange (SCORE) has provided over 1.3 million students the opportunity to experience research for over two decades. Our mission is to develop both culturally sensitive students and skilled researchers intended on shaping the world of science. Over 2500 students go on a research exchange each year to over 70 countries. After the exchange, each student fills an evaluation form assessing the exchange program academically and logistically.
Method/Results: Through evaluation forms, we gather data on how the research exchange impacted the students and their future in research. From our analysis of 2015 to present, using a visual analog scale from 1 to 10, 73% marked amount of learning as 7+, 73% reported 7+ motivation to do research and 61% reported 7+ usefulness to future scientific career. These results appear promising but it is difficult to assess whether these are a direct outcome of our exchange or to which extent our research exchange impacted these qualities, as the baseline of the student prior to the exchange is unknown.
Discussion: In order to better understand the direct impact of our research exchange on the students, we are developing a new system of evaluation involving both pre- and post-exchange assessment. Ten questions have been developed to evaluate if the student has gained knowledge, skills or been positively affected by the research exchange based on the goals and objectives of the research exchange program. The student will answer these 10 questions before and after the exchange, and the data will be analysed to determine the impact.
The new evaluation system will be implemented at the end of March, in time for the new exchange season. Data will be collected from the season and analysed to produce an impact assessment report.
Conclusions: Collecting impact through a pre-/post-assessment system will help us understand the direct effects of the research exchange program on the students and how we can use this to continue improving our exchange program for the best for our students.

9FF4 (3673)
An international peer-led research camp for medical students

Authors
Meritxell Mallafré Larrosa
Tarek Turk
Katherine Wang

Presenter:
Meritxell Mallafré Larrosa, IFMSA SCORE, Barcelona, Spain

Background: Research is a cornerstone in the development of medical science and the promotion of healthcare delivery around the globe. Unfortunately, medical students do not always have the opportunity to participate in a research project while in medical school. This might affect their understanding of the importance of research and ability to conduct their own research projects.
Method: As part of our efforts to facilitate research training for medical students, we have created a four-day peer-taught program where we systematically approach students in a stepwise fashion to introduce them to the basics of medical research. First, we present basic concepts that will enable students to read, comprehend and critically appraise a research study. Then, we familiarize them with essential methodological aspects to help them start designing their own studies. Finally, we brief them on how to publish their results in a peer-reviewed journal. The camp also includes journal clubs, open discussions, activities, posters fair, and a hands-on experience where students need to create a research project, present it at the end of the program, and appraise each other's work.
Discussion: The program is planned for late spring and our evaluation system includes both an objective part, where we use validated tools to assess students' knowledge prior to and after the training, and a subjective part that consists of surveys to investigate students' perspectives, attitudes and satisfaction. This international activity is a translation of several local projects conducted and led by medical students, and endorsed by professional external partners.
We believe that medical students are a vital force that can effectively participate in synthesizing evidence-based medical knowledge that can help to promote healthcare delivery worldwide. We also believe that building a generation of scientifically-oriented future physicians will help in battling the upsurge of public health threats that we are witnessing nowadays.
This research camp aims to expose students to the basics and significance of research at an early stage of their career in an attempt to boost the outcomes of their medical training and increase the impact that they impose on people's health.

9FF5 (2944)
"SciMo": a program to train medical students' competences to compete at scientific conferences

Authors

Matthias Briel, Basel University Hospital and University of Basel, Basel, Switzerland
Michael Wilde, University of Basel, Faculty of Medicine, Basel, Switzerland
Daniela Finke, UKBB, Department Biomedicine, University of Basel, Basel, Switzerland
Nino Künzli, Swiss Tropical and Public Health Institute (Swiss TPH) and University of Basel, Basel, Switzerland
Christiane Pauli-Magnus, Basel University Hospital and University of Basel, Basel, Switzerland
Jürg Schwaller, UKBB, Department of Biomedicine, University of Basel, Basel, Switzerland

Presenter:
Michael Wilde, University of Basel, Faculty of Medicine, Basel, Switzerland

Background: Medical students should learn to critically appraise and feel motivated to actively contribute to medical research. Scientific work in terms of a master thesis is mandatory for all our students. However, medical students typically lack practical experience with the peer-review process and competences to present their work in abstracts and scientific talks. Therefore, we established the Science Month (SciMo) in which students not only improve their research skills, but also learn how to evaluate and present research data of their master thesis in a simulated research conference.

Method: The SciMo is part of the core curriculum for 5th year medical students in Basel. The SciMo-program includes compulsory as well as optional parts. Didactic formats range from lectures to small group tutorials to "one-to-one" coaching. Hereby students refine their master thesis abstracts, learn how to review abstracts and to present their work in a short and precise manner. A special electronic SciMo-conference tool was developed to anonymously distribute abstracts and collect reviews. All abstracts are published in an abstract book, printed by a medical publisher. Short presentations are held in small groups and evaluated by students and tutors. The best six presentations compete in a plenary session for three SciMo awards. An invited leader in medical research provides the SciMo-keynote lecture.

Results: Since its introduction in 2011, over 1200 students have completed the SciMo which is annually evaluated and updated. Over 90% of students appreciated the diversified teachings of the SciMo-program and deemed the training content useful for their future career. Students felt well supported to submit and present their master thesis at the simulated congress whatever stage they were at with their work (study protocols, collected data, completed analyses).

Conclusions: The SciMo fills a gap in traditional medical school curricula and provides an example of how medical students can acquire first-hand experience of a scientific congress fostering their competences and interest in medical research.

Take-home message: A program like SciMo provides a unique opportunity to make pre-graduate medical students familiar with research-based scholarly working.

9FF6 (517)
The Attitude of Medical and Pharmacy Students towards Research Activities: A Multi center Approach

Authors

Yonas Getaye Tefera, University of Gondar-College of Medicine and Health Sciences, Gondar, Ethiopia
Akshaya Srikanth Bhagavathula, University of Gondar-College of Medicine and Health Sciences, Gondar, Ethiopia
Deepak Kumar Bandari, Vaagdevi College of Pharmacy, Telangana, India

Abdulla Shehab, UAE University, Al Ain, UAE

Presenter:
Yonas Getaye Tefera, University of Gondar, Gondar, Ethiopia

Background: Positive attitudes to and opportunities for research activities with adequate provision of facilities and mentorship will equip medical and other health profession students for becoming future healthcare scientists.

Method: An anonymous, cross-sectional, self-reported online survey questionnaire was administered to medical and pharmacy students studying in various Asian and African universities through social media between May and July 2016. A 68-item close-ended questionnaire consisting of Likert-scale options assessed the students' research-specific experiences, and their attitudes towards scholarly research publications.

Results: A total of 512 questionnaires were completed, with a response rate of 92% from Asia and 94% from Africa. More pharmacy students (70.8%) participated than medical students (29.2%). Overall 52.2% of the pharmacy students and 40% of medical students believed that research activities provided a means of gaining respect from their faculty members. Lack of encouragement, paucity of time, gaps in research activities and practices, and lack of research funding were some of the most common barriers acknowledged by the students. A nonparametric Mann-Whitney test showed that a statistically significant difference was observed, in that more than 80% of the pharmacy students viewed scientific writing and research activities as valuable experiences ($p = 0.001$) and would like to involve their co-students in scholarly research activities ($p = 0.002$); whereas the majority of the medical students desired to be involved more in scholarly research publications ($p = 0.033$).

Discussion: The majority of the medical and pharmacy students in this study felt that publishing as a student would provide them personal fulfillment and a formative training experience, as well as regarding writing for publication to be a good experience; others claimed their mentors encouraged them to conduct research for publications. Cultivating and motivating student

participation in research activities in addition to their curricular coursework should be encouraged.

Conclusions: Pharmacy students had good attitudes towards research activities and a higher number of medical students desired to be involved more in research publications. Faculties may consider taking special research initiatives to address the barriers and improve the involvement of medical and pharmacy students in scholarly research activities.

Developing Interdisciplinary Student-led Initiatives against Antimicrobial Resistance in Primary Care: Protocol from the UK Primary Care Research Collaborative (UKPCRC)

Authors

Jon Mok, UKPCRC, London, UK
Maya Connolly, UKPCRC, Liverpool, UK
Rajiv Sethi, UKPCRC, Manchester, UK
Garth Funston, UKPCRC, Cambridge, UK

Presenter:

Jon Mok, UK Primary Care Research Collaborative, London, UK

Background: Antimicrobial resistance is a growing issue in today's clinical practice in the UK and globally. Previous evidence from the literature suggest that 80% of antibiotics are prescribed in primary care .There is a clear need for more research in this area. Other medical fields have developed student-led collaboratives to help students and trainees improve research skills as well as recruit students into large-scale research projects, with considerable research outputs. However, there are none to our knowledge which have occurred in primary care till date and are led by interdisciplinary health students.

Method: We aimed to investigate the practicality of engaging health students in an interdisciplinary manner to audit and evaluate primary care antimicrobial prescribing for urinary tract infections across the UK. A pilot was undertaken in London, Manchester, Scotland and Wales to evaluate feasibility. The Royal College of General Practitioner's and Public Health England TARGET toolkit for documenting antibiotic stewardship was employed. Inclusion criteria consisted of cases of uncomplicated urinary tract infections in primary care as per electronic clinical coding over a defined time period. Students then completed the toolkit and evaluated their data against current national guidelines.

Results: Our initial findings suggest this project has capacity to be extended across a wider geographical region. We thus suggest the following protocol. We aim to recruit leads and students from universities across the country to extend this project. Each student would complete the above TARGET toolkit, completing approximately 40 documented urinary tract infections in primary care at GP practices. Data from all students across the country would then be analysed to evaluate antimicrobial stewardship patterns.

Conclusions: To our knowledge, this is the first known documented project of a student-led nationwide research collaborative in primary care. It is hoped that this project

will develop into a larger-scale sustainable initiative with collaborators across the UK, possibly providing the foundation model for a global Primary Care Research Collaborative.

Take-home messages: The UKPCRC was established in 2016 to engage students and trainees in primary care research

An innovative way for students and trainees to learn audit/research skills

9FF8 (3086)

Evaluation of medical students' attitudes to research opportunities

Authors

Kaifeng Liang, Barts and The London School of Medicine and Dentistry, London, UK
Charmilie Chandrakumar, Barts and The London School of Medicine and Dentistry, London, UK
Joshua Wong, Barts and The London School of Medicine and Dentistry, London, UK
Rajesh Sivaprakasam, Royal London Hospital, London, UK

Presenter:

Kaifeng Liang, Barts and The London School of Medicine and Dentistry, London, UK

Background: Academic research provides foundations for modern medicine and it's essential for medical students to pursue them during their medical education. But, the available opportunities and supervision are variable; therefore, a formal pathway from medical school is necessary. To organise a formal pathway, it's important to understand the attitudes of students towards research and we aimed to ascertain by this study.

Method: 105 medical students attended the Barts and The London 7th National Undergraduate Surgical Conference, of which, 70 (66%) filled out an online questionnaire-based survey about research opportunities. Data was collected regarding demographics, previous research experience and exposure levels, intent to do research, challenges in obtaining and completing projects as well as confidence levels in various research skills.

Results: Student attitudes towards research opportunities and its associated challenges were explored. 90% of students stated that they were interested in research with variable areas of preference. 64% had approached someone with the intention of getting involved in a project, 56% got involved in research and only 46% of students completed their project. More than 90% of students felt that it was not easy to obtain a project, especially within the hospital setting. Furthermore, 55% students reported having difficulties with performing literature reviews and statistical analysis.

Discussion: The survey highlights that throughout all year groups, students find it hard to get involved in research projects. The biggest concerns were the perception of consultants, lack of timing and projects available and the challenge to finishing a project due to the students' limited knowledge.

Conclusions: Medical students at various career stages felt that it was challenging to get involved in a research project

due to various factors and it identified a definite need to develop a structured pathway to assist them.

Take-home message: It would be beneficial to medical students and doctors if there is a formal platform for students to access research projects.

A journey to improve students' awareness and competences in medical research

Authors

Carolina Madruga, Department of Medical Education (DEM), Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Nuno Ribeiro, Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Susana Henriques, Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Madalena Patrício, Department of Medical Education (DEM), Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Presenter:
Carolina Freitas, Department of Medical Education (DEM), Faculty of Medicine, University of Lisbon (FMUL), Lisbon, Portugal

Background: Medical schools are now aware that student involvement in scientific research is of value not only to broaden their scientific culture and complement their medical skills but also to increase postgraduate research productivity and the number of future physician-researchers.

Method: Being aware of a lack of research focus in the FMUL curriculum, two 5th year students asked DEM for their collaboration to design and implement a course based on a series of 5 thematic sessions plus a 'hands on' workshop on medical research fundamental topics. The objective of this study was to identify student course evaluation which, despite having been initially designed for a potential group of 20, ended up with 133 participants.

Results: After the course, students were asked to fill in an online evaluation survey, which response rate was 89%. The course appears to 'have exceeded' (67%) or 'met' (24%) the participants' initial expectations with only 9% reporting that 'they were not reached'. The relevance of sessions for the clinical practice was well recognised namely the 'Perspective of a Senior Researcher and a Young Doctor' (91%), 'Study design' (89%), 'Bibliographic search (hands-on-session)' (100%), 'Biostatistics' (86%), 'Scientific writing' (96%), 'Poster design'(88%). In terms of qualitative results, comments were globally very positive – 'excellence and diversity of contents', 'informative and useful course', 'good and accessible facilitators', 'innovative initiative that bridges School's Curriculum frailties' and 'very important practical component'. The need for more 'hands-on' sessions and 'more interaction with facilitators' seem to be the least positive aspects identified.

Conclusions: The unexpected attendance to this extracurricular course offered from 5.00 till 8.00pm, highlights the students' need for more information and skills regarding medical research. This course seemed to

have motivated students and make them feel empowered for the future growing demands of clinical research. Medical Schools must prepare students for basic/clinical research rather than simply asking for quality scientific work (for example a master thesis) without providing the necessary background knowledge and skills. Therefore Faculties must focus on promoting medical research throughout the curriculum, with an early start.

9FF10 (1407)
Developing an implementable Health Informatics curriculum for Otago Medical School – a new and innovative approach

Authors

Amy O'Neill, University of Otago, Wellington, New Zealand
Diane Kenwright
MaryLeigh Moore, University of Otago, Christchurch, New Zealand
Tim Wilkinson, University of Otago, Christchurch, New Zealand
Rebecca Grainger, University of Otago, Wellington, New Zealand

Presenter:
Amy O'Neill, University of Otago, Wellington, New Zealand

Background: Health Informatics (HI) is 'the study of design and application of technology-based healthcare service delivery, management and planning, with the aim of improving the quality and efficiency of healthcare services'. Doctors use HI everyday in clinical practice, most do not have training in HI skills. Our goal was to develop an implementable HI Curriculum for Otago Medical School. Our aim was to benchmark HI curricula in comparable medical schools.

Method: The websites of university medical degrees listed as eligible for registration to practice medicine with relevant country medical registration body in Australia (n=21), Canada (n=16) and the UK (n=32) were identified. The curriculum pages of the web-sites were reviewed, and data extracted regarding: 1. Declared HI courses, learning outcomes, teaching and assessment, and 2. Learning outcomes mapped to the 6 outcomes of a proposed medical HI curriculum.

Results: The website search found 78% (55/69) of medical schools have HI learning outcomes, but only 5% had HI as declared curriculum with dedicated learning time. 'Searching online information sources and databases' was the most frequently identified learning outcome (Australia 57% (12/21), UK 66% (21/32), Canada 63% (10/16)). An outcome related to 'Evaluating software and systems' was identified in 17% (12/69) of medical school curricula. Learning outcomes related to "Managing data and information" were most frequent in the UK medical schools (72% (23/32)), but less frequent in Australia (33% (7/21)) and Canada (38% (6/16)). The remaining three objectives (Knowledge Engineering and Decision Support, Communication and the Internet, and Data security and Confidentiality) were found in 14% - 44% of medical schools.

Conclusions: Declared HI curricula are infrequent in medical schools in Australia, Canada and the UK. While some HI learning outcomes are included, many curricula

have an absence of specific HI learning modules. Identification of components of an HI curriculum relevant to the current health environment is a high priority, along with practical means for implementation. Frequent curriculum revision may be required to keep pace with emerging technologies.

Take-home message: Medical educators should reflect if their HI curriculum is sufficient to equip future doctors for the modern health care environment.

9FF11 (2988)
Implementing health informatics in undergraduate medical curricula in leading medical schools in the Americas - not an easy task

Authors
Jessica Ortiz Huerta, Technische Hochscule Deggendorf European Campus Rottal-Inn, Pfarrkirchen, Germany
Camila Tomikawa, Technische Hochscule Deggendorf European Campus Rottal-Inn, Pfarrkirchen, Germany
Oscar Blanco,Technische Hochscule Deggendorf European Campus Rottal-Inn, Pfarrkirchen, Germany
Carolina Dos Santos,Technische Hochscule Deggendorf European Campus Rottal-Inn, Pfarrkirchen, Germany
Fernando Jacobo Avila,Technische Hochscule Deggendorf European Campus Rottal-Inn, Pfarrkirchen, Germany

Presenter:
Jessica Ortiz Huerta, Technische Hochschule Deggendorf, European Campus Rottal-Inn, Pfarrkirchen, Germany

Background: Medical graduates may not be adequately prepared for the modern challenges in health informatics implementation as medical education has barely added competencies matching the changing pace of today's technological world. This paper evaluates the integration of health informatics within medical curricula amongst leading medical universities in North and Latin America. As the region's leaders, these medical universities set the trend for other schools and the medical landscape to adapt towards the changing clinical environment.

Method: Online curricula offered from the top medical universities in North and Latin America according to QS World Ranking were examined for the presence of health informatics as an explicit component of the curriculum. The initial search identified courses meeting this definition. The data collected was consequently submitted to qualitative analysis.

Results: In North America, nine out of the ten top universities had at least one health informatics subject. Of these nine universities, six of them made those courses mandatory. By contrast, seven out of the ten leading Latin American universities had a health informatics course with only one university making the course mandatory.

The incorporation of Health Informatics subjects in North American universities is high. As North America sets the trends, Latin America would follow and include health informatics in their medical school curricula. However, the importance of those competencies is underestimated in America and aren't developing as quickly as the market itself. Beginning health informatics education during core medical education reduces resources necessary to train clinicians with emerging tools and processes. This

simultaneously provides opportunities for quick adoption of the changing health information technologies and reduces the burden of specialized training needed.

Conclusions: Although medical education is evolving to embrace recent development of health informatics, the movement hasn't yet fully rooted itself in top medical schools in Latin America. Medical curricula from other universities to evaluate the real impact of the health informatics deficiency in the Americas for further review is required.

9FF12 (2050)
Talking to physicians may help to motivate medical students to study Evidence Based Medicine

Authors
Victor Rebello, UFCSPA, Porto Alegre, Brazil
Lucia Pellanda, UFCSPA, Porto Alegre, Brazil

Presenter:
Lucia Pellanda, UFCSPA, Porto Alegre, Brazil

Background: Evidence Based Medicine (EBM) is the reasonable use of scientific evidence in healthcare decision making. In a world with an overwhelming amount of information, EBM turns to be a synonymous of good medical practice and the need to incorporate its teaching to medical formation is clear, although still a challenge.

Method: The present study is a report of a teaching experience. First year students of Federal University of Health Sciences of Porto Alegre (UFCSPA) medical school were stimulated to make an interview with a graduated physician in order to understand the matter of EBM for medical practice and stimulate its learning.

Results: Students performed 52 interviews. All interviewees were unanimous in stating that EBM is very important in their current medical practice. Twenty-two said that they undervalued methodology and biostatistics when they were in medical school, and 30 suggested to the students that they should value EBM since beginning medical school.

All of the interviewed physicians said that knowing how to read scientific papers is important for them to keep updated and to have developed critical reasoning. The students were motivated by these interviews to value concepts that they consider very distant from clinical practice when they begin medical school.

Conclusions: Although the importance of methodology and biostatistics is clear to EBM, medical students undervalue those disciplines, which poses difficulties to their learning. Listening to professionals who use EBM in a daily basis in their practices helps to contextualize its importance.

Take-home message: Practical activities to motivate students may help to contextualize the importance of EBM in clinical practice.

Can clinically integrated teaching help in assessing students' skills in applying evidence based medicine in clinical decisions?

Authors
Bharathy Kumaravel
Samantha Gale
Veeresh Patil
Milan Bhattacharya
Venkat Hariharan
Ann Howard

Presenter:
Peter Thomas, UK

Background: The University of Buckingham Medical School is integrating Evidence Based Medicine (EBM) teaching as a longitudinal theme into its MBChB curriculum. While studies have evaluated whether EBM teaching can improve skills, knowledge and attitudes in medical students; there is lack of evidence on whether EBM teaching is effective in changing clinical practice or if schools can assess students' application of EBM knowledge and skills in clinical decisions. The aim of this study is to test the feasibility of integrating EBM teaching in clinical rotations and assessing students' skills in applying EBM in clinical decisions.
Method: In addition to EBM teaching in the pre-clinical phase, it has also been integrated into the clinical phase in primary and secondary care. Public Health team alongside clinical leads offer teaching in the form of interactive, clinically integrated small group seminars. Students are asked to complete a formative assessment where they develop answerable clinical questions from ward rounds and interactions in primary care; search and appraise evidence and then discuss the relevance of evidence to clinical practice. Students complete the assignment and present them in public health grand rounds.
Interviews and focus groups were held with clinicians (n= 8) and students (n=29) in order to gather perceptions of integration of EBM teaching and assessments into clinical placements.
Results: EBM teaching in the clinical phase has made it possible to assess students' ability to apply it in clinical decisions. Students' feedback suggests that they find the reinforcing of EBM teaching during clinical placements very helpful in appreciating its relevance to clinical practice. Clinicians are keen to further integrate EBM teaching and assessments into clinical placements in undergraduate medical curriculum.
Discussion & Conclusions: A clinically integrated teaching can encourage students to apply EBM in clinical practice. Clinicians play a central role in integrating EBM into the clinical phase of undergraduate medical curriculum.
Take-home message: Evidence Based Medicine teaching is quite effective in teaching students its relevance to clinical decisions when it is clinically integrated. It is feasible to formally assess students' application of EBM knowledge in clinical decisions.

9FF14 (1156)
Educating Healthcare Professionals in Clinical Photography. A perspective from medical education: Systematic Review

Authors
Andrés Guillén-Gracia, Universitat Rovira i Virgili, Facultat de Medicina, Reus (Catalonia), Spain
Ariadna Roca-Fernández, Universitat Rovira i Virgili, Facultat de Medicina, Reus (Catalonia), Spain
Maria Rosa Fenoll-Brunet, Universitat Rovira i Virgili, Facultat de Medicina, Reus (Catalonia), Spain

Presenter:
Ariadna Roca-Fernández, Universitat Rovira i Virgili, Facultat de Medicina, Reus (Catalonia), Spain

Background: Medical photography is not only crucial for disease diagnosis, patient follow-up, clinical communication, but also for medical education, research, and scientific documentation. In the past, it required a high level of technical skills. However, over the last years, due to the widespread use of 'smartphones', it has never been so easy to obtain medical images in professional environments. As a consequence, it has become a rising, complex and controversial issue worldwide which, as a recommendation, should see healthcare professionals acquire knowledge in medical photography during their training.
Method: We investigated for competences to train medical students in clinical photography. Methods for qualitative data collection included a PRISMA protocol for systematic review. Articles published from 2013 to 2017 were identified according to predefined inclusion and exclusion criteria in six databases (MEDLINE/PubMed, SCOPUS, Web of Science, ERIC, CINAHL, and Embase).
Results: 14.811 potential studies were initially found, of which 30 were included. This review identified essential competencies and, fundamentals needed to face current challenges in medical photography. Including current technology, existing standardized protocols for research, surgery, dermatology, forensics, and clinical trials. Also guidelines in relation to smartphone publishing of medical images and, evolving issues and legal perspectives, comprising patient's perception and rights governing privacy and copyright requirements when obtaining and publishing clinical pictures.
Discussion & Conclusions: The impact of assembling ICT and photography on 'smartphones' has been enormous for medical photography. The time-reduction in obtaining images, the low-cost of reproducing them and the ease of sharing photographs have increased the capture of clinical images but also their inappropriate management. Therefore, it's strongly recommended that students are advised and trained in clinical photography. Being necessary to take into account the diverse cultural, ethical and legal aspects and the wide variety of Journals publication's criteria. It is said that 'a picture tells 1000 words', but in the case of medical photography, this statement can only be true if the photographer's skills in taking high-quality clinical photographs are achieved and the patient's rights are respected.

Take-home message: We encourage implementing educational programmes in medical photography. Our course is constantly evolving since 1993.

Evidence-Based Practice Curriculum Development for Undergraduate Nursing Students

Authors
Hsiao-Ying Hung
Yu-Wen Wang
Jui-Ying Feng
Chi-Jane Wang
Ching-Lan Lin
Ying-Ju Chang

Presenter:
Ying-Ju Chang, Department of Nursing, National Cheng Kung University Hospital, Institute of Allied Health Science; Department of Nursing, College of Medicine, National Cheng Kung University, Tainan, Taiwan

Background: Equipping undergraduate nursing students with sufficient competence of Evidence-based practice (EBP) is essential for meeting the demands of future practice. Systematically integrating necessary EBP knowledge and skills into the formal curriculum allows students to have a better learning experience and outcomes. In Taiwan, however, a systematic nursing curriculum that integrates EBP concepts across a 4-year program has not yet been constructed. Additionally, engaging students in the clinical application of evidence remains a teaching challenge.
This study aimed to construct an EBP undergraduate nursing curriculum and develop clinical scenarios that support EBP teaching.
Methods: Three cycles of action research, incorporating both focus group interviews and questionnaire surveys, were applied to construct and evaluate the appropriateness and feasibility of the EBP nursing curriculum and relevant teaching strategies.
Results: An EBP nursing curriculum was constructed, integrating three levels of learning objectives and corresponding learning outcomes, teaching content and learning activities. Scenario activities were developed to familiarize students with the EBP process and maximize their learning of the clinical application of evidence. Through preliminary evaluation, the curriculum's appropriateness and feasibility were demonstrated, and was found to successfully fostered students' EBP competency and increased students' confidence and positive attitudes toward EBP.
Conclusions: A systematic EBP bachelor nursing curriculum with effective pedagogical strategies was developed, the process of which and the information provided could serve as a valuable reference for other nursing schools.

Improving final year medical students' knowledge in, and confidence of, patient safety incidents

Authors
Rebecca Crook, Chelsea and Westminster NHS Foundation Trust, London, UK
In-Ae Tribe, Chelsea and Westminster NHS Foundation Trust, London, UK
Naomi Mathew, Chelsea and Westminster NHS Foundation Trust, London, UK

Presenter:
Rebecca Crook, Chelsea and Westminster NHS Foundation Trust, London, UK

Background: Undergraduate patient safety education typically focusses on ethical quandaries and human factors. This leaves a gap in knowledge regarding the practicalities of reporting incidents, basic governance surrounding serious incidents (SI) and what happens if you are an involved in an SI as a junior doctor. This project intended to increase knowledge of patient safety incidents and confidence in dealing with an SI in the early years of a medical career.
Method: This project used qualitative improvement methods to achieve its aims. Final year medical students completed surveys on their confidence in (using 1-10 likert scales), and knowledge of (using MCQs), patient safety issues before and after a tutorial. This tutorial focussed on why incidents are reported, who can report them and what happens if you are involved in a serious incident as a junior doctor. The tutorial was later redesign based on student feedback and the same data was again collected.
Results: Pre- and post-tutorial surveys were completed by 29 students. Of this group all had "heard of" incident reporting, 2 had been involved in an incident and 3 had received prior teaching on SIs.
After both the tutorial (intervention 1) and the second version of the tutorial (intervention 2) the number of students using the word "Datix" when describing how to report a patient safety incident, the number of correct responses to why incidents are reported, the ability of students to correctly identify SIs from non-serious incidents all significantly improved. After both intervention 1 and intervention 2, students' confidence in reporting incidents, knowing why we report incidence and their overall preparedness in dealing with an SI all significantly improved.
Conclusions: The programme was effective in increasing student's confidence in all areas of patient safety incident reporting that were measured. The programme was also effective in increase knowledge in almost all areas of patient safety incident reporting measured. The small sample size (n=29) of this project limits its generalizability. The number of questions on the survey was also small.

Active learning instructional strategies for patient safety education

Authors
Wanna Angkasuvan, Hatyai Hospital, Songkla, Thailand

Presenter:
Wanna Angkasuvan, Hatyai Medical Center Hospital, Songkla, Thailand

Background: Active learning which involves active participation of students have evidenced to get better student attitudes and promote higher order thinking. Using active learning instructional strategies and WHO patient safety curriculum with toolkits were implemented for patient safety education to improve safety competencies in everyday life of medical students.
Method: Different active learning methods were conducted for forty fourth year and thirty-one fifth year of medical students with topic 1-7 of WHO patient safety curriculum in academic periods within two years. Time schedule instructed four periods (topic1-4), four periods (topic5-9) and one period (topic10-11) in the fourth, fifth and sixth year with two hours each period.
Results: All medical students had participated activities such as paired activity for practice communication (Situation-Background-Assessment-Recommentation and Handover), competitive between groups for recall unsafety conditions, workplace based for human factor engineering survey in OR, OPD and wards, small groups discussion for scenario and video of adverse events to stimulate system thinking in Swiss Cheese Model, role play of adverse events in video clip for incident report practice and projects for quality improvement concepts. Immediately after class review, the contents which medical students mainly preferred to apply in their everyday life were Swiss Cheese Model, SBAR for communication and incidents reports.
Conclusions: Active learning instructional strategies help intentional engagement of medical students to get experiences what we want them to learn. Medical students could develop deep understanding of patient safety concepts that experiences make the concepts increasing clear. Active learning instructional strategies requires becoming involved the activities of medical students both physical and psychological energy lead to limit in group larger than 40. We have some level of risks to concern that we can't cover as much course contents and much pre-class preparation of both teachers and students.
Take-home message: How to assess and maintain safety competencies of medical students in everyday life until after graduate. We should design varieties of active learning activities with modest expectation.

9GG3 (2004)
Patient safety learning: A gap-analysis project to create solutions/innovations in the corporate Obstetrics and Anesthesiology module

Authors

Wipada Laosooksathit, Srinakharinwirot University, Nakhon-Nayok, Thailand
Amarin Narkwichean, Srinakharinwirot University, Nakhon-Nayok, Thailand
Patchanee Pasitchakrit, Srinakharinwirot University, Nakhon-Nayok, Thailand
Aurasa Hemachandra, Srinakharinwirot University, Nakhon-Nayok, Thailand
Parit Wachasiddhisilpa, Srinakharinwirot University, Nakhon-Nayok, Thailand
Chaiyapruk Kusumaphanyo, Srinakharinwirot University, Nakhon-Nayok, Thailand

Presenter:
Wipada Laosooksathit, Srinakharinwirot University, Nakhon-Nayok, Thailand

Background: In view of the emerging importance of integrating the awareness of patient safety into medical curriculum, project-based learning was initiated allowing 5-year medical students to perform gap analysis to tackle issues on patient safety during the corporate Obstetrics and Anesthesiology module.

Method: The 9-week corporate module first started with an interactive 1-hour lecture on patient safety, before students were divided into groups of 5-7 people. Students chose the problem they had encountered during their daily practice, root-cause analyzed, and created either solutions or innovations to solve the problem. The students were scheduled to meet with their supervisor along the course and presented their work when completed the module. Assessment was done by supervisor, peer, and audience (lecturer, other personnel) feedbacks regarding their responsibility, creativity, systematic thinking, and practicality.

Results: There were 24 (16 obstetrics, 8 anesthesiology) unduplicated individual projects according to the SIMPLE guideline developed by the Thai national standards. Safe surgery (S) followed by care process (P) and medication safety (M) were the most selected issues. There were also projects concerning emergency response (E), for instance, one group chose to improve intra-hospital patient-transfer system. All projects were evidence-based which were systematically analyzed under supervision. Various solutions/innovations were existing which many can be practically applied to use. Open discussion at the final presentation was also useful.

Discussion: Students reported the benefits of the project in variety of dimensions both medical and non-medical related. Medically, students got to interact with other medical professionals enhancing their understandings and relationship. Besides, it was an avenue to learn to plan critically and execute actions constructively. Additionally, students got to ignite their creativity, something not usually found in a medical curriculum. Furthermore, the evidence-based process was systematic used by student group.

Conclusions: A project-based learning appropriately suits the patient safety education in order to enhance student awareness and ignite their creativity. Students are also able to systematically work as a team and experience inter-professional learning.

Take-home message: Patient safety education can be organized as a project-based learning and can develop various students' skills.

Self-assessment of safety practices in students attending the Inter-Professional Education (IPE) for Patient Safety Course

Authors

Thitima Suntharasaj
Pratyanan Thiangchanya
Nattasiri Thanawuth
Wanna Angkasuwan
Boonyarat Warachit
Arnuparp Lekhakula

Presenter:
Thitima Suntharasaj, Department of Obstetrics and Gynecology, Prince of Songkla University, Faculty of Medicine, Songkhla, Thailand

Background: An "Inter-Professional Education for Patient Safety Course" was arranged for the 6th year medical students, the 4th year nursing students and the 5th year pharmacy students. Groups of 12-13 students and 3-4 faculty staff were set. The activities composed of a half-day workshop, project-based learning and presentation, with the contents based on the WHO Patient Safety Curriculum Guide, multi-professional edition, Thai Patient Safety Goals, and Rational Drug Use Handbook.
To evaluate the safety practices among students attending the IPE for Patient Safety Course.

Methods: At the beginning of the workshop, all students had to engage in a self-assessment questionnaires, using electronic keypads. Nine aspects of safety practices were rated from 1: never done, 2: 50% done, 5: 100% done.

Results: A total of 399 students (44.4% medical students, 36.8% nursing students and 12% pharmacy students) completed the survey. Eighty percent were between 21-24 years old, and 65% were female. Most of the student (89%) had learned about patient safety. The top three rankings of always having practiced were checking drugs before prescribing or administering (53.4%), asking the patient's first name and surname (48.1%) and wearing a face mask when having a common cold (43.1%). The practice that was never performed, in highest orders, was checking the inpatient's wristband (17.3%), followed by speaking out at the detection of a medication error (14.5%) and checking drug interaction (10.3%), respectively. Comparison among the faculties, nursing students had significantly higher percentages of practice in; self-introduction, patient identification, hand washing, face mask wearing, and drug checking before administration. However, pharmacy students had the highest practice in; checking for drug

allergies and interaction. Medical students showed the highest practice in speaking out of a medication error.

Conclusions: Student safety practices were quite low for the checking of an inpatient's wristband, speaking out of a medication error, and checking drug interaction. Each profession had different strengths and weaknesses in safety practices, so the IPE might help to improve their competency.

Take-home message: Safety practices were inadequate in some aspects, and varied among each profession.

Introducing a Structured Medication Reconciliation Practicum in Final Year Medical Education

Authors
Hwa Lin Law, Tan Tock Seng Hospital, Singapore
Rachel Wei Shih Chong, Tan Tock Seng Hospital, Singapore
Ngek Mien Chin, Tan Tock Seng Hospital, Singapore
Wan Peng Lim, Tan Tock Seng Hospital, Singapore
Kum Ying Tham, Tan Tock Seng Hospital Singapore

Presenter:
Hwa Lin Law, Tan Tock Seng Hospital, Singapore

Background: Medication error can occur when patient is transferred between cares which imposes risk to patient safety. Medication reconciliation is important to minimise such errors but is rarely incorporated in medical education. Medical students usually learned this during clinical rotations which might not support safe prescribing. This study proposes to incorporate an interactive medication reconciliation into the medication safety curriculum for medical students in Singapore.

Method: The medication reconciliation practicum was introduced for final year medical students in October 2017. Medical students were required to pre-read materials with information and tips on how to perform an accurate and comprehensive medication reconciliation. Team-based learning was applied and co-facilitated by clinician and pharmacists. Students took turns to role-play as patient, doctor and observer over 3 scenarios. At the end of each 10 minutes session, observers would provide peer feedback and each group was asked to write a prescription before the Pharmacists' debrief. All students were asked to complete a pre- and post-survey to assess their understanding as well as the effectiveness of the lesson.

Results: Fifty final year medical students participated in this study. There was no statistical significance between pre and post survey results on their understanding of performing medication reconciliation (p= 0.78, SD=1.54). This could be related to the e-learning and clarifications made before the role-play. On a 4-point Likert scale, students found that the course materials were essential (3.47). In terms of learning, they were able to relate each of the learning objectives to the learning they achieved (3.59), agreed that ample opportunities were given to practice the skills (3.52) and able to apply what they learnt immediately (3.47). Most students reflected that this lesson reinforced the importance of medication safety.

Conclusions: The medical reconciliation lesson was well received. Incorporating an interactive medical

reconciliation lesson co-facilitated by clinicians and pharmacists allows the medical students to practice in a safe environment. It also teaches medication error which is currently lacking in the undergraduate medical curriculum.

Take-home message: Medication reconciliation practicum is important for medical student allowing them to practise and learn in a safe environment.

9GG7 (848)
Can trainee doctors refuse to work in unsafe conditions?

Authors
Mohammad S Razai

Presenter:
Mohammad Razai, St Georges University, London, UK

Background: The conviction of manslaughter by gross negligence and subsequent revocation of a paediatric trainee's license to practice by the GMC has sent shock waves through the medical profession and education community in the UK. Dr Bawa-Garba was working in a severely understaffed paediatric department without consultant support where a six-year-old patient died of sepsis. A medical tribunal found that she was covering the workload of 3 other doctors, there was a serious IT breakdown at the hospital and the patient was looked after by an adult nurse due to staff shortage.

Method: Following concerns about the impact of this case on trainees, the GMC has issued guidance for doctors who find themselves in unsafe working conditions. It states that trainees must raise concerns about safety with their senior colleagues and healthcare managers with clear documentary evidence to show that this has happened. This paper explores the implications of this guidance for doctors in training and evaluates the ethical justifications of refusing to work in unsafe conditions.

Results: The moral objection to refusing to work is that doing so would put patients at risk of harm. It breaches doctors' contractual responsibilities and damages their relationships with patients and the public at large. The counter arguments state that it would lead to greater long term good for the patient population and doctors have a legal and moral right to refuse to work in conditions where safe patient care is not possible. They emphasise the principle of primum non nocere (first, do no harm), and the risk of civil or criminal action if harms occur to patients under their care.

Discussion: It would be difficult to extend common moral objections, historically developed for doctors' strike, to this novel contemporary context.

Conclusions: The risk of greater harm to patients and the increasing threat of litigation and prosecution would make it unsustainable to restrict, completely or even partially, a doctor's moral right to refuse to work in unsafe conditions.

Take-home message: It is both ethically justifiable and necessary to refuse to work in unsafe conditions within a clear agreed framework.

9GG8 (379)
Coroners Case Compendium

Authors
Benjamin Burrows
Caroline Pennels

Presenter:
Ben Burrows, Gloucester Hospitals NHS Foundation Trust, Gloucester, UK

Background: To review the Coroners decisions of clinical cases within our trust, and to present the learning points raised so that we may improve the care we deliver.
Method: We initially selected a small case series that was representative of a broad spectrum of commonly encountered clinical problems. We reviewed the notes from both a medical and legal perspective, and presented a summarised medical and legal view of each case –with additional references for further reading where appropriate. New cases will also be included as and when they are concluded. The cases will be uploaded to a web tool so they are easily accessible to both clinical and managerial hospital staff.
Results: Initial review of the project suggests an appetite for such an educational tool amongst clinicians. A survey of junior doctors suggested the following headings would provide the information of most interest: Story; Outcome; Medical Comment; Legal Comment and Further Reading, we have also chosen to include the additional heading of Organisational learning.
Discussion & Conclusion: The review of the Coroners cases from within the trust has proven to be a valuable resource of knowledge for hospital clinicians and managers. The cases have highlighted common problems and of equal use presented both medical and legal advice on how to avoid similar problems in the future, this we trust will prove invaluable to improving patient care. Further data collection remains ongoing and additional feedback from doctors and managers is being sought to ensure the case reviews retain the brevity essential to ensuring they are read, and yet remain comprehensive enough to remain of value. All the information is in the public domain, and as such this learning tool could easily be made accessible nationwide. We would hope this project will also assist the NHS to meet the recent guidance from both the Care Quality Commission and the National Quality Board on learning from deaths within the NHS.
Take-home message: Legal cases represent a previously under utilised wealth of knowledge that we must embrace as an educational tool to help drive forward care.

9GG9 (787)
Instant web and apps-based access to practical and procedural information improves patient safety and reduces adverse incidents by interns

Presenter:
Yan Jin, The Chinese University of Hong Kong, Hong Kong

Background: The transition from medical student to a frontline medical worker, not only requires competencies in numerous generic medical procedural skills, but an increasing burden of responsibility for the care and safety of patients admitted under the supervising team. With a perpetual shortage of hospital beds and an ever-increasing clinical workload, the pressure to complete work on time, requires quick action on the part of the junior-most staff in the hierarchy – namely the interns. Consequently, the reduced time available for completing procedures and administrative duties may translate to reduced efficiency and adversely towards patient safety.
Method: A series of web-based and apps-based educational resources were developed for junior interns and doctors to use for quick access to important information and administrative practices related to procedures. These eLearning resources addressed key procedural steps that covered patient safety. An obligatory built-in self-assessment exercise ensured that all interns had access to the resource provided they reached competency on the assessment. Over a period of 5 years 1936 interns made use of the resources.
Results: Focus group interviews of 2 successive batches of CUHK interns (n= 220) revealed that 80% of interns were highly satisfied with the educational resources provided. They believed that the resources were available as and when needed and provided a useful reference. Guidelines embedded within the resource ensured administrative compliance. The education resource had a positive impact on patient safety. A 30 % reduction in prescription errors, a 50% reduction in transfusion errors, and a 50% reduction in specimen mislabeling and other identification errors was reported.
Conclusions: Just-in-time resources have a positive impact on user behaviors. Health-care is no exception. The use of APPS and the ever-increasing use of mobile devices enable us to place useful tools and reference that junior doctors could use in their daily practice. The challenge NOT to overwhelm them with information needs to be addressed. One possible means of doing this would be to embed NFC-interfaces at the site where procedures are being conducted to deliver safety and procedural requirements as a ready reference.

Speak Up, For Patient's Sake! Empowering Students and Staff with Interprofessional Communication and Teamwork Tools to Improve Patient Safety

Authors
Nicole Puccinelli-Ortega, Wake Forest School of Medicine, Winston-Salem, USA
Kristin Lindaman, Wake Forest School of Medicine, Winston-Salem, USA
Sonia Crandall, Wake Forest School of Medicine, Winston-Salem, USA

Presenter:
Nicole Puccinelli-Ortega, Wake Forest School of Medicine, Winston-Salem, USA

Background: The National Academy of Medicine and other reports depict alarming medical error statistics in the U.S. healthcare systems. These statistics have been attributed to poorly coordinated care and systemic problems in healthcare delivery. Contributing to this problem is inadequate communication. To address this issue we developed a patient-centered Interprofessional Collaborative Practice (IPCP) model of care that focused on interprofessional communication for third-year medical students, PA students and postgraduate interdisciplinary staff. Our goal was to empower learners with tools to more effectively communicate within interprofessional teams to improve patient safety.

Method: The setting for this experiential learning is a high acuity inpatient hospital unit. We designed and piloted a program that incorporated TeamSTEPPS tools and interdisciplinary bedside rounds to introduce students and staff to the role communication plays in patient safety. The interprofessional training focuses on the critical nature of communication and its impact on safety with the goal to empower learners with tools to confidently assert a safety concern, resolve conflict and coordinate care plans with interprofessional teams.

Results: To assess the program, we used questions from the Assessment for Collaborative Environments (ACE-15), TeamSTEPPS-Teamwork Attitudes Questionnaire (T-TAQ) pre and post training, and qualitative debriefs. Collected data revealed that during interdisciplinary rounds, 97% of the 25 respondents reported feeling safe bringing up patient concerns; 87% reported the team constructively manages disagreements; and 84% reported all voices on the team are valued. T-TAQ data is in the process of analysis.

Discussion: Students reported they had not considered how critical a role communication plays in patient outcomes and felt that interdisciplinary rounds provided accountability for the medical team to provide safer care plans. By empowering learners with communication tools, providers are better equipped to advocate for their patients, resolve conflict and develop coordinated care plans.

Conclusions: Fragmented care is a byproduct of learning in silos and task-oriented training. While there are many safety mechanisms already in place, effective communication is at the core. Training within this unique setting has proven to be viable, well received, and effective.

Presenter:
Jia-Ling Change, Nursing Department of WanFang Hospital, Taipei Medical University, Taipei, Taiwan

Background: From the past experiences of Novice training, the evaluation standard is mostly focusing on single technical practices and tests. However, the training is not practical for the trainees to perform in the clinical practice nowadays. The lack of confidence caused by incomplete training may seriously impact trainees nursing ability, and in the long term the turnover could be much higher.
Therefore, in order to assist the trainees to perform better in the high pressured work environment, we develop a simulation training that is centered by the trainees and focusing on develop their sense of confidence and security after they finish their basic clinical technical Novice program.

Method: A simulation training is designed for the trainees who are already finished their basic training in respiratory critical care unit. It is designed for nine trainees who joined the program, and to evaluate not only by the trainers but also by the trainees themselves during the simulation process, and provide practical feedback after the training completes.

Results: In this training, the gap between the evaluation of trainers and trainees is very close. Most of the feedback from trainees are suggested that the lack of practical experiences can be made up by the simulation program, and they can build a stronger confidence when they face the patient.

Conclusions: Most of novice training are lack of the ability to integrate different situations. A simulation training that is closed to what is going to happen in the reality allows the trainees to have the opportunity to practice more, and by using the self-evaluation form, they could find out problems and difficulties. The result indicate that compared the new simulation program with the old one, most trainees are likely to have enough confidence to

cope with the emergencies, and overall elevates the result in terms of clinical nursing.

Take-home message: In order to decrease the stress of the novice in the clinical environment, we provide a simulation program that is focusing on trainees themselves after they have the basic clinical technical training to enhance the sense of security and reality.

The Interdisciplinary Patient Partner Program: Building Better Health Care Professionals through Mentorship with Patients

Authors
Krista Baerg, University of Saskatchewan, Saskatoon, Canada
Cathy Cole, Saskatchewan Health Authority, Saskatoon, Canada
Heather Thiessen, Patient Advisor, Saskatoon, Canada

Presenter:
Krista Baerg, University of Saskatchewan, Saskatoon, Canada

Background: Patient and family centered care (PFCC) is a philosophy of care delivery. PFCC promotes collaborative empowering relationships among patients, families, and health care professionals. The four pillars of PFCC include information sharing, participation, respect and dignity, and collaboration. To teach concepts in PFCC, the healthcare organization's Client and Family Centered Care department partners with the College of Medicine, Pharmacy, and Nursing to match students with patient and family advisors.

Method: Students and Patient and Family Advisors are surveyed after participation in the 10-hour program. Ethics exemption was received (n=30) and advisors (n=14).

Results: Students reported a mean satisfaction score of 4.50 on a scale of 1 (Not at all) to 5 (Very much) (SD = .58). Students also completed the 9-item Attitudes Toward Patient and Family Centeredness Scale. Paired samples t-tests were conducted to gauge perceived increases over the program. Effect sizes (Cohen's d) were calculated as a practical measure of significance. All items increased significantly with large effect sizes. Families were satisfied with the program with a mean rating of 4.80 (SD = .42) on a scale of 1-5, with higher scores reflecting greater satisfaction. Comments from students and advisors will be presented.

Discussion & Conclusions: When medicine, pharmacy, and nursing students meet directly with Patient and Family Advisors they experience a positive shift in attitude towards the meaning of Patient and Family Centered Care and learned about the inter-dependencies between health care professionals and the importance of and interdisciplinary approach to health care. Many students commented on this as an added benefit to the structure of the program. Patient and Family Advisors highlighted the importance of sharing stories and exploring them through dialogue with the students as a key factor in the success of the program.

Take-home message: Matching medicine, pharmacy and nursing students with Patient and Family Advisors is an effective way to improve students' understanding of Patient and Family Centered Care.

How "Patient Centered Medicine" helps medical students get clinical competencies in Medical Education Center, Vachira Phuket Hospital

Authors
Withita Jangiam, Vachira Phuket Hospital, Phuket, Thailand

Presenter:
Withita Jangiam, Vachira Phuket Hospital, Phuket, Thailand

Background: The term "Patient centered medicine" means that physicians have to understand the individual patient to diagnosis both disease and illness. As we know, education in medical schools focuses mainly on biomedical subjects but less on soft skills (communication skills, professional values, humanistic attitudes). The main aim of this study was to assess the clinical competencies of medical students after practicing patient centered medicine.

Method: Observations by a teacher of the medical students care of patients and deep interviews were performed in 24, 4th year medical students. Sequentially, questions about the following topics were asked; ideas, feelings, reflections, and what clinical competencies got better. The interviews were recorded and analysed using the qualitative SCAT method.

Results: Medical students developed better processes of caring for the patients; explored both disease and illness, technique of communication skill, family oriented care and holistic care. Their attitudes after practicing patient centered medicine were very impressed; they understood a doctor who works in communities, they understood themselves, they understood patients, they realized their own competencies for development, and got real information and better compliance from patients. They thought patient centered medicine is the key to successful care for patients nowadays.

Communication skills and holistic care were performed well and all 4th year medical students developed positive attitudes and opened their minds to understand others. Medical schools can help with this by creating this subject in their curriculums. Medical students should learn all of these skills because they are essential.

Conclusions: Patient centered medicine should be added to the curriculum of a medical school with reflection. Medical students should be given an opportunity to practice for more experiences and confidence in these skills as early as they can. Additionally, medical students can further their development by adding soft skills and good attitudes to their overall practice.

Can narrative help bridge Patients', Caregivers' and Physicians' experiences of illness and care? Results from a scoping review

Authors
Tracy Moniz, Mount Saint Vincent University, Halifax, Canada
John Costella, Western University, London, Canada
Maryam Golafshani, Western University, London, Canada
Chris Watling, Western University, London, Canada
Lorelei Lingard, Western University, London, Canada

Presenter:
Tracy Moniz, Mount Saint Vincent University, Halifax, Canada

Background: Patients, family caregivers and physicians tell different stories about illness and care experiences. Better understanding of the relationships among these narratives could offer insight into intersections and disconnections in patient, caregiver and physician perceptions of illness and care. Such understanding could support enhanced patient-centred care in medical education and practice.
Method: We conducted a scoping review of literature that analyzed narratives of illness and care written by at least two of our interest groups: physicians, patients and caregivers. A search strategy involving 9 databases located 6,337 citations. Two reviewers independently screened titles and abstracts. Full-text screening followed (n=82), along with handsearching of grey literature and bibliographies. Of these, 22 met inclusion criteria.
Results: Most of the 22 papers analyzed narratives by patients and caregivers (n=13), followed by patients, caregivers and physicians (n=7), and patients and physicians (n=2). Only 9 pieces compared perspectives. The rest combined narratives for analysis, largely those of patients and caregivers (n=12). Most of the 22 papers used descriptive content analysis to derive themes. Themes of humanity, identity, agency and communication intersect and diverge between groups. What was absent, however, was a more interpretive narrative analysis of structure, orientation and characterization within these narratives, which may have revealed even more than their content. This review offers a cautionary tale of lost potential and a call for the power of narrative and narrative analysis as an interpretive method. Many narratives are gathered and analyzed, but usually only thematically and rarely comparatively. Comparative narrative analysis may enrich understanding of how differences between perspectives come to be and what they mean for the experience of illness and care.
Discussion & Conclusions: Through narrative, we can understand not only the diverse and divergent experiences of others, but also the process of meaning-making behind the storytelling. Future research that aims to compare written reflections across groups should draw on analytical techniques of narrative inquiry. Narrative is a powerful tool that offers something distinct, and we call for researchers to explore and exploit that distinctiveness through a more robust use of narrative inquiry in the field.

Wen-Chii Tzeng, National Defense Medical Center, Taipei, Taiwan

Presenter:
Yaw-Wen Chang, Tri-Service General Hospital, National Defense Medical Center, Taipei, Taiwan

Background: One of the primary goals of undergraduate medical education is to prepare the graduates who exhibit the attitude and ability of patient-centered care. The foundation of patient care is the ongoing partnership between patient and health provider. However, the relationship between patient and medical student is short and fragmented in the framework of discipline-based rotational clinical training. The principles of longitudinal integrated clerkship (LIC) are continuity of care, curriculum, and supervision. This study explored the patients' perspectives of the LIC students' roles and functions in the base of continuity of care.
Method: Patients who were cared longitudinally by the LIC medical students were invited to participate. The data was collected by a trained research assistant with a semi-structured interview in person or over the telephone. The researchers thematically analyzed the transcribed verbatim using a general inductive approach to identify themes in patient's descriptions of their experiences interacting with medical students.
Results: The results of the analysis revealed three significant roles of students in the longitudinal integrated clerkship: friends of the profession, caretakers, and learners. The major interactions between patients and students identified in this study were students' comforting and consulting. Patients felt warmness from students' comforting. Through communication apps of handheld devices, patients felt much easier to access health advises. With support from attendings, patients recognized the student's assistive roles in care. And patients and students learned simultaneously during the processes of consultation: patients got health education or care and students learned communication skills and experience of care. Interviewed patients had high satisfaction with this program.
Conclusions: The LIC students could establish a longitudinal relationship with patients. This link was not like the disease treatment relationship between attendings and patients. From the patient's perspective, the roles of medical students were more like learners and friends of the medical profession. Therefore, what the patients expected the students learned from this

relationship were empathy and doctor-patient communication, not only medical knowledge and skills.

Evaluation and Impact of Patients' Feedback on Allied Health Students

Authors
Hui Ling Lee, National University Hospital, Singapore
Sherlyn Chan, National University Hospital, Singapore
Wee Kee Hew, National University Hospital, Singapore

Presenter:
Naomi Wong, National University Hospital, Singapore

Background: Effective feedback is key to students' clinical learning and performance (Turan et al., 2009). Receiving patients' feedback can allow students to understand the patients' values and improve on their own clinical and communication skills.
This study aims to:
• evaluate the patients' feedback on Allied Health students and its usefulness for the students; and
• discuss the implications on clinical training.
Method: A cross-sectional study was carried out through face-to-face interviews with patients visiting the Department of Rehabilitation or University Medicine Clinic (UMC) from 28 Mar 2016 to 29 Dec 2017. The questionnaire contained seven (7) sections that surveyed the patients' viewpoints of the students.
The clinical educators of Physiotherapy (PT), Occupational Therapy (OT), Speech Therapy (ST) and Psychology (Clinical) [CP] students identified coherent patients who were able to provide comments. At the end of the posting, students evaluated the usefulness of the patients' feedback in their learning.
Results: 137 patients participated in the survey voluntarily and 100% were satisfied with the treatment received from the students. Constructive qualitative comments, both positive and negative, were received.
While there were patients who felt that students were patient and professional, others felt that some students lacked confidence. With the patients' constructive feedback on their performances, students opined that they were able to obtain insight into the patients' values, how to treat them better and improve on their communication skills.
Discussion: There is a common perception that patients are unaccepting of students and their treatment. However in this study, we have shown that 100% of the patients surveyed were satisfied with the treatment received from the students. Together with the encouraging comments provided, these has helped to boost the confidence in the students.
Conclusions: This study will continue in AY18/19 as the questionnaire is enhanced to survey the patients' perception of having Allied Health students as part of the healthcare team.
Take-home message: Patients provided constructive feedback on the Allied Health students, which the latter found useful. Students were able to improve their communication skills, clinical performance and overall confidence.

Evaluation of an Online Education Resource on Radiation Therapy Created for Post-Prostatectomy Prostate Cancer Patients and their Caregivers

Authors
Ewa Szumacher University of Toronto, Toronto, Canada
Katija Bonin, University of Toronto, Toronto Canada
Merrylee McGuffin, Sunnybrook Health Sciences Centre Toronto, Canada
Deb Feldman Stewart, Queens University, Kingston, Ontario, Canada
Eli Lechtman, University of Toronto, Ontario, Canada
Lisa Di Prospero, Sunnybrook Helath Sciences Centre, Toronto, Canada

Presenter:
Ewa Szumacher, University of Toronto, Canada

Background: We created an online program for patients with prostate cancer considering post-operative RT and their families or caregivers.
Purpose: Evaluation of effectiveness of this program and assesses the use and reach
Method: Survey evaluation process using Purpose-based Information Assessment tool
Results: Nineteen patients and caregivers participated in this study. Of these, 14 agreed to participate, and only five completed the study (36% response rate). All were patients post-prostatectomy and the majority were 65 years or older (80%, 4/5). Sixty percent were Caucasian or European and 40% (2/5) as African-American. Eighty percent (4/5) reported more than high school education. Sixty percent lived ten kilometers away from the Centre. "Information about how you used the information-Forty percent (2/5) spends one to three hours and 60% (3/5) spend less than one hour; Overall Quality, 40% (2/5) rated the information somewhat helpful, 60% (3/5) very helpful and all would recommend it to others. Sixty percent (3/5) did not find the information hard to understand but 20% (1/5) found it a bit hard to understand; Types of Help The most valued types of help that reported were organizing thoughts, understanding prostate cancer and its treatments, deciding on treatment, as well as planning The lesser valued involved providing emotional support and discussing the situation with others. The online education program is hosted by the website MedSchoolForYou.ca. Since its launching in April 2015 the program has had 16,606 page views. The average time spent on any page in the program was 30 seconds. The pages with the most views included the main page, Understanding My Situation and Prostate Cancer Diagnosis, Making a Decision and Radiotherapy Procedures Involved. The videos with the most views were the introductory video and the videos on the Understanding My Situation and Prostate Cancer Diagnosis, Making a Decision and Side Effects pages. Most page views were from May 2015 to January 2016.
Conclusions: Overall, this online education resource has the potential to reach a large number of patients and their caregivers who desire specific information and involvement in future treatment decisions.

9GG18 (2592)
Clinical teachers' perceptions of informed consent inquiry in patient care involving medical students

Authors
Eeva-Maija Nieminen, University of Helsinki, Faculty of Medicine, Clinicum, Department of Medicine, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Medipeda, Helsinki, Finland

Presenter:
Eeva-Maija Nieminen, University of Helsinki, Faculty of Medicine, Clinicum, Department of Medicine, Helsinki, Finland, Helsinki, Finland

Background: For medical students' clinical skills learning, it is vital that they participate in patient care. Patients need to be inquired an informed consent for students' involvement in their care. The Ombudsman in Finland claimed that students' participation requires a written consent from a patient. The aim of this study was to explore the clinical teachers' perceptions of inquiring informed consent for medical student involvement in patient care.
Method: The data were collected with an online survey addressed to clinical teachers at the University of Helsinki 2017. The survey consisted of items on informing the patient, asking for their consent and patients' refusal of student involvement. 83 teachers responded, 54% female and 46% male. Most of the respondents were experienced teachers. 45% had over 10 years, 29% 6-10 years of clinical experience and 60% were over 50 years old.
Results: Teachers who answered the survey involved patients very frequently in their teaching. 36% reported to always and 40% to often have patients in their clinical teaching. Most teachers, personally inquired consent from patients before teaching with students (always 54%, often 12%, sometimes 6%, never 4%). 22% of the teachers reported that someone else in the unit inquired consent. The teachers reported that teaching units informed patients by letter (32%) or upon admission (15%). 32% reported they did not know the procedure, and 18% told that the unit informed the patient. 97% asked consent in spoken and 3% in written.
Most teachers inquired informed consent personally. There were hurdles in the chain of the events of the teaching units' informing patients and documenting the consent in the health record. Similar challenges from patients' and students' perspective have been recognized in previous studies on the same topic.
Conclusions: Students actively participate in patient care in patient care in Finland. The process of informing and asking for consent requires clear instructions, procedures and commitment from the whole teaching hospital community.
Take-home message: Systematic directions and procedures of inquiring informed consent and commitment from the whole healthcare community is required to improve informed consent inquiry.

3D3P: Digital Do's and Don'ts, Potency and Pitfalls of the Patient portal

Authors
M.C.L. Eijkelboom, Department of Paediatrics, University Medical Center Utrecht, Utrecht, Netherlands
J.J van Wijngaarden, School of Medical Sciences, University Medical Center Utrecht, Utrecht, Netherlands
W.D. Schot, Educational Development and Training, Utrecht University, Utrecht, Netherlands
P.J. van den Hoven, Utrecht Institute of Linguistics OTS, Utrecht University, Netherlands
J. Frenkel, Department of Paediatrics, University Medical Center Utrecht, Utrecht, Netherlands

Presenter:
Charlotte Eijkelboom, Department of Paediatrics, University Medical Center Utrecht, Netherlands

Background: Physicians and patients increasingly communicate using e-consults. E-consults are defined in this study as written asynchronous messages within an electronic health record. Communication training of medical students traditionally focusses on face to face interaction, with emphasis on non-verbal cues. In e-consultation these cues are missing. In order to effectively use e-consultation, specific training is required. The 3D3P project aims to develop such training, the first step being identifying features of good vs. poor e-communication.
Method: Two approaches were employed. Assessing user opinion and analyzing real life e-correspondence. Individual open interviews were held with 7 patients and 6 physicians. Subsequently, items identified in the interviews were discussed in focus groups with 3 patients and 3 physicians each. Moreover, students in Communication and Information Sciences systematically analyzed written messages for text characteristics indicative of potential miscommunication.
With this knowledge, an electronic teaching module for undergraduate medical students is currently being developed. This module aims to provide skills for effective communication via e-consults. Results will be evaluated by questionnaires, semi-structured interviews and rating students' performance on e-consult scenarios prior to and after the e-module.
Discussion: In general, e-consults are valued by patients and doctors as a medium for short simple questions. In addition, e-consults can help order patients' thoughts. Notably, many doctors overestimate the clarity of their messages.
Simple characteristics were identified, that make a message better appreciated and understood by patients, e.g. formal salutations, double check of patients' understanding as well as agreement regarding suitable subjects and response time.
Full results of the learning outcomes of the teaching module will be presented and discussed at conference.
The 3D3P Project identified different elements of effective electronic asynchronous communication. These elements form the basis for the development of an e-module regarding e-consultation.

Take-home message: E-consults are becoming essential in doctor patient interaction. Future physicians should receive training focused on this form of communication, since it differs vastly from face to face communication.

Using case studies to test a model of education for health and social care staff that leads to patient benefit

Authors
Sally Corbett, Newcastle University, Newcastle upon Tyne, UK
Jan Illing, Newcastle University, Newcastle upon Tyne, UK
Madeline Carter, Newcastle University, Newcastle upon Tyne, UK
Amelia Kehoe, Newcastle University, Newcastle upon Tyne, UK
Hannah Hesselgreaves, Newcastle University, Newcastle upon Tyne, UK
Charlotte Rothwell, Newcastle University, Newcastle upon Tyne, UK

Presenter:
Sally Corbett, Newcastle University, Newcastle upon Tyne, UK

Background: NHS investment in education and training of health and social care staff exceeds £40 million annually. The process for translating this into improved patient outcomes is unclear. A model of learning transfer that benefits patients has been derived from a realist synthesis (Illing et al. 2017), and provides a useful tool to inform the development and implementation of educational interventions. Our aim was to test this model (programme theory) in real NHS settings by delineating context and mechanisms that can be causally linked to patient outcomes.
Method: A purposeful sample of cases were selected to inform educational interventions aiming to address NHS quality indicators (safety, clinical effectiveness, and patient experience) in different acute care contexts. The opinions of programme initiators, managers, educators, and staff were sought using a semi structured interview. Examples of contextual factors, mechanisms for change were identified to compare with the model. Published and internal reports pertaining to the interventions and data on patient outcomes (research, audits, and patient surveys) were reviewed.
Results: Each intervention reported positive and negative experiences. Overall organizational climate, individual motivation, training relevance and quality, and the management of change in the clinical context were key indicators for effective implementation, maintenance, and spread of learning through each organization. The fit of the programme theory varied depending on the extent to which patient's behaviour could influence outcomes. Patient safety in surgery was dependent on reducing health professional error, whereas patient adherence to treatment was strongly influenced by patient characteristics. Unsuccessful aspects of interventions provided support for the theory.

Discussion & Conclusions: The model provided a good fit with practice and could be used to provide a framework for developing good educational practice in clinical settings. We are seeking to extend model testing to non-acute settings to examine generalizability to other healthcare contexts.
Take-home messages: Educational interventions are complex and multifaceted but their effectiveness can be understood using a theory of transfer of learning. Testing of this theory has provided evidence that NHS organizations can make education beneficial for patients with a supportive climate, motivation and well designed, relevant education.

9HH2 (3289)
Permanent education as a training strategy for health professionals in the context of quality management with a view to certification in humanization

Authors
Rogério Saad Vaz
Gabriela Eyng Possolli
Araiê Prado Berger de Oliveira

Presenter:
Rogerio Vaz, Faculdades Pequeno Principe, Curitiba-PR, Brazil

Background: Quality management focusing on humanization has as a fundamental strategy on training of health professionals. Continuing education enables quality of life of patients and employees. In this perspective, what is the potential for the implementation of the permanent education program in a reference pediatric hospital?
Method: The aim of this study was to verify the feasibility of implementing the Planetree program in a Pediatric Reference Hospital based on the experience of another Certified Reference Philanthropic Hospital. Methodology used was exploratory-descriptive of qualitative approach, observing convergences and divergences, verifying implemented programs and the necessary adaptations. There were eight subjects from the Child Hospital sectors according to Planetree criteria. Data collection performed through a questionnaire and semi-structured interview and the analysis and elaboration of an intervention proposal to adapt the context to the proposed model. The Research was approved by the Ethics Committee.
Results: Through field research and semi-structured interviews, it was possible to delimit the implemented processes of humanization and criteria of care centered in the patient of the two hospitals. In the first hospital, a highly complex philanthropic hospital, the accreditation process is consolidated, with certification in humanization (Planetree). Despite the difficulties in making the initial training feasible, since it has 15,000 employees to be trained, it used distance mode, enabling everyone to be trained. In the second hospital, philanthropic and the largest exclusively pediatric hospital in the country, for some criteria there was 100% compliance: Family Involvement; Program of art / activities and entertainment; Spirituality and Diversity; Healthy communities; Human interaction. This reality brought recognition and international awards, but not yet a specific accreditation in

humanization. In other criteria, such as Food and Nutrition, Complementary Therapies and Access to information, there was disagreement on some topics, which represent opportunities for improvement.

Conclusion: The children's hospital has great potential for certification as long as the organization works on the gaps found and broadens its processes of Permanent Education for health professionals. Strategies such as distance education, and active methodologies are indicated. These actions can provide greater excellence in the services provided, increase the quality of the service, financial sustainability and accreditation.

9HH3 (3616)
The relationship among age, self-efficacy, and personality in CPD activities to remediate dyscompetence

Authors
Michael V. Williams
Philip Flanders
Dillon Welindt
Betsy White Williams

Presenter:
Michael Williams, Wales Behavioral Assessment, Lawrence, USA

Background: Due to the ever accelerating breadth of knowledge in medicine, maintaining currency can be a daunting task. We report an effort to parse age related differences to differences in cognitive processes.

Method: Data from a series of CPD activities focused at the core competencies areas of interpersonal and communication skills, professionalism, and systems-based practice were aggregated to explore the relationship among knowledge of the core competencies and age of the learner. The activities were conducted over several sessions and provided to individuals who were identified as dyscompetent in at least one of those core competencies

The dataset is drawn from 111 CPD participants. The data were aggregated into three Activity time frames: Initial (prior to instruction); Middle (second or third instructional session); and, Late (fourth, fifth, or sixth instructional session).

The analyzed data included the measure of knowledge of the meaning and effect of the core competencies, the Activity (when measure was taken), age (range: 28-75 years), participant's personality as measured by the Ten Item Personality Inventory (TIPI), and a two factor measure of self-efficacy (Historic Success and Personal Confidence).

Results: Both participant age and Activity were significantly related to Knowledge. The interaction between the explanatory variables was not significant. Three personality dimensions (Openness, Extraversion and Emotional Stability) were significantly related to Knowledge.

Self-efficacy was related to both Openness and Emotional Stability (Personal Confidence) but not to Extraversion.

Discussion & Conclusion: The Activities appear successful at increasing knowledge in these core competency areas for all age groups across time frames. The effect of age

with this instructional design may be abetted by personality structure. Personality is thought to be very stable over time. Those more adaptive to change are more likely to respond to the activity. Self-efficacy because it is teachable may offer a viable approach to supporting older learners whose personality structure might impede learning.

Take-home message: Age does not appear to uniformly impede learning in an appropriately structured activity. Results suggest addressing self-efficacy may improve the benefit of CPD activities to older learners.

9HH4 (2239)
One step backwards, but one giant step forward: The challenges of introducing backwards planning in CME design

Authors
David Hak
Chitra Subramaniam
AO North America Education Advisory Board

Presenter:
David Hak, AO North America, Denver, USA

Background: During the summer of 2017 each of the five AO North America clinical divisions (Craniomaxillofacial surgery, Hand surgery, Spine surgery, Trauma surgery, and Veterinary surgery) convened thought leaders to attend an individual 2 day backwards planning process for the development of future CME activities. These sessions were facilitated by an experienced PhD educator and were designed to adopt best practices in curriculum development.

Several challenges were encountered when introducing the backwards planning process. These included:
* Absence of evidence based guidelines on many topics
* Lack of information regarding participant knowledge and skills gaps
* Difficulty differentiating participants wants from needs
* Expectations that certain topics must remain core agenda items regardless of their value or need
* Difficulty shifting from teacher centered instruction to a more learner centered instruction
* Prior over-reliance on lectures over other teaching formats

Each clinical division developed unique solutions in attempts to overcome the challenges they faced in backwards planning. Assumptions and extrapolations had to be made using available data. Brief surveys and data collection were sometimes required to delineate participants needs. Continuous encouragement to think outside the box, or at least outside the lecture, were necessary to develop a learning activity that was learner centered, and that promoted active learning and engagement.

A Novel, Interactive Narrative Medicine Conference: Impact on Personal Resilience

Authors

Rebecca Harrison, Oregon Health & Science University, Portland, Oregon, USA
Elizabeth Lahti, Oregon Health & Science University, Portland, Oregon, USA
Niki Steckler, Oregon Health & Science University, Portland, Oregon, USA
Deborah Woodstock, Oregon Health & Science University, Portland, Oregon, USA

Martha Driessnack, School of Nursing, Oregon Health & Science University, Portland, Oregon, USA

Presenter:
Rebecca Harrison, Oregon Health & Sciences University, Portland, USA

Background: We report the impact of a novel, 3-day, interactive narrative medicine conference in Portland, Oregon. The central question explored is if an active-learning narrative medicine conference impacted personal resilience.

Method: 140 participants, including health care providers, patients, caregivers, scholars, and artists explored narrative medicine through a combination of large, didactic sessions and small group interactions. The emphasis was on developing narrative competence – the ability to express, listen, absorb, and be moved to act by stories of healing and illness. Focused writing and generous listening exercises were used throughout and integrated with art-based activities. Participants were identified by name only, not by profession or role with the intention to decrease hierarchies and create a sense of team. Participants were invited to complete a conference evaluation within 14 days. Qualitative analysis was used to identify themes. Data were analyzed individually by members of the research team, then discussed until 100% consensus was achieved.

Results: Our response rate was 61% (85/140). The overarching theme was enhancing personal resilience attributed to conference participation. Seven sub-themes were identified: identity formation, expanding teamwork, building self-compassion, refocusing on patient-centered care, generating community and connection, building awareness of parity and equality in healthcare settings, and promoting self-care and self-reflection through expression and writing.

Discussion: International attention is emerging on the need for collaborative practice and patient-centered care, yet few opportunities are available for patients, caregivers, and healthcare providers to develop connections and learn how to collaborate. Our novel, hands-on, interactive conference focused on writing and hearing stories of illness and healing and illness provided an opportunity to create community, and learn with/from each other.

Conclusion: Engaging in writing and hearing stories of health and healing in mixed-role groups was reported to strengthen participants' sense of resilience. Next steps include a six-months follow up to assess the integration of narrative skills into everyday practice in healthcare encounters and determine if there is a sustained impact on personal resilience.

The Effects of Team-Based Learning Techniques on Nurses' Perception of Continuing Professional Education

Authors

Ying-Tzu Lai, Tungs' Taichung MetroHarbor Hospital, Taichung City, Taiwan
Ya-Hui Chen, Tungs' Taichung MetroHarbor Hospital, Taichung City, Taiwan
Kuang-His Chang, Tungs' Taichung MetroHarbor Hospital, Taichung City, Taiwan
Ching-Shiang Chi, Tungs' Taichung MetroHarbor Hospital, Taichung City, Taiwan

Presenter:
Ying-Tzu Lai, Tungs' Taichung MetroHarbor Hospital, Taichung City, Taiwan

Background: Team-Based Learning (TBL) is a collaborative learning and teaching strategy that have been widely used to include education of all health care professionals. Most students in Taiwan come from a background of teacher-centered learning and little is known about the application of TBL in continuing nursing education. The purpose of this study was to apply the TBL method in a continuing professional education (CPE) workshop and evaluate its effects on nurses' learning outcomes.

Method: A quasi-experiment with one-group pretest-posttest design was conducted to examine the effects of team-based learning in CPE. Fifteen nurses were divided into ten groups participating in a workshop on Port-A-Cath in 2017. The first and second levels of Kirkpatrick's evaluation were used to evaluate nurses' learning outcomes and investigate nurses' perceptions of TBL learning in CPE through a self-structured questionnaire.

Results: The age (P=0.508), length of service (P=0.099) were non-significant in the overall satisfaction with the TBL course. The overall satisfaction with the TBL course was significant (p<0.0001), especially for those who were college educated or higher (p=0.046).
90% of nurses thought that their intrinsic motivation of learning, the ability of autonomous learning, communication, interpersonal skills, and their capacity for work after the Team-Based Learning (TBL) Workshop increased. In addition, 87.41% of nurses volunteered to ask questions during the lesson.

Discussion: In general, nurses in TBL classes have much more positive attitudes. Although the results of Kirkpatrick's first and second levels answer to our expectations, but if we want to further explore and find more useful and effective teaching methods that improve the nurses learning outcomes, we should assess it through Level 3 (Action) and Level 4 (Results) of Kirkpatrick's evaluation.

Conclusion: Taiwanese students are culturally conditioned to learn passively, without asking or answering questions verbally in the classroom is an obvious dilemma for

teachers. Perhaps this is a teaching strategy for Taiwanese teachers to encourage students to ask questions or respond to questions in a group.

9HH7 (811)
Reflection revisited: how physicians conceptualize and experience reflection in professional practice – a qualitative study

Authors
Elisa Bindels, Maastricht University, Maastricht, Academic Medical Center, Amsterdam, Netherlands
Christel Verberg, Leiden University, Leiden, Netherlands
Albert Scherpbier, Maastricht University, Maastricht, Netherlands
Sylvia Heeneman, Maastricht University, Maastricht, Netherlands
Kiki Lombarts, Academic Medical Center, Amsterdam, Netherlands

Presenter:
Elisa Bindels, Maastricht University, Maastricht, Netherlands / Academic Medical Center, Amsterdam, Netherlands

Background: In the last decades, developments in health care have accelerated and require physicians' constant adaptation, change and learning. Competencies such as cooperation, communication and leadership have become preconditions for professional practice, calling upon reflective capacity. In light of this context, we explored how physicians conceptualize and experience reflection in professional practice.
Method: We conducted a qualitative study using in-depth interviews with 13 hospital-based physicians from various specialties and institutions. The interviews were transcribed verbatim and were analyzed iteratively, following the interpretative phenomenological analysis approach.
Results: Data analysis resulted in the identification of three main topics: fuzziness, domain specificity and dialogical dynamics of reflection in professional practice. Reflection was conceptualized as a fuzzy process of contemplation and action, leading to change and hopefully improvement of personal performance and health care in general. Physicians' experiences with reflection were different for the patient domain and the team domain. Whereas experiences in the patient domain were recalled first and discussed in relatively clear terms, those in the team domain came second and were discussed in more ambiguous terms, rendering these experiences rather 'remote' and 'shady'. In order to achieve improvement in daily practice, honest and open dialogues were perceived as necessary. These dialogues were regarded as the result of an interplay between an internal and an external dialogue. The internal dialogue required sensitivity and courage of the individual; the external dialogue required psychological safety and encouragement of the environment. Within the team domain however, handling the external dialogue effectively was not self-evident, underlining the importance of psychological safety.
Discussion & Conclusion: This study draws attention to the interdependence between the individual and the collective

contributions to reflective activity in professional practice. Apart from its importance to physicians' individual medical performance, reflective activity is also important to the functioning of a team of physicians. To allow reflection to rise from an individual activity to a team activity, it is necessary to invest in a safe environment in which people are encouraged to think, act, and be engaged.

Associations between Continuing Medical Education (CME) Teaching Methods and Participant Reflection on Content Adjusted for Learning Style

Authors
Charles Collins, Mayo Clinic, Rochester, MN, USA
Brian Palmer, Mayo Clinic, Rochester, MN, USA
Sanjeev Nanda, Mayo Clinic, Rochester, MN, USA
Jay Mandrekar, Mayo Clinic, Rochester, MN, USA
Thomas Beckman, Mayo Clinic, Rochester, MN, USA
Christopher Wittich, Mayo Clinic, Rochester, MN, USA

Presenter:
Charles Collins, Mayo Clinic, Rochester, MN, USA

Background: Goals of CME are to improve knowledge, change behaviors, and positively impact patient outcomes. Reflection on CME content is prerequisite to knowledge synthesis and behavior change. Learning styles are the individualized and preferred ways that a student perceives, comprehends, and retains information. Attention to participant learning styles has been suggested as a framework for planning CME curricula. Our research question was: "What CME teaching methods stimulate the most reflection on the content when adjusting for participant learning style?"
Method: We conducted a cross-sectional study of all participants (N=393) at the Mayo Clinic Updates in Internal Medicine (N=175) and Psychiatry Clinical Reviews (N=218) CME courses. Participants completed the Kolb Learning Style Inventory and a previously validated reflection on CME content questionnaire (5-point scale) for each presentation. Teaching method utilization (example: cases studies, learning pauses) was coded for each presentation. Associations between teaching methods and participant reflection were determined using a multivariate model adjusting for learning style.
Results: 241 surveys were returned (response rate=61.3%). After adjusting for learning style, participant reflection scores were higher if the following teaching methods were used: cases (β=0.62, p<0.0001), audience response system (β=0.83, p<0.0001), and summary slides (β=0.62, p<0.0001). For each of these variables, the diverging learning-style participants had higher reflection scores than those with assimilating, converging, or accommodating styles. There were no associations between reflection scores and specific objectives, article citations, or learning pauses.
Conclusion: We report the relationship between CME teaching methods and participant reflection scores after adjusting for learning styles. Presentations that employed context (cases), interaction (audience response), and distillation (summaries) stimulated participant reflection on the content. These teaching methods generated higher

reflection among divergers, who tend to emphasize traits of curiosity, reflection, and experiencing. Awareness of techniques that stimulate reflection in CME may improve educational outcomes.

Take-home messages: 1) CME presentations that were contextual, interactive, and distilled stimulated greater reflection among CME course participants. 2) Certain CME teaching methods may produce more reflection for specific learning styles. 3) Understanding synergistic relationships between teaching methods and specific learning styles may improve educational outcomes in CME.

9HH9 (1809)
Evaluating the impact of a coaching pilot on the resilience and retention of UK General Practitioners

Authors
Judy McKimm, Director of Strategic Educational Development and Professor of Medical Education in the College of Medicine, Swansea University
Jane Povey, Deputy Medical Director, Faculty of Medical Leadership and Management, UK

Presenter:
Judy McKimm, Faculty of Medical Leadership and Management, London, UK

Background: The UK Faculty of Medical Leadership and Management (FMLM) was invited to provide 4 sessions of 1:1 coaching to 50 general practitioners (GPs) who were actively considering leaving the profession, or had recently returned to practice after a break. The aim of this pilot project was to support and enable the GPs to remain in practice and to evaluate the impact of the approach.
Method: Four professional coaches designed the application process, selected the GP coaches delivered the coaching and gathered feedback. An independent academic expert was engaged to analyse the feedback and verify the evaluation.
Evaluation tools included two tools for measuring individual stress/resilience, a pre- and post-coaching questionnaire, qualitative interviews with the four coaches, and the collation of informal feedback.
Reasons for GPs applying included burnout, becoming disillusioned, losing confidence in their ability to do the job in the current pressurised climate, being dispirited by patient demands or complaints and work-life balance issues. GPs also wanted to reflect on their careers and make decisions about next steps.
Results: GPs rated their likelihood of leaving the profession, both before and after coaching, on a scale of 1–10, where 1 was highly unlikely and 10 highly likely. The pre-coaching average score was 7.2, whereas post coaching, the average had dropped to 4.9.
The Human Function Curve pre-coaching measures placed 31 GPs (60%) in the 'exhaustion' or 'burnout' segment of the curve, indicating that this cohort was unhappy and under considerable pressure. By the end of the coaching, 63% (of the 83% who responded to this question) were operating in the 'safe zone', compared with 8% pre-coaching.
Discussion & Conclusions: Building on the positive outcomes of this pilot, additional coaching programmes should be provided to meet the needs of doctors who have been identified as potentially benefitting from coaching and to evaluate longer-term impacts. Making coaching more accessible as part of continuous professional development could contribute to alleviating recruitment and retention issues.
Take-home message: Coaching can be of value to struggling GPs to enable them to flourish, despite the increasingly demanding climate in which they operate.

9HH10 (1394)
Towards National Needs Assessment – Perceived CPD Needs of Qatar Healthcare Practitioners

Authors
Samar Aboulsoud
Essam Elasyed A Elsayed
Muneera Ali H Abdullah

Presenter:
Samar Aboulsoud, Qatar Council for Healthcare Practitioners, Ministry of Public Health, Doha, Qatar

Background: Since March 7 2016, ALL healthcare practitioners in the state of Qatar are mandated by Qatar Council for Healthcare Practitioners (QCHP) to participate in continuing professional development (CPD) activities to be able to renew their license of practice. This participation is regulated by the National Continuing Medical Education (CME) / continuing professional development (CPD) framework and accreditation system. National CPD needs assessment would be of great importance to inform planning for healthcare workforce CPD and though a comprehensive National CPD needs assessment is not yet conducted, several efforts towards assessing the CPD needs of different healthcare professions in Qatar were initiated.
In March 7 2016, Qatar Council for Healthcare Practitioner – Accreditation Department (QCHP-AD) launched Qatar's National CME / CPD Accreditation system and framework. Since that date, all licensed healthcare practitioners (Physicians, Nurses, Pharmacists, Dentists, Allied Health Professionals and Complementary Medicine Practitioners) working in state of Qatar are mandated to participate in CPD activities and fulfill CPD credit requirements to be able to renew their license of practice. Fifty percent of such CPD requirements are mandated to be collected from participation in accredited group learning activities.
Method: A questionnaire for assessing the perceived CPD needs of dentists and dental allied health professionals was developed and electronically distributed among target healthcare practitioners. Responses were collected, analyzed for this research.
Results: The results of distributed questionnaires show national CPD needs perceived by dental and allied health professionals in terms of common gaps in practice and convenient CPD formats.
Discussion: Interprofessional and team-based education can play important to improve quality of care and patient outcomes. Online and blended CPD formats are convenient formats for provision of CPD.
Conclusions: Qatar's dentists and dental allied health professionals perceive some common gaps in practice that

should be considered in planning for CPD activities targeting such professionals. The conducted needs assessment represents a step that should be built-upon to have a national CPD needs assessment for all healthcare professions in the state of Qatar.

Take-home message: National needs assessment inform planning for CPD of healthcare workforce and ensure improvements in healthcare quality and patient outcomes.

9HH11 (229)
Moving beyond traditional medical education: Building capacity among healthcare professionals in nutrition

Authors
Sohaila Cheema, Weill Cornell Medicine-Qatar, Doha, Qatar
Ravinder Mamtani, Weill Cornell Medicine-Qatar, Doha, Qatar

Presenter:
Sohaila Cheema, Weill Cornell Medicine-Qatar, Doha, Qatar

Background: With the rising rates of lifestyle-related chronic diseases (NCD's) worldwide, it is important for doctors and healthcare practitioners to possess adequate knowledge and skills in nutrition. Published literature suggests most healthcare practitioners are inadequately trained in nutrition. Furthermore, while nutrition research has considerably advanced, it has also resulted in confusion. Distinguishing reliable nutrition research findings from those that are invalid and surrounded by sensationalism is imperative. With the soaring rates of diabetes, obesity and heart disease in Qatar and beyond healthcare professionals must remain abreast with evolving nutrition research. Incorporating up-to-date evidence-based information in continuing professional development (CPD) programs in the broad area of nutrition is a step in the right direction.

Method: It is in the above context, that we developed and implemented an evidence-based certificate course in early 2016 at Cornell in Qatar for doctors and healthcare practitioners. Three courses have been offered so far. The 50-hour course consists of 32 hours of face-to-face learning and 18 hours of online self-study. The activity is approved by the local accreditation agency, enabling practitioners to gain CPD credits for re-licensure.

Results: 150 participants from varying interprofessional and cultural backgrounds have completed the course to-date. Multiple educational strategies enable active, learner-centric and self-directed learning. The learners provide feedback orally and via an anonymous evaluation. A majority of learners have indicated an increased level of nutrition knowledge and skills; improved knowledge focused on management and prevention of chronic diseases; acquisition of skills to better manage illness and promote health; and empowerment with practical cross-cultural information to help manage patients in a holistic manner.

Discussion & Conclusion: The course curriculum is robust and up-to-date. It has been well received. Scheduling conflicts are an ongoing challenge but manageable. Participant feedback and nutritional scientific advances are considered for future course offerings. Nutrition education is effective when delivered to a multicultural audience with participants from interprofessional backgrounds.

Take-home message: Ignoring nutrition in patient evaluation and management is not an option. CPD programs must be customized to meet the needs of the local healthcare professions community to provide life-long interprofessional learning opportunities.

9HH12 (3679)
Assessing Educational Need: A Multiprofessional Approach

Authors
Gayle Appleby, Evelina London Children's Hospital, London, UK
Vanessa Boadu, Evelina London Children's Hospital, London, UK
Matthew Norridge, Evelina London Children's Hospital, London, UK
Hilary Cass, Evelina London Children's Hospital, London, UK

Presenter:
Gayle Appleby, Evelina London Children's Hospital, London, UK

Background: Hospitals have a duty of care not only to the patients they treat, but also to their employees to provide high quality training and continuous professional development for all. How this is best achieved or structured to meet the needs of everyone though is less clear.

Method: A baseline review of educational practice at the Evelina London was undertaken to ascertain how staff access training and to explore their feelings about current and future education provision. This was mainly through 1:1 or group interviews with all staff groups. The conversations were collated and thematically analyzed.

Results: Thematic analysis revealed areas of strength in simulation and for the breadth of courses available. Descriptions of good educational practice within departments exist but not necessarily everyone is aware of this. Several generic gripes were expressed by all professional groups, for example the need for more time to attend sessions and awareness of sessions. Within different professional groups specific needs also emerged. Participants enjoyed voicing their views and valued the chance to share ideas about future initiatives.

Discussion: Whilst a number of educational opportunities exist for staff at the Evelina London sometimes they are not always able to access them due to a multitude of factors. When planning events educators need to not only address the participants' learning needs but also consider system or logistical issues and create mechanisms to facilitate sharing of good educational models.

Conclusions: Even though everyone has their individual learning needs by undertaking a review of education through the use of 1:1 interviews we were able to gain an appreciation of the similarities of issues facing teams when accessing education. An advantage of asking multiple professionals their views about education meant a robust and comprehensive insight was achieved into current education practices and this generated a plethora of ideas of how to improve things.

Take-home message: An educational needs assessment is one approach to developing education within an institute. Current employees can be an invaluable asset to generate innovative ideas as they have an appreciation of the key issues affecting training and education.

9HH13 (2145)
Understanding the brokering role of clinician-scientists: a realist review

Authors

Margot Barry, HAN University of Applied Sciences, Nijmegen, Netherlands

Esther de Groot, University Medical Centre Utrecht, Utrecht, Netherlands

Martin Smalbrugge, Vrije Universiteit Medical Centre, Amsterdam, Netherlands

Roger Damoiseaux, University Medical Centre Utrecht, Utrecht, Netherlands

Nynke Scherpbier-de Haan, Radboud University Medical Centre, Nijmegen, Netherlands

Manon Kluijtmans, University Medical Centre Utrecht, Utrecht, Netherlands

Presenter:
Margot Barry, HAN University of Applied Sciences, Nijmegen, Netherlands

Background: Healthcare is a knowledge intensive industry. Knowledge generated through research should inform clinical decisions and enhance patient outcomes. Practice problems should form the basis for new research questions. Yet, the worlds of research and practice do not connect effortlessly, boundaries exist at various levels. Effort from both sides is required to facilitate connections. Clinician-scientists (CS) are professionals who, by virtue of their dual-role, are well placed to span the boundary between research and practice. Limited empirical attention has been given to the nature of their brokering activities.

Method: This literature review, a realist review, provides an insight into CS broker activities in context.
The databases CINAHL, Embase, WebOfScience, PubMed and PsychINFO were searched. From the initial 3312 articles, nine articles were selected for the final full text review. Articles reporting empirical data on CS broker activities were included. Text fragments related to the broker role of CS were coded and subsequently context-mechanism-outcome configurations were identified.

Results: CS performing broker activities were described as 'having an ambassadorial role'. Outcomes of broker activity were as follows: at organisational level broker activities led to increased use of evidence based practice and an increase in clinically relevant research results. At individual level broker activity led to professional development in skill, knowledge, status and attitude. The contextual factors required to achieve organisational outcomes were higher in number and complexity than those required to achieve individual outcomes. Mechanisms instrumental in achieving outcomes indicate that brokering requires a high degree of change management and networking skill.

Discussion & Conclusion: Training and continuing professional development for CS should focus on research, clinical practice and brokering a connection between the two. Brokers require competencies in three distinctly separate fields of knowledge. This might contribute to an understanding of the difficulties with work-related pressure experienced by CS.

Take-home message: The change management and networking skills needed to be an effective broker add a third skill set to the acumen of a CS who already displays research and clinical skills.

9HH14 (2840)
Let Participants Be the Master of the Class: Using Corporate Training Skills in Continuing Professional Development

Authors

Wei-Min Chu, Department of Family Medicine, Taichung Veterans General Hospital, Chia-yi Branch, Chia-yi, Taiwan

Wen-Hsien Hsieh, Lewis International Consultant Ltd., Taipei, Taiwan

Yung-Fu Wang, L&J Ltd., Taipei, Taiwan

Hsin-En Ho, Department of Family Medicine, Taichung Armed Forces General Hospital, Taichung, Taiwan

Chao-Huei Chen, Center for Faculty Development, Taichung Veterans General Hospital, Taichung, Taiwan

Presenter: Wei-MinChu, Department of Family Medicine, Taichung Veterans General Hospital, Chia-yi Branch, Chia-yi, Taiwan

Background: Though student-centered education is a common concept in our under-/post-graduate medical education, most of our continuing professional development (CPD) program is still conducted in a teacher-centered way. The core concepts of adult learning are: Self-concept, past learning experience, readiness to learn, practical reasons to learn, and driven by internal motivation. Those five concepts are widely used, especially in corporate training, such as business marketing, team building, time management, and creativity inspiration. We tried to integrate corporate training skills in our CPD program.

Summary of work: There are five key steps in our education process: 1. Opening of the class: introduction of teacher and the importance of the topic; 2. Grouping: to separate participants in groups of 4-6 persons; 3. Award driven: design a contest and the winning group will get award; 4. Multiple teaching techniques: such as catechetical method, group discussion, walkthrough method, video education, and game... 5. Ending with participants' feedback.

Summary of results: We collected 45 participants' feedback after 2 classes of "Advanced empathy workshop", a CPD program designed for medical staff members including doctors, nurses, physical therapists and pharmacists. The average score of program assessment was 98.0%, while the average score of teacher assessment was 98.97%. Among 45 students, 42 of them gave positive feedback to teachers and the program.

Discussion and Conclusion: The key corporate training skills for a successful CPD program are: 1. Well control of

the learning environment, including seats, place of chairs and tables, pretest of all equipment, video and audio support; 2. Pre-evaluation of participants' needs and demands, by a pre-class survey and assignment of learning material. 3. Teacher's experience in problem solving, guidance and fast response during teaching.

Take-home message: Corporate training skills can be integrated in all fields of postgraduate/continuous medical education. Faculty development is crucial before conducting CPD programs.

9HH15 (683)
The Pacemaker Agenda: Promoting a culture of wellness, scientific update, and happiness for teaching Professionalism and Ethics in daily practice

Authors
Pablo González Blasco
Graziela Moreto
Marco Aurelio Janaudis
Marcelo R. Levites
Pedro S. de Paula

Presenter:
Pablo G Blasco, SOBRAMFA - Medical Education and Humanism, São Paulo, Brazil

Background: To prepare General Practitioners for the growing opportunities in private practice in São Paulo (Brazil), SOBRAMFA - Medical Education and Humanism, has developed an innovative learning agenda required for all trainees and senior members. The practicing scenarios include: Geriatric Care, Managing Complicated Patients with comorbidities in Hospitals, Palliative Care, Family Medicine Clinics and Ambulatory, Home Visits, Nursing homes and Hospices. Ethical dilemmas, and ongoing challenges come daily to our practice. An assorted routine of regular meetings booked in advance permits to combine a busy work schedule with scientific learning, develops competences and professionalism, solves ethical issues, and allows physicians to perceive personal success in their lives.

Method: The Pacemaker Agenda (PA) working for 15 years includes:

• Scientific "pacemaker" - Weekly Scientific Meeting. Case-base discussion, update with articles from the most relevant publications, case-decisions for specific patients supported by Evidence Based Medicine, and solve ethical issues.

• Construction "pacemaker"- Monthly Meeting. Conducted as workshops include topics to promote reflective practice: professionalism, medical education, ethics, humanism, personal development, teamwork, and leadership.

• Cultural monthly Meetings –with leaders coming from non-medical fields. (Philosophers, Journalists, Educators, Lawyers, Artist and Musicians, Entrepreneurs, Humanists). At dinner time displayed as a familiar get-together.

• Young Doctor Monthly Meeting- case-based discussions leaded by medical students, and the young doctors play the facilitator role.

• Mentoring and Evaluation- every trimester the trainees are evaluated and giving feedback by their respective preceptors.

Results: The main outcomes of the agenda are:
•   Effective Training- Clinical Competence
•   Mastering Communication
•   Respect, Credibility and happiness

Conclusions: An innovative learning agenda composed by an assorted routine of regular meetings combining a busy work schedule with scientific learning scenarios, to develop competences, professionalism and reflection over perceived personal success are provided. The Pacemaker agenda is set for training young family doctors for the wide basket of services and the growing diversity of opportunities in family practice in Brazil.

Take-home messages: 1. Set an agenda combining a busy work schedule with real scientific learning,
2. Including meetings regarding philosophical, educational and cultural issues a familiar, collaborative and teamwork scenario is created

Teaching skills in medical school

Authors

Mario A. Secchi, Instituto Universitario Italiano de Rosario - Argentina
Nicolas Rodriguez León, Instituto Universitario Italiano de Rosario, Rosario, Argentina
Walter Bordino, Instituto Universitario Italiano de Rosario, Rosario, Argentina
Roberto Garcia Turiela, Instituto Universitario Italiano de Rosario, Rosario, Argentina

Presenter:
Mario Secchi, Instituto Universitario Italiano de Rosario, Argentina

Background: This paper presented is the result of research on teaching skills in Medical School and higher education, supported by IUNIR and the Spanish Agency of International Cooperation for Development (AECID) of the Ministry of Foreign Affairs and Cooperation, which focuses on competency-based training of teachers in health sciences of Italian University Institute of Rosario (IUNIR) in Argentina
Method: Twelve competencies were defined over all worked. The study was conducted with IUNIR teachers of Medical School and a group of experts from other participating universities (multicentric). The sample consisted of 145 IUNIR teachers (100%), of them 81 women and 64 men aged between 22 and 57. The average year of University experience was 11 years modality (in this or another University). For data collection, a questionnaire was that aimed to explore teaching skills as academics health sciences.
Results: From the results obtained, the participating teachers teaching competencies identified the following order of preference: Teacher Professional Identity : 35.%, Planning: 20.6%, Motivation: 15.2%, Institutional Belonging: 11.0%, Research:6.9% ,Communications: 4.5%, Innovation: 3.4%, Methodology: 2.0%,Mentoring: 0.6, Evaluation: 0.6%, Interculturaty: 0.6%, and Media integration: 0.6%.
Discussion & Conclusions: This multicentric research of teaching skills enabled us to expand and establish a nest ranking by the same teachers. This study allows to use the results and form a larger program of research and action for own training and professionalization of teachers in health sciences. Teaching competencies are, for some time, preoccupation in the teaching-learning process at any level of education and country. These competencies allow teachers become better professionals and contribute to the assessment of professionalism and the optimization of the quality of education in medical school.

Leadership matters? The evaluation system of educational program directors in Taiwan

Authors

Chi-Wei Lin, I-Shou University / E-Da Hospital, Kaohsiung, Taiwan
I-Ting Liu, E-Da Hospital, Kaohsiung, Taiwan
Ru-Yi Huang, E-Da Hospital, Kaohsiung, Taiwan
Wei-Leng Chin, E-Da Hospital, Kaohsiung, Taiwan
Wei-Chieh Hung, E-Da Hospital, Kaohsiung, Taiwan
San-Nan Yang, I-Shou University / E-Da Hospital, Kaohsiung, Taiwan

Presenter:
Chi-Wei Lin, I-Shou University / E-Da Hospital, Kaohsiung, Taiwan

Background: Good training programs can build up strong basis for future clinical practice in all medical specialties, and program directors may play an important role conducting the training programs. There are 23 official medical specialties regularly accredited by Residency Review Committee (RRC) in Taiwan. The accreditation standards for the program and program director are set up by each medical association and approved by RRC. Our study aims to exam the standards for evaluating program directors, compare the differences between specialties and evaluate the applicability of the standards.
Method: The accreditation standards regarding program director's qualification and responsibilities in each medical specialty were acquired from Ministry of Health and Welfare and related medical associations in Taiwan. The standards of qualifications were classified into four major domains and the standards regarding responsibilities were also allocated into five domains for further analysis.
Results: As for qualifications of program directors, all specialties set standards regarding experiences, twelve specialties exam research abilities such as recent publications, but only 5 specialties put attention on continuing education such as specific faculty training. Ten specialties set vague requirements for leadership and professional fame, however, being both department chief and program director concurrently exists contrary opinions in different specialties. Most specialties share the same requirements about responsibilities of the program director, but only family medicine demands teaching activity supervision and emergency medicine asks for clinical hours restriction to protect supervising hours.
Discussion & Conclusion: None of the surgical related specialties set standards for continuing education, and among them, only ophthalmologists ask for recent publications while urologists and plastic surgeons demand directors to have academic titles. No objective standards such as previous managerial position can well represent leadership. Standards related to responsibilities reasonably distributed in planning, trainee affairs, supervising and reporting, but most of them are directly adopted from official version of RRC without any modification, which may limit the applicability in each specialty.
Take-home message: The role of educational program directors in education program is crucial, but current

evaluation and accreditation system specifically for program directors in Taiwan still leave some room for improvement.

Ren-Huei Fu, Chang Gung Memorial Hospital, Chang Gung University, Taoyuan, Taiwan
Chang-Chyi Jenq, Chang Gung Memorial Hospital, Chang Gung University, Taoyuan, Taiwan

Presenter:
Liang-Shiou Ou, Chang Gung Memorial Hospital, Chang Gung University, Taoyuan, Taiwan

Background: Students' reluctance to give feedback to teachers creates obstacles for teachers' professionalism development. This study aims to explore the factors of improving students' feedback provision to teachers.
Method: A qualitative group interview method was used within a realist evaluation framework. Realist evaluation seeks to understand how mechanisms work in contexts to produce outcomes. Eight focus group interviews were conducted with n=50 fifth-grade medical students following paediatric training.
Results: Seven contexts (Cs), eight mechanisms (Ms), and five outcomes (Os) produced eighteen C-M-O configurations. Specifically, the context of "culture," includes the "medical environment," "trainees' learning alternatives," and "questionnaire issuing strategy". Mechanisms include psychological/emotional feelings, such as "fear," "understanding teachers' dilemma," and "not believing changes will happen," obstructing students' feedback provision. One example of how the C-M-Os come together is: in the context of a Confucianism society, fear (mechanism) leads to students' failure to provide feedback.
Discussion: Although students appear dissatisfied with teachers' professional performance, "Confucianism" and the "medical environment" in the context influence students' emotional feelings such that they are reluctant to provide feedback to teachers.
Conclusions: We need to think of ways in which we can provide a safe environment in which students can feel free to give feedback to their seniors. As a result, both the quality and the provision of feedback could be enhanced.
Take-home message: Culture and environment restricts students from giving truthful feedback; however, if students' fears and worries could be reduced, their provision of better quality feedback could be enhanced.

Presenter:
Nomy Dickman and Lea Even, Bar-Ilan University, the Azrieli Faculty of Medicine, Haifa, Israel

Background: Medical students complete clinical rotations during their clinical years. In each department, a junior resident plays the role of a "tutor" that covers medical, logistical and personal aspects. This role has yet to be investigated in depth in the medical education literature. Our experience taught us, that good departments typically get good remarks on their tutors. Accordingly, we assessed the contribution of students' satisfaction from their tutors to students' overall satisfaction from the clinical rotations.
Method: A retrospective chart review (2014-2017) of all students' teaching surveys, on their experience in the clinical rotations, focusing on the tutors' role was conducted. 710 students completed the questionnaires (102 rotations with 40 tutors) in the departments of internal medicine, pediatrics, obstetrics and gynecology, and surgery, in two hospitals. The perceived satisfaction of the clinical rotation was assessed using a Likert five rank scale. Qualitative written assessment of the tutors was converted into one to three numerical scale. Spearman correlations tested the relationship between perceptions of tutors and satisfaction from clinical rotations.
Results: A positive, high significant correlation (rs = .78, p < .01) was found between students' satisfaction from the tutors and their overall satisfaction from the clinical rotations. Despite the fact here are on average 10 physicians teaching per clinical rotation, only with respect to tutors we found high positive correlation between these two parameters. Interestingly, in two departments when only the tutors (no other staff) were changed from one group to the next during the same year, the departmental satisfaction score rose with the tutor's score.
Conclusion: Our findings confirm our practice-based hypothesis: perceived students' satisfaction from the tutors was positively correlated with their satisfaction from the clinical rotations. To the best of our knowledge, this is the first time in the literature that the relationship between students' satisfaction from their tutors to students' overall satisfaction from the clinical rotations has been reported.
Take-home message: Based on our results, it is essential to study in-depth the characteristics of "excellent" tutors and to invest substantial resources in training tutors.

Exemplary allied health educators: Perspectives and insights

Authors
Charmaine Krishnasamy, National Healthcare Group, Singapore
Heidi Tan Siew Khoon, Tan Tock Seng Hospital, Singapore
Kum-Ying Tham, Tan Tock Seng Hospital, Singapore

Presenter:
Charmaine Krishnasamy, National Healthcare Group, Singapore

Background: Clinician educators design and implement clinical learning experiences for students and junior staff. Awards are given to recognise their contributions to their professions, and in teaching and developing others. This study was conducted to understand what it means to be an exemplary clinician educator i.e. one who has received awards repeatedly, and their perspectives on good practices. Insights from allied health professionals who received at least three of these annual awards, will be shared.
Method: Individual semi-structured interviews were conducted with six award recipients from Medical Social Work, Physiotherapy, and Occupational Therapy. The institution review board approved this study. Interviews were audio-recorded and transcribed verbatim. A grounded theory approach was used with open coding to cluster codes into categories, and axial coding to establish connections between categories. Themes were identified.
Results: The participants had 10 to 20 years of clinical practice and 7 to 15 years as supervisor-educators. Three themes emerged: Being open to receiving feedback and to learning; Fulfilling their dual core roles as clinicians and supervisors, and being authentic; Being practical and looking ahead. They were proactive in seeking honest feedback and in improving; and open to learning from mentors, peers, and their supervisees. Patient care was top priority, and they actively shared their knowledge, utilising various formats, to help others develop. While the participants were thankful to receive the awards, they were also mindful of their responsibilities, and some felt burdened to do more, and reflected on more cost-effective methods of training. They were intentional in reflecting on their performance, unafraid to admit that which they did not know, and in filling knowledge gaps. While awards served as encouragement, the real source of fulfilment was knowledge that they had contributed to another person's success.
Conclusions: Exemplary clinician educators value their core roles as clinicians and supervisors, pursue continuous learning and improvement, are motivated to help others progress and learn, and find fulfilment in contributing to the professional success of another person. These perspectives and insights can contribute to the development of resources and training for future clinician educators.

What makes a good medical teacher? Perspective of Polish medical students

Authors
Dawid Bugara, Student's Scientific Group of Teaching and Examining Methodology Jagiellonian University Medical College, Cracow, Poland
Sebastian Janiec, Student's Scientific Group of Teaching and Examining Methodology Jagiellonian University Medical College, Cracow, Poland
Urszula Skorus, Student's Scientific Group of Teaching and Examining Methodology Jagiellonian University Medical College, Cracow, Poland
Anita Wach, Student's Scientific Group of Teaching and Examining Methodology Jagiellonian University Medical College, Cracow, Poland
Kondrad Jabłoński, Jagiellonian University Medical College, Cracow, Poland
Michał Nowakowski, Jagiellonian University Medical College, Cracow, Poland

Presenter:
Dawid Bugara, Student's Scientific Group of Teaching and Examining Methodology Jagiellonian University Medical College, Cracow, Poland

Background: Teacher's personal traits have a large influence on the education that medical students receive. Part of that influence also comes from whether they succeed in meeting the expectations that students might have towards their teachers. Hence understanding those expectations might let us specify what makes a great teacher. A factor to consider is that this may be influenced by local or national culture. Therefore, the students' perspective should be explored in order to improve the quality of education and effectiveness of educators in medical college.
Method: The aim of the study was to determine the opinion of Polish medical students about the most appreciated characteristics of an academic teacher and to define the most desirable way of conducting didactic classes. The prepared questionnaire was distributed electronically among students from 7 different Polish medical universities.
Results: The survey was completed by 336 students. As many as 91.1% of them believed that not every person is able to be a good academic teacher. Students most often defined personality traits (96.4%) as a predisposition to the teaching profession. The most appreciated character traits were helpfulness, friendliness, patience and respect for students (over 99% of students agreed with all of them). Ability to transfer knowledge was a key factor for 98,8% while only 64,9% appreciated diagnostic skills and case management and only 10,4% scientific achievements. Regarding teaching methods: 83% of students appreciated a personal feedback. Other admired factors were preparation of teachers' own didactic materials (84.9%) and precise specification of requirements (97%). Only 31.5% of the students positively rated the presence of multimedia presentations during seminars. 91,7% appreciated teachers sharing their personal challenges. Up

to 34,3% of students did not see the benefit of learning in a team with other students.

Conclusions: Medical students have defined current expectations towards academic teachers. Those expectations are reasonable and in line with the majority of educational principles. They also show that more emphasis should be placed on teachers' non-technical skills development and demonstration of the value of teamwork.

Take-home message: Students have reasonable expectations. Why not try to meet them?

9II8 (3410)
Do Postgraduate Trainees Learn from Peer Feedback on Video Consultations and can they Facilitate Sessions for Themselves?

Authors

Rachel Phillips
Helen Allbutt
MeiLing Denney

Presenter:
Rachel Phillips, GP Unit, NHS Education Scotland (NES), Edinburgh, UK

Background: Research shows that despite initial logistical and psychological challenges, doctors at all stages find peer review of their video consultations improves practice and resilience. However, most studies emphasise the importance of skilled facilitation for this which is prohibitively expensive in an era of budget cuts. Training students to become peer tutors may make regular scheduling of video sharing feasible. Our pilot project aimed to evaluate whether early stage GP Trainees in SE Scotland, introduced to a model of peer feedback on video consultation, could successfully facilitate sessions for themselves.

Method: Six trainees were recruited to two groups that met three times during their first GP attachment to provide peer feedback on video consultations according to a set format. The first session was facilitated by a near peer, observed and recorded. Trainees were then left to facilitate the next two sessions whilst being observed. Authors met after each session to analyse and agree interpretation of data. Data was synthesised with trainee and facilitator views gathered through focus group, interviews and emails. The intervention was evaluated using Kirkpatrick levels and programme analysis proposed by (Haji et al 2013)

Results: Evidence of learning was observed in knowledge, attitudes and confidence. Trainees revealed changes to their practice in workplaces (Kirkpatrick level 3). All participants critically analysed their own and others' consultations when watching videos and giving feedback and some found choosing the videos for each session also triggered learning. The near-peer facilitator reported educational benefit from watching trainees consult and joining their discussions.

Conclusions: Our data showed educational value in peer and near-peer feedback on consultations for clinical postgraduates. Trainees were able facilitate sessions by themselves but preferred facilitation by a near-peer. The

discomfort of exposing one's consultations can be mitigated by establishing a supportive, constructive atmosphere and a structured format.

Take-home messages: • Peer feedback on video consultations provides valuable formative assesment and learning
• Post-graduate Trainees can self-facilitate the peer feedback process
• Near-peer facilitation adds insight and helps challenge group thinking

Teachers' Academy: Five years of teachers' reward system - lessons learned?

Authors

Liisa M. Peltonen, University of Helsinki, Faculty of Medicine, Medicum, Helsinki, Finland
Hanna Korsberg, University of Helsinki, Faculty of Arts, Department of Philosophy, History and Art Studies, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Helsinki, Finland

Presenter:
Liisa M Peltonen, University of Helsinki, Faculty of Medicine, Medicum, Helsinki, Finland

Background: The Teachers' Academy (TA) was established at the University of Helsinki, to reward teaching excellence, improve status of teaching and create an inspiring scholarly community. The Academy members and their home units were awarded. First members of TA were selected in 2013. This study examines the Academy members' perceptions of the impact of TA on teaching esteem, academic careers and teachers' networking.

Method: Data were collected with an anonymous online questionnaire. The target groups were all the four cohorts (2013, 2014, 2015 and 2017) of TA (N=80). The respondents came from all the four campuses and cohorts of TA and were very experienced teachers with an extensive training in university pedagogy. 65% were female and 35% male.

Results: Becoming a member of TA was an important step in the participants' academic career. At the university level, the appreciation of teaching had increased, whereas in faculties and units, the valuation of teaching merits had not improved. TA members reported that the most important effect of TA was in providing them an interdisciplinary community. This network crossed the faculty boundaries and spread teaching innovations throughout the university. The individual grant was used for research (58%), educational innovations (96%), courses (60%), seminars and conferences (88%) and international visits (58%). The home unit grant enabled the TA members to support the colleagues' participation in educational conferences.

Discussion: Reward systems are important to stimulate teaching and learning and to support scholarly teachers' careers. In Helsinki, the decision of extending award grants to the member's home unit and establishing one

Academy for the whole university proved successful. Teachers' networks and innovations spread throughout the university and internationally.

Conclusion: his study provides an overview of the impact of the TA after five years of establishing a teachers' reward system. The TA model offered teachers a stimulating interdisciplinary community and fostered international networking. In the trajectory of esteem of teaching, no progress was seen at the unit and faculty level.

Take-home message: The Teachers Academy in Helsinki rewards both excellent scholarly teachers and their units. Improving the status of teaching requires further actions.

Perceptions of Characteristics of Effective Clinical Teachers among Medical Students and Residents in an Asian Healthcare Setting

Authors
Shirley Beng Suat Ooi
Clement Woon Teik Tan
Janneke M. Frambach

Presenter:
Shirley Ooi, National University Health System, Singapore

Background: Almost all published literature on effective clinical teachers were from western countries and only two compared medical students with residents. Hence, the purpose of this study is to explore the perceived characteristics of effective clinical teachers among medical students compared to residents graduating from an Asian medical school, and specifically whether there is a difference between the cognitive and non-cognitive domain skills, to inform faculty development.

Method: This study was conducted at the National University Health System (NUHS), Singapore. Using a pragmatic qualitative research design, maximal variation sampling of six final year undergraduate medical students at the National University of Singapore, and six residents from the NUHS Residency programme, was done. Semi-structured one-on-one interviews using open-ended questions were audiotaped and transcribed. Analysis was done using a three step approach based on Grounded Theory principles.

Results: Baseline clinical competence in their clinical teachers were identified by both students and residents. However, medical students valued a more didactic spoon-feeding type of teacher in their earlier clinical years. In contrast, final year medical students and residents valued feedback and role-modelling at clinical practice. The top two characteristics of approachability and passion for teaching are in the non-cognitive domains. These seem foundational and lead to the acquisition of effective teaching skills such as the ability to simplify complex concepts and creating a conducive learning environment. Being exam-oriented is a new characteristic that has not been identified before in "Western-dominated" publications.

Discussion: The results support Jonassen's theory of constructivism (1991) as seen by the medical students at the beginning of their clinical year wanting more didactic

teaching to 'spoon-feed' them with medical knowledge. The more senior learners valued self-directed learning and feedback to help them deal with more complex ill-defined problems encountered during their daily clinical work.

Conclusions: There are differences in the perceptions of effective clinical teachers between medical students and residents. Medical training institutions should look for clinically competent teachers with foundational non-cognitive domain skills such as approachability and passion for teaching first before developing their cognitive domain skills further to make them effective teachers.

A stepwise evaluation strategy to improve teaching skills for young faculties in a teaching hospital

Authors
Cheng-Yi Chao
Chin-Sheng Lin
Yaw-Don Hsu
Wei-Yun Wang
Hsu-Kai Huang
Cheng-Chin Hsieh

Presenter:
Cheng-Yi Chao, Pharmacist, Taipei, Taiwan

Background: The evaluation of teaching efficacy of young faculties is critical but is a big challenge. In this study, we aimed to set up an evaluation system to improve the teaching skills for young faculties in a teaching hospital.

Method: An evaluation system, which includes items of teaching contents, teaching attitude, teaching skills, and course design, had been established by the consensuses meeting of physician educators in the hospital. There were two to three sub-items in each item. Each sub-item was scored as "below the average", "in the average", "above the average", and "far above the average". Seniors faculties were requested to evaluate the teaching efficacy of young faculties according to the evaluation system. A second evaluation was performed for the young faculties who did not reach the average in any of the sub-item. In the second evaluation, the young faculties were educated with the basic requirements of the teaching process and then evaluated by two senior faculties, including one physician educator.

Results: In the year of 2017, there were totally 30 young faculties receiving the evaluation in the hospital. Ten of them (33%) did not reach the average in any of the sub-item in the first evaluation. The most common sub-items they did not reach the average were "inspiring and practical teach", "variety of teaching modalities", and "interaction between teacher and students". After well delivering the basic requirements of each sub-item to the young faculties, all of them pass the evaluation in the second evaluation.

Discussion: Our results suggested that young faculties need guidance and well-monitoring to achieve better teaching efficacy. A stepwise, comprehensive evaluation system is required for the young faculties who are not familiar with teaching process. We will deliver the information of such evaluation system to our young faculties in the pre-educational training course.

Conclusions: Being a young faculty, how to be a qualified teacher is an important objective that he/she needs to learn. An evaluation system with detailed and comprehensive requirements will play a vital role to guide them to be qualified.

Design and Validation of an Instrument to Evaluate Clinical Training in Health Careers

Authors
N Navarro
M Illesca
C Cerda
R Rojo
G Resi
L González

Presenter:
Nancy Navarro, Universidad de la Frontera, Temuco, Chile

Background: Clinical teaching covers a significant proportion of the curriculum ofhealth professions students. The clinical teachers guide the development of generic and specific competences of the future health professionals. The aim of this study was to design and validate an instrument to evaluate clinical teaching. We applied this instrument to explore the strengths and weaknesses of Faculty members, in order to detect areas for improvement.

Method: The instrument was designed based on literature review, the qualitative exploration of students' (focus groups) and clinical teachers'opinions (in-depth interviews), and expert judgment. The instrument consists of 31 items related to the clinical teacher´s role. The answers were collected on a Likert scale, 1-to-5. It was applied in 2017 to 443 students from different careers. We performed an exploratory and confirmatory factor analysis to establish the validity and reliability of the construct(Cronbach´s alpha).

Results: Of the 31 items of the survey, "Demonstrates theoretical knowledge of their professional practice" was eliminated due to non-discrimination. Two factors were identified: (F1) related to Clinical Teaching Performance (25 items; Cronbach's alpha 0.97) and (F2) Learning Environment (5 items; Cronbach's alpha 0.76). The averages of each factor were 4.7 and 3.8, respectively. Theitems with highest averages were "Demonstrate experience in practice" (4.7), "Encourage incorporating ethical aspects into clinical work" (4.5), and "Encourage self-learning" (4.5). Lower averages correspond to "Enough number of experiences" (3.8), "Adequate material resources" (4.0),and "Analyzes clinical practice objectives" (4.0).

Discussion: The items of the instrument confirm the representativeness of the domains to be evaluated;hencethe instrument has a high validity and reliability in the two identified factors. This survey allowed us to diagnose the competencies of clinical teachers, enabling to detect areas where additional training is required.

Conclusions: The evaluation of the clinical teacher is critical as it guides the role that theyshould assume in the

clinical teaching process. Here we have developed an instrument of high validity and reliability to assess clinical teachers. This instrument will allow the continuous improvement of the training process, which should be both systematic and reflexive.

9II13 (1600)
Effect of Matching Communication Styles on Educators' Effectiveness and Overall Training Experience

Authors
Hui Ling Lee, National University Hospital, Singapore
Sherlyn Chan, National University Hospital, Singapore
Wee Kee Hew, National University Hospital, Singapore

Presenter:
Wee Kee Hew, National University Hospital, Singapore

Background: Having good communication skills is a characteristic of an effective educator (Sutkin, et al., 2008). Appropriate listening and speaking skills can allow educators to encourage participation, build relations and teach more effectively. More importantly, they will be able to understand and appreciate the uniqueness in students, thereby motivating them in their work.

Method: In this study, we investigate from the students' perspective, the effect of matching communication styles between the educators and students on the educators' effectiveness and the overall training experience. Data was collected from 116 educators and 214 students (01 Feb 2016 to 30 Apr 2017) from Diagnostic Radiography (DR), Radiation Therapy (RT), Physiotherapy (PT), Occupational Therapy (OT), Speech Therapy (ST) and Pharmacy.

Using materials from Motivation Resources Pte Ltd, educators and students completed a set of 30 questions to determine their communication styles. For each student and educator pair, the similarity in their communication style was matched as a percentage. The students' reports were shared with the educators for adaptation of the appropriate style to facilitate students' learning.

At the end of the attachments, students were asked to rate the effectiveness of their educator and their overall training experience. Average scores were used for analysis.

Results: 20% - 80% match in communication styles resulted in proportionate increment in the educators' ratings ($R2 = 0.8682$). However, it did not correlate to better training experience ($R2 = 0.1991$).

Discussion: With matching communication styles, educators were able to relate, motivate and teach students better. Hence, students perceived them as being more effective. Conversely, this did not result in the students having a better training experience. An interpretation to this is that a good training experience is multifactorial, which includes having adequate resources, a conducive learning environment and training that meets the objectives. Apart from having an effective educator, other aspects of the clinical training need to be considered for a good training experience.

Conclusions: Matching communication styles between the educators and students resulted in more effective

educators, but did not correlate to a better training experience.

Using OSTE and OSCE to Evaluate Respiratory therapists as Clinical Teachers: Differences in Clinical Teaching Skills and Professional Technologies ability

Authors
Su-Ling Chen
Ya-Yun Chen
Te-Jung Chiao
Min-Shu Wang
Ching-Chung Lin
Hung-I Yeh

Presenter:
Su-Ling Chen, Mackay Memorial Hospital, New Taipei City, Taiwan

Background: Respiratory Therapist works not only clinical therapy, but also acts as clinical teacher in daily practice.
Method: We used objective structured teaching examination (OSTE) and objective structured clinical examination (OSCE) to assess whether they have differences in teaching skills and professional technologies ability, and then to further analyze and improve teaching skills and professional technologies.
Results: A total of 12 respiratory therapists who are clinical teachers, accepted 2 OSTE stations including incentive spirometry feedback teaching, and arterial blood gas technology teaching, and 4 OSCE stations which evaluate procedure of using metered dose inhaler, small volume nebulizer, oxygen and mechanical ventilator. The Examiner will test the procedure, timely feedback, and response the satisfaction survey. SPSS was used to analyses data.
The total scores of OSTE and OSCE 65 points vs.79 (p <0.01) were analyzed by paired T test. The results showed that OSCE was significantly higher than OSTE. The average passing rate of OSCE was 85%, was also higher than that of OSTE(50%). The average learning satisfaction was 83%. Clinical teaching skills (feedback and technical teaching skills) was significantly worse than professional technologies, thus teaching skill training program was arranged [one minute teaching and feedback method in clinical teaching Skill]. The satisfaction rate of teaching program was 86%, and it is helpful to enhance clinical teaching ability.
Conclusions: Through OSTE and OSCE assessment, we find that there is a difference in teaching skills and professional technologies ability among clinical teachers in respiratory therapist. To reduce the number of respiratory therapist who can only do professional ability without teaching, we can nessarily implement the training program for clinical teaching ability.
Take-home message: OSTE and OSCE can be applied to test the respiratory therapist who can be a clinical teacher or not. These test also can be assessed their teaching skills or professional technologies competence.

9II16 (2200)
Prevalence of observed characteristics of positive doctor role models in general internal medicine: a cross-sectional study with resident physicians

Authors
Simone Krähenmann-Müller
Felicitas-Maria Lahner
Sören Huwendiek
Sissel Guttormsen

Presenter:
Simone Krähenmann-Müller, Department of Internal Medicine, Kantonsspital St. Gallen, Switzerland

Background: Observational learning from supervisors is a main element in postgraduate education. The importance of doctor role modelling in professional development of postgraduates has been shown by medical educators worldwide. We aimed to evaluate, which positive role model characteristics are prevalently observed by residents of general internal medicine during their day-to-day-work with supervisors.
Method: A 60-item questionnaire was developed. We first identified 144 characteristics of positive doctor role models from the literature. By content analysis, we derived 10 distinct characteristics per category "teaching skills" and "personal qualities". To each characteristic, three practical observable examples were identified and implemented into the questionnaire to support content validity. The questionnaire was pre-tested and distributed web-based to 255 residents of 12 different sized training sites of general internal medicine in Switzerland in Mai 2017. Residents were requested to indicate, to which degree they have observed the outlined characteristics of their supervisor during the last 4 weeks. Respondents could drag a slider to adjust the level of the observed characteristics intuitively on a scale from 0-100%.
Results: 188 residents completed the questionnaire (response rate 74%). A t-test showed that "teaching skills related" characteristics were significant lower prevalent than "personal related" characteristics (t(259.71) = -5.72, p<0.001). 6 out of the 20 characteristics had a prevalence of ≥ 85%. Highest prevalent characteristics were: "Has integrity" (92.54%), "Is enthusiastic about his work" (87.96%) and "Has availability" (87.41%). Lowest prevalent characteristics were: "Directs his/her teaching to the learners' needs" (65.15%), "Stresses the importance of the doctor-patient-relationship" (65.95%), and "Provides feedback to trainees" (72.07%).
Conclusions: Prevalence of positive role modelling characteristics can be pointed out selectively. This could be used as a basis for tailored faculty development strategies to foster role modelling in postgraduate education. As 14 out of 20 characteristics had a prevalence of <85%, we conclude that positive doctor role modelling is actual an underestimated and dormant teaching opportunity in our training sites.
Take-home messages: Prevalence of positive role modelling characteristics can be pointed out selectively. Role modelling is a powerful but dormant teaching opportunity in postgraduate education in Switzerland.

Prototyping: Rapid PDSA Cycles for Accreditation System Reform

Authors

Sarah Taber, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Denis Laliberté, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Tara Phillips, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Ric Almond, College of Family Physicians of Canada, Toronto, Canada

Anne-Marie MacLellan, Collège des médecins du Québec, Montreal, Canada

Jason R Frank, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Presenter:

Sarah Taber, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada

Background: The current Canadian residency education accreditation system has evolved into a system with many manual procedures and process-oriented standards. Three Canadian accrediting colleges came together, forming CanRAC, to develop a new conjoint residency accreditation system that is aligned with the principles of competency-based medical education (CBME), and comprises 10 components. However, given the high-stakes nature of accreditation, there was a desire to test any new innovations before they were fully deployed.

Method: Interviews with Canadian postgraduate deans highlighted strengths and challenges of the current system; more than 50% identified that the system needed major, transformative change. CanRAC created a governance structure to develop a new accreditation system, with key stakeholders, by consensus, using a multi-year, iterative development process. During this process, stakeholders identified the need to implement the changes in a way that would recognize the importance and size of the change, give schools and programs time to prepare and adjust to the changes, and continuously seek input and make improvements as the changes were implemented.

Results: CanRAC developed a three-stage prototype model of implementation; each prototype collected and implemented feedback from previous phases and increased in impact on and effort required by accreditation stakeholders. Prototype 1 focused on a small group of volunteers providing feedback on draft standards and processes while observing the current process; Prototype 2 expanded to a group of shadow surveyors conducting the new accreditation process in parallel with the current process; and Prototype 3 consists of full testing by the schools, programs and surveyor teams.

Discussion & Conclusions: The Canadian residency accreditation system had not undergone a comprehensive review and reform in more than 20 years. The CanRAC prototype model balanced the need to introduce major transformative change in the system in a rapid way, while recognizing the length of time needed to prepare for accreditation and the need to continuously improve the new system prior to its full implementation.

Take-home message: The CanRAC prototype model of rapid improvement cycles and increasing impact on stakeholders provides a successful, pragmatic change management model for health professions education and accreditation reform worldwide.

Presenter:
Sutida Sumrithe, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand

Background: Burnout is a psychological condition consisting of high emotional exhaustion, low personal accomplishment and depersonalization. It is prevalent among medical students especially in Western countries. The Maslach Burnout Inventory survey is the gold standard to diagnose but it has never been translated into Thai language nor validated to use in Thai context.
Method: The Thai version of the Maslach Burnout Inventory-general survey for student (MBI-SS) was developed to measure burnout among Thai medical students by a two-stage process, namely the translation process and testing the result for factorial validity and psychometric properties. Then interrater reliability (IRR) by means of Kappa's was assessed to identify the degree of agreement in translation process. Data from the questionnaire was tested for internal consistency. A confirmatory factor analysis was carried out using as fit indices of the X2, df, Comparative Fit Index (CFI), the Tucker-Lewis Index (TLI), and the Root Mean Square Error of Approximation (RMSEA).
Results: 545 medical students participated in the survey (76.1% response rate, female 52.1%). The IRR was acceptable with Kappa of 0.83. The confirmatory factor analysis demonstrated to an adequate fit of X2/df=2.619, CFI=0.937, TLI=0.944 and RMSEA=0.060, which indicated that the Thai version of the MBI-SS provided reasonable fit to the data among Thai medical students. However, removal of a factorial model with item 13 provided a superior fit with RMSEA 0.055. Internal consistency by Cronbach's' alpha was acceptable with 0.79.
Conclusions: The Thai version of the MBI-SS was shown to have adequate validity and reliability. The final model with item 13 removal provided superior fit than the original version.
Take-home message: The Thai version of the MBI-SS represents a valid and reliable instrument to diagnose burnout among Thai medical students.

9JJ2 (1132)
The Prevalence and Associated Factors of Burnout in Thai Medical Students

Authors

Somporn Wangruangsathit
Chatchai Ardonk
Wanna Ardonk

Presenter:
Somporn Wangruangsathit, Buddhachinnaraj Medical Center, Phitsanulok, Thailand

Background: Burnout has been described as a syndrome of emotional exhaustion, relating to students' mental distance from studies and reduced academic efficacy. Many studies show students experience high burnout during medical education. Little is known about the prevalence of burnout, and its associated factors, among Thai medical students.
Method: The Maslach Burnout Inventory-Student Survey (MBI-SS) questionnaire was translated to Thai and distributed to 671 second- to sixth-year medical students at Naresuan University. High burnout can be characterized by a score of >14 on exhaustion, >6 on cynicism, and <23 on academic efficacy. The GPA <2.5 (from 4) or the failure to pass the National License tests were used to classify poor academic achievement. Gender, medical school admission scheme, and age were recorded. Results were analyzed using the Chi-square test.
Results: A total of 510 medical students (76% response rate) completed the survey. The second-year to sixth-year students demonstrated various high burnout rates (13%, 12%, 22%, 24%, and 35%, respectively; p<0.001). The prevalence of high burnout in low-performing students was significantly greater than that in the high achievers (31% and 18%, respectively; p=0.024). While the difference in high-level burnout between graduate entry students (mean age 29, 14%) and the undergraduate group (mean age 21, 18%) was not significant (p=0.229), a significant difference was found in high emotional exhaustion (42.50% and 61.03%, respectively; p=0.001). There was no difference between male (21%) and female (16%), p=0.244.
Conclusions: High burnout progressively develops over the course of medical education, with the highest in the final year; possibly due to increased professional responsibility. The lower degree of emotional exhaustion in graduate entry students could be related to greater motivation, emotional maturity or better coping strategies from previous studies, whereas high burnout found in low-performing students may be caused by academic struggle or low motivation. These factors should be further investigated.
Take-home message: The clinical academic year may lead to high burnout in medical students. There should be an appropriate support system/program to assist and/or prevent the increasing rate of burnout.

Well-being and educational environment in initial clinical training in medicine. Perception of students from 11 Chilean medical schools

Authors
Denisse Zuniga
Oslando Padilla
Maribel Calderon
Guadalupe Echeverria
Isabel Leiva
Marcela Bitran

Presenter:
Denisse Zuniga, Pontificia Universidad Católica de Chile, Santiago, Chile

Background: In medical schools training is relevant to develop competencies related to professionalism and self-care that benefit the integral formation and professionals of excellence, who are also prepared to face a high demand, similar to the demand that they will find in the postgraduate and professional practice. Chile offers undergraduate medical education that lasts 7 years. The common profile of Chilean medical schools describes the clinical competencies for which they must be prepared and including being able to self-care (recognition of personal limitations and ability to ask for help). The objective of the study is to evaluate the perception of well-being level and the educational environment that Chilean medical students have during their undergraduate initial clinical training.
Method: 4th and 5th year students from 11 Chilean medical schools participate. Student well-being levels were assessed with the MHC-SF and the MBI. Educational environment perceptions were evaluated with the DREEM. The data will be analyzed through Chi-square tests and T test.
Results: 50% of students reported flourishing mental health levels. One third of the participants perceived high levels of burnout risk (emotional exhaustion). The educational environment was evaluated as excellent or more positive than negative by 70% of the students. There are differences in the indicators of well-being and the educational environment between schools. The results also suggest associations between the perception of risk of burnout and educational environment.
Conclusions: Medical students in clinical training report high levels of positive mental health at the same time that a proportion of them perceive high levels of risk of burnout. The perception of risk of burnout is associated with the educational environment of which the students part of. Despite of the high level of burnout risk perceived, this is a population with high levels of positive mental health that can be a protective factor to maintain motivation and continuity of studies.
Take-home message: High risk of burnout requires the identification of contextual factors to respond to these findings. It is also suggested to identify organizational and individual opportunities to promote self-care of students.

Dispositional Mindfulness - a protective factor for burnout in undergraduate medical students?

Authors
Marcela Bitran, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile
Manuel Torres-Sahli, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile
Guadalupe Echeverría, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile
Denisse Zúñiga, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile
Nuria Pedrals, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile
Attilio Rigotti, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile

Presenter:
Marcela Bitran, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile

Background: Medical students are continuously exposed to stressful situations that may impair their physical and psychosocial wellbeing as they progress through their clinical training. Without timely academic and medical assistance, one in two students may develop burnout, a syndrome characterized by emotional exhaustion, depersonalization, and loss of the sense of purpose and achievement. Many burnout-reducing interventions apply some form of mindfulness practice. However, little is known about the relationship between dispositional mindfulness and psychosocial wellbeing with burnout during clinical training. We studied the relationships between these variables across the undergraduate medical curriculum.
Method: In 2017, 240 students enrolled in years three, four, six and seven of a 7-year medical curriculum at a large Chilean university answered dispositional mindfulness, psychosocial well-being, distress, and burnout questionnaires. We compared scores across study-years and analyzed the relationships between psychosocial well-being and distress as well as the distribution of mindfulness scores in students with or without burnout. ANOVA and Chi-Square tests were used to compare scores across study-years and proportions, respectively.
Results: Burnout frequency ranged from 47.1% to 69.9%, with year six presenting the highest level. Wellbeing and distress displayed a significant inverse relationship. Students without burnout had higher dispositional mindfulness and psychosocial well-being, and less distress compared to burned-out students.
Discussion: This study confirms the high prevalence of burnout in medical students and reveals its sensitivity to progression along the curriculum. The soaring burnout levels in year six may relate to the increase of students 'responsibilities on direct patient care.
Conclusions: Causal relationships cannot be drawn. However, the negative association between dispositional mindfulness and burnout warrants further research and may open new avenues for preventive interventions.
Take-home messages: • Given its high prevalence and associated risks for students and patients, clinical teachers

and medical education authorities should address burnout during medical training.

• Curricula should be analyzed for its influence on students' wellbeing and revised to facilitate healthy transitions into clinical setups.

• Deliberate practice of mindfulness and positive psychosocial resources should be explored as means to potentiate students' wellbeing and resilience during clinical training.

Funded by FONDECYT 1150340

Stress management for medical students: Scientific knowledge converts into practical tools through interaction and reflection

Authors
Saara Repo, University of Helsinki, Center for University Teaching and Learning, Helsinki, Finland
Pauli M Turunen, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Maarit Hölttä-Vuori, University of Helsinki, Faculty of Medicine, Helsinki, Finland

Presenter:
Saara Repo, University of Helsinki, Center for University Teaching and Learning, Helsinki, Finland

Background: High level of harmful stress is common among medical students. In order to give students useful knowledge and tools, a compact and optional course "Stress management methods for students" was designed in University of Helsinki. The course has been organized twice (2016 and 2017) for group of approximately 50 students.
Method: Students kept stress and sleep diary before the course, attended interactive lectures on physiology and psychology of stress, connections of brain function, sleep and exercises to stress, studying techniques and mindfulness. All lectures included research based knowledge and practical methods. Furthermore, students prepared a group presentation of optional theme and wrote individually a reflective journal. Journals (N=67) were analysed by content analysis.
Results: Students participated course mostly because they had experienced stress during first study year and needed tools for their studies and for future as practitioners. Participants became more aware of their stress symptoms and their helpful and harmful ways of coping with stress. Especially sleep diary and knowledge about sleep and stress gave new insights. Sharing their experiences with peers was felt encouraging and relieving. Active group work empowered students and they highly appreciated peers' point of views.
Discussion & Conclusions: Students were stimulated by versatile scientific knowledge as well as new practical tools. They started to see stress as a functional reaction that can not be totally avoided, but rather could be used as resource. A framework which combines physiological, psychological and social aspects of stress helps medical students to understand the emotions that are connected to stress. Furthermore, diverse content gives every student some new coping mechanisms, for example

mindfulness or, at least, reinforces good, but forgotten habits.
Take-home message: Most of the participants were very satisfied with the course and would recommend it to their peers. This interactive course is one way to create a culture that supports healthy stress coping mechanisms at the very beginning of medical school. As one student crystallized: "A doctor who is feeling well is a best resource a patient can have".

The voice of medical students to establish the meditation course at Maharaj medical education centre

Authors
Naphatsaphon Chumwong, Maharaj Medical Education Centre (MEC), Nakhon Si Thammarat, Thailand
Paphan Musikawat, Maharaj Medical Education Centre (MEC), Nakhon Si Thammarat, Thailand
Nathamata Ruangon, Maharaj Medical Education Centre (MEC), Nakhon Si Thammarat, Thailand
Kanjana Wongsiri, Maharaj Medical Education Centre (MEC), Nakhon Si Thammarat, Thailand

Presenter:
Naphatsaphon Chumwong, Maharaj Medical Education Centre(MEC), Nakhon Si Thammarat, Thailand

Background: Regarding positive evidence of meditation in medical education, many medical schools and medical education centres(MEC) have developed meditation course. However, little is known about students' preferences concerning meditation course. To devise a meditation course which would be most suitable for medical students, Maharaj MEC created a questionnaire to ask every clinical year students.
Method: The electronic questionnaires were sent to 91 undergraduate clinical year medical students in 2017 to gather information about characteristics of the preferred meditation course. Questions include the willingness to join the course, positive factors affecting meditation practice, preferred teaching styles and meditation techniques.
Results: Of 91, 67(73.6%) completed the questionnaires. Results showed that 62(68.1%) were willing to join the course for improving their mental health. All of them agreed that learning both theory and practice using interactive study would help them gain more applicable knowledge. The variety of meditation postures and techniques were mentioned by the students. In addition, sitting, lying and walking were the top three preferred meditation postures while awareness of breathing and open-monitoring meditations were the top two meditation techniques they preferred.
Conclusions: It is seen that meditation course is of students' interest, with some details of the programme being noted. To meet the needs of the students, the proper meditation course should consist of both interactive theoretical part and practical training. This is as

provision of theory would inform the principles of meditation practice that could help the students choose their own preferable meditation techniques under instructors' supervision.

Take-home message: The interactive theoretical teaching and practical training seems to be a proper teaching method of meditation for medical students.

9JJ10 (1687)
Does a gap year work against stress? A cross-sectional study of Finnish medical faculties in 2016

Authors

Piitu Parmanne, Finnish Medical Association, Helsinki, Finland
Peppiina Saastamoinen, Finnish Medical Association, Helsinki, Finland
Sami Heistaro, Finnish Medical Association, Helsinki, Finland
Kristiina Patja, Pro Medico Association for continous professional development in Finland, Helsinki, Finland

Presenter:
Piitu Parmanne, Finnish Medical Association, Helsinki, Finland

Background: In Finland, a gap year in between medical studies has gained popularity. Medical education has gone through several reforms, from problem-based learning in 1990´s to the latest of competency based education. Health care working environment has also become more efficient and causing reduction in tutoring facilities for medical students at workplaces. We studied the prevalence of gap years (n=152) as well as intentions to take a gap year (n=348) reported by students in five medical faculties and potentially associated factors such as stress, motivation and social support.

Method/Results: Data were collected with online survey to 2nd–6th year medical students in September 2016 (total n=1557, response rate= 36%). The most common phase to take a gap year was in the clinic. Prevalence of gap years was 11% (8% men vs. 14% women). There were differences between faculties (17% vs. 7%). The most common reasons reported for taking a gap year were student exchange (24%), unspecified need for break (24%), concerns of wellbeing (20%) and family reasons (17%). Almost one third of students intended to take a gap year. These students reported higher study burden and stress and lower motivation than others. Students who had taken a gap year reported equal amount of study burden, stress and low motivation.

Conclusions: Students report several different reasons for taking a gap year. The phenomenon appears to be related partly to student-related factors and partly to learning environment. The study burden seems to be at a higher level for those who intend to take a gap year or have already taken it. If a gap year doesn't increase motivation nor reduce stress and coping problems, it may not be beneficial to students to take a gap year. Instead faculties should develop new strategies to identify students in need for intensive support.

Take-home message: A gap year may be effective to gain more experience and new skills, but it doesn't seem to be helpful in stress reduction nor in increasing motivation in studies.

9JJ11 (1732)
Disillusionment in medical education: An exploratory study

Authors

Victor Loh, Family Medicine, National University of Singapore (NUSMed), Singapore
Shuh Shing Lee, Centre for Medical Education (CenMed), National University of Singapore (NUSMed), Singapore
Yanika Kowitlawakul, Alice Lee Centre for Nursing Studies, National University of Singapore (NUSMed), Singapore

Presenter:
Victor Loh, National University of Singapore (NUSMed), Singapore

Background: Although associated with work attrition and burnout literature, disillusionment or the "… feeling of disappointment, akin to depression, arising from the realization that something is not what it was expected or believed to be, possibly accompanied by philosophical angst from having one's beliefs challenged" has been little studied in medical training. In this study we explored the experience of disillusionment in medical training.

Method: An exploratory qualitative methodology using focus group discussions (FGD) was employed. Participants were recruited by email. A total of 5 FGDs (n=39) comprising medical students from 2 preclinical (MS1 and MS2, n=15) and 3 early clinical (MS3 and MS4, n=24) FGDs were conducted. The experience of disillusionment in medical training was discussed using a semi-structured guide. Discussions were audio-recorded, transcribed, and independently analysed for themes and subthemes by a family physician, a nurse educator, and a medical educationalist.

Results: Four themes emerged: (i) Mismatched expectations: disillusionment occurred when reality challenged pre-existing expectations and meaning perspectives. This fueled (ii) uncertainty about role and purpose in the world of medicine. (iii) Resilience factors were marshalled through self-reflection and enlisting the psychosocial support system. Mentors exemplified patient-centredness despite pressures to do otherwise. This could lead to (iv) personal growth in the form of deeper self-awareness and strengthened resolve in medical training.

Discussion: Medical training does well to prepare students for the unexpected inherent in medical practice. Transformative learning theory (TLT) informs us that "disillusionment" may be understood as a "disorientating dilemma" that cascades transformative learning. Illeris posits that this in fact affects the identity of the learner. Students described how meaningful purpose gave reason to endure self-deprivation in the course of duty, and mentors showed how it was possible.

Conclusions: Finding meaning in the care of patients fortifies students in their resolve to endure difficulties in the process of medical professional identity formation. We train learners for this capability by encouraging critical self-

reflection and providing a platform for support and discourse on their experience.

Long-term peripheral placements, social isolation, and mental health. What does this mean for medical students?

Authors
Ansab Fazili, Kings College London, London, UK
Naveed Khan, Kings College London, London, UK
Munaib Din, Kings College London, London, UK
Simran Dhesi, Kings College London, London, UK
Ahmed Fazili, St George's University, London, UK
Obaid Syed, Kings College London, London, UK

Presenter:
Ansab Fazili, Kings College London, London, UK

Background: Depression and suicidal ideation amongst medical students is increasingly prevalent with hierarchical structures, a competitive environment, and social isolation playing pivotal roles. Within this critical context, modern medical curricula are increasingly adopting long-term peripheral placements, whereby students can be moved away from central sites (and support systems), for months at a time.
As students from GKT School of Medical Education, year-long peripheral placements have also been propositioned as part of Curriculum 2020. We are concerned about the social isolation this could cause, and the consequential impact on mental health.
Method: To understand the impact of long-term peripheral placements on students' mental health, we undertook a literature review using the Web of Science. Key terms such as 'peripheral placements', 'mental health', and 'medical education' helped us to analyse and identify recurring themes and key factors. A scoping search focussed on high-impact publications.
Results: Students who undergo long-term peripheral placements experience higher levels of social isolation, which is associated with depression. They are also less likely to access mental health services. Otherwise, there is limited research on the impact on students' mental health. Conversely, many positive educational consequences are reported; from improvements to rural healthcare provision and increases in medical students' competency levels.
Discussion/ Conclusions: It is worrying to see that peripheral placements lead to social isolation. Before introducing them, medical educators should address the gap in literature by exploring the impacts on students' wellbeing– especially considering the stressful nature of the jump from pre-clinical to clinical years. Preventive measures should be put in place. The one-sidedness of research, with focus on academia, is concerning. This suggests that educators prioritise academic success over student wellbeing, despite the gravity of 11% of medical students reporting suicidal intent. Do educational advantages outweigh the negative impacts on mental wellbeing?

Take-home messages: • Long-term peripheral placements have benefits on educational elements of clinical training.
• Medical students report increased social isolation on long-term peripheral placements.
• Social isolation is associated with depression.
• Medical schools should prioritise mental wellbeing and do more research on the impact of long-term peripheral placements on students' health, before implementation.

The comparison of stress level among students in engagement of surgery and non surgery clinical rotation

Authors
Meiky Fredianto
Supriyatingsih

Presenter:
Meiky Fredianto, Universitas Muhammadiyah Yogyakarta, Yogyakarta, Indonesia

Background: The growing debate regarding stress level of students in the clinical rotation at medical program has been receiving consirable attention recently. Medical students face numerous stressors during their clinical years, including difficult clinical events. The greater differences environments and work load compared to under-graduate contribute to increasing stress, especially when the students enter surgery clinical rotation. Our objective was to specifically studied the comparison of stress level among them when they engaged in surgery or non surgery.
Method: A cross sectional descriptive analytic study was carried out on all students in surgical fields (obsgyn, surgery) and non surgical fields at the 3 Teaching Hospitals of Universitas Muhammadiyah Yogyakarta after one month discharge from their rotation. Level of stress was measured by DASS 21 after modified. The subjects consisted of 24 students in each groups.
Results: Data analyzed with independent T-test. There were significant differences between two groups (p: 0,001, 95% CI:11,12-14,32). In surgical group 10% students had severe depression with serious anxiety and average stress level, 5% had mild depression with average anxiety. In non-surgical group there was no student with severe depression. Only 5% have mild depression with mild anxiety.
Discussion & Conclusion: Students experienced many difficult clinical events and poor team dynamics most stressful. This is likely due to their role in the hierarchy, stress of evaluation, and vulnerable position as a medical student especially in surgical group. Students were not stress because of the patient care rather than the new environment and night shift everyday during ten weeks of their rotation. They did not perceive medical errors or patient care events as stressful given their lack of autonomy and they don't yet feel responsible for patient care.
Take-home messages: Surgical group had effects on stress level compared to non-surgical group.

Stress level among students in surgery clinical rotation
should be emphasized as attention in medical education.

9KK1 (3261)
Developing a Continuous UGME Curriculum Quality Review Process

Authors
Roona Sinha, University of Saskatchewan, Saskatoon, Canada
Beverly Karras, University of Saskatchewan, Saskatoon, Canada
Regina Taylor-Gjevre, University of Saskatchewan, Saskatoon, Canada

Presenter:
Roona Sinha, University of Saskatchewan, Saskatoon, Canada

Background: With the development of new knowledge in medicine and expectations for physicians, medical school curriculi are perpetually undergoing iterative evolution and enhancement. The living nature of such programs necessitates an accompanying continuous or cyclic process for curriculum scrutiny to evaluate direction, applicability and quality of content and learning objectives. At the University of Saskatchewan, a major curriculum change was implemented for the 2018 graduating student cohort. Subsequently, it was recognized that a more robust and formal course review process was required for the entire UGME curriculum.
Method: The University of Saskatchewan Curriculum Quality Review Sub-Committee (CQRSC) was established as a subcommittee of the curriculum committee in July 2016. A course review cycle was created to review each UGME course once during a four year cycle. Each course review involves the course director filling out a comprehensive template outlining course information including course hours, changes made, evaluations, assessments, which program level objectives are covered, and which vertical themes are covered in the course. Next, during the course review orientation, the course director provides an overview followed by an assessment summary from the assessment specialist and an evaluation summary from the evaluation specialist. Three course review focus groups then look in detail at content and objectives as well as for consistency with key documents including the Program Level Objectives, Medical Council of Canada Objectives, CanMEDS roles, Learning Charter Goals, Future of Medical Education in Canada Recommendations, Social Accountability, and longitudinal curricular themes. A summary report is then created, reviewed and approved by CQRSC for presentation to the Curriculum Committee.
Results: Course directors report that it has been useful to identify ways to improve the course and commend courses for successes. Recent accreditation visit confirms that the process complies with accreditation standards for program review.

Discussion & Conclusion: Continuous curricular review can be done comprehensively and effectively using a peer review process. A key requirement for successful and effective course review is active faculty investment and participation.

9KK2 (2686)
Inadequacies of musculoskeletal medicine curriculum for undergraduate medical students: an institutional and regional study

Authors
Delio Martins, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil
Robson Oliveira, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil
Erika Rymkiewicz, Anhembi Morumbi Universtiy-Laureate International Universities, Sao Paulo, Brazil
Ana Roncati, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil
Rosana Rodrigues, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil
Marcos Freire, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil

Presenter:
Germano Emilio Conceicao Souza, Anhembi Morumbi University-Laureate International Universities, Sao Paulo, Brazil

Background: The musculoskeletal disorders account from up to one in four of the general practice consultations and almost one third of the complaints among primary care clinical practice, however the time and importance given to its teaching is neglected in most Medical Schools.
Method: Medical students from the 1st to the 5th year were enrolled in a survey using the Freedman and Bernstein musculoskeletal examination test, in order to evaluate the acquisition of musculoskeletal competencies. Time spent with theoretical and practical activities; students' confidence in performing physical examination and in making diagnostic hypotheses for musculoskeletal disorders were also evaluated.
Results were analyzed using software R (Austria). Descriptive data and confidence interval were determined. Categorical data were analyzed using Chi square test. Continuous data were analyzed using a one-way ANOVA. The level of significance was set as $p < 0.05$.
Results: 545 students completed the questionnaire being from year 2=115/167 (29,6%); year 3=118/138 (30,4%); year 4=98/130 (25,3%); year 5=57/110 (14,7%). Nobody achieved the pass mark established as 70%.
The level of confidence in performing musculoskeletal examination was very low (3.7 2.2, n=386) and had no relationship with the percentage of right answers in the questionnaire (r=0.331; 95% CI 0.239-0.417, p<0.001). The confidence in physical examination was higher in the third year (4.8 1.7, n=118).
The majority (83.7%) of the students considered reasonable or good the amount of time spent with theoretical classes (83.7%) and also it was the most common teaching methodology used during the program (44.5% 23.4, n=349).

Discussion: Burden of musculoskeletal problems seen in primary care medical practice is well known. Undergraduate teaching accounts for the only exposure to orthopedic problems to most of the general practitioners. Universities are concerned about the adequacy of the musculoskeletal programs taught in their institution. Students' results were found insufficient in all the topics evaluated.

Conclusions: The way musculoskeletal disorders are being taught must be reviewed. Attention to curricular competencies, standardization of the contents, commitment of teachers, improvement of active teaching methodologies and good and in-depth syllabus could help improving the results.

9KK3 (2967)
Pre-orientation program at the University of Arkansas for Medical Sciences (UAMS) in three consecutive years: What do students perceive important in their adjustment to medical school?

Authors
Jasna Vuk, University of Arkansas for Medical Sciences, Little Rock, AR, USA
David L. Davies, University of Arkansas for Medical Sciences, Little Rock, AR, USA
Nicholas A. Pettus, University of Arkansas for Medical Sciences, Little Rock, AR, USA
Billy R. Thomas, University of Arkansas for Medical Sciences, Little Rock, AR, USA

Presenter:
Jasna Vuk, University of Arkansas for Medical Sciences, Little Rock, USA

Background: A pre-orientation program to assist entering students with successful transitioning to medical school1 was implemented at the UAMS in 2015, 2016 and 2017. Preference was given to applicants that were the first generation college graduates, had a nontraditional academic background or self-identified as an under-represented minority. The program differed in length: two days in 2015, ten in 2016, and five in 2017.

Method: Twenty-nine, 37 and 24 students participated in three consecutive years of the program. The two-day program consisted of social events and small group discussions with faculty and second-year medical students. The expanded ten-day program included lectures and team-based learning in basic science, and hands-on activities (in the anatomy lab, ultrasound session, and suturing). Workshops were conducted on time management and test-taking skills.2 Students' study methods were assessed by Learning and Study Strategies Inventory (LASSI). Students engaged in daily lunch discussions with second-year students and faculty. 3 The briefer five-day program included fewer lectures in basic science, similar hands-on activities, a lecture on social determinants of health and mindfulness, and participation in an inter-professional free community clinic.

Results: Programs were evaluated by online survey at the end of the first semester with response rates of 93%, 89%, and 67%. Across the programs, participants rated with high importance development of friendships and academic relationships with their peers, upper-class students, and faculty. The highest importance was given to daily discussions with second-year students (63% in 2017). Hands-on activities were perceived with higher importance than content lectures. Scores on LASSI anxiety subscale were negatively correlated and time management positively correlated with students' performances in the Anatomy module and the first year ($p < .05$)

Conclusions: The pre-orientation program had the positive impact on the connectedness of program participants with classmates and faculty and improved their comfort level to ask for help. Medical students could benefit from assistance in time management and reducing anxiety in the first year of medical school. Hands-on activities could increase the motivation of students.

Take-home message: Participants connectedness with classmates and faculty, increased confidence, and reduced stress improved their adjustment to medical school.

9KK4 (1329)
Adapting Approaches to Value-based Care into Education: What, Why, and How

Authors
Boyd Richards, University of Utah School of Medicine, Salt Lake City, USA
Janet Lindsley, University of Utah School of Medicine, Salt Lake City, USA
Tony Tsai, University of Utah School of Medicine, Salt Lake City, USA
Sara Lamb, University of Utah School of Medicine, Salt Lake City, USA

Presenter:
Sara Lamb, University of Utah School of Medicine, Salt Lake City, USA

Background: University of Utah Health is well known for its value-based care. A key to this success has been use of a simple value equation by the clinical enterprise (Value = Quality + Experience / Cost). With funding from the American Medical Association Accelerating Change Initiative, we have explored how to best adapt this equation to promote value-based education.

Method: We interviewed key stakeholders (10) from medicine, nursing, dental, health, and pharmacy about how to measure quality in health professions education, including entire curriculum to course level interventions. Using a structured protocol we gathered both quantitative (priority rankings of different domains of quality measures) and qualitative data (rationale for rankings about measurement strategies).

Results: The majority of interviewees supported use of value-based education strategies, with recognition that the conditions shaping use of the value equation in education were quite different than in health care. Interviewees tended to prioritize measures of core knowledge and skill acquisition over measures of readiness to collaborate or transform one's field. Interviewees tended, on average, to give relatively equal emphasis to process and outcome measures, but with a few interviewees expressing strong and contradictory preference for one over the other. Finally, interviewees

had little consensus regarding actual measures for their specific programs/projects.

Discussion & Conclusion: The general idea of adapting value-based care approaches for education appears to have support from educational leaders across health professions colleges at one institution in the US, but without a consistent strategy for doing so. Based on our interview data, we recommend that a panel of expert educators be created (modelled after a National Institutes of Health study section) who could estimate the relative value of specific proposals for educational interventions weighing probable quality estimates over cost estimates.

Take-home message: Measuring quality in medical education is important and challenging. Applying principles of value-base clinical care to education shows promise when applied to medical education in the US.

9KK5 (210)
The clinical skills confidence: reflection from the first year of practice

Authors
Rossukon Khotcharrat
Supawadee Makanut
Apirath Wangteeraprasert
Preaw Suwannasrisuk
Sirikasem Sirilak

Presenter:
Rossukon Khotcharrat, Faculty of Medicine, Naresuan University, Phitsanulok, Thailand

Background: Training for effective healthcare providers, the Faculty of Medicine highlights the importance of reflection and feedback system to assess and develop our curriculum and instructional resources. Hence, a survey has been conduct to assess how their 2014-year graduates have performed during their first year in practice.

Method: A cross-sectional survey of 163 doctors who graduated from Faculty of Medicine of Naresuan University in year 2014 was carried out in 11 provincial hospitals in the lower northern area of Thailand during year 2015. The questions were constructed to identify self-confidence in their clinical procedures and patient treatment using Likert scale.

Results: There were 87% response rate. Male was 53. The mean of confidence for all skills was 3.79 ± 0.76. The highest mean of confidence was the anesthetic skills and intubation = 4.14 ± 0.55, followed by emergency care 4.05 ± 0.99 and internal medicine skills =4.05 ± 0.51 respectively. Surgical skills = 3.97 ± 0.50, Orthopedics skills = 3.77 ± 0.56, Obstetrics and Gynecology = 3.86 ± 0.55, Pediatric skills = 3.82 ± 0.59, Radiology 3.73 ± 0.54, chronic diseases and long term care = 3.83 ± 0.57. On the other hand, Ophthalmological skills = 3.37 ± 0.69, Oto-Rhino-Laryngology = 3.39 ± 0.64 and Psychiatric patient caring skills = 3.47 ± 0.65.

Discussion & Conclusions: The mean of clinical skills self-confidence were high but in some courses with limited time in our curriculum; especially in Ophthalmology, Oto-Rhino-Laryngology and Psychiatry, the graduates need more time to practice. Thus, we should suggest the

medical students to spend time after class or apply for post-graduated clinical course to be proficient.

Take-home messages: Most of the self-confidence in clinical skill of Naresuan's graduated doctors was high especially emergency care and life saving skills. The less learning time in rotation, the less clinical skill confidence of the graduates. Thus, we should concern about this aspect when design and develop the curriculum.

9KK6 (339)
The confidence of medical interns to perform basic medical procedures based on criteria of The Medical Council of Thailand

Authors
Jantira Hongrapipat
Pakarat Sangkla
Sirikoon Thunthep

Presenter:
Jantira Hongrapipat, Surin Hospital, Surin, Thailand

Background: According to The Medical Council of Thailand criteria, medical students have to perform their competence in medical procedures to obtain their national medical license. Medical students have to practice medical procedures with training manikins and patients to maintain accuracy in the treatment, reduce the medical errors and increase their confidences.

Method: A cross-sectional descriptive study was conducted in 30 medical interns who work at Surin hospital. The research tools were demographic and specific questionnaires involved 5 from 42 most concerned medical procedures according to The Medical Council of Thailand criteria. The data were analyzed using descriptive and chi square statistics ($p<0.05$).

Results: All medical interns had completely practiced only two procedures of the criteria with both manikins and patients which are advance cardiopulmonary resuscitation and endotracheal Intubation. Their confidence on medical procedural skills in advance cardiopulmonary resuscitation 76.48%, endotracheal intubation 90.14%, lumbar puncture 80.19%, amniotomy 74.6% and normal labor 70.19%. The confidence to perform medical procedures significantly correlated with the number of patients they had been practicing as following: advance cardiopulmonary resuscitation P=0.007, endotracheal intubation p=0.03, lumbar puncture p=0.33, amniotomy p=0.008 and normal labor P=0.001

Discussion: All the medical interns realized the importance of medical procedural skills training with manikins and patients under medical staff supervision. However, the only two criteria that interns had completely practiced were advance cardiopulmonary resuscitation and endotracheal intubation with both manikins and patients. The average confidence to perform medical procedures was more than 70% and significantly correlated with the number of patients they experienced during procedural skill training.

Conclusions: The medical interns recognized the importance of practicing basic medical procedures with manikins and patients under the supervision of medical

staffs to reduce medical errors and thus increase their confidences. However, the number of patients during procedural training is the factor that may affect their confidence on procedural skill.

Take-home message: In order to prevent the medical errors, medical interns should practice basic medical procedural skill training with manikins and patients under staff supervision to increase their competence and confidence before graduation.

Undergraduate medical curriculum in the University of Tartu: strengths and weaknesses of the curriculum and factors affecting changing the curriculum according to university teachers

Authors
Marge Vaikjärv

Presenter:
Marge Vaikjärv, University of Tartu, Estonia

Background: In Estonia undergraduate medical training is offered by University of Tartu. In recent years it has been pointed out that there are several shortcomings in the currently implemented curriculum. New approaches to the organization of studies have been suggested as a solution. Feedback has been collected from the students and received during curriculum evaluation but the position of the university teachers has not been investigated.
Method: The aim of this study was to describe the strengths and weaknesses of the undergraduate curriculum and factors supporting and inhibiting changes in the curriculum according to university teachers. Consequently, a qualitative study was conducted by interviewing 12 university teachers of the medical studies. Data was analyzed using thematic analysis method.
Results: The results showed that the teachers valued a strong theoretical background and hands-on approach to teaching and learning. The teachers questioned the rational for dividing the curriculum into pre-clinical and clinical studies and rather saw it as a source for gap between theory and practice. The current system was used as a basis when discussing possible changes in the curriculum and the teachers tended to find similarities between a new approach that was introduced to them during the study and the current system.
Discussion & Conclusions: The results were partly controversial. Strong theoretical basis of the curriculum has been valued by students too but the results regarding hands-on approach to teaching and learning are contradictory in the results of this study as well as with previous feedback to the curriculum. Initiation of curriculum development and changes in the structure of the curriculum are difficult since majority of teachers have no experience outside the current one.
Take-home message: Teachers opinion about the curriculum and factors influencing curriculum change is just as important as the students and other parties participating in the process.

The National Policy on RDU Curriculum: Is it possible to implement it in the Medical Education Centers under The Ministry of Public Health (MOPH), Thailand?

Authors
Roungtiva Muenpa
Usa Siriboonrit
Rajin Arora

Presenter:
Roungtiva Muenpa, The Collaborative Project to Increase Production of Rural Doctor, Bangkok, Thailand

Background: The Ministry of Public Health (MOPH) in Thailand implemented a Rational Drug Use (RDU) policy in 2017 to promote medication safety. For education, a Memorandum of Understanding (MOU) between the MOPH and five Health Profession Councils and medicine-related faculties was created. The MOU covers teaching RDU as a core competency, adding RDU to the professional examinations, and including RDU in continuing education. A teachers' guide and RDU teaching workshops were also established. This study aimed to evaluate the effectiveness of the RDU policy one year after it was implemented in the Medical Education Centers (MECs) under the MOPH.
Method: A survey about RDU teaching in 37 MECs under the MOPH was completed by their director or deputy director during January 2018. Data were analyzed and described.
Results: Among the 21 MECs that responded, 18 (85.7%) knew the policy, 15 (71.4%) had attended a workshop and 4 (19.0%) had used the teachers' guide. No MEC provided RDU lectures as a core topic. Sixteen MECs integrated RDU with skills teaching such as taking a drug history, prescription writing, administering drugs safely, providing patients with appropriate information about their medicines, and monitoring drug therapy. The average teaching time was 2.2 ± 0.9 hours. An awareness of RDU was taught in 17 MECs when they had an opportunity. All MECs agreed that monitoring and evaluation of the impact of drug therapy and misconceptions about generic drug quality were the weak points for medical students. The obstacles are: not enough time, partial understanding of the RDU curriculum and using the teachers' guide.
Conclusions: To implement the National Policy on teaching RDU as a core topic effectively, an explicit core curriculum is required from the medical schools as this is directly linked to the curriculum of the MECs. Lack of time and poor understanding of the RDU curriculum were the main obstacles.
Take-home message: Including RDU in the core curriculum, cooperation between medical schools and MECs, and strong support from the MOPH and medical councils are needed for the success of the RDU teaching policy.

The teacher's role in classroom teaching – A qualitative research on the opinion of Taiwanese medical students

Authors

Chia-Yih Liu, Department of Psychiatry, Chang Gung Medical Center and Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Hsuan-Yu Liu, Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Pei-Hsuan Yang, Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Hung-Hsueh Chou, Department of Gynecology, Chang Gung Medical Center and Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Ji-Tseng Fang, Department of Nephrology, Chang Gung Medical Center and Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Presenter:
Chia-Yih Liu, Department of Psychiatry, Chang Gung Medical Center and Chang Gung University School of Medicine, Tao-Yuan, Taiwan

Background: Due to rapid expansion of medical knowledge, medical education in Taiwan has undergone major reform during the last two decades. Learner-centered approaches (such as PBL, CBL, TBL), new curriculum design (such as organ-systems block), and new evaluation methods (such as OSCE, mini-CEX) were introduced and implemented. More emphasis was placed on clinical training, with lectures markedly reduced to cover only the necessary knowledge. In response to the drastic change, effective and efficient classroom teaching/ learning become a challenge to medical teachers.

Method: A qualitative research using in-depth interview method was performed to investigate medical students' opinions and expectations about classroom teaching. Twenty one high-grade medical students (year 5 and 6) participated in this study. The questionnaires comprised open questions covering the respondents' subjective preferences and objective judgments on effective teaching. Data were collected from taped interviews conducted by two trained interviewers. The interviews were transcribed, coded and analyzed.

Results & Discussion:

(1) Teaching models: There is no "almighty" model. The best teaching model should be tailor made. For fundamental knowledge (for example, biochemistry, immunology, ……), face to face teaching will be better. Small group discussion, PBL, CBL or TBL are suitable for clinical knowledge, and a good teacher guiding the discussion is very important.

(2) Teaching methods: Streamlining teaching materials and key point teaching, with supplementary information are favored. Backboard with chopsticks or powerpoint, which one is better? Everyone has his own taste. No matter which one, handout or lecture note is very important.

(3) Teaching style: Good teachers show their thinking process about the learning issues/ items. This will help students learn the issue more easily. Interest-inducing and concentration enhancing approach are also highly appreciated.

(4) Self learning is important, with reduced lecture hour. For example, online learning, lecture notes, self learning powerpoint file,…..etc. However, knowledge is boundless, the content of supplementary materials should be adequate and must learn for future physician.

Conclusion & Take-home message: Medical teacher of the new era should be a coach, rather than a knowledge provider.

Medical Education in Georgia: Crossroads of East and West

Authors

Natalia Tsereteli

Lana Bokuchava

Khatuna Saganelidze

Madona Modu

Presenter:
Natalia Tsereteli, New Vision University, Tbilisi, Georgia

Background: Through the History the connection of Europe and Asia was the milestone for most of the Empires. Georgia was playing crucial role in connection of East and West. One of the brightest examples is the Caucasus rote of the Great Silk Road going through Georgia. This country from the beginning of times was the concentration of different cultures, creeds, traditions.

Method: The aforementioned experience is continuously used in NVU, where we make the merging of East and West in Medical Education, both in teaching and learning process as well as in assessment. Today teaching at Medical School becomes more and more demanding. The diversity of the students envisages new challenges for the academic staff. Students enter the New Vision University from different cultural and socioeconomic backgrounds and bring various types of experiences. Our University aims to grow the world competitive MD. The presentation introduces the assessment methodologies used in New Vision University and how they are adjusted to the reality of the world.

Moreover, NVU provides students with opportunities to improve their knowledge in order to implement it in practice effectively.

Results: The assessment methodologies based on the International Standards and incorporate country specific experiences.

Discussion & Conclusions: New Vision University at the different loops of the curriculum refers different types of the assessment, which is integrating MCQ based on experiences of different countries (e.g. USMLE, MCI, PLAB, and etc.) with the practical spot examination (OSCE, USMLE step 2 CS and etc.), as well as capstone projects prepared by students on there last year of education.

Curriculum evaluation: Case study of Anesthesia Internship, Faculty of Medicine, Universidad de los Andes, Bogotá, Colombia

Authors

Elena María Trujillo Maza
Yuranny Zambrano Castellanos
María Teresa Gómez Lozano
Juny Montoya Vargas

Presenter:
Elena Trujillo, Universidad de los Andes, Bogotá, Colombia

Background: This case study in pre-graduate Anesthesia internship aimed at analyzing the curricular system to understand the necessary changes and adjustments regarding teaching and evaluation methods to meet requirements of Competency–Based Medical Education (CBME).

Method: A case study was conducted in 2014/2015 with 8 students in their internship year and 6 professors of medicine. The sources of information were: academic documents, observation in operating rooms, seminars and subject revision, academic meetings, interviews, learning diaries. The different sources of information allowed a muli-layered perspective, canvassing the curriculum, the learning process and the evaluation of the academic program according to CBME.

The curriculum promotes the CBME model by recommending teaching strategies such as observation and supervised practice in operating rooms. Together with topic-centered tutorials it enables students to understand and apply techniques and skills and helps to integrate the various aspects of their studies.

Results: The results show teachers being actively involved, facilitating and guiding the learning process. Students felt more motivated to study and specify problems. Although objectives and learning strategies correspond to CMBE, evaluation practice is more summative than formative, so contrary to the principles of this educational model. Acquired knowledge is mainly evaluated by written exams (summative evaluation) forming a high percentage of the grades. Mainly though scenarios of this clinical rotation are seminars and participation in surgery rooms - all evaluated subjectively without any objective criteria or evaluation matrix.

Discussion: Medical education rooting deeply in traditional models faces difficulties creating a curriculum consistently in accordance to CMBE.With the variety of learning approaches during this rotation in anesthesia, the curriculum has to connect different learning processes in clinical scenarios adequate for CMBE. Results show a low level of coherence in teaching and evaluation practice making it difficult for students and teachers to satisfactorily account for all progress and performance levels.

Conclusions: The curricular system has to be focussed regarding its educational model to clearly shape academic programs. Evaluation must reflect the applied teaching strategies and methods using different criteria and measurements to unfold the full potential of CBME.

Strengths and Challenges of Implementing an EMI Medical Program in China: Developing Remedial Strategies for an "Alien" Curriculum

Authors

Changmin Lin, Shantou University Medical College, Shantou City, China
Miao Yang, Shantou University Medical College, Shantou City, China
Zexin Chen, Shantou University Medical College, Shantou City, China
Chun Lin, Shantou University Medical College, Shantou City, China

Presenter:
Changmin Lin, Shantou University Medical College, Shantou City, People's Republic of China

Background: In many non-English speaking countries, English-medium instruction (EMI) has been widely advocated in medical education as a way to achieve internationalization and improve educational outcome. But discussions on EMI medical program seldom address the issues that faculty and students have to deal with, while only focusing on the acquisition of terms and disciplinary knowledge.

Method: In this case study, interviews (N=12), questionnaire survey (N=262) and focus group (N=18) were conducted to investigated the strengths and challenges of implementing an EMI medical program from 2007 to 2017 in Shantou University Medical College (SUMC), China. A comprehensive view of this program was obtained by involving students from different grades and faculty members teaching foundation and clinical courses. Quantitative data was subject to statistic analysis and verbal data were verbatim transcribed, analyzed and coded for triangulation.

Results: The EMI program proves to be effective in terms of student performance in OSCE and USMLE in the last several years. Its strength lies in the longitudinal curriculum development that successfully initiates conceptual changes of education philosophy. The inadequate English proficiency of local teachers have impaired the EMI teaching quality, classroom interaction in particular, with 51% of teachers and 71% of students unsatisfied with the clarity and depth of teaching content. Both the teachers and the students adopt strategies to remedy these disadvantages, ranging from problem-based and active learning strategies, motivation mechanism to the appropriation of original English textbooks for localized needs.

Discussion & Conclusions: Problem-based and case-based educational concepts are essence of EMI medical program, executed through perseverant use of original English textbooks and sustainable faculty development. Without the institutional culture of active learning, the remedial strategies would not be effective. The acculturation takes 2-3 years for both faculty members and students, implying the need to develop an EMI program longitudinally for substantial changes, rather than a superficial change in the teaching language.

Take-home message: EMI medical program entails profound transformation in learning/teaching practice. The challenges of implementing such an "alien" curriculum can be properly dealt with by building the institutional culture through faculty/student training.

Perceptions of Emergency Medicine: from getting in the way to getting on the way

Authors
Alexander Grant, Weston Area Heath Trust, Weston-super-mare, UK
Sean Mackin, Weston Area Heath Trust, Weston-super-mare, UK
Bee Martin, Weston Area Heath Trust, Weston-super-mare, UK
Charlotte Reid, University of Bristol, Bristol, UK
Emma Pearson, University of Bristol, Bristol, UK
Amybel Taylor, University of Bristol, Bristol, UK

Presenter:
Alexander Grant, Weston Area Health Trust, Weston-Super-Mare, UK

Background: The Emergency Department (ED) is the frontline of the NHS, seeing 23 million patients in 2016 alone. Bristol medical students have placements in the ED in their 3rd/5th year. Other research has considered the student perceptions impacting career choice, but there is little on student views of the learning experience in the ED. This study seeks first to explore the student perceptions and experiences of their undergraduate placement in emergency medicine, and second seeks viable strategies to improve their learning experience.
Method: White space questionnaires investigated perceptions of ED attachments from 23 3rd/5th year medical students. These responses were then further explored through focus groups.We have designed and are currently implementing a pilot novel near-peer support programme in which 5th year students have been allocated one on one time in the ED supporting a 3rd year medical student. This will be a structured session including observed clerk-ins, real-time feedback, and practical advice about emergency medicine. This will be followed by a further student focus group and written questionnaire, and reflections on the experience from the 5th year students.
Results & Discussion: 43% of all 23 students completing the questionnaire spontaneously used the phrase "getting in the way" or "feeling in the way" in answer to what they were least looking forward to in their ED placement. Focus groups revealed that although students feel like this in multiple clinical areas it was more pronounced in the ED, and that they felt that peer support in ED would be of benefit. Other themes to emerge were: self-reported feelings of "being useless", being allocated a clinical role was rewarding, and confidence in seeking learning opportunities increases between 3rd and 5th year.
Conclusions: Students perceived themselves as "getting in the way" in clinical environments, particularly in the ED. To support their learning in emergency medicine we are implementing a near-peer led clinical support pilot.

Take-home message: A peer led teaching and support intervention in a clinical environment aiming to reduce self-reported feeling "in the way" and getting students "on the way" to becoming more confident in the ED.

How to efficiently close the gap between expected and actual performance during assembly of mechanical chest compression device (LUCAS)?

Authors
Hon-Ping Ma, Taipei Medical University Shuang Ho Hospital, New Taipei City, Taiwan
Jiann Ruey Ong, Taipei Medical University Shuang Ho Hospital, New Taipei City, Taiwan
Che-Wei Lin, Taipei Medical University Shuang Ho Hospital, New Taipei City, Taiwan

Presenter:
Jiann Ruey Ong, Taipei Medical University Shuang Ho Hospital, New Taipei City, Taiwan

Background: Mechanical chest compression (CC) devices has replaced manual CC in some emergency department (ED). ED staffs are said to familiar with the device and could incorporate it into the existing resuscitation. Is that the truth?
Method: After videotape recording the resuscitation of cardiac arrest were examined, the process of assembling mechanical CC device (i.e. LUCAS) was identify as an important interruption of CC during the early resuscitation phase. 24 experienced ED staffs were enrolled in a resuscitation quality improvement program (RQIP). Participants document their confidence in assembling the LUCAS before the workshop.
The participants were guided through steps based on Kolb's cycles:
Experience step: Participants were divided to form groups of three and sequentially assembly the LUCAS on a full-body manikin. Primary outcomes were recorded: LUCAS assembly time(AT) and Chest compression fraction during the assembly (CCF). Participants document their confidence again.
Reflection step: Participants were divided into four groups, each group has to derive measures that streamline LUCAS assembly through group discussion.
Conceptualize step: Four groups shared their idea and derived a stepwise approach to assembly LUCAS under supervision of facilitator.
Planning step: Participants were asked to deliberately practice on this approach. Primary outcomes were recorded.
Finally, participants were asked whether they would adopt this approach in future.
Results: 20/24 participants were confident before experience step but decrease to 8/24 after step. A Stepwise approach to streamline the assembly of LUCAS was derived. After deliberate practice, AT and CCF were greatly improved. All participants unanimously would adopt this approach in future.
Discussion & Conclusion: There is a discrepancy between expected and actual performance on LUCAS assembly. A RQIP was designed based on problem-solving approach

through steps following Kolb's learning cycle. The participants experienced to find their problems. Then they actively engaged in process of solving the problem through group discussion and team-based learning. After deliberate practice on the approach they created, they unanimously would adopt it in their future daily practice.

Take-home message: Active experience and engagement is powerful to learn and improve resuscitation quality.

Assessment of Knowledge Regarding Sexually Transmitted Diseases Among Students in a University in Riyadh, Saudi Arabia

Authors
Asma Hagsharfi
Amira Nassr Allah
Maya Soufan
Muhammad Raihan Sajid

Presenter:
Maya Soufan, Alfaisal University Medical College, Riyadh, Saudi Arabia

Background: Sexually transmitted diseases (STD) are infections that are spread during any sexual contact. Signs of STD may include vaginal or penile discharge, pelvic pain, and ulcers around genitals or on them. However, most of the STD are asymptomatic which increases the possibility of transmitting it to other persons. Although the incidence of STD in Saudi Arabia is low in comparison to other countries, further efforts are needed to avoid health, economic, and psychological problems. STDs can cause severe health complications such as pelvic inflammatory disease, ectopic pregnancy, infertility, cancer, infections of newborns, and even death . Incorrect sexual health knowledge results in adapting negative behavior and risky sexual practices. Sexual health knowledge is affected by multiple factors including: educational background of parents, internet and other social factors. In Saudi Arabia, discussing sexual topics is usually limited due to cultural and religious values.

We are conducting a cross- sectional study among university students in a private university in Riyadh, Saudi Arabia to explore their knowledge of STDs and safe sexual practices in order to determine knowledge gaps regarding this topic and based on that we can initiate well established health programs.

Method: The study is a cross-sectional study that targets students of the 1st, 2nd, and 3rd years of medical college and 1st, 2nd, 3rd,and 4rth years engineering and business colleges at Alfaisal University. A paper based self-developed questionnaire will be distributed to the students.

Discussion & Conclusion: The students generally have poor sexual education.

Take-home message: Determining the gap in sexual education is fundamental to raise awareness about STD to decrease its prevalence.

9KK16 (3521)
The relationship of clinical performance and program satisfaction - is it independent or interactive? Experience from the clerkship program of international medical students

Authors
Ru-Yi Huang, E-Da Hospital, Kaohsiung, Taiwan
Wei-Leng Chin, E-Da Hospital, Kaohsiung, Taiwan
Chi-Wei Lin, I-Shou University / E-Da Hospital, Kaohsiung, Taiwan
I-Ting Liu, E-Da Hospital, Kaohsiung, Taiwan
Tzu-Hsien Lien, E-Da Hospital, Kaohsiung, Taiwan
I-Hui Chiang

Presenter:
Ru-Yi Huang, E-Da Hospital, Kaohsiung, Taiwan

Background: Assessing learning outcome and program satisfaction is important but also challenging. Since the complex nature of teaching-learning process, both the learning outcome and satisfactory result may be interactively influenced by each other in some situation. The study was conducted to find if these important outcomes totally independent or reciprocally affected in certain conditions.

Method: Thirty-four international medical students are divided into 9 groups during clinical rotation and evaluated according to their clinical performance. The program satisfactory evaluation was also performed at the end of each session. Descriptive analysis and Pearson's correlation were performed to discover the relationship between the performance outcome and satisfaction.

Results: The mean score was 86.6/100 and the satisfaction was 4.5/5 in total 172 group-sessions. The Pearson's correlation coefficient was 0.04 ($p=0.63$), representing no relationship without statistical significance. The results were similar in most departments except emergency department (ED), which showed high correlation with statistical significance (correlation coefficient 0.83, $p=0.04$).

Discussion: The results showed no obvious factors simultaneously influencing both students' performance scores and the satisfaction for the program. ED is the only exception which showed strong correlation. Considering ED also had the lowest satisfactory result, students might feel frustrated and regard their relatively low learning outcome as the consequences of poor program design and environment.

Conclusions: In conclusion, international medical students' learning outcome and their satisfaction to the clinical department showed no correlation in general, but the result could be different in lower satisfaction program, which may show strong correlation between them. The learning outcome of students and satisfactory evaluation results for clinical program should be monitored regularly and analyzed carefully. They are generally independent but can also be interactive in some specific situations, which may conceal issues to be solve immediately.

9KK17 (3394)

Comparison of the results of the graduation surveys of Yeditepe University Faculty of Medicine between the years 2013-2017: What has changed regarding the self-perceived competency level of medical graduates on program outcomes?

Authors

Güldal İzbırak, Yeditepe University, Faculty of Medicine, İstanbul, Turkey

Ayşe Arzu Akalın, Yeditepe University, Faculty of Medicine, İstanbul, Turkey

Elif Çiğdem Altunok, Yeditepe University, Faculty of Medicine, İstanbul, Turkey

Kevser Vatansever, Ege University Faculty of Medicine, Izmir, Turkey

Halil İbrahim Durak, Ege University Faculty of Medicine, Izmir, Turkey

Presenter:

Güldal İzbırak, Yeditepe University, Faculty of Medicine, İstanbul, Turkey

Background: The undergraduate program outcomes of Yeditepe University, Faculty of Medicine were revised in the year 2013. 47 program outcomes were defined under seven roles namely; (1) physician at primary health care level, (2) leader and manager at primary health care level, (3) advocate of health for community and individuals, (4) ethical medical practice, (5) communicator and collaborator with all stakeholders, (6) researcher and scholar in medicine, (7) effective career manager. Since the academic year 2013-2014 the graduate questionnaire regarding the program outcomes has been applied to graduates at the end of the each academic year.

The aim of this study is to compare the self-perceived competency level of medical graduates at different years on curriculum outcomes. This study is planned as a panel study which serves to the continuing revision process of undergraduate medical education program as a whole. The results it was applied was shared in AMEE Conference 2015 as oral presentation.

Method: A questionnaire including socio-demographic variables and 47 items related to competencies were applied to all 200 graduates. The graduates rated each item on a ten point categorical scale from least to highest competency level.

Results: The internal consistency of questionnaire was high (Cronbach's 0,974). The average competency score under the role of primary care physician was higher (7,3413±1,04987) in 2017 compared with the total average score of the previous years (6,8820±1,24277), (p-value =0.025,statistically significant). Similar results were observed for health advocacy (7,4022±1,26434 / 6,8101±1,60551) and ethical medical practice (7,5057±1,44694 / 6,9348±1,57734), (p-value = 0.023 and 0.030 respectively, statistically significant).

Discussion: The average scores of the leadership and managerial role competencies were relatively higher although there was no statistical significancy which could be explained by the implementation of a new clerkship program, Transition to Clinical Settings in the year 2014.

Also seminars in Internship program could have supported these differences.

Conclusions: We conclude that the results of graduation surveys serve as an important component of program evaluation.

Take-home message: Graduation surveys aiming to obtain students' ratings of their competency levels, are much more efficient if they are applied continiously and systematically.

SESSION 10: SIMULTANEOUS SESSIONS

Wednesday 29th August
0830-1015 hrs

10A: Symposium: Assessing Social and Behavioural Sciences in Medical Education: Square Peg in a Round Hole

Location: Event Hall
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Jeni Harden, UK
Tracey Collett, Plymouth University, UK
Dan Hunt, AAMC, USA
Ellie Hothershall, University of Dundee, UK
Kathy Kendall, University of Southampton, UK
Hiroshi Nishigori, Kyoto University, Japan
Madalena Patricio, University of Lisbon, Portugal

Summary: Attention has turned in recent years to the broader inclusion of social and behavioural sciences (SBS) in medical curricula. However, there is as yet only limited evidence about how best to assess these subjects. This is very pertinent given that SBS questions have recently been included in the MCAT exam in the USA (in MCQ format) and are likely also to be included in the proposed UK Medical Licensing Assessment. This symposium will discuss key issues including: whether and how SBS is included in assessment blueprinting; what is being assessed (knowledge, skills, competencies); and whether, and on what basis, tools used for assessing SBS are considered to be 'fit for purpose'. We will hear from speakers representing a range of educational contexts. Each speaker will identify a key challenge which we will then open for discussion among the panel. Those attending the symposium will be invited to participate with questions and comments in the traditional manner and via Padlet (an online collaborative space). Although focussed on SBS, the symposium is of wider relevance to medical educators interested in assessment.
Format: Short presentations by a maximum of 4 speakers followed by a discussion of the key challenges identified. The panel (speakers and a discussant) will respond to questions and comments from the symposium participants. We would prefer to make this interactive so we plan to encourage discussion via Padlet, the online collaborative wall which participants can access during and after the session.
Who should participate in the symposium? The primary group attending this session is likely to be those with an interest in SBS. We have demonstrated in our AMEE sessions (workshops and a symposium) over the last three years that there is a strong interest in this area. However, this session will also appeal to those with interests in assessment more generally including those with interests

in other areas that are often regarded as more challenging to assess such as humanities and professionalism.

10B: Symposium: Undergraduate National Medical Licensing Exams from an international perspective: lessons learned and future directions

Location: Montreal, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Sören Huwendiek, Institute of Medical Education, Bern, Switzerland
Raphael Bonvin, Medical Education Unit, Fribourg, Switzerland
Brian Clauser, National Board of Medical Examiners, Philadelphia, USA
Ingrid de Vries, Medical Council of Canada, Ottawa, Canada
Mi Kyoung Yim, Korea Health Personnel Licensing Examination Institute, Seoul, Korea
Marc Braun, conseil scientifique du CNCI, Nancy, France
Christoph Berendonk, Institute of Medical Education, Bern, Switzerland

Summary: A national licensing exam (NLE) represents a very special type of high stakes exam. It is typically a large-scale "one shot" exam that assesses several years of training. The licensing role of those exams require them to be highly defensible. With all these constrains, NLEs can assess certain competencies and use specific methods. This symposium will offer an insight into the assessed competencies and the assessment methods used from the perspective of five countries running such exams (Canada, USA, France, Korea and Switzerland) and discuss the lessons learned and future directions among the presenters and with the audience. As deeper insights in these important issues concerning NLEs are usually not easily accessible we decided to establish this symposium.
Who should participate in the symposium? All who are interested in high stakes assessment and want to get more insights on the lessons learned and future directions drawn from NLEs.
What will they gain from participating? Participants will get an insight into the National Licensing Exams of four countries. In particular, they will learn about following aspects:
Main experiences and lessons learned from countries with established NLEs concerning the competencies assessed and methodological approaches used.
Visions and future directions for NLEs from an international perspective.
Further, participants will be invited to reflect on how to transfer these reflections to the exams they are involved with.

10C: Symposium: Glocalisation of Medical Education and the Teacher's Role

Location: Sydney, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Dujeepa Samarasekera, National University of Singapore, Singapore
Lambert Schuwirth, Flinders University, Australia
Lee Shuh Shing, National University of Singapore, Singapore
Matthew Gwee, National University of Singapore, Singapore
Yvonne Steinert, McGill University, Canada

Summary: Educational discourse in recent years has increasingly centred on the 'twenty-first century skills' that aim to prepare students to meet the challenges and demands of the society. There is also a trend in adopting and adapting curricula, teaching-learning methods /materials and assessment formats conceptualised and operationalised in different countries/settings to one's own. Most times, educational philosophies, cultural and contextual issues have been ignored when operationalising these educational activities. This has led to ground level challenges where the teachers and students have been struggling to cope. Consequently, many misconceptions have colored the actual discourse leading to conflict and negative impact to international collaboration in medical/health professions education. However, Clifford (1988, p. 76) mentioned that "We come to understand our own culture by trying to understand others". In this symposium, instead of highlighting the differences between cultures and educational philosophies, we would like to discuss some of the best practices in incorporating and contextualising such educational activities with different philosophies in order for the medical/health professionals to acquire skills required for the 21st century. Clifford, J. (1988). The Predicament of Culture: Twentieth Century Ethnography, Literature, and Art. Cambridge, Massachusetts: Harvard University Press.
Who should participate in the symposium? The symposium is suitable for teachers, academic heads, curricular leads of undergraduate and post graduate medical education, program directors and mentors of health professionals.
What will they gain from participating? After attending this session, participants will gain understanding of: glocalisation in different settings or context contextualisation of different educational activities adopted or/and adapted in different countries roles of teaches in incorporating cultures and educational philosophies in adopting or/and adapting different educational activities.

10D: Symposium: Social Realities Impacting Medical Education - XVI Iberoamerican Session

Location: Singapore, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Alberto Dougnac, ASOFAMECH, Chile
Milagros Garcia Barbero, SEDEM, Spain
Julio Cesar Gomez, AMFEM, Mexico
Geneviève Moineau, AFMC, Canada
Debora Silva, AAMC, Puerto Rico
Pablo Pulido, PAFAMS - IAI, Venezuela
Ricardo Leon Borquez, PAFAMS, México

Summary: The main challenge for education in the health professions resides in the demonstration, by the educational institutions, of their contribution to health systems performance for the population they serve. Identification of Key problems and priorities along with accepted social responsibility are needed.
New models for provision of healthcare services are emerging as a result of natural disasters, earthquakes, hurricanes as well as economic, political violence, migrations and financial crises in the countries and regions. The scope and complexity of these problems require comprehensive quality solution. Significant challenges in society and in science and technology may end up requiring understanding to be addressed appropriately. If not resolved promptly, medical education and health systems of the future could be shrouded with uncertainty, or potential instability.
This session will analyze concrete examples of interactions between academic Institutions, public health policies and results of the real impact and involvement of Medical Schools. Addressing new health care determinants with social justice and responsibility.

10E: Research Papers: Discourse and Theory

Introduction: Formal accreditation standards shape key structures and practices by powerfully influencing what is taught in health professions education. Accreditation systems in healthcare are intended to improve patient care and reflect the values of a profession. One essential step in promoting core ideals such as compassion and caring is to ensure that these professional values are emphasized within formal accreditation standards and related documents. Accordingly, this research project critically examined caring and compassion in the accreditation standards for Canadian nursing and pharmacy education.
Methods: This project used accepted principles and practices of critical discourse analysis to interrogate accreditation standards and related pertinent documents. In addition to this primary textual archive, the project team also analyzed secondary documents, consisting of regulatory documents related to health professions education and other key profession-specific policy documents.
Findings: Accreditation standards for pharmacy and nursing education foreground curriculum development and delivery, education program outcomes and evaluation processes. Both sets of standards also introduce quality as a fundamental goal of the accreditation process and draw heavily on the competencies and education outcomes defined by their associated regulatory bodies.
A key finding was the relative absence of the words caring and compassion in the documentary archive. In the nursing accreditation standards, the words 'caring' and 'compassion' were not found, however compassion was found in 11 places in the nursing documentary archive. All references to compassion were from a single regulatory competency document (i.e. Jurisdictional Competency Process, 2012) in which 'compassionate' was listed adjacent to the terms 'safe', 'competent', and 'ethical' to describe nursing care in a variety of practice settings.
In the pharmacy accreditation standards, although the word 'compassion' appears in the introductory preface alongside the terms 'empathy' and 'integrity', it does not appear subsequently in the standards. There is also no explicit reference to compassion found in the associated documents for pharmacy education.
Discussion: In the documentary archive, the listing of compassion contiguously with other terms has the effect of deemphasizing its importance. When the term is but one of several listed concepts, it does not suggest primacy of compassion and caring, despite these being key concepts in humanistic healthcare education. In our analysis, we also found an explicit focus on educational outcomes and competencies, which highlight education processes such as curriculum development, delivery and evaluation. Notwithstanding the necessary importance of a focus on outcomes in any accreditation program, the absence of any substantive emphasis on compassion in a healthcare education program is problematic. We realize that it is possible that accrediting bodies view compassion as more of an ideology to be subsumed under educational program values and curricula. Nevertheless, although the term 'compassion' itself is amorphous, it is arguably the most important professional ideal of any healthcare provider.
Conclusion: Healthcare practices will be imperiled if we ignore the importance of training practitioners to provide humane, compassionate, person-centered care. Accreditation standards must include fundamental professional ideals such as caring and compassion. Healthcare education programs must explicitly espouse these professional values. Those teaching in educational institutions must also ensure that they train professionals to be caring and compassionate health care providers. This project provides essential information to ensure alignment of formal standards for nursing and pharmacy education accreditation with core values of compassion and caring that are essential for holistic, person-centered healthcare.

Recognising, valuing and enhancing the role of clinicians who teach: an exploration of medical school practices

Authors

Claire MacRae, University of Edinburgh Medical School, Edinburgh, UK
Derek Jones, University of Edinburgh Medical School, Edinburgh, UK
Terese Stenfors, Karolinska Institutet, Stockholm, Sweden

Presenter: Claire MacRae, University of Edinburgh Medical School, Edinburgh, UK

Introduction: A great deal of undergraduate medical teaching in Scotland is delivered in the workplace by practising doctors, many of whom do not have a formal contract with their medical school. Increasingly these doctors complain that they feel unappreciated by and disconnected from their medical schools. This issue is of concern, because teachers who do not feel valued are likely to lack motivation to participate in faculty development, and ultimately the absence of any formal accountability means that they could refuse to teach at all. Our research aimed to explore why teachers and teaching in one medical school were perceived to be undervalued despite formal efforts to recognise contributions to teaching, and to suggest realistic ways to improve the situation.

Methods: A critical realist (CR) perspective was adopted, allowing 'the medical school' to be analysed as a unit consisting of more than the sum of the individuals it employs. The 'depth ontology' of critical realism acknowledges complexity and the unseen effects that organisational rules and norms have on individual behaviour. CR research begins with a problem, and attempts to understand why it arose and why it persists [1]. It assumes that problems experienced by individuals or groups have 'real' causes, often located at organisational level.

A qualitative, mixed-methodological approach was taken, combining a CR case study [2] with Critical Discourse Analysis (CDA) [1]. An intensive, transdisciplinary theoretical phase identified potential causal mechanisms of the issue, which were then investigated empirically. A corpus of around 1000 organisational documents related to undergraduate medical education was analysed using CDA. This documentary analysis was then combined with the wider case study data, including structural features of the organisation, perspectives of individuals, and the positioning of the organisation in its social, historical and cultural contexts. Continuous, iterative comparisons of data and theories then suggests the most likely mechanisms.

Results: Four types of contributing factor were identified:
1. 'Interventions', particularly overuse of teaching awards creating a winner-loser culture;
2. 'Organisational factors', such as prioritising assessment and quality assurance during meetings whilst neglecting to talk about teaching at all;
3. 'Individual factors', including breach of the 'implied contract' governing who, what, how and when clinicians expect to teach;
4. 'Contextual factors', including government initiatives to reduce doctors' autonomy and to regulate the profession.

Discussion & conclusions: Faculty development research is often conducted by, or for, education organisations seeking insights into the 'best' ways to recruit, retain and train faculty. However, changes implemented following such research may yield disappointing results, as tensions arise when attempting to balance individual attitudes, beliefs and experiences with organisational constraints, including time, money and regulatory frameworks.

Our results suggest that the problem being investigated is the cumulative result of many linked factors interacting over a period of time. We feel that our findings can inform multiple small, feasible changes at key points in these chains, such as reducing the emphasis on award ceremonies, and including more teaching related 'standing items' on committee agendas which are more likely to lead to long-term success.

The next phase of our research involves comparative case studies in two other medical schools to further explore the extent to which organisational and regulatory contexts affect this issue.

Presenter: Zac Feilchenfeld, Sunnybrook Health Sciences Centre, Division of General Internal Medicine, Department of Medicine, University of Toronto, Canada

Introduction: In recent years point-of-care ultrasound (POCUS) has become a widely used clinical tool in a number of clinical specialties. In response, POCUS has been incorporated into medical curricula across the learning continuum, bolstered by enthusiastic appraisals of the technology's benefits for learners, clinicians, and patients. In research previously presented at AMEE and subsequently published, we found an absence of evidence supporting the incorporation of ultrasound in undergraduate medical education.1 In our current work we have sought to understand the nonetheless persistent enthusiasm for increasing integration of POCUS into medical education.

Methods: We conducted a Foucauldian critical discourse analysis (CDA) to identify and analyze discourses that legitimize and privilege the use of POCUS in medical education. We assembled an archive beginning with articles retrieved from MEDLINE using search terms "ultrasound," "ultrasonography," and "medical education;" added relevant texts from reference lists; and used Google Scholar to add relevant articles that cited titles already included in our archive. All 1553 articles were evaluated for relevance: we excluded articles that did not address ultrasound and medical education by reading titles and abstracts (741), full texts where no abstract was available (248), or after initial inclusion due to a more thorough evaluation (91). Our archive contained 573 texts

published in journals between 1980 and 2017. Each article in the archive was analyzed to identify frequently occurring truth statements (expressing concepts whose truth need not lie in evidence, but are unquestioned within particular discourses).2 We used these truth statements to characterize the major discourses that construct representations of POCUS in medical education.

Results: We identified three dominant discourses that have emerged and developed over recent decades: 1) A visuo-centric discourse prioritizes visual information provided by the ultrasound machine as more 'truthful' than clinical data obtained via other means or other senses than sight. 2) A utilitarian discourse emphasizes the clinical utility of POCUS in improving patient care, and the need for dedicated training to achieve competence, necessitating ultrasound-integrated curricula across the continuum of medical education. 3) A modernist discourse redefines POCUS as the central clinical and educational tool of the 21st century physician, replacing centuries-old outmoded tools that should no longer belong in our modern, technological world. As is expected in CDA, these discourses overlap and converge; in this instance, the core discursive effect makes the further elevation of POCUS in medical education, and the corollary attenuation of other curricular priorities, appear inevitable.

Discussion & Conclusions: Dominant discourses influence what can and cannot be said, what is or is not questioned, what is 'natural' or 'obvious'. In our archive, the increasing integration of POCUS into medical education appears discursively to become natural, obvious and inevitable. Evidence for the utility of POCUS (in clinical or educational applications) is therefore not required, and any absence of evidence can be dismissed as evidence only of insufficient study, which would indubitably uncover expected and accepted truths. Therefore, these three dominant discourses, separately and together, engender ideal conditions for the proliferation of POCUS in medical education. Identifying these discourses and their underlying assumptions allows critical scholars to ask questions that do not take for granted these supposed truths. While our findings are provocative, proposed curricular changes deserve rigorous assessment and critique, especially when endorsing a change that calls for considerable financial and temporal investment with unknown risks and benefits.

Introduction: Continuous professional development (CPD) has been historically perceived as separate from clinical workplaces. Leaders in CPD argue for an evolution of the field, advocating for better alignment between educational delivery and workplace needs. Proposed CPD strategies include developing curricula in response to workplace priorities and situating education directly in the workplace setting. However, health care organizations are not empty vessels. Instead, these organizations are occupied by near constant change efforts. These change efforts are often accompanied by workplace initiated CPD programs. As a result, these organizations are discursively crowded spaces with their own implicit and explicit pedagogies: theories and practices of what, when, and how professionals should learn. Pedagogical tensions likely exist between university based CPD programs and workplace initiated change efforts implemented through CPD programs. These tensions must be understood, otherwise we risk CPD continuing to operate as separate from – and potentially irrelevant to – the larger aim of improving patient care.

Methods: We chose a single case study approach to explore pedagogical alignments and possible tensions between existing university based CPD and workplace initiated CPD. In this case study, we engaged in a discourse analysis of two educational programs operating within the same institution. The first was a formal CPD program developed by the affiliated university. This university based CPD program emphasized interprofessional collaboration and communication, with a declared aim of improving patient safety and the quality of patient care. The second was a formal workplace based curriculum implemented by an urban hospital network. This workplace based curriculum was one element of a large scale organizational change effort also with the declared aim of improving patient safety. We deployed a governmentality analytic (Dean, 2010) to examine the two curricula, paying particular attention to alignments and misalignments between the two.

Findings: The two curricula shared many declared principles: a commitment to team based learning, an emphasis on communication, and explicit valuing of interprofessionalism. However, there were nuanced pedagogical differences: there were different forms of knowledge were being deployed, different curricular foci/priorities, different techniques and technologies of learning, and different implied expectations of what it meant to be a good professional. Most notably, the analysis of the two curricula highlighted a potential disconnect between the university based CPD as "transformational adult learning" and the workplace based CPD as "human resource management".

Discussion and Conclusions: While both programs were considered examples of CPD to improve patient care, they displayed different assumptions about education and practices to drive learning. This is not to suggest that one

is inherently superior to the other. Either curriculum could be valorized or critiqued within its own domain. What is striking is the intersection between the two, particularly as they are acting under similar banners (improving patient care) within the same organizational space. However, the two programs implicitly displayed disparate ways of being a good professional. While both the university based and the work place based CPD programs aim to improve patient care, they compete for influence on professional identities. This analysis questions whether CPD programs and workplace based change efforts – even those with the same declared aims – are always benignly aligned (Fenwick, 2010). Explicit consideration of these tensions advances our understanding of workplace learning and provides guidance for educators that wish to align CPD more explicitly with clinical workplaces.

A systematic review of theory in general practice vocational training research. What theory, in what way and to what purpose?

Authors

Abstract Text:
Introduction: Scholars call for more effective use of theory in educational research. Biesta et al identify that researchers require 'theoretical connoisseurship'(1). To gain theoretical connoisseurship they recommend that we first need to understand what and how theory is currently being used. While there is much written about how theory should be used, there is little investigation into how it is actually used. Our interest is in general practice (GP) vocational educational research, an area of medical education research that is particularly lacking in theoretical framing(2). Our systematic review answers the research questions: what theory is being used in GP vocational education research, in what way and to what purpose?
Methods: We used a thematic systematic review methodology following the PRISMA guidelines. We searched the Ovid MEDLINE, ERIC and PsycINFO data bases for a five-year period between 2013 and 2017. Our search parameters were variants of 'GP', 'Education', 'Post-graduate/Pre-fellowship' and 'Theory'. The collected articles were analysed from both a descriptive and an interpretative perspective for: context; theory used; the way theory was used; and the purpose for which theory was used. We built our analytic framework in an iterative way as we approached our data. The interpretative component of our analysis incorporated team discussion in order to draw on each team member's contrasting experiences and perspectives.
Results: Twenty three papers met our selection criteria. There was a spectrum of engagement with theory in GP vocational training research from gesturally to substantively. Theory was used for range of purposes. These included using theory as a justification for an intervention, as a sensitising frame, as an interpretive tool, and as a positioning manoeuver for credibility. Some authors used specific theories and others drew on constructs from multiple theories creating a theoretical 'hue'. Authors took different positions with regard to theory including theory as an expression of orthodoxy or the ideal, theory as a utility and theory as an object of examination itself. Theory and methodology sometimes aligned and sometimes did not. Theory could add depth to the research and sometimes it was an adjunct to the main narrative.
Discussion and Conclusion: There is a broad range of ways that researchers position and use theory in GP vocational educational research. The way theory is used changes both the fundamental design of the research and its rhetorical impact. By being aware of the ways theory can be positioned and used, researchers can make informed choices in their use of theory so that theory adds depth to the research and its use aligns with the intended rhetorical impact.

Co-productive learning health care practices

Authors
Karin Thörne, Linköping University, Linköping, Sweden

Presenter: Karin Thörne, Medical Faculty Linköping University, Linköping, Sweden

Introduction: Health care is characterized by increasing complexity with large amount of actors, technologies and calls for patients' involvements. A great deal of knowledge opportunities are however lost to patient and professional when they need it. There are urgent needs of reform in health care practices (Frenk). To better understand how everyday learning happens and can be developed in practice can contribute to such needs, physicians´ being important enabler.
Theoretical perspectives of professional practices include what a group of people do in a particular time and at a particular place as meaningful activities. The way a specific practice is arranged both socially and materially forms practitioners´ understandings and actions. These arrangements, unique in each practice, are defined as practice architectures (Kemmis). By applying practice architectures', we provide answers and can contribute to how to improve practices and learning.
The aim is to deepen understandings of learning and interaction in health care practices through (I) investigating health professionals' pedagogical processes in interaction with patients and (II) physicians´ own learning and support of the learning of others in daily work. Through focusing a specific health care practice, (III) investigate how social and material conditions influence interactions between participants and (IV) how junior physicians´ learn when they participate.
Method: The first study used individual interviews of three professions in several disciplines, focus groups in each profession and team interviews (I, II). In the second data was a changed model of ward round practice in a destined room with one patient at a time, aiming to improve patients' active participation and collaboration between professionals. It was interpreted through an inductive and theory driven interactive research approach with a field study design (II, IV).
Results: I. There was significant amount of pedagogical processes embedded in daily work with patients, usually not planed and summarized in the concept of "read (needs of learning) – guide (how to support learning)- learning support". II. During daily work physicians dynamically alternated between their own learning and the support of the learnings of patients´/staff/generations of physicians in individual patient processes and in interconnection with physicians versatile mobility across different contexts, with their participation in multiple communities of collaboration and through tensions between responsibilities. III. The practice architecture in

the changed ward rounds formed co-productive learning rounds in interplay between patients "double participation" (as people and as information on screens) and groups of professionals. IV. Specific socio-material interconnections caused junior physicians´ overly involvement in administrative work, distancing them from patients, and left them working in solitude from other professionals´. Observing other professionals' provision of medical care refined the junior physicians' theoretical knowledge, but their learning through their own actions providing medical care was limited.
Discussion & Conclusion: There are strong needs to reveal and increase awareness of learning and learning support as important parts of daily health care work, which to date are almost silent discourse. Contextualized health care practices have opportunities to change into co-productive learning practices being sources for continual improvements. Not taking junior physicians' learning in practices into consideration risks marginalization of their professional development. The theoretical lens of practice architecture helps us to understand relationships between practice, learning, and change. And also a concrete transformational resource for making practical judgements about what to be done at specific workplaces getting continuing learning the heart of the practices.

Influence of Different Scoring Algorithms for Multiple True-False Items on the Measurement Precision of Multiple Choice Exams

Authors

Sören Huwendiek, University of Bern, Institute of Medical Education, Bern, Switzerland

Presenter: Felicitas-Maria Lahner, University of Bern, Institute of Medical Education, Bern, Switzerland

Introduction: High measurement precision in assessment is of main concern in medical education. It ensures competent candidates pass and incompetent candidates fail an exam, and not vice versa. Measurement precision can be estimated globally, as well as specifically at the cut score. Multiple True-False (MTF) items are a multiple-choice question format that prompts true/false decisions to all options to an item, enabling partial knowledge to be rewarded. Rewarding partial knowledge, in return, can

affect measurement precision. MTF items are either scored dichotomously by rewarding no partial knowledge (DS), to reward every bit of partial knowledge (PS1/n) or to reward partial knowledge, but with a threshold to suppress marginal knowledge and guessing (e.g. above 50% correct true/false decision to an item, PS50).

This PhD thesis analyzes the influence of different scoring algorithms for MTF items on the measurement precision of medical exams.

Methods: To investigate the influence of scoring algorithms, we performed three studies. First, we analyzed the effect of scoring on global reliability, i.e. Cronbach's alpha. In a second study, we analyzed how to calculate measurement precision at the cut score by introducing the concept of conditional reliability, using both Item Response Theory (IRT) and Classical Test Theory (CTT). In the third study, we analyzed the influence of scoring algorithms of MTF items on the measurement precision at the cut score by determining the conditional reliability and conditional Standard Error of Measurement (cSEM) at the cut score, and the number of candidates with ambiguous results.

Results: We could show that rewarding partial knowledge in MTF items indeed influences measurement precision, both at a global level as well as at the cut score. In the first study, we could show that crediting partial knowledge with a threshold (PS50) leads to high global reliability. In the second study, we introduced the concept of conditional reliability to analyze measurement precision at the cut score, showed that results are quite contrary in IRT and CTT and argued to use it in IRT. In the third study, we showed that scoring MTF items with PS50 leads to high conditional reliability and low cSEM at the cut score, as well as the lowest number of candidates with ambiguous results.

Discussion and Conclusion: With this PhD project, we comprehensively analyzed the influence of scoring for MTF items on the measurement precision in summative medical exams. By examining the effect of different scoring algorithms, we advanced the understanding regarding measurement precision introducing the concept of conditional reliability to assessment in medical education. Since rewarding partial knowledge above a certain level showed high global reliability, high conditional reliability and low cSEM at the cut score, as well as the lowest number of candidates with ambiguous results, we recommend using this scoring algorithm. To use real data, we simulated different scoring algorithms on existing items that were originally constructed for rewarding partial knowledge (PS50). It would be interesting to analyze whether these results hold true if items are constructed with another scoring algorithms in mind.

Quantifying Two Dimensional (2D) and Three Dimensional (3D) Anatomical Learning Using a Neuroeducational Approach

Authors

Sylvain P. Coderre, University of Calgary, Undergraduate Medical Education, Calgary, Canada
Kent G. Hecker, University of Calgary, Veterinary Clinical and Diagnostic Sciences; Community Health Sciences, Calgary, Canada

Presenter: Sarah Anderson, University of Calgary, Canada

Background: Advances in computer visualization enabling both 2D and 3D representation have generated tools to aid perception of spatial relationships and provide a new forum for instructional design. To date, studies examining the effectiveness of these educational tools have been comparative, using performance measurement as proxy variables for learning. A key knowledge gap in the field of health professional education is the lack of understanding of how the brain processes and learns from spatially presented content. Direct monitoring of the neural processes as learners interact with 2D and 3D representations could provide an alternative quantitative measure to direct best practices in spatial teaching and learning. Event-related brain potential (ERP) measurement by electroencephalography (EEG) has been used to examine changes in signals associated with reinforcement learning during development of perceptual expertise (1). N250 is an ERP associated with visual object recognition and amplitude increases for familiarly perceived objects. Reward positivity is an ERP associated with positive feedback and scales like a prediction error- as a subject learns, there is a diminished amplitude in response to positive feedback. The objective of this study was to compare 2D and 3D spatial learning in anatomy using a reinforcement-based learning paradigm to determine whether differences in N250 and reward positivity ERP components track learning. Methods: Health sciences students (n = 61) learned to identify and localize anatomical structures through a feedback-dependent trial and error process. Participants learned either from 2D, 3D, or a combination of 2D and 3D neuroanatomical models as EEG and behavioural (accuracy) data was recorded. Mean ERP waveforms of N250 (measured at the O1 electrode site when a participant was shown an anatomical model) and reward positivity (measured at the FCz electrode site following feedback presentation) were compared across learning.

Results: Regardless of model type all participants successfully learned how to identify neuroanatomical structures and significantly improved on post task knowledge tests. N250 is significantly greater when participants view 3D versus 2D represented anatomical images. Behavioural learning curves and reward positivity did not significantly differ when learning from 2D compared to 3D models. However, interleaved training incorporating 2D and 3D model types provided an advantage in retention and transfer activities represented by a decreased reward positivity. Similar to a behavioural learning curve representation (2), reward positivity amplitude changes across learning are symbolic of learning phases can be graphically represented. Discussion and

Conclusions: This study demonstrates the application of neuroscientific research methodologies in an educational setting to better understand perception and learning in spatial anatomy. Despite the lack of differences in behavioural-based learning outcomes for 2D versus 3D models, neural evidence reveals new insights. Participants learning from 3D models had greater object recognition while interleaved training provided advantages for memory retention. In applied settings, educators should consider these findings in the design of learning interventions that employ stereoscopic anatomical models. Validation of quantitative neurophysiological variables that measure learning will enable a direct measure of knowledge acquisition that can be used to strategically assess and optimize new forms of teaching, learning, and evaluation.

The Influence of Peers on Medical Students' Learning of Psychomotor Skills Necessary for Physical Examination

Authors

Bernard Martineau, Universiy of Sherbrooke, Sherbrooke, Canada

Silvia Mamede, Erasmus University, Rotterdam, Netherlands

Linda Bergeron, Universiy of Sherbrooke, Sherbrooke, Canada

Henk G Schmidt, Erasmus University, Rotterdam, Neitherlands

Presenter: Bernard Martineau, University of Sherbrooke, Canada

Introduction: Clerkship programs directors of and the students themselves are concerned about the insufficient mastery of the physical examination (PE) of the students upon their entry into clerkship, whereas the EP is an essential element of the diagnosis for the doctors. Most medical schools use small group learning activities to teach PE during undergraduate training. Little is known about the factors that affect the learning of PE in small-group environments, particularly with respect to the influence of peers in these activities.

Methods: This PhD thesis included a series of studies conducted with second-year medical students at Sherbrooke University to test whether peer observation, peer feedback and the order of practice influenced the acquisition of psychomotor skills needed to master PE.

Results: A first study showed that students with the opportunity to observe a peer performed better than those who did not have this opportunity (83.9% vs 75.9%, p .05). A second study has shown that the observation of a good peer performance influences positively the acquisition of PE (81.1% vs 68.3%, p > .002). Peer observation seems to help, by giving students a mental image of the performance to be learned that is closer to their ability to reproduce the gestures taught.

Peer feedback involves feedback on the performance of colleagues in small group training sessions. A third study showed that peer feedback contributed positively to the mastery of PE (89.5% vs. 86.2%, p = .02). Students receiving peer reviews learn more. However, this influence, studied in a subsequent study, remains complex. No characteristic of peer feedback, either quantity or specificity, seems to explain the positive effect of peer feedback when learning PE.

Discussion: Many students are generally reluctant to be the first to practise in a small group, so we checked in two other studies if the order of practice in a small group makes the difference. The data show that at the end of the training session, the students have a similar performance (regardless of the order they practise (p = .706) or the amount of feedback received (p = .096).

Conclusion: In conclusion, it appears that PE small group training is useful for students as learning is positively influenced by peer observation and feedback. The use of small groups to learn physical examination in health science training programs is a method of choice, not only for logistical reasons, but also for the contribution of peers to the mastery of PE of their colleagues.

The deliberate attainment of basic airway management skills via simulation and clinical exposure, demonstrates the value of focussed observation for medical students

Authors
Sarah Whereat
Anthony Mclean
Graham Hendry

Presenter: Sarah Whereat, University of Sydney, Australia

Background: In the Australian CCM (Critical Care Medicine) context, Residents (Junior Doctors) clinical experience and preparation was identified as insufficient. Inadequate knowledge of medical student learning and skill attainment along with an absence of clinical assessment during their Critical Care Medicine Rotation (CCMR) was thought to be a cause.
Method: A interpretative/constructive theoretical approach to the observation of student learning during the CCMR of the Sydney Medical School Program (SMP), used the deliberate assessment of basic airway skills, to identify both the effect of a specific assessment and the experience of the rotation on student learning.
Results: Declarative knowledge was confirmed as improved. The students' clinical management of patients' airways was equal, to their simulation capability maintaining both procedural and conditional knowledge. The assessments guided student learning. Analysis of focus group discussion identified four themes Goal setting, Observation and participation, peer learning and conflict.
Discussion: One of the core features of student learning were found to be observation and participation. 'Observation' included observing peers from across the continuum, their practice and reasoning process, with the definition of observation broader than currently identified in the literature. Participation in both simulation and clinical assessments assisted in student learning, the assessment providing structure to their learning. 'Conflict' for the students emerged, when curriculum requirements external to the clinical rotation, restricted student time to gain adequate clinical experience.
Conclusion: Skills teaching, utilizing the principles of deliberate practice, when continued into the clinical environment, guided student learning most effectively. More simulation, greater involvement with patient activities and directed learning were core to increasing experience and transfer of skill into clinical environment.
Take-home message: Deliberate assessment effectively guided students learning during the rotation. Students want to participate in more clinical activities than they currently do. Peers of all levels are vital to the success of student learning.

Broad curriculum requirements can impact on the degree of clinical immersion when specified clinical time not mandated.

10G2 (2293)
First Steps in Developing an Adaptive Curriculum

Authors
Ryan Palmer, American University of the Caribbean School of Medicine, Pembroke Pines, FL, USA
William Behrns, American University of the Caribbean School of Medicine, Pembroke Pines, FL, USA
Mark Quirk, American University of the Caribbean School of Medicine, Pembroke Pines, FL, USA

Presenter: Mark Quirk, American University of the Caribbean, Pembroke Pines, FL, USA

Background: The Adaptive Curriculum is an idea gaining greater acceptance in the medical education community. The concept is a dynamic educational experience that adapts to the individual needs of the learner who strives to achieve defined competencies. It is the "Holy Grail" of many medical education programs yet, to date, implementing an adaptive learning and teaching system has largely been theoretical. Practical, scalable implementations of curricular components need to be tested and adopted.
Method: This presentation will describe a promising implementation of an Adaptive Curriculum component at one international medical school. Presenters will demonstrate a system that uses a unique combination of formative quizzes and exams to produce individualized feedback to improve learning outcomes. All students receive quizzes in each course each week with feedback and the opportunity to achieve 100%. After feedback, students can retake summative exams (different versions) and choose the best score. Through standardized spaced reporting of results, formative 'data' not only directs student studying but also faculty teaching and academic support efforts. The process represents assessment 'for' as well 'of' learning.
Results: Initial findings indicate a statistically significant improvement of scores on exams as a result of the adaptive system. Data on the correlation between formative quiz and exam data will also be shared. Additionally, consistent reporting of student assessment data facilitated robust, dynamic adjustments at the student, faculty and administrative levels. Struggling student issues were proactively addressed, improving student success. The system also helped facilitate synergy between the multiple institutional stakeholders.
Discussion & Conclusions: Assessment data, both formative and summative, is proving to be an essential 'adaptive' data source for our institution's growing adaptive curriculum. Though standardized assessments and consistent reporting, all institutional stakeholders consistently accessed student performance data and applied institutional resources accordingly.
Take-home message: Institutions seeking to implement adaptive curricula should start by transforming assessment systems to 'assessment for learning.' This

begins by identifying educational data sources that are consistent across the curriculum and easily consolidated for educational reporting.

Medical students' achievement emotions and preferences for testing among supplemental study resources

Authors
Sean Tackett, Johns Hopkins Bayview Medical Center, Baltimore, USA
Alice Hudder, Lake Erie College of Osteopathic Medicine, Erie, USA
Matthew Lineberry, University of Kansas Medical Center, Kansas City, USA
Kim Moscatello, Lake Erie College of Osteopathic Medicine, Erie, USA

Presenter: Sean Tackett, Johns Hopkins Bayview Medical Center and Osmosis, Baltimore, USA

Background: Adaptive learning, believed to maximize learning efficiency and foster self-regulated lifelong learning, requires frequent and learner-driven self-assessment.
Achievement emotions may influence learner's engagement with self-assessment. For example, students with greater mastery goal orientation (i.e. learning for learning's sake) may be more likely to seek "desirable difficulties" for learning, such as testing oneself. Meanwhile, those with stronger performance avoidance orientations (i.e. avoiding looking incompetent) may prefer more passive strategies and avoid receiving the negative feedback that can follow assessment items.
The goal of this study was to investigate relationships between achievement emotions and selection and usage of supplemental study resources.
Method: After IRB approval, surveys were given to all first year medical students on Lake Erie College of Osteopathic Medicine's (LECOM's) Erie campus in September 2016. Students completed an achievement emotions inventory and reported to what extent they used 16 common supplemental study resources; responses were dichotomized as trying or using the resource vs never trying it. Survey data were merged with students' item response data from Osmosis, a web- and mobile app provided to first year LECOM students for free. Bivariate analyses were performed for the 5 curricular supplements with at least 15% students reporting they tried it, with Bonferroni correction applied to p values.
Results: A total of 172/268 (64%) students completed surveys. Most (72%) tried at least one supplemental resource. The resources with at least 15% of students trying them were Osmosis (32%), Anki (26%), Kaplan (25%), FirstAid (17%), and SketchyMicro (16%).
Mastery learning approach was strongly associated with students' reported use ($p<.002$) and number of items answered in Osmosis ($p<.002$). Performance avoidance orientation trended with fewer items answered in Osmosis ($p-=.054$). No statistically significant associations were found when comparing achievement goal orientations to use of the other 4 resources.

Discussion & Conclusions: Student use of supplementary resources is common, and the most popular ones offered self-assessment opportunities. Goal orientation may predict preferences for testing, which has been shown to make learning more efficient.
Take-home message: Shifting students toward mastery goal orientations might improve their engagement with self-assessment and adaptive learning.

10G4 (2781)
The Role of Student Moderators in an Adaptive Curriculum: Lecture Capture Review

Authors
Phillip Pearson, American University of the Caribbean, Dutch Lowlands, St Maarten, Netherlands Antilles
Mark Quirk, American University of the Caribbean, Dutch Lowlands, St Maarten, Netherlands Antilles

Presenter: Phillip Pearson, American University of the Caribbean, Dutch Lowlands, St Maarten, Netherlands Antilles

Background: The value of questioning in learning is becoming increasingly clear (HL Roediger et al. J Experimental Psychology Applied 17 (2011), 382-395 and MA McDaniel et al. J Educational Psychology 103 (2011), 399-414). Previously, we demonstrated that a question and answer (Q&A) function on a lecture capture platform increased quiz scores and subject matter comprehension by faculty answering asynchronously submitted student questions. This presentation reviews those findings plus additional results of a follow-up study that investigated the use of student moderator- led online discussions to solicit additional Q&A from students and increase student dialog to increase quiz scores and subject comprehension.
Method: Two hundred and four embryology students participated in the first part of this study. Students were incentivized to use Echo 360 Q&A by demonstrating its ease of use and its ability to increase quiz scores. In part two, nine student moderators replied to questions on the Q&A module and asked additional questions under faculty guidance to 112 embryology students. Statistical analyses focused on quiz performance linked to specific questions and overall performance was compared to performance of a previous cohort that did not have student moderators and/ or did not use the Q&A module. Authors also compared quality of students' questions and satisfaction of this type of learning with and without moderators.
Results: Use of Q&A was significantly related to better quiz performance ($p<0.05$). Use of student moderators increased the overall number of student responses online by 26%. A substantial increase (13%) in students responded to question threads by asking additional questions. The quiz scores also increased by 7% compared to this module use without moderators and 14% without Q&A. Comparing comprehensive exam scores to previous semesters also showed an increase of 6%. The quality of student questions and satisfaction with this type of learning also improved using moderators.
Discussion & Conclusions: The act of self-questioning has been linked to deep vs. surface learning and this has been

correlated to long-term knowledge retention. Student moderators working in 'the parallel curriculum' helped adapt student learning and improve outcomes.

10G5 (2900)
Crowd-sourcing for assessment items to support adaptive learning

Authors
Sean Tackett
Rishi Desai
Steven Haist
Shiv Gaglani
Amy Morales
Mark Raymond

Presenter: Mark Raymond

Background: Adaptive learning requires frequent and valid assessment for learners to track and accelerate progress against their own goals. While adaptive learning seeks to ensure self-regulated and lifelong learning, generating the many assessment items that this requires is challenging. The goal of this study was to determine if "crowd-sourcing" could generate items that meet the highest standards for valid assessment.

Method: In November 2015, all registered users of a web- and mobile app commonly used by medical students as a curricular supplement were given the opportunity to submit case-based multiple choice questions (MCQs). After determining who could effectively create MCQ items that adhered to National Board of Medical Examiners (NBME) question-writing guidelines, the best 11 writers (9 of whom were medical students) were asked to write 10 items each related to gastrointestinal and cardiovascular pathology targeted at second year medical students enrolled in graduate medical education programs. After review by 2 physician content experts, items were sent to the NBME who identified 5 internal medicine physicians who rated each item for relevance and accuracy. The best items were included on clinical subject exams completed by a U.S. national sample (approximately n = 235 students per item), and analyses were done to determine item performance.

Results: The 11 writers completed a total of 220 items. Of these, 78% met relevance and accuracy standards based on content review by the 5 internists. When included in exams, 50% met statistical standards for inclusion in national standardized exam question banks. Of those items not meeting statistical criteria, about one-half were too easy (p-value > 95% correct), while another half had low discrimination indices (r < .10).

Discussion & Conclusion: Quality ratings by experts and statistical performance on exams for items produced by a "crowd" of medical learners were similar to those produced by a traditional process that employs faculty item writers.

Take-home message: Crowd-sourcing efficiently produced high-quality assessment items. Similar models may be adopted by students and educators seeking to augment their own pool of assessment items to support adaptive learning and teaching.

10G6 (2916)
Best practices in student-led instruction

Authors
Jeffrey Gordon Seegmiller, University of Idaho Medical Education, Moscow, ID, USA

Presenter: Jeff Seegmiller, University of Idaho WWAMI Medical Education, Moscow, ID, USA

Background: Student-led instruction (SLI), also known as peer-led instruction or the 'flipped classroom,' increases student engagement, conceptual understanding, capacity for self-motivated problem solving, critical thinking skills, overall educational outcome measures, and long term retention of new knowledge. Adoption of SLI in medical education is often inconsistent with few, if any, guidelines for implementation.

Method: A global search of 14 databases at the University of Washington Health Sciences Library was conducted for this literature review. The search yielded 274 results and was limited to peer-reviewed articles published in English between 2012-2017 and available online with keywords of student-led instruction and medicine and excluding wellness, community, nursing, and interprofessional. Articles not directly related to the literature review focus of medical education and editorials were excluded, decreasing the total number of articles to 65.

Results: Various student-led instruction models have been used in medical education with success. The specific method generally varies depending on instructor willingness to try different instructional approaches, learning objectives, institutional support for curricular change, student and instructor comfort with modern student-centered instructional methods, and resources.

Discussion & Conclusion: Best practice in student-led instruction was not found to be a single method, but rather encompassed a variety of educational pedagogies including: case study presentations, neer-peer instruction, team-based learning, interactive lectures, role-playing, service learning, technology-mediated instruction, and student-led interest groups. Because active learning is more dynamic than lecture, curricula often must be adapted to accommodate changes in instructional design. Obstacles to implementation include faculty and/or student discomfort and inexperience with student-centered teaching pedagogy, insufficient teacher-facilitator training and support, physical space limitations such as auditorium style seating, increased cost, poor instructional design, student discomfort with social learning environment, lack of authority, and student anxiety about active role in teaching self and fellow students. Well-planned implementation minimizes obstacles and improves student satisfaction.

Take-home message: Student-led instruction can provide a rich learning experience when planned and implemented well. Examples of best practices in student-led instruction such as those presented provide a foundation for planning and adoption of these active learning methods.

UK Fitness to Practise inquiries: Which types of doctors are under investigation and why?

Authors
Paul Crampton, University College London, Research Department Medical Education (RDME), London, UK
Asta Medisauskaite, University College London, London, UK
Leila Mehdizadeh, University College London, London, UK
Alison Sturrock, University College London, London, UK

Presenter: Paul Crampton, UCL, London, UK

Background: Each year doctors in the UK are referred for Fitness to Practise (FtP) investigations for a wide a range of issues. Whilst not all investigations lead to further action it is well documented that certain types of doctors are more likely to be sanctioned if they face FtP investigations. This study sought to understand which types of doctors were referred for FtP inquiries and whether they were complained against for particular reasons.
Method: A retrospective cohort analysis of complaints for performance in FtP from 2008 till 2017 was undertaken. We analysed sources of complaints and allegations types against the demographic characteristics of doctors. Allegation types included clinical care, teamwork and probity, amongst others. Enquiries were provided by other doctors, employers, public organisations and patients.
Results: Over half of all complaints (1844) were made against male doctors. Males were more likely than females to be complained about by patients and for issues linked to maintaining trust, while females were more often complained by their organisations and for safety issues. It is also noticed that other characteristics, such as doctors age, region of primary medical qualification, etc. are also important factors when analysing the differences in the enquiry and allegation type.
Discussion & Conclusion: The findings demonstrate the patterns within the data for FtP investigations. Certain groups were more likely to be reported than others by allegation type. Generally, males are more often subjected to FtP investigations and are more often referred for trust issues.
Take-home message: The findings inform policy makers, educationalists and practitioners about the most commonly identified characteristics of those who are reported for FtP issues. This information can be used to guide processes to help alleviate and tackle issues at an earlier stage.

10H2 (3414)
Unprofessional behaviour in doctors - is it a problem?

Authors
Pippa Watson, Manchester Medical School, Manchester, UK

Presenter: Pippa Watson, Manchester Medical School, Manchester, UK

Background: Most medical schools are now teaching professionalism to undergraduates. To what extent is unprofessional behaviour in practicing doctors an issue?
Method: A systematic literature review was performed to identify all relevant articles [full detail will be presented including search terms, databases searched and basis of article selection]. Out of 896 abstracts reviewed 73 were included in the analysis.
Results: The General Medical Council GMC describes professionalism as "behaviour which justifies the trust that patients and the public have in them"[1]. There are many reports of what might be considered unprofessional behaviour in doctors the literature ranging from disruptive behaviour (probably some 3-5% of doctors frequently display this)[2] to misrepresenting academic achievements, substance abuse (including alcohol), falsification of medical records, sexual misconduct and shirking responsibility. Other lapses of professionalism which might be viewed as more minor such as discussing personal things in hospital corridors or making fun of others appear to be even more frequent [3].
Discussion & Conclusion: Unprofessional behaviour amongst doctors is clearly an ongoing concern. This behaviour is important as it has been linked to poor teamwork ,reduced job satisfaction amongst healthcare professionals and impaired patient care. Many of these conclusions about the scope and extent of unprofessional behaviour are drawn from the American literature. Before considering how to change behaviours we need to understand the current position. An in depth international study to assess and categorise the extent of unprofessional behaviour would greatly enrich the literature.
Take-home message: Unprofessional behaviour in doctors is an on-going problem which is detrimental to healthcare services and needs to be addressed. Future work is needed to evaluate the scope of this and identify ways to reduce it.

Box ticking and Olympic High Jumping – How do Physicians accept their national Physician Validation System?

Authors

Carolin Sehlbach, Maastricht University, Faculty of Health, Medicine and Life Sciences, Department of Educational Development and Research, Maastricht, Netherlands
Marjan J B Govaerts, Maastricht University, Faculty of Health, Medicine and Life Sciences, Department of Educational Development and Research, Maastricht, Netherlands
Sharon Mitchell, European Respiratory Society, Department of Education, Lausanne, Switzerland
Gernot G U Rohde, Johann Wolfgang Goethe University Hospital, Respiratory Medicine, Frankfurt am Main, Germany
Frank W J M Smeenk, Catharina Hospital, Respiratory Medicine, Eindhoven, Netherlands
Erik W Driessen, Maastricht University, Faculty of Health, Medicine and Life Sciences, Department of Educational Development and Research, Maastricht, Netherlands

Presenter: Carolin Sehlbach, Maastricht University, Maastricht, Netherlands

Background: National physician validation systems aim to periodically appraise physicians' competence, and to ensure lifelong learning. These systems' effectiveness, however, is determined by physicians' perceptions about the system and resulting acceptance and commitment. We therefore aimed to explore physicians' perceptions and self-reported acceptance of different physician validation systems in Europe.
Method: Using a constructivist grounded-theory approach, we conducted semi-structured interviews with 32 respiratory specialists from countries with validation systems that differed with respect to requirements, procedures and consequences: mandatory revalidation (UK); mandatory, credit-based continuing professional development (Germany), and recommended annual dialogues (Denmark). We analysed interview data per country, focusing on factors influencing physicians' perceptions.
Results: Although our interviewees unanimously approved of having some validation system in place to stimulate continuing professional development and to evaluate competence, they challenged the practical implementation of these systems. Differences across countries resulted from an interaction between the individual, specific features of the system and the context. Factors influencing acceptance were assessment authenticity, and alignment of requirements with clinical practice. Other important aspects were physicians' beliefs about learning, perceived autonomy, coordinated and organisational support along with trust in the system.
Discussion & Conclusions: Acceptance levels determine any system's effectiveness. National physician validation systems therefore need to be carefully designed and integrated into clinical practice to effectively support lifelong learning and competence assessment. Findings resonate with assessment research, showing that assessment culture and assessment embedment in learning and work affect assessment acceptance and outcome.
Take-home message: National physician validation systems designed to foster continuing professional development and to assess performance for accountability purposes profit from offering activities which the individual can integrate into daily work. This can help to align individual goals with the system's intended goal to safeguard quality of care. Engaging physicians as key stakeholders to design more authentic physician validation systems might enhance their acceptance and commitment.

10H5 (428)
Care Under Pressure: a realist review of interventions to tackle doctors' mental ill-health

Authors

Karen Mattick
Daniele Carrieri
Simon Briscoe
Chrysanthi Papoutsi
Mark Pearson
Geoff Wong

Presenter: Karen Mattick, University of Exeter, UK

Background: Mental ill-health is prevalent across all groups of healthcare professionals and its high incidence is of great concern in the UK and elsewhere (1, 2). Doctors-in-training are affected both directly (e.g. by becoming ill themselves), and indirectly, by this problem (e.g. through colleagues becoming ill). Medical education is important because the 'culture of medicine' probably influences how all doctors deal with ill-health. The aim of this National Institute of Health Research-funded project is to improve our understanding of how, why and in what contexts mental health services and support interventions can be designed, to minimise the negative impacts of providing care on doctors' mental ill-health. Although there is a large literature on interventions that offer support, advice and/or treatment to medical students and sick doctors, the evidence has not been synthesised in a way that takes account of the complexity and heterogeneity of these interventions, and the many dimensions of the problem.
Method: This research is a realist review of interventions to tackle doctors' mental ill-health and its impacts on the clinical workforce and patient care, drawing on diverse literature sources. Stakeholder perspectives (e.g. doctors who have experienced mental ill-health, medical educators, representatives of patients and public, policy makers, charities) were incorporated through a stakeholder group.
Results: Our programme theory about why doctors develop mental ill-health, and why some strategies to reduce mental ill-health are more effective than others, will be presented. The focus will be on implications relevant to medical education and training.

Discussion & Conclusions: The insights gained through this research shed light into individual, organisational and socio-cultural aspects that contribute to the development of mental ill-health in doctors. Medical education and training is identified as a key component. The recommendations from this project support the tailoring, implementation, monitoring and evaluation of contextually-sensitive strategies to tackle mental ill-health and its impacts.

Take-home message: Realist review is particularly well suited to the exploration of complex problems such as the development of mental ill-health in doctors.
Medical education and training is an important aspect of the problem – and therefore also of the solution.

10H6 (530)
Do I know how my CPD might change practice? Development of a tool to code the behaviour change techniques in training courses

Authors
Jo Hart
Emma Pearson
Eleanor Bull
Lucie Byrne-Davis

Presenter: Jo Hart, University of Manchester, UK

Background: Health professional education is often an intervention to change practice, but the behaviour change content is rarely systematically studied. Educators report that behavioural science is inaccessible. There are over 50 theories of behaviour change and a recent taxonomy of techniques to change behaviour found 93 techniques in 16 domains. The breadth of theories and techniques may need adjustment if educators are to use them to study the content of training and impact on the learner and their practice. We aimed to develop and refine a tool, using the BCT taxonomy (v1), with relevant examples, which health professional educators could use to describe the content of their courses.
Method: Two psychologists observed three medical CPD courses over seven days. The BCT taxonomy (v1) was used to live-code BCTs i.e., observing and coding in real time; inter-rater reliability was assessed. A pilot e-tool contained observed BCTs with relevant examples. Six behaviour change consultants commented on its comprehensiveness and suggested revisions. Three psychologists then formally rated examples (20% were double-rated) regarding accuracy, clarity, distinctiveness from other BCTs and generalisability to other behaviours. The tool was subsequently refined.
Results: Live coding inter-rater agreement was high (Cohen's Kappa 0.75-0.89; PABAK 0.81-0.92). Forty-one BCTs were coded by at least one observer; behaviour change consultants suggested two more to enhance comprehensiveness. The pilot e-tool contained 43 BCTs with 86 examples. Thirty-seven examples were altered following recommendations; raters subsequently judged that 63/86 met all four example criteria (inter-rater agreement was 92%). The final e-tool contains 43 BCTs and 72 examples.

Discussion & Conclusions: A training version of the behaviour change technique taxonomy was systematically developed and refined to assist educators in understanding the behaviour change content of education. It had high inter-rater reliability when used by psychologists. The e-tool should now be piloted by non-psychologist health professional educators in a wider range of courses.
Take-home messages: CPD contains many techniques to change practice. These can be 'live-coded'. Coding the techniques allows them to be systematically varied and studied to understand how to optimise CPD to make practice change more likely.

10H7 (1043)
How does the education of health and social care staff lead to patient benefit: a realist synthesis?

Authors
Jan Illing
Sally Corbette
Madeline Carter
Amelia Kehoe
Hannah Hesselgreaves
Paul Crampton

Presenter: Jan Illing, Newcastle University, Newcastle upon Tyne, UK

Background: The aim of the research was to answer the question: How does education and training of health and social care staff lead to patient benefit? We explored this question using a realist synthesis approach which lends itself to explaining complex interventions.
Our theoretical approach was initially developed following the work of Kirwan and Birchall (2006) and Kirwan (2009).
Method: We conducted a systematic search of the literature to identify educational interventions with health and social care personnel and included the databases: Embase, Social Services Abstracts, PsycINFO, CINAHL, and Social Care Online. Search terms referred to three conceptual areas: education and training; patient outcomes; and health and social care occupations. Over 24000 articles involving education and patient outcomes were identified, after reading titles and abstracts this number reduced to 1149 and following full paper review to 465. The final model draws on 50 key papers that contained in depth process information. We identified the context (C), mechanisms (M) and outcome (O) variables in each paper and used Realist And Meta-narrative Evidence Syntheses: Evolving Standards (RAMESES) to guide the approach.
Results: Our model starts with when the organisation recognises the learning need and the intervention (focused on patients) is put in place. This is followed by individual motivation to learn before they attend the training and is followed by the educational intervention where the learner acquires knowledge and skills and ends with the learner both wanting to and being facilitated to transfer the learning to patients . The relationships between the contexts, mechanisms, and outcomes for each stage of the model was coded and tabulated for all

included papers and informed the model. Cases studies were used to fill any gaps in the model and revise and strengthen it.

Discussion & Conclusions: The programme theory presented illustrates how and why interventions lead to patient benefit (or fail to), enabling those implementing educational interventions to identify the key features required to support transfer of learning to patients.

Take-home message: A model has been developed and tested, and illustrates how education of the healthcare team can reach and benefit patients.

What Can We Learn from the Analysis of Top-cited Articles in Medical Professionalism?

Authors
Samy Azer, King Saud University, Riyadh, Saudi Arabia

Presenter: Samy Azer, King Saud University, College of Medicine, Riyadh, Saudi Arabia

Background: Physicians are expected to demonstrate professional behavior in their day-to-day practice. Citation counts of articles have been used by universities and funding bodies to measure scientific outcomes and assess suitability for grant applications. With the rise of social media, altmetric scores could provide an alternative assessment tool. Considering these two measures, it was decided to assess the highly cited articles on medical professionalism.
Method: The Web of Science was searched for most cited articles on medical professionalism. The identified articles were searched for key characteristics. The altmetric database was searched to identify report for each article. A model to assess the relationship between the number of citations and each of key characteristics as well as altmetric scores were developed.
Results: No correlations were found between the number of citations and number of years since publication (p=0.192), number of institutes (p=0.081), number of authors (p=0.270), females in authorship (p=0.15), or number of grants (p=0.384). The altmetric scores varied from zero to 155, total= 806, median=5.0, (IQR=20). Twitter (54%) and Mendeley (62%) were the most popular altmetric resources. No correlation was found between the number of citations and the altmetric scores (p=0.661).
Discussion & Conclusions: The top topics covered were learning and teaching professionalism, curriculum issues, professional and unprofessional behavior, defining and measuring professionalism. Only the number of countries correlated with the number of citations (p= 0.001). Countries that contributed to these articles were mainly the USA, Canada, and the UK and the articles were mainly published in Academic Medicine, Journal of the American Medical Association, Journal of General Internal Medicine, and Annals of Internal Medicine. Future studies should investigate the specific features of highly cited articles that contributed significantly as a resource in medical curricula, research or postgraduate training.
Take-home message: Top-cited articles in professionalism offer a useful resource to students and teachers interested in this area.

10I2 (378)
Talking about professionalism, do we have the words? A qualitative study to explore internal medicine residents' and attending physicians' understanding of professionalism

Authors
Marco Mancinetti, University and Hospital of Fribourg, Switzerland
Janko Kaeser, IML, University of Bern, Switzerland
Christoph Berendonk, IML, University of Bern, Switzerland

Presenter: Marco Mancinetti, University and hospital of Fribourg, Switzerland

Background: Little attention has been given to the perspectives of practicing physicians on professionalism. We don't know what residents and attending physician in internal medicine understand about professionalism and if they can speak about it. The aim of this study is to explore their discourses about it.
Our research questions: how residents and attending physician define professionalism, what they recognize as unprofessional and how they teach it and learn it.
Method: The methodological framework was based on the principles of the discourse analysis. 7 Focus groups were conducted with a total of 35 residents and attending physicians from the department of internal medicine of 4 different tertiary hospitals in Switzerland. All three investigators independently reviewed transcripts and developed codes in an iterative process.
Results: Participants in our focus groups couldn't speak easily about the definition of professionalism, stating that the meaning of professionalism is blurred for them. When speaking about the flaws of professionalism the grey zones were difficult to determinate and lead to an unresolved agreement. Learning, teaching and assessing professionalism was an issue for the participants of the interviews.
Analysing the discourses using the frameworks described by Irby we found that the participants were expressing definitions proper to either a virtue-based professionalism, behavior-based professionalism or professional identity formation. Many aspects of unprofessional behavior were referring to the discourse of complexity as reported by Monroux. During the conversation about teaching and learning we observe that professionalism is forged more by an empirical approach (observation and imitation) rather than by lectures and handbooks.
Discussion & Conclusion: Our findings suggest that if practicing physicians don't have the basis to speak about professionalism they will then struggle to recognize what is unprofessional. This leads to an improvised approach to educational strategies which results in un-systematic ways of learning, teaching and assessing professionalism.
We must give the right words to the medical professionals to speak about professionalism, this would give them a consciousness of their professional values, helping them learn, teach and assess professionalism in their everyday work.

Charlotte Rees, Monash University, Clayton, Australia
Lynn Monrouxe, Chang Gung Memorial Hospital, Linkou, Taiwan

Presenter: Lynn Monrouxe, Chang Gung Memorial Hospital, Linkou, Taiwan

Background: Social constructs such as status, gender inequality and religious stratification are reproduced in medical settings. Such values impact medical professionals' behaviours, ethical reasoning and sense of empathy: essentially their medical professionalism. As notions of medical professionalism are context-specific, this study considered Sri Lankan and Taiwanese medical students' experiences of professionalism dilemmas: situations in which they witnessed or participated in unprofessional practice.
Method: As part of a larger international research programme, this qualitative study comprised 26 focus groups (n=136 participants) at a Sri Lankan (n=71) and Taiwanese (n=64) medical school. Participants described professionalism dilemmas they had experienced during their clinical education. Audio-recorded data were anonymised, transcribed and thematically analysed to identify students' professionalism dilemmas.
Results: Students narrated diverse professionalism dilemmas including patient safety and dignitiy breaches, alternative medicine and family inteventions. Here, we focus on patient, healthcare professional (HCP) or student mistreatment. Narratives from Taiwan were embedded in notions of power imbalances. Those from Sri Lanka also included gender inequality. Mistreatment towards students and other HCPs was generally psychological. Mistreatment of patients also occasionally compromised patients' health. For example, prescribing pregnant women oxytocin to induce labour to adhere to doctors' schedules. Some narratives emphasized patients' mistreatment of students and HCPs, such as patients being rude to nurses but respectful toward doctors.
Discussion & Conclusion: Sri Lankan and Taiwanese students' narratives of professionalism dilemmas demonstrate how social constructs are reproduced in healthcare. In these societies women typically hold subordinate social positions, contrasting with the high social status of doctors. In Taiwan, low numbers of female medical professionals and students reflect this. The hierarchical nature of Sri Lankan and Taiwanese medical cultures further subordinate female students and other HCPs, such as nurses, exposing them to increased mistreatment and impacting the quality of patient care.

Take-home message: Experiencing gender- and power imbalance-related professionalism dilemmas impacts how medical students engage with their superiors and patients, whether they voice concerns or seek assistance and affects their emotional status. Future research might consider how such experiences impact on students' development as future doctors and on burnout.

The struggle for professionalization – students´ experiences of emotionally challenging situations during medical school

Authors
Annalena Lönn
Maria Weurlander
Robert Thornberg
Astrid Seeberger
Håkan Hult
Annika Wernerson

Presenter: Annalena Lönn, CLINTEC, Karolinska Institutet, Stockholm, Sweden

Background: The professionalization process is an important part of medical education. During clinical placements, students encounter situations that can be emotionally challenging, such as witnessing patents´suffering, death and a detached health culture. The aim of the study, was to investigate how medical students manage situations they perceive as being emotionally challenging and what they learn during the process.
Method: Qualitative data was collected from 86 students during their last semester. The students were asked to describe, in writing, situations they perceived as being emotionally challenging and also to describe if and how their ability to
manage these situations had changed during medical school. A constructivist grounded theory approach was used to analyze the data.
Results: Medical students´ main concern in situations they perceive as being emotionally challenging, is the struggle to achieve a professional approach. This includes being able to focus on the task in a demanding situation and to maintain the ability to show empathy. Active reflection and debriefing with peers and close relatives are important when reolving the main concern.Other strategies are to actively expose themselves to stressful situations and the search for good role models.In this process, students get insights about how they can relate to patients and medical staff, and learn about what their own needs are in order to cope.
Discussion & Conclusion: Medical students´experiences of emotionally challenging situations, evoke feelings that they have to manage in order to become a professional. Students take an active part in this process – being aware of the importance of resolving the negative feelings that emerge. The learning outcome in this process seems to be the insight about one´s own reactions, shortcomings and needs.

Take-home message: To experience and learn how to manage emotionally challenging situations is an important part in the struggle of becoming a professional physician. Increased knowledge about this process may help faculty and supervisors to better support students in this. challenge.

Remediation of unprofessional behaviour in the UK: the 'unknown unknown'

Authors
Susannah Brockbank, University of Liverpool, Liverpool, UK
Viktoria Joynes, University of Liverpool, Liverpool, UK
Vikram Jha, Apollo Hospitals Group, Chennai, India

Presenter: Susannah Brockbank, University of Liverpool, UK

Background: A link between unprofessional behaviour as a medical student and later misconduct post-qualification has been well described. This correlation has led to calls for robust remediation of lapses in professionalism at medical school, including a mandate from the UK medical regulator, the General Medical Council, to address this behaviour. Unfortunately, there is a dearth of evidence for how remediation can be successfully achieved. Furthermore, a North American study revealed that remediation practices vary across medical schools, so this study aimed to explore the remediation practices in UK (UK) medical schools.
Method: An online survey was sent to all UK medical schools in early 2017. This survey contained a combination of multiple choice questions and free text answers. Information about the medical school's demographics, as well as current methods of identification and remediation of professionalism lapses, was requested. Responses were subject to inductive qualitative analysis.
Results: 13/36 (36%) of UK medical schools responded to the questionnaire. These responses revealed a variation in practice in terms of identification of lapses, with a minority schools having formal systems in place. Participants also expressed uncertainty regarding how best to undertake remediation and, as well how to ensure its success.
Discussion & Conclusion: The response rate to this survey demonstrates a lack of engagement of UK medical schools with the debate about remediation of unprofessional behaviour, possibly symptomatic of the uncertainty expressed by our respondents. Furthermore, this uncertainty reflects the paucity of evidence, policy and procedure for remediation of unprofessionalism. This in turn stems from a lack of understanding of the determinants of unprofessional behaviour in medical students, which acts as a barrier to remediation.
Take-home message: Establishing evidence-based strategies for remediation of unprofessional behaviour should be a priority for medical schools. In order to remediate lapses in professionalism successfully, determinants of unprofessional behaviour must first be better understood. A framework for remediation can then be created in light of this understanding, from which a broader evidence base for remediation strategies can develop.

Managing your OSCE: Should candidates be quarantined?

Authors
Gillian Lever, University of Leeds, Leeds, UK
Richard Fuller, University of Leeds, Leeds, UK

Presenter: Gillian Lever, University of Leeds, UK

Background: OSCEs are widely used assessment formats in healthcare education. Should we isolate or 'quarantine' candidates pre- and post-OSCE to deliver a 'fair assessment', even though quarantine may increase candidate anxiety? Or should we focus on a quarantine-free 'compassionate' assessment, which releases students to pursue their own potentially anxiety-mediating activities? To date literature is lacking surrounding the impact of quarantine on student wellbeing
Method: A questionnaire was disseminated to medical students undertaking OSCEs at a UK medical school, exploring activities undertaken and behaviours and habits displayed in the time surrounding the exam. This sensitized a series of candidate interviews to understand in greater detail whether activities and habits had any effect on OSCE-related anxiety
Results: Analysis highlighted that immediately proximate to the OSCE, candidates undertake highly personalised activities, often in private, to prepare for and relax after an OSCE. Compared to males, females were more likely to 'revise' in this period, through a need to occupy their mind rather than as a score booster. High performing students described anxiety whilst waiting for the assessment but felt able to relax in the interim period, linking this with long-term OSCE preparation. Relaxing between assessment days reduced anxiety and increased positivity for the second day.
Discussion: Institutions often employ quarantine to promote fair assessment but here we found candidates expressing anxiety when faced with this. A wide array of activities and habits were cited as anxiety-mediating and would not be possible if candidates were quarantined. Current literature in the main shows no advantage to quarantine and candidates in this study seem willing to trade off "fair" assessment with the opportunity to manage their anxiety. Long-term preparation and relaxation led to reduced OSCE-related anxiety and promoted a positive mindset to ultimately boost performance.
Conclusion: This work reveals important rites and rituals undertaken by candidates during the time surrounding and between days of an OSCE. By employing quarantine these behaviours are interrupted and can increase anxiety for a performance assessment. Quarantine could therefore be the difference between a pass and fail.

10J2 (2107)
ReCIPE for Success: The development and assessment of neonatal Resuscitation Competencies in InterProfessional education

Authors
Brian S. Simmons, Department of Newborn and Developmental Pediatrics, Sunnybrook Health Sciences Centre and Department of Pediatrics, Faculty of Medicine, University of Toronto, Toronto, Canada
Susan J. Wagner, Department.of Speech-Language Pathology, Faculty of Medicine, University of Toronto, Toronto, Canada
Marilyn D. Hyndman, Department of Newborn and Developmental Pediatrics, Sunnybrook Health Sciences Centre, Toronto, Canada
Marion E. Deland, Department of Newborn and Developmental Pediatrics, Sunnybrook Health Sciences Centre, Toronto, Canada
Martina Esdaile, Evaluation at Ecole Centrale, Paris, France
Scott Reeves, Centre for Health and Social Care Research, Kingston University, London & St. George's, University of London, London, U.K.

Presenter: Brian Simmons, Department of Newborn and Developmental Pediatrics, Sunnybrook Health Sciences Centre and Department of Pediatrics, Faculty of Medicine, University of Toronto, Canada

Background: Health care delivery driven by economic and public expectations requires a high level of effective collaboration between teams of health professionals. Neonatal resuscitation (NR) requires a group of dedicated health care professions with such expertise. The basis of this is rooted in the Neonatal Resuscitation Programme (NRP) which is been available as a tool for newborn resuscitation training since 1987. However, the emphasis on teamwork is only just being realized .The ability to assess performance in interprofessional teams is essential. This study will develop and validate an interprofessional competency framework for the assessment of NR teams using a low fidelity simulation model (OSCE)
Objectives:
• To develop NR team competencies using anonymous consensus- building(Delphi)
• To develop an innovative competency-based, low-fidelity tool (OSCE) for assessing NR team performance.
Method: Anonymous consensus building (two round modified Delphi) was used to determine interprofessional team competencies in NR. Representatives from four professions (medicine (staff/fellows), registered nurses, neonatal nurse practitioners and registered respiratory therapists) within NR teams across Canada were recruited to participate. A series of interprofessional objective structured clinical examinations (OSCE) were developed to validate the resuscitation competencies. Three scenarios were developed which reflected a range of NR team tasks. Competences were assessed using a 5 point global rating scale (GRS).
Results: Forty three participants provided the 177 NR team competences. Independent analysis by members of the research team determined 14 distinct competencies

through group consensus. Two competencies collaboration and expertise were mutually exclusive and removed. The remaining competencies became the basis of the NR GRS.

Discussion & Conclusion: OSCEs were conducted with neonatal intensive care unit (NICU) staff from two different hospitals. Competencies used in each scenario varied based on the task and their use within the NR. There was variability in competency performance depending on size, task and composition of the team. Results suggest the strengths of using a NR team competency framework extended beyond assessing the traditional NR knowledge and skills using a checklist.

Take-home message: The development of neonatal resuscitation team competencies as determined by anonymous consensus building appear to be reliable and valid as assessed with low fidelity simulation.

10J3 (2818)
Introducing Entrustment Scales in Objective Structured Clinical Examinations

Authors
Ylva Holzhausen
Asja Maaz
Maren März
Victoria Sehy
Harm Peters

Presenter: Ylva Holzhausen, Charité-Universitaetsmedizin Berlin, Germany

Background: The introduction of the Entrustable Professional Activity (EPA) concept in medical training is accompanied with the development of entrustment scales, designed both for post- and undergraduate medical training. Entrustment scales provide trainees with feedback on the level of supervision they need to perform an EPA in the workplace. This study set out to test the usability and added value of employing an entrustment scale in the context of Objective Structured Clinical Examinations (OSCE).

Method: In our institution, we introduced an entrustment scale as an addition to the regular assessment form used in the OSCE of the fifth year of a six year, competency-based undergraduate medical curriculum. The regular assessment form includes a checklist of items and a global rating scale. The added entrustment scale involved 6 levels aligned with the entrustment levels for undergraduate medical education. Assessors (faculty clinical teachers, n=54) rated under which level of supervision they would let the examinee perform the observed clinical tasks in the workplace. Assessors evaluated the usability of the entrustment scale.

Results: A total of 227 students were assessed in the OSCE consisting of various clinical tasks in six stations. The correlations of the entrustment ratings with the OSCE checklist results were in five stations between rs=.433 and rs=.674, in one station rs=.211. The correlations of the entrustment scale and the global rating were in four stations between rs=.518 and rs=.659, in one station rs=.374. All correlations were significant (p<.005). The

majority of the examiners rated the usability of the entrustment scale as high.

Discussion & Conclusion: The entrustment scale can provide a comprehensive and meaningful evaluation of the students' performance that adds to the results of the regular OSCE checklist and global ratings. Beyond the evaluation of how students perform a clinical task in a simulated setting, a link can be established to the potential performance in the workplace. Examiners perceived the entrustment scale as a valuable addition.

Take-home message: Introducing entrustability scales in OSCE needs not much extra effort and adds a meaningful evaluation of the students' performance to the assessment.

Pre-Clinical Clerkship Objective Structured Clinical Examination Scores Predict Placement in Japan Residency Matching Program (JRMP)

Authors
Shoko Horita, The University of Tokyo, Tokyo, Japan
Yoon Soo Park, The University of Illinois, Chicago, USA
Daisuke Son, The University of Tokyo, Tokyo, Japan
Masato Eto, The University of Tokyo, Tokyo, Japan
Tatsuya Yamasoba, The University of Tokyo, Tokyo, Japan

Presenter: Shoko Horita, The Office for Clinical Practice and Medical Education, The Graduate School of Medicine, The University of Tokyo, Japan

Background: In Japan, the Pre-Clinical Clerkship Objective Structured Clinical Examinations (PCC-OSCE) is a nationally-organized assessment, measuring medical knowledge and clinical skills administered to medical students at the transition from preclinical to clinical training. However, no prior studies have analyzed the predictive relationship between PCC-OSCE scores and educational outcomes, including residency match status and National Board Examination scores. This study identifies factors that predict educational outcomes, as medical students transit between undergraduate and postgraduate training.

Method: Data were analyzed using 68 graduating medical students at The University of Tokyo. Students were invited to answer surveys asking their daily activities and study behaviors, such as meals, sleeping, self-studying hours, part-time job hours, and social activity hours. Survey responses were merged with performance on PCC-OSCE, computer-based test (CBT), clinical clerkships scores, and the results of Japan Residency Match Program (JRMP) and analyzed using the statistical software JMP(R).

Results: Performance on PCC-OSCE significantly predicted residency placement (Odds Ratio = 4.32, p < .05). Furthermore, performance on PCC-OSCE were significantly correlated with graduation competency examination (Post-Clinical Clerkship OSCE) scores, and clinical clerkship scores (correlation range: .40 – .43, p < .001). However, daily activities including meals, commuting time, sleep, social activities, and part-time-job-hours did not have significant relationship with these scores. Moreover, students who were promoted to medical school through a

separate screening process after admission, received higher scores and JRPM placement results than students who were directly admitted to medical school (p < .001).

Discussion & Conclusion: PCC-OSCE administered at the fourth-year of medical school was predictive of graduation competency examination scores, clinical clerkship scores, and JRPM results. Students who underwent after-admission selection may have acquired self-studying habits immediately following admission, likely resulting in higher examination scores, clerkship performance, and greater likelihood of residency placement through the JRPM. PCC-OSCE scores can predict the educational outcome of the medical students at the graduation and residency placement.

Take-home message: Medical educators should encourage students to acquire self-studying habits during the early preclinical phase of undergraduate medical training.

10J5 (650)
Objective Structured Examination (OSCE) in Physiotherapy: What is the difference between communication competence and therapeutic climate?

Authors
Beatrice Buss
Eefje Luijckx
Slavko Rogan
Evert Zinzen

Presenter: Beatrice Buss, University of Applied science, Bern, Switzerland

Background: The OSCE is an examination tool which is used to assess clinical skills. This study is in the area of evaluation of physiotherapy students` skills and applies data from Bern University of Applied Science. In the first semester, the OSCE consists of eight stations that each last eight minutes. The OSCE in the fifth semester consists of two short time stations (eight minutes each) and three long time stations (16 minutes each). Hodges and McIlroy (2003) concluded that global ratings are an important element of OSCE measurement and can have good psychometric properties. However, OSCE researchers should clearly describe the type of global ratings they use. Therefore, the aim of this study was to determine if there are differences in the rating between communication competence and therapeutic climate. These results would provide valid judgments about clinical competences of physiotherapy students.

Method: This study investigated two selected criteria of communication and therapeutic climate of every single station of the eight stations in the first semester and the five stations in the fifth semester of the OSCE circle at Bern University in 2015. It included 50 students from the 1th Semester and 49 students from the 5th semester. The criteria of communications were rated by the examiner and the criteria of therapeutic climate by a standardized patient. Data was analyzed by the means of t-test and the SPSS program (Version 2015).

Results: No differences were found in the ratings of the therapeutic climate and the communicative competences for physiotherapy students in the first semester on 8 stations (p=0.16 to p=.956) and in the 5th Semester (p=0.34 to p= 0.485).

Discussion & Conclusion: This study could not find differences in the ratings between therapeutic climate and communication. Therefore, the assessment criteria of communication and therapeutic climate could be used as valid judgments to determine clinical competencies of physiotherapy students. However, the study did not provide results on the difference between the short and long stations. We assume that in short stations the student cannot establish a good relationship with standardized patients. Further research is suggested to be focused on the data collected during the long stations.

10J6 (1041)
Sharing reliable and valid OSCE stations so as to improve cross-institutional assessment strategies: Are we equipped for it?

Authors
Thomas Kropmans
Enda Griffin
Deborah Coffey
David Cunningham

Presenter: Thomas Kropmans, Qpercom Advanced Assessment Solutions, Galway, Ireland

Background: Transforming cross-institutional assessment strategies in terms of sharing quality assured assessment outcome and sharing proven reliable and valid assessment stations in an integrated way throughout Europe is sensible and rarely done.

Method: Written informed consent was thought between institutions using an electronic OSCE Management Information System (OMIS) in Europe having a mutual Non Disclosure Agreement (NDA) for OMIS in place. Institutions that embraced the idea of sharing formative quality assured assessment results of OSCE stations were included in this study. Those referring to their agreed NDA were respectfully excluded. Mixed Methods were used to compare quantitative and qualitative assessment outcome in terms of quality assurance outcome like pass mark/standard setting, internal consistency (Cronbach's Alpha), Generalizability coefficients and the Standard Error of Measurement and station goals/names.

Results: Ten out of twelve institutions participated sharing pre-final clinical skills assessment results. Student numbers varied from 50 to 250 within institutions with min and max pass marks varying from X (institution X) to Y (institution Y). Internal consistency (Cronbach Alpha) of exams varied from A (Institution A) to B (Institution B) and more modern G-Coefficient from C (Institution C) to D (Institution D). The Standard Error of Measurement around the Observed Scores varied from F (Institution F) to G (Institution G).

Discussion & Conclusion: Transparency is sensible but hopeful comparing EU clinical skills exams and opens the opportunity for sharing valid and reliable assessment stations within institutions. Quality assured formative assessment outcome varies within and across EU

institutions. More emphasis to transparent outcome (big data) analysis is required to transform EU clinical skills assessment strategies. We are equipped for it but are we ready for it?

Supporting nurses' transition using WhatsApp

Authors

Felicity Daniels, University of the Western Cape, Capetown, South Africa
Rita Ologun-Abiodun, University of the Western Cape, Capetown, South Africa
Christoph Pimmer, University of Applied Sciences and Arts, Northwestern, Switzerland
Jennifer Chipps, University of the Western Cape, Capetown, South Africa

Presenter: Felicity Daniels, University of the Western Cape, Capetown, South Africa

Background: Transitioning into practice can be exciting, but also challenging and traumatic. Despite the necessary training and assessment of student nurses, a period of additional support is considered essential to help these nurses settle into their new role and responsibilities. There is, however, no standardized, well-structured, evidence-based, and professionally focused education and social support program of transition in South Africa.
Method: This qualitative, exploratory comparative study focused on the experiences of new nurses about a WhatsApp support group. A total of 63 newly graduated nurses in community service were purposively selected. Divided into rural and urban groups, they participated in a three month structured group discussion based on identified needs. Thereafter in-depth interviews were conducted with 12 participants (6 rural and 6 urban). Data were analysed using content analysis. Trustworthiness was established and ethics approval was obtained from the university.
Results: Participants benefitted from collegial shared experiences and support received during the program. They developed resilience and confidence by being connected with colleagues from school and acknowledged that content of discussion was relevant to their personal and professional development. The challenges reported varied between urban and rural groups. They recommend that this group should be continuously used in supporting new nurses.
Discussion & Conclusion: The findings indicate the benefits of WhatsApp groups in supporting nurses in transition; however, there are a range of factors which are reported to affect the successful use. Rural participants need more support that their urban counterparts. The findings of this study will inform the development of an online transitioning program to further support new nurses during transition.
Take-home message: Online intervention which is real time, cost effective and evidenced based can be useful in supporting newly graduated nurses towards a successful transition.

10K2 (1862)
Support strategies during the transition to undergraduate clinical training: a scoping review

Authors

Anique Atherley, Maastricht University/Western Sydney University, Maastricht/Sydney, Netherlands/Australia
Pim Teunissen, Maastricht University, Maastricht, Netherlands
Sonita Alexander, The University of the West Indies, Cave Hill, Barbados
Iman Hegazi, Western Sydney University, Sydney, Australia
Wendy Hu, Western Sydney University, Sydney, Australia
Diana Dolmans, Maastricht University, Maastricht, Netherlands

Presenter: Anique Atherley, Maastricht University, Maastricht, Netherlands/Western Sydney University, Sydney, Australia

Background: The period of transition from an undergraduate pre-clinical to clinical student can be stressful. Research suggests that transitions are periods up to two months where students adapt to their new environment. Exploring how students are supported during this critical learning period could inform relevant, evidence-based support strategies.
Method/Results: We developed a protocol to examine the scope of research, identify gaps and summarise findings related to support strategies aimed at helping students transition to clinical training. Between October 2017-January 2018, we conducted a scoping review on English literature with no date limits. A systematic search in six databases yielded 1582 articles. Using a defined eligibility criteria and peer-review process, 36 articles were charted and thematically analysed. Reference list searching yielded a further 14 articles. We included papers that described or evaluated formal and informal support strategies or described students' experiences transitioning to clerkships. We used the latter to extract findings about informal support strategies — observation and learning by doing.
Students are supported as they adapt to the clinical environment by: 1) reducing the gap of skills and knowledge to gain in the new environment through transition courses and curriculum innovations 2) fostering transferable learning and reflection capabilities 3) fostering relationships with senior doctors and peers. Most evidence fell into the first category and most had no clear theoretical underpinning. Some studies measured student perceptions showing that students appreciate transition courses and felt more confident afterwards.
Discussion: This review of the existing literature highlights strengths and weaknesses in how students are supported during the transition to clinical training. Findings have implications for future research by guiding development of support strategies to enhance this transition.
Conclusion: Existing research focuses perceived effectiveness of interventions to reduce the gap between

pre-clinical and clinical training. It could be beneficial to conduct more studies with relevant, long-term outcomes and to focus on transferable learning and reflection capabilities and building relationships with others while being underpinned by theory.

Take-home message: This scoping review provided insight into documented formal and informal support strategies for optimizing the transition to undergraduate clinical training.

10K3 (1066)
Transitions in Medical Education: Final Year Medical Student to FIrst Year Family Medicine Resident - A Qualitative Study

Authors
Britta Laslo, Western University, London, Canada
Judith Belle Brown, Center for Studies in Family Medicine - Western University, London, Canada
Thomas R Freeman, Center for Studies in Family Medicine - Western University, London, Canada

Presenter: Britta Laslo, Western University, London, Canada

Background: Transitions in medical education has been a renewed area of research given the well-documented negative emotions and experiences reported by learners across the medical continuum. This study aimed to explore the feelings and experiences of first year Family Medicine residents (FMRs) surrounding the transition to first year Family Medicine residency through a descriptive qualitative study.
Method: y transcribed and then reviewed by three investigators to identify emerging themes. The data analysis was both iterative and interpretative. Credibility of findings was enhanced through field notes, questioning of the data, individual and team coding, concurrent analysis of data with ongoing data collection and by employing reflexivity.
Results: FMRs described this transition as complex as they experienced evolving, and often competing, positive and negative feelings during this transition. FMRs articulated an important professional transition that occurs as a first year resident as well as personal, intrinsic attributes (ie: personality traits, attributes or habits) and a multitude of extrinsic factors (ie: geographical moves, residency rotation schedule, prior experiences with transition) that affect this transition. Importantly, FMRs consistently noted a perceived lack of connection to their FMR peers, Family Medicine clinical supervisors and the Family Medicine postgraduate program which contributed to a distinct feeling of disengagement.
Discussion & Conclusion: The findings increase our understanding of this complex transition in medical education. Negative feelings and experiences of disengagement with FMR peers, supervisors and the Family Medicine Program are experienced by first year FMRs during this transition. Feelings of disengagement can overshadow the positive feelings and experiences of this transition and may increase the risk of burnout and disengagement in this learner population. The findings

support recommendations to improve the transition from final year medical student to first year FMR through a training environment with increased connectivity to the Department of Family Medicine, Family Medicine peers, early Family Medicine rotations and fewer transitions between services.

Supporting doctors when it counts: presenting a framework of doctors' transitions into practice

Authors
Lisi Gordon, University of St Andrews, St Andrews, Scotland
Roona Sinha, University of Saskatchewan, Canada
Pim Teunissen, School of Health Professions Education (SHE), Maastricht University, Maastricht, Netherlands
Anne Van Dijk, School of Health Professions Education (SHE), Maastricht University, Maastricht, Netherlands
Michiel Westerman, VU University Medical Centre, School of Medical Sciences, Amsterdam, Netherlands

Presenter: Lisi Gordon, School of Management, University of St Andrews, UK

Background: Doctors experience numerous career transitions that impact on well-being and may lead to burn out.(1) Transitions are also periods of learning and development.(2) To navigate transitions well, doctors must be resilient and organisations must provide support networks.(3) Context influences educational outcomes and plays a role in the development of professional identities; behaviours, attitudes and beliefs; career choices; and response to challenges.(4) Context thus shapes transition experiences.
Method: We asked: how does context influence transition experiences of senior trainees to consultants? Drawing on Multiple and Multidimensional Transitions (MMT) theory,(3) we undertook secondary analysis of 55 interviews undertaken as part of three separate projects exploring transition experiences of senior trainees from three countries: UK (n=21); Netherlands (n=14); and Canada (n=20).
Results: Our findings show the different trajectories resulting from the unique lived experience of doctors across varying contexts they inhabit. Irrespective of context, how participants experienced and dealt with changes involved four dimensions in line with MMT theory; psychological; cultural; physical; and social. We developed an explanatory framework depicting interactions between changes to role expectations, practice, home and learning during transitions.
Discussion & Conclusion: Context cannot be reduced to a single factor influencing transitions or a backdrop within which transitions happen. It has multiple dimensions and is shaped by individuals' developing roles in their communities of practice. We will introduce the transitions framework to delegates and discuss the impact of these new understandings of doctors' transitions on how medical educators and organisations can support doctors.

10K5 (3056)
Case study: How prepared are medical graduates in Saudi Arabia to begin their postgraduate training?

Authors
Ali Alasmri
Susan Jamieson
Jill Morrison

Presenter: Ali Alasmari, University of Glasgow, UK

Background: This study examined how prepared medical graduates were to begin their postgraduate training in Saudi Arabia and identified possible ways to improve their level of preparedness.

Method: This was an embedded single case study which had three units of analysis, and the study was divided into three phases, which respectively considered the perspectives of three different groups. Medical graduates, consultants (postgraduate faculty members), and national figures in positions of leadership within the medical education context in Saudi Arabia.

In the first phase, focus group interviews were carried out with medical graduates. In the second and third phases, one-to-one semi-structured interviews were carried out with faculty members and deans of medical schools. Thematic analysis was used in this study, and the data were analysed manually.

Results: All (80) first-year trainees in the training centre, from all different programmes, were invited to participate. Nineteen new doctors participated in four focus group sessions. The participants (female n=5, male n=14) graduated from 9 different Saudi medical schools. Seven faculty members responded and participated in individual face-to-face interviews, and three medical school deans participated (two face-to-face interviews, and one phone interview) in the third phase.

Discussion: There was lack of preparedness in general among the graduates at graduation, but they were confident about their level of preparedness at the time of data collection (one year into their postgraduate training). They reported that they were not prepared when they started their training programmes. A lack of proper clinical exposure and mentorship in medical schools was frequently reported by graduates. The clinical placement and internship and the quality of clinical exposure were linked to the variation in teaching hospitals. Although most of the graduates agreed that internship was a great opportunity for preparing them for practice, some argued that it was not sufficient due to different educational standards at the training hospitals.

Conclusion: There were no notable differences between graduates from the different types of school. However, faculty members, consistently mentioned that graduates from the old medical schools were more competent and confident in their knowledge and skills.

10K6 (618)
Preparedness for postgraduate practice: the point of view of junior residents and senior physicians of western Switzerland

Authors
Laura Brunet, CHUV, Lausanne, Switzerland
Matteo Monti, CHUV & FBM-University of Lausanne, Lausanne, Switzerland

Presenter: Matteo Monti, Faculty of Biology and Medicine - University of Lausanne, Switzerland

Background: Recent studies have shown that newly graduated doctors feel insufficiently prepared in some areas of competence to start their clinical activity. The aim of this study is to explore the perception of Lausanne Medical School's graduates on their level of preparedness for clinical activity at the beginning of the postgraduate training.

Method: Multicentric, cross-sectional mixed-method study, among junior residents and senior physicians of Swiss hospitals. The quantitative part consisted in a 27-items questionnaire exploring the perception of performance in five areas of competence (knowledge, skills, clinical reasoning, communication, collaboration) as well as personal aspects (time management, job satisfaction). The qualitative part consisted in semi-structured focus groups with PGY1 residents. An initial open discussion on self-perception of preparedness for practice was followed by a more structured discussion based on the CanMEDS roles. Two authors performed independently the analysis of the verbatim transcriptions inductively and deductively.

Results: 68 (50% response) junior doctors and 80 (31%) senior physicians returned the questionnaire. 54.0% of residents consider their studies to prepare them adequately for practice. 49% however consider the knowledge base to be incomplete. They feel least prepared in planning therapeutic strategies (49.2%), communicating with families (51.7%) and write a discharge letter (72.9%). Moreover, 50.8% of them feel overwhelmed from the workload. Interestingly senior physicians share the same vision on forces and difficulties. 19 residents agreed to participate to 6 focus groups. They confirmed to feel well prepared in terms of theoretical knowledge, but to have been insufficiently exposed to ''simple'' and frequent diseases. They also feel less prepared in the interprofessional collaboration, in critical thinking, in proposing diagnostic strategies, interpreting tests, performing procedural skills, coping with the administrative tasks and in time management.

Conclusion: The majority of young graduates feel globally well prepared for the postgraduate training. However,

several important competencies and aspects of the medical profession are not sufficiently mastered, with a possible negative impact on perceived workload, job satisfaction and perceived self-proficiency. Our study provide important information to program directors and educators, who are accountable for preparing competent physicians for the postgrade training.

Perceived strain of undergraduate medical students during a simulated first day of residency

Authors
Sophie Fürstenberg, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Sarah Prediger, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Pascal O. Berberat, Technical University of Munich, Munich, Germany
Martina Kadmon, University of Augsburg, Augsburg, Germany
Sigrid Harendza, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Presenter: Sophie Fürstenberg, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: Residents have been found to perceive high levels of strain and show abnormal burnout scores. Medical students also reported a high degree of strain and even depressive tendencies when entering their clinical rotations. The aim of this study was to explore the perceived strain of medical students from different undergraduate curricula and at different stages of academic advancement during different phases of a formative assessment simulating a resident's first day in hospital.

Method: Sixty-seven undergraduate medial students participated in the following three phases of the assessment in the role of a resident: a consultation hour with five simulated patients, a management phase with interprofessional contact, and a patient handover with a colleague. They completed the validated Strain Perception Questionnaire (STRAIPER) after each phase. Students from different undergraduate curricula (VI: vertically integrated, N = 35 vs. non VI: not vertically integrated, N = 26) and different academic advancement (10th semester, N = 26 vs. final year, N = 41) were compared.

Results: All students showed the highest strain level after the management phase compared to the consultation hour and the handover. Medical students from a non-VI curriculum felt significantly more strain in the dimension of agitation ($p < .05$) after the consultation hour compared to students from a VI curriculum and compared to the management phase and the handover. No significant difference in perceived strain was found between students from semester 10 compared to final year students.

Discussion & Conclusion: During the consultation hour and the handover with a colleague medical students faced tasks, which are familiar to them from undergraduate education. Their higher strain levels during the management phase may occur because they are confronted with unfamiliar tasks and decisions. Feeling responsible for the right actions might have added to the strain students perceived during this phase. Hence, patient management should be emphasized more in any type of undergraduate medical curriculum.

Take-home message: Training patient management should be emphasized in undergraduate medical training to reduce strain in medical practice.

Ward round simulation in final year medical students: Does it promote students' learning?

Authors
Claudia Behrens, Universidad católica del Norte, Coquimbo, Chile
Diana Dolmans, Maastricht University, Maastricht, Netherlands
Jimmie Leppink, Maastricht University, Maastricht, Netherlands
Gerard Gormley, Queen´s University, Belfast, Northern Ireland
Erik Driessen, Maastricht University, Maastricht, Netherlands

Presenter: Claudia Behrens, Universidad Catolica del Norte, Coquimbo, Chile

Background: Ward round skills are essential for doctors in a hospital setting. Literature reveals deficiencies in those skills among medical students and junior doctors. Simulation is increasingly emerging as a modality to train ward round based skills. However, exposing learners to ward round simulation at a too early stage may be associated with a high cognitive load and limited learning. This study aims to determine to what extent students experience a cognitive load and its interplay with performance and to explore factors that may promote and impair learning.
Method: Fifty-six final year medical students participated in a simulated ward round training exercise with three standardized patient scenarios. Both students' performance and cognitive load were measured to determine if there was any correlation. Interviews were carried out in order to provide a deeper understanding of factors that may support and impair learning.
Results: Performance scores revealed deficiencies in ward round skills. Students experienced some intrinsic but very low extraneous cognitive load, and both cognitive loads weakly correlated with performance. Qualitative findings provide important insights into simulated ward-based learning. On the one hand, well-designed clinical scenarios, prioritization tasks, teamwork and feedback may support students' learning process. On the other hand, distractions can impair their learning.
Conclusion: WRS seems to be a good teaching method to improve clinical skills at this stage of training, as the cognitive load associated to the exercises is not too high to impair learning. Moreover, the inclusion of relevant tasks in the simulation design can enhance the learning process.
Take-home message: WRS can offer meaningful learning opportunities for final year medical to improve not only technical and non technical skills but also clinical decision making skills that are more contextual particularly in emergency situations.

Teaching procedural skills in simulation environment as a route to improve patients' safety

Authors
Katarzyna Naylor
Ewa Domańska- Glonek
Kamil Torres

Presenter: Katarzyna Naylor, Department of Didactics and Medical Simulation, Medical University of Lublin, Poland

Background: Technological advances provide educators with tools that can enhance and stimulate the teaching-learning process. Additionally, this can improve students learning experience and provide them with an immediate access to the necessary resources.
Method: We describe a modeling of the teaching-learning process by engaging the students through instructional methods in simulation environment at the undergraduate level of medical schools to teach protocols of basic procedural skills. First and second year undergraduate medical students participated in basic clinical skills training lead in the simulation environment. The first group training was enriched by Peyton's four-step approach for small group teaching, including role play with peer assisted learning and teaching with technology (simulation based training). After five sessions (15 h) participants of both courses were evaluated using Objective Structured Clinical Exam employing procedural checklists. Additionally, students completed a questionnaire concerning their confidence in performing those procedures and opinions on the course.
Results: Students in the course implementing the four step methods in the simulation environment outperformed students learning without Peyton's four step approach during the OSCE stations commencing the training (P < 0.05). Training improved significantly their performance in the most invasive procedures for the patients: peripheral vein cannulation (p=0.001) and catheterization (p=0.000).
Conclusion: The simulation course lead by implementing instructional methods based on Peyton's four-step approach significantly benefits participant's performance. The method promotes active participation through an intensive practice during labs aiming at adherence to safety protocols and improving patients' safety.
Take-home message: This study illustrates that simulation-based education can improve patient safety through training and protocols. Students receive the opportunity to practice procedural skills before entering the clinical setting.

10L3 (1477)
The power of simulation: a narrative analysis of learners' experiences

Authors
Margaret Bearman, Deakin University, Melbourne, Australia
Jennene Greenhill, Flinders University, Adelaide, Australia
Debra Nestel, Monash University/University of Melbourne, Melbourne Australia

Presenter: Margaret Bearman, Deakin University, Melbourne, Australia

Background: Simulation-based education (SBE) is now a ubiquitous part of health professional education. The current literature in SBE is extensive but does not explicitly investigate why SBE can be such a powerful learning experience. The National Health Education and Training in Simulation program (NHET-Sim) offers the opportunity to investigate this question. NHET-Sim has been providing Australia-based health professionals with the introductory skills and concepts necessary to facilitate SBE since 2011.
Method: This study investigates learners' narratives of powerful experiences in SBE. It seeks to identify the ways in which health professionals recount their learning through SBE, and through this to understand how SBE shapes learners' future practice. Drawing from the NHET-Sim learning management system, 2624 reflective responses were extracted (with consent) to the prompt "describe the most powerful learning experience you have had using simulation". 328 of these were deemed to be in narrative form and these were categorised into narrative types. Thematic analysis indicated features that spanned narrative types and factors that influenced learning.
Results: There were four categories: progression narratives, which describe development of skills (257/328 = 71%); practice narratives, which are reflections of clinical practice (36/328 = 11%); transformational narratives, which tell significant moments of professional development (29/328 =9%); and humiliation narratives, which describe distressing and harmful experiences (8/328 = 2%). Recurrent features across all categories were: formative early experiences; dramatic scenarios; an appreciation of simulation as a methodology; scenarios that 'go wrong'; emotional responses, most commonly negative in valence; and reflective practices. Factors that promoted learning were: verisimilitude (realism); feedback, debriefing and facilitation; observation of others: repetition of scenarios; and 'being the patient'.
Discussion & Conclusion: Analysing SBE narratives provides an understanding of how simulation induces powerful learning. The narrative data suggests that error and associated negative emotional valence prompted learning. In some instances, narratives were transformational, that is, they led to a profound and permanent shift in professional practice. On regular but infrequent occasions, learners described highly unpleasant experiences with no learning reward.
Take-home message: Making mistakes is a key feature of learning through simulation.

10L4 (329)
A Randomised Control Trial of simulation-based education for mechanical cardiopulmonary resuscitation training

Authors
Andrew Coggins, Westmead Hospital Department of Emergency Medicine, Sydney, NSW, Australia
Nathan Moore, Westmead Hospital, Simulated Learning Enviromnent for Clinical Training (SiLECT), Sydney, NSW, Australia,
Margaret Murphy, Westmead Hospital Department of Emergency Medicine, Sydney, NSW, Australia
Anna Todd, Sydney Clinical Skills and Training Centre, Royal North Shore Hospita, Sydney, NSW, Australia
Kevin Ho, Westmead Hospital Department of Emergency Medicine, Sydney, NSW, Australia
Cameron Nottingham, Westmead Hospital Department of Emergency Medicine, Sydney, NSW, Australia

Presenter: Andrew Coggins, NSW Health, Sydney, Australia

Background: Mechanical cardiopulmonary resuscitation (M-CPR) is increasingly used in the management of cardiac arrest. There are no reported randomised studies investigating M-CPR training to date. This study of newly trained M-CPR providers hypothesised that a brief standardised simulation-based intervention at 4-months would improve performance at a 6-month assessment.
• Newly aquired resuscitation skills decline significantly from 3 months.
• The use of M-CPR is assoicated with interruptions to chest compressions, highlighting the importance of an evidence-based approach to teaching and consideration of the issue of attrition resusciation skills and knowledge that are only used occasionally.
Method: This study utilised a simulated Emergency Department (ED) 'in-situ' cardiac arrest model. The M-CPR device used was a proprietary LUCAS-3 machine (Physio Control, Redmond, WA, USA). Participants were trained and assessed in pairs. Standardised baseline training was provided to all participants. A baseline assessment was completed for time to M-CPR initiation (primary outcome) and the number of critical errors made. Participants were randomised to an intervention group (additional simulation at 4-months) or control group (no specific additional training). After 6-months the performance outcome measures were reassessed. Comparative statistical tests were performed using an intention to treat analysis.
Results: 112 providers were enrolled. The intervention group (n=60) and control group (n=52) had similar baseline demographic characteristics. At a 6-month assessment of performance, median time to M-CPR initiation was 27.1 seconds (IQR 22.0-31.0) in the intervention group and 31.0 seconds (IQR 25.6-46.0) in the control group (p=0.003). The intervention group demonstrated a significant reduction in errors compared to controls at 6-months (p=0.001)
What this study adds:

• In this study we observed a significant decline of measured performance in ALS providers that received no additional simulation training.

• A brief additional simulation with semi-structured feedback improved M-CPR performance in a simulated model at 6-months.

Conclusion: Significant skill attrition was observed in ALS providers receiving no additional training at 6-month follow-up. Therefore, to maintain performance of new resuscitation skills, provision of regular follow-up training with simulation is crucial.

Smith KK, Gilcreast D, PIerce K. Evaluation of staff's retention of ACLS and BLS skills. Resuscitation. 2008;78:59-65.

The influences of fidelity toward students' perception on simulation and the effectiveness of simulation education

Authors
Tsuen-Chiuan Tsai, Kaohsiung Medical University and Kaohsiung Medical University Hospital, Kaohsiung, Taiwan
Po-Ching Chou, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan

Presenter: Tsuen-Chiuan Tsai, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan

Background: Medical simulation incorporating with team skill training has long been recognized essential in medicine. The simulation "fidelity" had been previously considered parallel to the effectiveness of simulation training, while increasing cost and consumption of manpower. However, recent reports indicated the degree of fidelity is not necessarily related to training effectiveness. It is important to identify target functions of "fidelity", such as physiological signals, those may be related with the effectiveness of simulation education. This study is to explore students' perception on the focus of simulation fidelity shifting from mannequin to "physiological signals".

Method: This is a quasi-experimental design that used two kinds of simulators as teaching intervention: a "full-scale high-fidelity model" and a "physiological signal simulator". The physiological signal simulator, along with a "low-fidelity" mannequin or a standardized patient, can be used either in-situ or in a simulation room. There were 10 simulation trainings for each model, with 1-2 teachers and 5-6 trainees as a group. Questionnaire regarding students' perception on simulation and the effectiveness of simulation education were distributed at the end of simulations. The learning objectives, simulation design and the tasks for trainees were also studied.

Results: Students perceived there have been no significant difference on the quality of the simulation, in terms of case, equipment and process, between the two simulation models. They recognized the model of "physiological signal" being more friendly and cost-effective when compared with the full-scaled simulation. Students appreciated the training conducted in their work place with their regular team members. Both the simulations

with "high- or low-fidelity" are generally perceived as helpful on improving their clinical skills.

Conclusion: The degree of simulation fidelity did not parallel with effectiveness of learning. The keys for conducting simulation successfully are to align the simulation focus with the learning objectives, simulation design and the tasks for trainees. With the smart and widespread uses of simulation, patient safety and quality of healthcare can be greatly enhanced.

Hardened tendencies: Persistence of initial appraisals following simulation-based stress training

Authors
Christopher Hicks, University of Toronto, Toronto, Canada
Andrew Petrosoniak, University of Toronto, Toronto, Canada
Kari White, University of Toronto, Toronto, Canada
Vicki R LeBlanc, University of Ottawa, Ottawa, Canada

Presenter: Vicki R LeBlanc, DIME - University of Ottawa, Canada

Background: Stress impairs performance during simulated acute events. This study was conducted to investigate the effects of two training interventions on stress responses to simulated trauma scenarios.

Method: Twenty (20) Emergency Medicine residents were randomly assigned to the Crisis Resource Management (CRM) or Stress Inoculation Training (SIT). The CRM targeted non-technical skills required for effective teamwork. The SIT targeted skills related to cognitive reappraisal and relaxation training. Each group received a 3-hr training session: didactic teaching followed by multi-disciplinary simulation scenarios and debriefing with emphasis on either CRM or SIT. Participants served as team leaders in simulated trauma scenarios pre and post intervention. Stress levels and responses (peak minus baseline) were measured with the State Trait Anxiety Inventory (anxiety), cognitive appraisal (degree to which situation is interpreted as threat vs challenge) and salivary cortisol levels.

Results: Both CRM and SIT resulted in decreased overall cortisol and anxiety scores post interventions (mixed-design ANOVAs, significant = $p<.05$). However, the magnitude of the cortisol and anxiety responses did not decrease post interventions. Stepwise regression analyses showed that the only predictor of stress responses in the post-intervention scenarios was the residents' appraisal responses to that scenario (degree to which they interpreted it as a threat), explaining 21% and 28% of the variance in cortisol and anxiety responses respectively. In turn, appraisals of the post-intervention scenarios were predicted by the residents' appraisals of the pre-intervention scenario and gender, explaining 53% and 15% of the variance respectively. Men were more likely than women to appraise scenarios as threatening.

Conclusion: The stress regulation interventions led to reductions in stress levels, but with limited impact on responses. Those who appraised an initial scenario as more threatening were more likely to interpret a

subsequent scenario as threatening. In turn, they were more likely to have larger stress responses. Interventions that have been largely successful in other domains, namely CRM and SIT, had limited effects in overcoming initial appraisals of potentially stressful events.

Take-home message: Approaches to stressful events may represent hardened tendencies; significant training & practice is likely needed to overcome coping approaches developed over a lifetime.

Simulation-based mastery learning improves totally implantable venous-access port care skills of interns

Authors
Young-Min Kim, The Catholic University of Korea Seoul St. Mary's Hospital and START Center for Medical Simulation, Seoul, South Korea
Su-Mi Choi, The Catholic University of Korea Yeouido St. Mary's Hospital, Seoul, South Korea
Myung Ah Lee, The Catholic University of Korea Seoul St. Mary's Hospital, Seoul, South Korea
In-Ho Kim, The Catholic University of Korea Seoul St. Mary's Hospital, Seoul, South Korea
Jieun Lee, The Catholic University of Korea Seoul St. Mary's Hospital, Seoul, South Korea
Sung A Lee, The Catholic University of Korea START Center for Medical Simulation, Seoul, South Korea

Presenter: Young-Min Kim, The Catholic University of Korea Seoul St. Mary's Hospital and START Center for Medical Simulation, Seoul, South Korea

Background: Totally implantable venous-access ports (TIVAPs) are valuable device for long-term intravenous treatment of cancer patients but complications can be developed during implantation and care of the device. Inserting and removing the TIVAPs needle are one of the intern jobs in our hospital and were identified as a potential source in catheter-related bloodstream infection.

Method: We developed and implemented a simulation-based mastery learning (SBML) course for TIVAPs care to solve the problem. The course was developed according to the 7 principles that characterize SBML programs. One week before internal medicine internship, 12 interns studied pre-course self–learning materials and participated in the 2.5-hour SBML course. The course was comprised of baseline test, deliberate practice with feedback, post-training test, and repeated practice and retest. The assessment tools were developed by subject matter experts and validated by clinician educators. Based on the pilot testing data, the minimum passing standard (MPS) was set using the modified Angoff and Hofstee methods by an expert panel. We also evaluated self-assessed confidence and competence through questionnaires.

Results: A checklist with 20 items (2 points per item) for 10-minute skill test was developed and the raters were trained. The intraclass correlation coefficient and Kappa coefficient of the raters were 0.889 and 0.608-1.000, respectively. A total of 8 courses were implemented and 98 interns participated in the courses during 1-year internship. The mean baseline test score of the interns was 32.4±4.7 points and the score in the second half of the internship was significantly improved compared to the first half. Six (8%) interns did not pass the post-training test and were needed repeated practice and retest. Confidence and competence of the interns for the procedures were significantly improved before and after the course and they felt that many aseptic steps were difficult to master the procedures.

Conclusion: A SBML course improved interns' skills of TIVAPs needle insertion and removal in a simulated setting and confidence for the procedures.

Take-home message: SBML is an effective way for interns to learn and improve their TIVAPs care skills that is simple but require strict aseptic technique.

Exploring Clinicians' Motivation to Teach: The Subjective-task Value Perspective

Authors
Nicolas Fernandez, Université de Montréal, Quebec, Canada
Annie Dubeau, Université du Québec à Montréal, Canada
Diane Robert, Université de Montréal, Quebec, Canada

Presenter: Nicolas Fernandez, Université de Montréal, Canada

Background: Because of increasing clinical demands on physicians, their availability to train future doctors is limited. Previous studies report that constraints forcing physicians to choose between providing care and supervising trainees tend to inhibit their motivation to teach and to engage in Faculty Development activities. We sought to investigate how physicians motivate themselves to teach.
Method: We selected the subjective task-value model of motivation based on social-cognitive theory. We measured the subjective task-value perceptions with regards to clinical teaching tasks, and tested their relationship to engagement and time devoted to teaching.
Data was collected by survey sent to 486 medical educators in teaching sites affiliated with a regional campus of a large medical school in Canada. The survey comprised four dimensions of the subjective task-value which are: 1) perceived importance; 2) interest for what is taught; 3) perceived cost of teaching relative to other tasks and; 4) perceived utility. As an independent variable, engagement indicators (persistence/tenacity and weekly time devoted to teaching activities) were included. Two linear regression equations were calculated to test the relationship of subjective-task value with engagement in teaching based on results from 85 medical educators (n=85).
Results: Medical educators engage in teaching predominantly because they deem it important to do it well. Linear regression equations indicate a significant relationship between subjective-task value and engagement in teaching task ($F_{(7,672)} = 1.83$; $p < .01$) and time devoted to teaching ($F_{(6,187)} = 1.83$; $p < .05$).
Conclusion: The subjective task-value model provides useful insights into what motivates medical educators to engage in teaching activities. Our results indicate how medical educators find motivation to persevere and devote some of their time to teaching. This leads us to suggest that what may motivate physicians to engage in teaching and in FD is to place greater emphasis on the complementarity between teaching practice and the maintenance of the quality standards for practice within the profession.

Valuing Clinical Teachers: Understanding Perspectives of Clinical Faculty at the University of Toronto

Authors
Alison Freeland, University of Toronto, Toronto, Canada
Hayley Mundeva, University of Toronto, Toronto, Canada
Sonya Pak, Trillium Health Partners, Mississauga, Canada
Deepy Sur, Trillium Health Partners, Mississauga, Canada
Arno Kumagai, University of Toronto, Toronto, Canada

Presenter: Alison Freeland, University of Toronto, Canada

Background: Clinician Teachers (CTs) constitute a large proportion of medical teaching faculty. With increasing dependance on busy clinicians to participate in teaching and faculty development, there is a need to ensure they feel supported and recognized for their contributions.
Method: Eleven focus groups of clinician teachers from academic and community health care settings across the Greater Toronto Area were conducted. Results were analyzed using a constructivist approach informed by Grounded Theory. Findings were validated with a faculty-wide survey of CTs which was analyzed using descriptive statistics. Open-ended survey questions were examined using a grounded theory approach.
Results: The 57 focus group participants identified intrinsic motivations, rewards, and challenges impacting their teaching roles. Survey results from 563 respondents validated these responses. In terms of intrinsic motivators and rewards, CTs described three themes: 1) desire to make connections with other faculty and students 2) professional interest and growth 3) work variety. Identified challenges included: 1) delays in obtaining student feedback, impacting ability to apply for awards/academic promotion 2) Inadequate financial remuneration 3) teaching is less valued than research 4) perceived lack of connection and communication between community hospitals and university 5) inadequate infrastructure and technology to support teaching.
Discussion & Conclusions: CTs feel intrinsically rewarded and motivated within their roles despite identified challenges. Opportunities to address challenges include developing standardized processes to routinely thank CTs for their contributions, to increase the number of teaching awards and to publically celebrate teaching achievements. Identifying and solving system barriers, such as evaluation and feedback systems, should be considered. Strategies to improve communication channels within and across teaching sites should be developed. Academic promotion processes should be reviewed to ensure CTs can realistically meet requirements. Using these results, U of T plans to institute a structured project plan to roll out and evaluate recommendations that will enhance the perceived value of CTs.
Take-home messages: 1) CTs feel undervalued compared to researchers.
2) Universities can develop strategies to meet the needs of CTs, including improved appreciation and acknowledgement, increasing opportunities for teaching awards, reviewing academic promotion requirements, and improving infrastructure and communication.

10M3 (1576)
Risk and vulnerability in clinical teaching: a qualitative study

Authors
Arvin Damodaran, Prince of Wales Clinical School, Medicine, UNSW Sydney, Australia
Philip Jones, Office of the Pro-Vice Chancellor (Education), UNSW Sydney, Australia
Boaz Shulruf, Office of Medical Education, Medicine, UNSW Sydney, Australia

Presenter: Arvin Damodaran, Prince of Wales Clinical School, Medicine, UNSW, Sydney, Australia

Background: Since entrustment is now a popular assessment strategy, it is important to understand risk and vulnerability, which drive trust decisions. The wider objective of this study was to explore clinical teacher's perceptions of trust, risk and vulnerability as relates to medical education. This paper addresses themes that emerged as hospital doctors considered their own vulnerabilities in the medical education context.
Method: This study adopted a constructivist, qualitative framework. Ethics approval was obtained from UNSW HREC. Doctors involved in teaching students and junior staff at a metropolitan teaching hospital were purposefully selected to vary age, gender and career stage. Semi-structured interviews were transcribed, iteratively coded and categorised utilising a general inductive approach.
Results: 20 doctors were interviewed with 9 females, 11 males, aged 25-59 (average 40). Career stage varied with 3 residents, 4 trainees and 13 specialists. Interviews ranged 21-54 (average 38.5) minutes.
Risks to clinical teachers could be categorised into:
1. Teaching, supervision and academic programs. Predictably, concerns raised included insufficient time, support and recognition. Topical risks, such as student wellbeing emerged:
"I don't want to have to reprimand someone because they've sworn at a nurse and then have them go home and do something stupid."
2. Self-perception, reputation and career. Participants reflected on the consequences of mistakes. Career was especially relevant to junior clinicians.
3. Patient care, clinical teams and workplaces. A prominent concern was "failure to fail":
"I am stunned by the number of people who have got references when none of us would let them look after our own relatives."
Discussion & Conclusion: In addition to recognised clinical teacher concerns, asking about risk and vulnerability drew attention to more personal dimensions of self-perception, reputation and career. Moreover, this study voiced doctor's concerns about risks of teaching and training to patient care. This may inform the current discussion contrasting the quality and safety agenda practiced in workplaces with traditional training programs.
Take-home messages: 1. Personal risks, including career and reputation, vary with career stage and influence engagement with teaching and supervision.

2. Doctors consider patient safety when making teaching and supervisory decisions. Education providers require similar sensitivity.

10M4 (166)
Are retired physicians suitable for the coaching of clerks?

Authors
Ivan Bank, Medical Center Zuiderzee, Lelystad, Netherlands
Johannes de Leeuw, Alrijne Hospital, Leiderdorp, Netherlands
Willem Lijfering, Leiden University Medical Center, Leiden, Netherlands
Marjolein de Bois, Haaglanden Medical Center, Den Haag, Netherlands
Theo van Woerkom, Leiden University Medical Center, Leiden, Netherlands
Marjo Wijnen-Meijer, University Medical Center Utrecht, Utrecht, Netherlands

Presenter: Marjo Wijnen-Meijer, University Medical Center Utrecht, Netherlands

Background: Coaching during clerkships is not yet happening on a large scale in Netherlands or in most other countries. Discussions with clerks have shown that many of them would like to receive additional guidance. Furthermore, they are also not able to discuss other matters than the usual, mostly clinical topics, without having to worry about possible consequences for their assessment. Finally, enthusiastic coaches are usually either unavailable or and involved in the assessment of clerks. Would retired be an alternative solution for daily practice?
Method: We linked retired medical specialists as coaches to clerks. Both clerks and coaches were followed for 18 months. Consecutive clerks starting their first clerkship were randomised between having a coach (n=61) and not having a coach (n=59). Both clerks and coaches completed questionnaires. In addition, in-depth interviews with the coaches were conducted.
Results: Clerks who had a coach were happy to have one. During follow-up, there were no differences between both groups concerning free time, self-esteem, stress, or the number of conflict situations. Clerks with a coach indicated to have less stress as compared to the clerks without a coach. Different issues were discussed with the coaches, such as career issues, deceased patients, unacceptable behaviour of staff, or unpleasant fellow clerks. All coaches liked fulfilling the role of coach. Many found it an interesting way of doing something after their recent retirement from clinical practice. They mentioned that clerks needed them more during the first year of clerkship than later on.
Discussion & Conclusion: The findings of this study on mentoring clerks show that clerks sometimes need a coach and that they are happy to have one. Coaches may be selected amongst retired physicians with good communication and social skills. They are highly motivated for this task and have enough time for this task. This intervention might decrease stress in clerks.
Take-home message: Retired physicians can be used as coaches for clerks.

Identifying professional development needs for clinical teachers

Authors
Lisa Cheshire, University of Melbourne, Australia
Robert Dowsett, University of Melbourne, Australia
Jayne Lysk, University of Melbourne, Australia

Presenter: Jayne Lysk, University of Melbourne, Melbourne, Australia

Background: Health professionals have diverse and challenging teaching roles undertaken alongside their clinical responsibilities. There is a body of research on student learning in the clinical environment compared to strategies needed to teach in the workplace. Currently, in Australian teachers employed by clinical schools attached to hospitals are not required to have any formal qualifications in education. This paper identifies specific perceived needs of clinical teachers and leaders to enhance the delivery of a University curriculum.
Method: This paper arose from an analysis of the professional development needs of tutors teaching into the Doctor of Medicine program at the University of Melbourne. Sources of data are derived from an online survey of directors and clinical teachers (n=68) of Medical Education and semi-structured interviews (n=8) with clinical teachers.
Results: Clinical teachers and leaders were able to identify many areas that would that would benefit from professional development. Amongst the top 5 frequently chosen areas for development, both groups chose teaching strategies, teaching with patients, feedback, and working with under-performing students. Notably, for the frequently selected items mentoring was in the top 5 items nominated by clinical teachers; but not by leaders who included questioning skills which clinical teachers did not.
Discussion & Conclusion: Clinical teachers and clinical leaders in clinical schools expressed a need to develop skills in specific areas to enhance their ability to deliver the curriculum in the workplace and to improve the student experience. The results of this study offer directions for education and training for specific areas of curriculum delivery in a clinical workplace environment.
Take-home messages: • Development should focus on the 4 areas of teaching strategies, teaching with patients, feedback, and working with under-performing students.
• Clinical teachers and leaders differ in the perceived needs of delivering mentoring and questioning skills to students.
• In planning profession development programs perspectives of all stakeholders need to be given consideration Including students.

Medical school selection as a learning experience

Authors
Marieke de Visser, Radboud University Medical Center, Nijmegen, Netherlands
Roland Laan, Radboud University Medical Center, Nijmegen, Netherlands
Rik Engbers, Radboud University Medical Center, Nijmegen, Netherlands
Janke Cohen-Schotanus, University Medical Center Groningen, Groningen, Netherlands
Cornelia Fluit, Radboud University Medical Center, Nijmegen, Netherlands

Presenter: Marieke de Visser, Radboud University Medical Center, Nijmegen, Netherlands

Background: Research on selection for medical school does not explore selection as a learning experience, despite growing attention for the learning effects of assessment in general. Insight in the learning effects allows us to take advantage of selection as an inclusive part of medical students' learning process to become competent professionals. The aims of this study at Radboud University Medical Center, Netherlands, were: 1. to determine whether students have learning experiences in the selection process, and, if so, what experiences; 2. to understand what students need in order to utilize the learning effects of the selection process at the start of the formal curriculum.
Method: We used focus groups to interview 30 students admitted in 2016 about their learning experiences in the selection process. Thematic analysis was used to explore the outcomes of the interviews and to define relevant themes.
Results: In the selection process, students learned about the curriculum, themselves, their relation to others and the profession they had been selected to enter, although this was not explicitly perceived as learning. Students needed a connection between selection and the curriculum as well as feedback to be able to really use their learning experiences for their further development.
Discussion & Conclusion: Medical school selection qualifies as a learning experience and students as well as medical schools can take advantage of this. We think that, given the substantial resources utilized in selection, and the volume of information gained on the applicants, there is great value in finding a way to connect the two processes for enhancement of education.
Take-home message: A selection procedure is implicitly priming students for the curriculum. We recommend a careful design of the selection procedure, integrating relevant selection learning experiences into the formal curriculum, providing feedback and explicitly approaching the selection and the formal curriculum as interconnected contributors to students' development.

Is selecting medical students based on face-to-face interviews more likely to identify those who will have better clinical performance?

Authors
Yen-Yuan Chen
Tzong-Shinn Chu
Shan-Chwen Chang
Shih-Li Tsai, Graduate Institute of Medical Education and Bioethics, National Taiwan University College of Medicine, Taiwan

Presenter: Yen-Yuan Chen, Graduate Institute of Medical Education & Bioethics, National Taiwan University College of Medicine, Taiwan

Background: Several different ways have been reported to identify the medical students who will respond to the needs of a society. We compared the clinical performance of post-graduate year one medical trainees (PGY-1) based on different admission criteria to medical schools, face-to-face interviews and only writing tests.
Method: We included the 2015~2016 and 2016~2017 PGY-1s in a university-affiliated medical center who graduated from the same medical school located at Northern Taiwan. The personal characteristics and the ways, writing test only (WTO group) and face-to-face interview (FFI group), they were admitted to the school were retrospectively reviewed and collected. Clinical performance was defined, in this study, as clinical skills, clinical reasoning, and procedural skills, which were measured using mini-Clinical Evaluation Exercise (mini-CEX), Case-based Discussion (CbD), and Direct Observation of Procedural Skills (DOPS), respectively. The clinical performance of each PGY-1 as indicated by mini-CEX, CbD, and DOPS examined during his/her clinical rotations were retrospectively collected. The association between clinical performance and ways of admitting to the medical school after controlling for personal characteristics was examined using multivariate linear regression analysis.
Results: 132 and 30 PGY-1s were admitted to the medical school by WTO and FFI, respectively. Before controlling for age, gender and academic performance upon medical school graduation, the PGY-1s in the FFI group have better academic performance upon medical school graduation than those in the WTO group with statistical significance (p<0.01). After controlling for other confounding variables, we found that none of clinical skills, clinical reasoning, and procedural skills were predicted by the ways of admitting to the medical school. In addition, we also found that PGY-1s' clinical skills as indicated by mini-CEX were significantly associated with their academic performance upon medical school graduation (p=0.02).
Discussion & Conclusions: It has been suggested that physicians with professional clinical performance are certainly expected by the society and fulfill the needs of the society. However, our study results weakened the suggestion that face-to-face interview is necessary for

admitting medical students to medical schools who will have good clinical performance. Some limitations of this study should be carefully deliberated.

Assessing how cultural values impact responding on a Situational Judgment Test

Authors
Fiona Patterson
John Spicer
Naureen Bhatti
Rachel Driver

Presenter: Charlotte Flaxman, Work Psychology Group, Derby, UK

Background: Evidence from research suggests that cultural values, which serve as guiding principles, may act as drivers for behaviour in workplace contexts. There is debate around the extent to which cultural values may impact judgments about behaviours relating to professional attributes. The attributes pertinent to effective performance for general practitioners (GPs) are measured in assessments across selection and development in GP trainees. Investigating the impact of cultural values on performance on such assessments would provide insight into this relationship.
There is a drive to understand how individuals' cultural values may play a part in their interpretation of and performance on assessments of interpersonal competency areas such as communication, empathy, teamwork and resilience. This study seeks to answer the question 'How do cultural values impact GP trainees' and subject matter experts' performance on an assessment of professional attributes?'.
Method: A questionnaire was designed to measure personal values, ethnic group identity, performance on a situational judgment test (SJT) assessing professional attributes, and demographic background for groups of GP Trainees and subject matter experts (SMEs - trainers, educational supervisors). Additionally, SMEs rated the 'cultural loading' (i.e., the extent to which SJT items reflect cultural values such as traditionalism, security and universalism) of the SJT items.
Data collection is currently underway with an aim to present and discuss preliminary results and findings for the meeting date in August 2018.
Discussion & Conclusions: The results of this project will improve understanding of relationships between cultural values, decisions about behaviours and their impact on assessments for selection and development.
Take-home message: The implications of this study extend to broader challenges in GP education and training policy and practice, such as contributing to conversations about how such differences should be managed, in terms of selection and development.

Situational judgment test helps medical staff reach consensus

Authors
Juliana Tze-Wah Kao, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan
Li-Ying Huang, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan
Dee Pei, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan
Kun-Long Hung, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan

Presenter: Juliana Tze-Wah Kao, School of Medicine, Fu Jen Catholic University, New Taipei City, Taiwan

Background: Situational judgment test (SJT) is a psychological assessment which presents the test-taker with realistic, hypothetical scenarios and asks the individual to select or rank the responses he/she considers appropriate. Exploration of its application in medical school admissions has been undergone by some countries. This study aims to evaluate its use in medical education in Taiwan.
Method: SJT was first introduced by a lecture to the medical staff of a newly established hospital. The staff was then invited to take two tests for interns developed by Dr. Goss of Australia (distributed in AMEE 2015). One is a selective-style test evaluating professionalism. The other is a ranking-style test concerning patient safety and assertive communication. The answers to the tests were then compared with the standard answers. Advantages and disadvantages of SJT were also discussed.
Results: Twenty-one medical staff (9 males, 9 doctors) completed the tests. For the selection-style test, 16 staff (76.2%) chose the standard answer. For the ranking-style test, 13 staff (61.9%, 3 doctors) gave the same ranking as the standard answer. Eleven staff (52.4%, 10 females, 1 doctor) chose the standard answers of both tests. All thought that SJT is interesting and can be used to assess students of medical schools. However, some thought that the answers are subjective with limited items to choose.
Discussion: More than 75% staff chose the same answer for the selection-style test, indicating that it is probably easier to gain consensus over professionalism and/or selection-style test has a lower degree of test differentiation. There were more different answers to the ranking-style test, probably because there were more items to rank and thus had a higher degree of test differentiation. Only three doctors chose the standard answer of the ranking-style test, indicating that doctors might have different ways of thinking and consensus over assertive communication is needed.
Conclusion: SJT may be used to assess students of medical schools and help figure out conflicts of healthcare issues among medical staff.
Take-home message: SJT may help medical staff reach consensus. Ranking-style SJT probably has a higher degree of test differentiation than selection-style SJT.

The ups and downs of using situational judgment tests for admission to medical school

Authors
Anja Schwibbe, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Johanna Hissbach, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Janina Lackamp, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Mirjana Knorr, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Stefan Zimmermann, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Wolfgang Hampe, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Presenter: Anja Schwibbe, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: With the intention to consider non-academic attributes and interpersonal skills in medical school admission procedures, situational judgment tests (SJTs) have become widespread in recent years. Some previous findings showed significant correlations to different study performance measures (Patterson et al., 2016). However, shortcomings regarding internal consistencies and validity evidence continue to be discussed.

Method: In the context of the admission procedure 2016 at the University Medical Center Hamburg-Eppendorf (UKE) we developed and piloted a contextualized SJT, which resulted in satisfactory internal consistencies (α=.62) and a significant correlation to our multiple mini-interview (MMI) (r=.22, p=.004). One year after admission we analyzed the predictive value of this SJT for supervisor ratings during an obligatory one-week teaching in a general practice. With the aim to further improve reliability and validity results, we modified and piloted a new version of the SJT in 2017 by adding scenarios and reducing the number of items per scenario.

Results: Correlations of the 2016 SJT to different aspects of supervisor ratings failed to reach significance. In addition, contrary to our expectations the internal consistency of the new 2017 SJT decreased (α=.52) and we found neither a significant relationship to the MMI overall score (r=-.052, p=.470) nor to the score of a single station, which was an oral version of an SJT-scenario (r=-.029, p=.684).

Discussion & Conclusions: The significant convergent validity to our MMI could not be replicated in 2017 and in our case the principle "the more items the better the reliability" did not prove true. SJT performance in 2016 and supervisor ratings one year later were not related. Our choice of a contextualized SJT rather than a construct-driven approach (Lievens, 2017) further complicates the interpretation of (non)significant relationships. Therefore we will attempt to address this problem by developing a new construct-driven SJT version, which should be piloted with applicants in 2019.

Take-home message: It seems to be a kind of lottery to attain satisfactory reliabilities and consistent validity

results for SJTs. Possible reasons as unclear construct validity have to be further investigated.

10N6 (314)
Influence of Language & Culture on International Medical Graduates' performance on Situational Judgment Tests

Authors
Harold Reiter
Kelly Dore
Chris Zou
Patrick Antonacci
Anurag Saxena

Presenter: Harold Reiter, McMaster University, Hamilton, Canada

Background: International medical graduates (IMGs) face challenges in familiarity with culture and language that domestic (Canadian) medical graduates (CMGs) do not (Triscott). As Situational judgment tests (SJT) use for Canadian resident selection increases, it is imperative to understand how an IMG's fluency in culture or language impact their scores.

Method: During Canadian postgraduate medical trainee selection in 2017, 816 IMGs and 1,172 CMGs wrote CASPer, an online, test-secure, video-stem, constructed-response SJT with validity evidence, measuring context non-specific personal competencies. Constructs are based upon CanMEDS 2015 intrinsic competencies; content, rater recruitment, and training are aligned with Canadian culture. The stems, instructions, and response scoring were all conducted in English. Mean IMG and CMG SJT scores were compared with large cohorts' CASPer score relationships with English as a Second Language (ESL) versus English as a First Language (EFL), spelling errors, and applicant writing grade level.

Results: Mean (standard deviation) of CASPer scores for IMGs and CMGs were 4.8 (1.1), and 5.9 (0.8), respectively (p<0.0001). This is consistent with similar differences between ESL (n=760) and EFL (n=3120) test-takers – 4.9(1.0) and 5.3(0.8), respectively (p<0.001). For score differentials specific to language fluency, there were negligible differences based upon number of spelling errors across 404,500 item responses (r=-0.04) and no difference for applicant writing grade level above grade six across 9,690 items (r=0.10).

Discussion: Significantly different SJT mean scores between IMGs and CMGs, and between ESLs and EFLs, may be due to differences in one of culture or language fluency or a combination. Research on metrics which apply to language fluency only demonstrate negligible differences in scores. However, SJT score dependence on national culture has been found elsewhere to be particularly critical, impacting both content development and scoring (Stegers-Jager).

Take-home messages: Differences in language fluency can be ruled out as contributing to CASPer results; differences in cultural fluency cannot. Assuming CASPer differentiates between applicants based upon level of acculturation, programs selecting IMG applicant with lower SJT scores

should be prepared to provide greater support to assist their incoming IMGs to adapt to their new culture.

10N7 (3383)
Graduate-Entry Medicine: Good for Widening Participation?

Authors
Emily Róisín Reid, University of Warwick, Coventry, UK
Paul Matthews, University Hospitals Coventry and Warwickshire, Coventry, UK

Presenter: Emily Róisín Reid, University of Warwick, Coventry, UK

Background: A Bourdieusian exploratory 2017 research project investigated the impact of 'Graduate Entry Medicine' on 'Widening Participation': the goal of creating a medical workforce representative of the population it serves, particularly when accounting for disability, ethnicity and socio-economic backgrounds.
Method: The study consisted of two phases. Phase I gained benchmarking data via a quantitative survey with qualitative insight, which was completed by 46% of the student population (n=326). Phase II consisted of a series of in-depth semi-structured interviews (n=22) and focus groups (n=2). A 'Grounded Theory' approach to data collection, coding (open, axial and selective) and analysis was taken, recursively analysing data to ensure rigour and validity.
Results: The main findings, which will be published in due course, are an exposition of the barriers students from 'Widening Participation' backgrounds have faced throughout their journey into medicine. The data in full demonstrates that graduate-entry medicine enables students to enter the profession who otherwise would not have been able to.
Discussion & Conclusions: Analysis into the barriers faced by those students not only confirms factors already known in extant WP literature e.g. the impact of structural determinants on career choice (i.e. fees and bursaries), but also elucidates other interesting factors, such as the demonstrable role of 'media' (in particular, TV programmes) on career choice, 'luck', the acute impact of either being explicitly told that 'you are not good enough' or not being recognised as having the 'potential' to be 'good enough', which serves to demotivate and disengage otherwise 'bright enough' students. This paper calls for us to think more critically about: what is 'good enough' to be a doctor? Are we really trying to attract a pool of applicants from wider backgrounds, whilst maintaining the status-quo on selection methods? How should we widen our own reach to help others enter the profession? We propose acting as a 'surrogate medical family' to best support candidates not only on entry, but throughout their careers.
Take-home message: We each have responsibilities strive to make medical workforces truly representative, and only by really taking these on, will we make a difference. This paper calls for further investigation and development of innovative approaches.

A quantitative analysis of use of mobile devices for learning by students at St George's from 2010 till present

Authors
Supriya Krishnan, St George's, University of London, UK
Sheetal Kavia, St George's, University of London, UK
Trupti Jivram, St George's, University of London, UK
Luke Woodham, St George's, University of London, UK
Terry Poulton, St George's, University of London, UK

Presenter: Sheeta Kavia, St George's, University of London, UK

Background: Smartphones and tablet devices have become ubiquitous and continue to be the most accessible device across the world. These devices have become integral part of communication, learning, and collaboration. There is a limitless amount of activity rendered using mobile devices, however, the adaption and pace of these in favour of learning is still unclear, and to extract this, we have attempted to do a qualitative analysis using a series of surveys released amongst students at St George's from 2010 till present. We have also attempted to gather interesting trends available from the feedback within the surveys.
Method: The e-Learning unit released surveys specifically designed to analyse the use of mobile devices amongst students. The survey was to investigate the number of hours spent and types of resources used on mobile devices for learning. The survey was released 6 times during 2010 through 2017. Each year the feedback and trends were examined carefully to improve questions for subsequent years. The surveys were created using SurveyMonkey and were disseminated to students via student emails VLE and posters.
Results: The number of students who provided feedback on the survey varied from 2010 to now with the highest response rate (~ 860) was in 2012 and lowest in 2017. There has been an increase in the number of hours spent per week listening to audio files (podcasts) and accessed educational apps or websites. Trends of popular resources accessed via mobile devices has largely remained the same with little variants i.e. the most popular website accessed has been Wikipedia each year.
Discussion: The results of the survey show that students are using their mobile devices more regularly. This could be a result of more availability of resources and infrastructure changes making accessibility to such resources easier.
Conclusion: The current trend of learning with mobile devices has rapidly changed and it is no longer a novelty but part of their daily learning practice.

Take-home message: Technology and learning are evolving together and are mutually supportive of each other.

1O2 (1152)
Use of Group Learning, Scenarios and Reflective Writing to Enhance Undergraduate Medical Students' Understanding of the Professional Implications of Social Media

Authors
Isobel Braidman, University of Manchester Medical School, Manchester, UK
Akshay Patel, University of Manchester Medical School, Manchester, UK
Maria Regan, University of Manchester Medical School, Manchester, UK

Presenter: Isobel Braidman, University of Manchester Medical School, Manchester, UK

Background: Although social media is advantageous in medical education and practice, it has concerning aspects so that in the UK, the General Medical Council provides guidance (Doctor's Use of Social Media 2013). Nevertheless, it is unclear whether medical students' fully understand its implications, especially in a large Medical School such as ours (>2,200 students). Years 1 and 2 students are introduced to professional development (PD) through scheduled Group PD sessions of 20 – 24 students. Each focuses on a specific aspect of professionalism and is the basis of a reflective portfolio entry.
Method: For second year students (n=376), one PD session is devoted to Probity and Professional behaviour. It uses three scenarios, each with a specific dilemma, one involving students' use of social media. We therefore investigated students' understanding of social media through their reflective entries from this session. Students' material was analysed only with their approval and consent. One student was randomly selected from each group (two students refused consent and one did not attend the session) and relevant reflective entries were thematically analysed (n=29).
Results: Twenty three students (79%) included social media in their reflections and one focussed on it alone rather than the other scenarios. The remaining six students (21%) reflected only on the other scenarios. Our preliminary data indicated that there was high quality reflection and identified five main social media themes, which were used on 56 occasions: "Sharing Information"(38%), "Behaviour Online" (21%), "Understanding the Cyber Footprint" (19%) "Benefits of Social Media" (18%) "Requirement for further Information" (4%). We found that although some students were aware of issues arising from social media, others were unsure how to report unprofessional online behaviour.
Discussion & Conclusions: The Group PD sessions and the resulting reflective entries enabled students to explore issues arising from using social media. Of concern, however, was that few students identified the need for further learning about social media, although they were

unsure of how to deal with important issues like unprofessional behaviour online.

Take-home message: By analysing students' written reflection we identified a need to encourage their further learning about social media.

1O3 (2022)
Lessons learned from a decade on YouTube

Authors
David Topps
Rachel Ellaway
Joyce Helmer

Presenter: David Topps, University of Calgary, Canada

Background: Back in 2007, we were one of the earliest groups to use YouTube for disseminating teaching videos. Now more than 300 hours of video are uploaded to YouTube every minute and most videos lose interest in days. Over a decade, our Clinisnips channel has seen sustained and vigorous uptake.

Method: Our Clinisnips videos have had over 5.7 million views, with a sustained rate over 2400 views/day. We examined the analytics and activity stream metrics, using various approaches. Some of these are simple and publicly available; some analytics have required a more in-depth approach, which will be shared. We explored what video sharing innovations have contributed to the lasting success of our channel, such as video mashup tools and widgets that facilitate video embedding into other curricular materials.

Discussion: Simply posting videos is not sufficient. It is important to assess what works and incorporate such feedback into ongoing developmental strategies. Detailed analytics allow you to explore how users engage with your materials, beyond simple click rates.

Take-home message: High quality base materials are an advantage but simple factors that allow other groups to easily incorporate your materials into their learning strategies make a big difference.

1O4 (3047)
Serious digital games using Twine open-source software, virtual patients, and digital chalk-talk videos: enhancing undergraduate and postgraduate medical education in diabetic acute care

Authors
Nathaniel Quail, University of Glasgow, Glasgow, UK
Mary Oje, Glasgow Caledonian University, Glasgow, UK
Paul Rea, University of Glasgow, Glasgow, UK
Daniel Livingstone, Glasgow School of Art, Glasgow, UK
Jane Nally, Glasgow Caledonian University, Glasgow, UK
James Boyle, University of Glasgow, Glasgow, UK

Presenter: Nathaniel Quail, University of Glasgow, UK

Background: The use of serious digital gaming, whereby clinical interactions are virtually played through by the user, is an evolving way of engaging healthcare professionals to learn in a safe environment. This study aimed to evaluate the use of virtual patient scenarios, made using easily accessible and programmable Twine open-source software, in enabling medical students and junior doctors to learn about diabetic acute care. Although 10-20% of hospital inpatients have diabetes, this is an area of low confidence among junior doctors.

Method: Three digital games with virtual patients were developed using Twine open-source software, Wacomb Intuous Pro, Camtasia Studio, Autodesk SketchBook, and simulated patient videos. These aimed to increase engagement, confidence, and knowledge in diabetic acute care among medical students and junior doctors. The scenarios address diabetic ketoacidosis, hyperosmolar hyperglycaemic state, and severe hypoglycaemia. Scenarios are played from presentation to resolution, with integrated chalk-talk explanations of important concepts. The scenarios reinforce themes of multi-professional care, multi-morbidity, poly-pharmacy, and safe insulin prescribing. These are frequently encountered by junior doctors but can form part of the hidden undergraduate curriculum. A prototype was piloted by a small cohort of senior medical students and junior doctors.

Results: Initial pilots with senior medical students and junior doctors have demonstrated high levels of engagement, acceptability, and overall satisfaction, as well as significant improvements in confidence and knowledge (p<0.05). Following this success, analysis using the Kirkpatrick model will subsequently be performed on a larger student cohort during our flipped classroom 'Diabetes Acute Care Day.'

Discussion & Conclusions: Our pilot testing suggests that this novel pedagogical approach is acceptable, encourages student engagement, and increases levels of confidence and knowledge in acute diabetes care. Virtual patient scenarios may be integrated into the undergraduate and postgraduate medical curriculum to create safe, engaging, and realistic learning opportunities. Virtual patient scenarios enable students and junior doctors to study subject-specific learning outcomes, while engaging with aspects of the hidden curriculum.

Take-home message: Open-source Twine software allows educators to easily develop virtual patient scenarios, which can be integrated into undergraduate and postgraduate teaching to enhance subject-specific and universal learning outcomes.

1O5 (609)
Evaluation of virtual case simulations considering the extraneous cognitive load and emotions of medical students

Authors
Regina Schönberger, Institut für Didaktik und Ausbildungsforschung in der Medizin, Munich, Germany
Valentina Jung, Institut für Didaktik und Ausbildungsforschung in der Medizin, Munich, Germany
Michael Sailer, Fakultät für Psychologie und Pädagogik, Munich, Germany
Frank Fischer, Fakultät für Psychologie und Pädagogik, Munich, Germany
Martin Fischer, Institut für Didaktik und Ausbildungsforschung in der Medizin, Munich, Germany

Jan Kiesewetter, Institut für Didaktik und Ausbildungsforschung in der Medizin, Munich, Germany

Presenter: Valentina Jung, Institut für Didaktik und Ausbildungsforschung in der Medizin am Klinikum der Ludwig-Maximilians-Universität München, Germany

Background: To establish clinical reasoning skills is one of the key goals of medical school. This study examined to what extent prior knowledge influences extraneous cognitive load(ECL) and how emotions influence the learning of clinical reasoning with virtual patients(VPs). Following research questions were asked:
RQ1:How does prior knowledge relate to ECL when learning with VPs?
RQ2:How do emotions relate to the learning process?
Method: N=142 Medical students were invited to a computer lab. The students answered a declarative and procedural knowledge test, and had to diagnose eight VPs in the learning environment CASUS.
Based on the declarative knowledge test a median split determined prior knowledge (low vs. high). After the pretest, after four VPs and after eight VPs the students' ECL was assessed, emotions before and after diagnosing the VPs. Medical students' required knowledge was limited to back pain and fever.
Data was analysed with SPSS Statistics and alpha error level was set to p<.05.
Results: 142 medical students participated in this study (72% female,M=24.41 years).
RQ1:A repeated measures ANOVA shows significant interaction for point of measurement and prior knowledge $(F(2;274)=8.04;p.eta2=.06)$. There is no significant difference at the pretest between low (M=7.61;SD=2.08) and high (M=7.98;SD=2.24) prior knowledge, after four VPs this difference (low:M=8.71,SD=2.64;high:M=7.73,SD=2.48) is significant, and so is the difference after eight VPs (low:M=8.84,SD=2.70;high:M=7.86,SD=2.52). Students with low prior knowledge experience significantly higher ECL.
RQ2:The correlation according to Pearson shows a negative linear relationship between success rate and the emotions anxiety (r=-.34), frustration (r=-.35) and confusion (r=-.26) after the pretest and anxiety (r=-.39), frustration (r=-.32) and confusion (r=-.20) after eight VPs. This indicates a significant negative relationship between success rate and anxiousness, frustration and confusion.
Discussion: Low prior knowledge students' higher ECL measurements may hint at how high prior knowledge influences the perception of VPs. When ECL rises, students might experience negative emotions which could lead to reduction in performance.
Conclusion: This study has shown that affective experience of CL and negative emotions might imply cognitive impairment.
Take-home message: Frustration and anxiety relate to the success rate when diagnosing VPs and low prior knowledge relates to higher ECL.

Current status and future directions of e-Learning in medical education: 10 years of experience from South Korea

Authors
Kyong-Jee Kim, Dongguk University, Goyang, Korea
Youngjoon Kang, Jeju National University, Jeju, Korea
Giwoon Kim, Sooncheonhyang University, Bucheon, Korea

Presenter: Kyong-Jee Kim, Dongguk University School of Medicine, Goyang, South Korea

Background: We present the current status and future directions of e-learning in medical education from the experience of the e-learning consortium of medical schools in in South Korea for the past 10 years.
The consortium has offered an e-learning portal (www.mededu.or.kr), containing contents contributed by approximately 180 faculty members from medical schools nationwide since 2007. There are now over 1,600 multimedia learning resources of various types, including clinical cases, clinical vignettes, clinical images, and quizzes. This website currently has over 26,000 registered users from 36 medical schools out of 40 across the nation. The website gets over 30,000 hits per month. Clinical videos have received far greater hits than any other types of contents; approximately 30% of them are accessed from mobile devices.
Results: The consortium has provided e-learning that supports important developments in medical education in Korea. First, the clinical skills test was added to the national licensing examinations in 2009. Accordingly, we're offering video clips to support student learning of the clinical skills. Second, the Korean Association of Medical Colleges recently revised the learning outcomes for basic medical education based on a clinical presentations model. Consequently, we are mapping our contents with these new learning outcomes. Third, multimedia items will be added and delivered using tablets in the national licensing examinations in 2020 for more authentic assessment. In preparation for such new assessments, we are expanding our collection of resources to incorporate more multimedia contents, including audio clips and vignettes of clinical encounters.
Discussion & Conclusions: Our website has grown for the past 10 years and we made it sustainable by implementing strategies aligned with recent developments and future directions of medical education so that we can meet students' needs and support improvement of medical education in Korea. One of the key success factors was the collaboration of medical schools across the nation for development of the necessary infrastructure and contents.
Take-home message: Inter-medical school collaboration is an effective strategy for implementing e-learning in medical education.

10O7 (533)

TeachMePaediatrics: A New Socially Constructed Education Resource

Authors
Adam Bonfield, University of Leicester, Leicester, UK

Presenter: Adam Bonfield, University of Leicester, UK

Background: The "TeachMe" series started with "TeachMeAnatomy" and "TeachMeSurgery", websites to help medical students and trainees learn key subjects. To date, they have amassed over 40 million hits worldwide. We wanted to build on this strong foundation to launch "TeachMePaediatrics", a free website full of high-quality content, to aid trainees in learning about common and important paediatric conditions.

Method: A list of articles was created in line with the RCPCH curriculum and discussions with trainees.
The model of article development is unique to the TeachMe series. Trainees complete the first draft of articles which are then reviewed by senior experts in the field. In this way, articles are pitched at a suitable level, while also ensuring the quality of clinical content.
To further enrich the learning experience, multiple choice questions are given on the topic being studied. Clinical cases enable the learning to be situated in a scenario, allowing the learner to apply their knowledge to a clinical setting.

Results: More than 40 articles have been completed and are being used worldwide in student learning. In just 8 weeks the website has amassed over 12,000 individual hits. Qualitative feedback includes 'great layout', 'concise' and 'informative'. A strong interest on Twitter has resulted in collaborative learning with other disciplines such as paramedics and nursing staff.

Discussion & Conclusions: "TeachMePaediatrics" has started well with a number of articles already being used extensively by students and trainees to study. The way the articles are created and continually reviewed by those using the content builds on the concept of social constructivism. This 'social learning' is further emphasised by providing the Twitter community with questions and 'In-twitu simulation' cases.

There are many more articles in production as well as initiatives to expand the website into a free question bank, situate the learning into more case scenarios and produce virtual reality simulation videos. It is the the hope that the website becomes a place synonymous with high-quality, free paediatric education.

Take-home message: "TeachMePaediatrics" is a new, socially constructed, website based learning platform aimed at all healthcare professionals interested in paediatrics.

Developing health professional education faculty in the Pacific

Authors
Louise Young
Sinead Kado
Linda Sweet

Presenter: Louise Young, College of Medicine and Dentistry, James Cook University, Townsville, Australia

Background: Since 2006, students from Pacific island nations have been sent to Cuba to train as doctors in a health system that emphasizes community and primary health care. They are now returning as interns to their home country. It has been found that they are not well prepared for hospital work as interns, and their supervisors have had little experience supervising and educating interns. Faculty development for this role is required.
Method: This paper reports outcomes from a series of health professional faculty development workshops that have been undertaken in the Solomon Islands, Kirribati, Vanuatu, Palau and Fiji. These workshops aim to upskill clinical supervisors in contemporary knowledge, skills and attitudes related to learning and teaching in clinical settings.
Results: The presentation will describe the theoretical basis for the workshops, using action research cycles, as well as the topics and skills covered. Outcomes from the workshops, including participant feedback will be described. A main outcome was the increase in teaching confidence as well as the development of educator skills. Recommendations for faculty development in other low resource countries will be discussed.
Discussion & Conclusions: One week workshops are effective for developing faculty educator skills for clinical supervisors in Pacific Island nations. Core concepts such as learning as opposed to teaching and active rather than passive learning are readily adopted by participants. Whilst a week long workshop is not the optimum time. it works well in time and resource poor nations for developing a positive teaching culture and supervisor skills as educators.
Take-home message: Week long workshops are effective in increasing capacity in health professional education in low resource settings and where there is no previous teaching culture.

Designing and Performing Personal Development Plan (PDP): A Practical Guide for Faculty Members' Educational Activities

Authors
Ideh Dadgaran, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Rasht, Iran
Hossein Khoshrang, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Rasht, Iran
Hossein Hemmati, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Rasht, Iran
Abtin Heidarzadeh, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Rasht, Iran
Nafiseh Dadgaran, Guilan University of Medical Sciences, Rasht, Iran

Presenter: Ideh Dadgaran, Medical Education Research Center, Education Development Center, Guilan University of Medical Sciences, Rasht, Iran

Background: Personal development plan is a written schedule to meet the professional needs of individuals in their development and promotion. The aim of this study was to increase the self-assessment culture, improve time management skills and promote the reflective thinking in faculty members.
Method: This is a cross-sectional study. First, the plan consisting of 9 steps including: determining and hierarchy of important objectives that faculty members expect to achieve them; determining the most important goal; devoted time to achieve the most important goal; identifying personal strength to achieve the goal based on priority; performing and stopping some activities to achieve the goal; identifying skills and knowledge need to achieve the goal; determining functional measures based on priorities; identifying proponents in order to achieving the goal faster; evaluating and analyzing percentage of progress.The PDP form distributed among 10 faculty members who selected by purposeful sampling. After each 3 months interview with faculty members have been done and the progress and self- evaluation have been assessed.
Results: Most teachers seriously were monitoring their activities, and tried to resolve the problems to achieve their goals. In relation to the promotion of teachers' time management skills, the study led to the majority of teachers planned and implemented their activities based on the sequence of time. It also played a significant role in determining the impact of teachers' reflective thinking on their own activities and abilities.
Discussion & Conclusions: PDP is not just for determining current situation of faculties professional progress but, as a practical guide for performing educational activities. It means that faculties by implementing plan, determine objectives and functional steps of personal plan to achieve the developmental goal and during deadline for time, and

they continuously analyze percentage of progress and self-thinking toward actions had been done in the past.

Take-home message: Personal Development Plan (PDP) can be used as a practical guide for the implementation of educational activities based on specific goals, time management and teachers reflection on his/her own activities.

10P4 (3378)
Evaluation of a train-the-trainer (TtT) program to improve patient centred communication (PCC) in treating patients with adherence problems in a rural hospital in Tanzania

Authors
Wolf Langewitz, University Hospital, Basle, Switzerland
Stefan Erb, University Hospital, Infectious Diseases, Basle, Switzerland
Gertrud Joseph Mollel, Ifakara Health Institute (IHI), Ifakara, Tanzania
Regina Ndaki, Ifakara Health Institute (IHI), Ifakara, Tanzania
Leila Samson, Ifakara Health Institute (IHI), Ifakara, Tanzania
Maja Weisser Rohacek, Swiss Tropical & Public Health Institute (Swiss TPH), Basle, Switzerland

Presenter: Regina Ndaki, Ifakara Health Institute (IHI), Ifakara, Tanzania

Background: Communicable diseases pose a major health problem in SSA especially, when patients have problems to follow treatment recommendations: non-adherence increases the likelihood of resistance. Patient-centred communication encourages patients to talk about adherence problems (Erb et al.; 2017), it helps identify patients' concepts that jeopardise his/her willingness to adhere. We conducted two TtT workshops at the Centre for Infectious Diseases (CID) in Ifakara, Tansania.

Method: Two TtT workshops, two days each, were offered to 7 medical doctors, 10 registered nurses, 2 health counsellors and one nutrition advisor. During the workshop participants presented 'problem cases' from their clinical practice, principles of PCC were presented and applied to problem cases in role-play sessions. Before and after the workshop participants filled in two versions of a questionnaire presenting 5 case vignettes of patients with adherence problems (Basel Communication Inventory-HIV; Kiswahili version). Case descriptions end with patient utterances, professionals respond with free text in 3/5 and with multiple choice options in 2/5 cases. Cases have in common that patients' behaviour or emotion is unclear, rendering it problematic for professionals to move forward without any input from the patient. Instead, PCC is recommended inviting the patient's perspective. We report on the free text responses that were categorised using a variant of the Roter Interaction Analysis System (RIAS).

Results: Before the intervention participants wrote down lengthy statements, the most common communication strategies being giving information (N=52), giving advice (N=45), praising the patient for his opinion (N=8), and giving reassuring information (N=22; other=12). After the intervention responses were shorter, the most common strategies being mirroring (N= 38), giving information

(N=16), reassurance (N=7), and advice (N=12), echoing (N=8) and summarising (N=5; other=1).

Discussion & Conclusions: After a two day TtT workshop participants are less likely to give information or advice or to use reassurance statements in face of a patient with unclear adherence-problems. Instead, they prefer PCC strategies in line with the gist of patient-centred communication – inviting the patients' perspective.

Take-home message: Training local professionals from SSA in the use of PCC skills is feasible and successful after two days of training.

10P5 (2896)
Evaluation of the Train-The-Trainer Program for Basic Communication Skills in Context of a University Hospital

Authors
Ozlem Surel Karabilgin Ozturkcu, Ege University Faculty of Medicine, Department of Medical Education, Izmir-Turkey
Ozen Onen Sertoz, Ege University Faculty of Medicine, Department of Psychiatry, Izmir-Turkey
Hadi Sagın, Berna Gökengin Psychodrama Organization Counseling, Izmir-Turkey
Okan Gulbahar, Ege University Faculty of Medicine, Internal Medicine, Izmir-Turkey
Meltem Ciceklioglu, Ege University Faculty of Medicine, Public Health, Izmir-Turkey

Presenter: Ozlem Surel Karabilgin Ozturkcu, Ege University Faculty of Medicine, Department of Medical Education, Izmir, Turkey

Background: Train-The-Trainer Program for Basic Communication Skills-TTP-BCS was implemented with the aim to prepare new trainers for basic communication skills courses-BCSCs. The ultimate goal was, by means of those new trainers, dissemination of BCSCs throughout Ege University Medical Faculty Hospital-EUMFH.

Method: TTP-BCS consisted of two consecutive parts. The first part was combination of Train-The-Trainer Course-TTC and Basic Communication Skills Course-BCSC. The second part required participants to deliver BCSCs at EUMFH similar to BCSC delivered within the program.
TTP-BCS was implemented with volunteer participation of 44-EUMFH-staff. 18-participants continued the second part.
Evaluation of the TTP-BCS was guided by Kirkpatrick's- 4-Level-Model. Quantitative data collected with Session Evaluation Form-SEF, Training Program Evaluation Questionnaire-TPEQ were used 'reaction' evaluation; 'learning' was evaluated with PreTest-PostTest scores. Qualitative data from in-depth interviews with eight TTP-BCS participants were used for evaluation at 'behaviour'. SEF, TPEQ, PreTest-PostTest were also used during the second part as 360-degree feedback on 18 new trainers'performance to evaluate third level. Outputs of TTP-BCS were considered for 'results' evaluation.

Results: Participants were satisfied with TTC/BCSC sessions; they found the program valuable in their preparation for BCSC trainer.

Pretest-posttest results indicated that TTP-BCS participants' knowledge level increased within the program.

In-depth interviews showed that TTP-BCS was effective on transferring gained knowledge/skills into practice.

The satisfaction levels of participants who attended BCSCs were high for sessions and the entire course. Pretest-posttest scores showed an increase in knowledge of BCSCs participants.

26 of 44 participants quitted the program at second part. 18-BCSCs were run by 18-TTP-BCS participants; 190-EUMFH-staff had been trained by those new trainers.

Discussion & Conclusions: Evaluation study showed that TTP-BCS was effective on three levels of Kirkpatrick's model; program's expectations related to reaction, learning, and behaviour were fullfiled succesfully. However, effectiveness of TTP-BCS at fourth level was below institutional expectations in terms of the ultimate goal of the program. Conditions necessary for expected organizational results such as motivation mechanisms for taking role as a BCS trainer need to be explored through further research.

Take-home message: Kirkpatrick model is a workable instrument to evaluate the effectiveness of a train-the-trainer program for BCS.

10Q: Short Communications: Postgraduate Education 2

Location: Lima, Ground Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

10Q1 (735)
Theories of teaching and learning and teaching methods used in postgraduate education in the health sciences: a scoping review

Authors
Patricia McInerney, University of the Witwatersrand, Johannesburg, South Africa
Lionel Green-Thompson, University of the Witwatersrand, Johannesburg, South Africa

Presenter: Patricia McInerney, University of the Witwatersrand, Johannesburg, South Africa

Background: Postgraduate education has not received as much attention as undergraduate teaching in the literature in terms of methods used, innovative ideas and outcomes. Teaching at postgraduate level in the health science disciplines is a complex endeavour, as higher level knowledge, skill acquisition and decision making must be taught in a world which is seeing more complex health problems. This scoping review was prompted by the reviewers' personal experiences in faculty development and in response to the needs of postgraduate teachers. A scoping review, using the methodology described by the Joanna Briggs Institute, was undertaken. The review question was: Which theories of teaching and learning and/or models and / or methods of teaching are used in postgraduate teaching?
Method: Studies conducted in postgraduate health science disciplines, including but not limited to medicine, nursing, occupational therapy, physiotherapy, pharmacy and dentistry were considered. Both quasi-experimental study designs, analytical observational studies and analytical cross-sectional studies were considered for inclusion. Also considered were descriptive observational study designs and qualitative studies, text and opinion papers. Five databases were searched. A data extraction table was developed.
Results: A total of 5381 papers were identified. Sixty-one papers were included in the review, the majority of which were from the medical disciplines. Most of the studies were undertaken in the USA. Surveys were the most common research method used. Theories of teaching and learning seldom formed the basis for the innovation. The range of teaching methods used was wide. It is not altogether surprising to find that simulation and simulation exercises were the most commonly mentioned method (17; 27.8%). It is evident that the advent of competency-based education has led to greater emphasis on the teaching of aspects such as professionalism and leadership. While a number of innovative teaching methods were described, didactic teaching in the form of lectures was often included in the teaching of the programme.

Conclusion: Theories of teaching and learning are often only alluded to, with poor explanation of application of the theory to practice.
Take-home message: More rigorous research is needed in postgraduate education studies.

10Q2 (3240)
Organization of Postgraduate Medical Education (PGME) in different countries of Europe and America. The PGME-AMEE Study 2017

Authors
Jesús Morán-Barrios, Spanish Society for Postgraduate Medical Education, Bilbao, Spain
Maria José Cerqueira, Direcció General d'Ordenació Professional i Regulació Sanitària (Generalitat de Catalunya), Barcelona, Spain
Arnoldo Riquelme, Pontificia Universidad Católica de Chile, Santiago de Chile, Chile
Horacio Yulitta, Dirección General de Docencia, Investigacion y Desarrollo Profesional, Buenos Aires, Argentina
Sebas Martín. Dirección de Planificación, Ordenación y Evaluación Sanitaria (Gobierno Vasco), Vitoria, Spain
Miguel Galán de Juana, Postgraduate Medical Education Committee of AMEE, Madrid, Spain

Presenter: Jesús Morán-Barrios, Spanish Society for Postgraduate Medical Education, Bilbao, Spain

Background: We have the perception that there is a great variability in the PGME between different countries. It is important to know the policy and rules that regulate the process of specialized training and the quality control, to facilitated free circulation of specialists.
Method: To contrast the policy and organization of the PGME between countries, we sent to members of the PGME Committee of AMEE and other experts, a form with 78 questions grouped in 7 topics: regulation by national laws and selection to access, accreditation and audits, national planning of the number of specialists, programmes, supervision and assessment, labour regulation and recertification.
Results: 13 countries responded (Argentina, Chile, Perú, Paraguay, Brazil, Venezuela, Mexico, USA, UK, Denmark, France, Portugal and Spain). Main topics. 1) The PGME is regulated at national level except Argentina (regional) and Venezuela (regional medical colleges). All countries have a selection system to access the PGME. 2) By law, all have a health centres accreditation system to assurance the quality of PGME, except Venezuela and Portugal, but Portugal has periodical quality audits. 3) The national/regional authority in PGME plans the needs of specialists according to criteria based on health policies, except Chile, Brazil, Venezuela and USA. 4) Each specialty has a unified national program excepting Argentina, Chile, Peru, Venezuela and Paraguay. 5) The resident's supervision system is very variable and its regulation by law is not generalized. The observation is the most common assessment method. 6) The maximum hours of work per week is determined by law in all countries (from 35 to > 56 h.). 7) There is no official recertification process in Brazil, Portugal, Denmark, Venezuela, France and Spain.

Conclusion: We confirm the variability of the PGME systems. The absence of national programs for each specialty is a weakness in several countries as well as the recertification process. We suggest regulation by law of the supervision as it is linked to safety patient.

Take-home message: It is very important to know the organization and management of the PGME system in each country to enhance its quality through benchmarking.

10Q3 (2734)
Residency Admission Process in Argentina: Psychometric Analysis of written test of three main public districts and a private Hospital

Authors
Marcelo Garcia Dieguez
Maria Ernestina Reig
Gabriela Serralunga
Marta del Valle
Isabel Dure
Eduardo Durante
Pablo Casado
Horacio Yullita

Presenter: Marcelo Garcia Dieguez, Buenos Aires Province Health Ministry, La Plata, Argentina

Background: Argentina residency admission process is manly based on a multiple-choice question test. Each district organizes its own process with candidates nominating to several of them simultaneously. This leads to heterogeneity in contents and quality differences.

Method: To study the admission test characteristics for 2015 in three main public districts and a private Hospital, analyzing similarities and differences of specification tables, quality of items, difficulty, psychometric characteristics and detect anomalous behavior indicative of cheating by statistical analysis.
The results of the test applied by the Unified examination (UE), Buenos Aires Province (BA), Autonomous City of Buenos Aires (CABA) and Hospital Italiano de Buenos Aires (HIBA) by 2015 were analyzed. The weighted proportion of subject areas and the difficulty categories were analyzed by Chi-square test; presence of clinical vignette and knowledge application by Galofré index, and score according to subject area were analyzed with ANOVA. Generalizability was analyzed using Edu G and the applicant's performance to various was compared with intraclass correlation. Possible cheating behaviors were determined by Acinonyx.

Results: Differences were identified among the four exams, in the proportion of items by subject area (p <0.01) and in the proportion of items by difficulty category (p <0.01). The percentages of items with vignette and knowledge application were: for UE 78% and 60%; for BA 38% and 35%, for CABA 84% and 80%; for HIBA 89% and 61%. Difficulty: UE 58%, BA 55%, CABA 56%, HIBA 62%. Only scoring differences were found between the different thematic areas in BA. The relative G coefficient: EU 0.84, BA 0.84, CABA 0.87 and HIBA 0.76. The correlation of the results were 0.77 for those who take three exams (n = 811)

and 0.60 for those who take four (n = 309). Cheating was insignificant.

Conclusion: The four exams showed differences in quality and importance given to each subject area. All had good reliability and an acceptable average level of difficulty.

Take-home message: To consolidate a national unified process the main characteristics of the existing process should be considered and strengths should be enhanced.

10Q4 (2574)
Time-Variable Medical Education, More Time Efficient, Higher Costs

Authors
Tiuri R. van Rossum, Maastricht University, Maastricht, Netherlands
Fedde Scheele, VU University and VU Medical centre, Amsterdam, Netherlands
Henk E. Sluiter, Deventer Teaching Hospital, Deventer, Netherlands
Ide C. Heyligers, Maastricht University and Zuyderland MC, Maastricht, Netherlands

Presenter: Fedde Scheele, Maastricht University, Maastricht, Netherlands

Background: Costs of postgraduate medical education (PGME) is a continuing topic for debate. One of the models that may help to reduce educational costs is time-variable medical training (TVMT). TVMT build around individual needs of learners can result in an increased educational efficiency at individual level, while maintaining educational quality. TVMT can be a step to meet new demands in more resource efficient models of medical education. The objective of this short communication is to look at how, and to what extent, alterations in the length of a PGME program impact on the cost of PGME at hospital level.

Method: We made a cost analysis of time-variable PGME by identifying the costs and revenues of educational activities of the Dutch gynaecology program and comparing the costs and revenues of a traditional program (6-year) to a shortened time-variable program (5.54-year). We calculated the financial effects of two scenarios, both leading to a shortening of 0.46 year for a 6-year program.

Results: Shorter training programs lead to overall lower cost of employment and training, but also to lower revenues generated by activities during training. This ultimately results in a net increase of the costs price per resident per training program. Training costs are generated in all educational activities. Revenues, on the other hand, are only generated in patient-related activities. In these patient-related activities, the revenues are high when residents are able to work with limited supervision. Based on the two scenarios the cost increment of a shortening of 0,46 year for a 6-year program will lie between 8.471 and 75.778 Euros per resident.

Discussion & Conclusions: Shortening PGME programs appears to be possible using TVMT but is only safely possible when time can be gained at the expense of activities in which residents are competent and can provide patient-care under limited supervision. However,

these activities generate the highest revenues. We conclude that shorter education leads to overall higher costs at the hospital level.

Take-home message: TVMT in PGME not only has educational implications but also financial implications.

10Q5 (3200)
Assessing non-technical skills in Emergency Medicine training: A reliable tool launched nationally

Authors
Will Townend, Emergency Department, Hull Royal Infirmary, Hull, UK
Alan Gopal, Hull Institute of Learning and Simulation, Hull, UK
Lynsey Flowerdew, Frimley Park Hospital, Camberley, UK
James Crossley, The Medical School, University of Sheffield, UK
Amanda Farrow, Head of School of Emergency Medicine, Wales Deanery, UK

Presenter: Will Townend, Emergency Department, Hull, UK

Background: The contribution of Emergency Medicine (EM) clinicians' non-technical skills (NTS) in providing safe and high quality care in the emergency department is well known. The 2015 UK Royal College of Emergency Medicine (RCEM) curriculum update introduced explicit validated descriptors of non-technical skills (NTS) needed to function effectively in the ED. A new NTS assessment tool, the Extended Supervised Learning Event (ESLE), was introduced and mandated for use in training. The aim of this study was to evaluate its psychometric reliability in its first year of use.

Method: We analysed the data for all ESLEs recorded on the UK RCEM e-portfolio from August 2015 to August 2016 for trainees in years three to six of a six-year programme, using generalisability theory.

Results: 1522 ESLEs were recorded. We found that the majority (62%) of the variation in NTS scores was attributable to the trainee's ability. Consequently 3 single-observer ESLEs provided by 2 or more assessors, as currently recommended in the RCEM curriculum, provides an assessment with a reliability coefficient of 0.8.

Conclusion: The reliability of the ESLE for its target group compares very favourably with other assessment tools in current use. Experienced EM supervisors are able to provide reliable assessments of and feedback to trainees about their NTS in the workplace.

10Q6 (1445)
The bigger picture of direct observation in residency: general practice supervisors' views

Authors
Chris BT Rietmeijer, VU university medical center, Amsterdam, Netherlands
Daniëlle Huisman, VU university medical center, Amsterdam, Netherlands
Annette H Blankenstein, VU university medical center, Amsterdam, Netherlands
Henk de Vries, VU university medical center, Amsterdam, Netherlands
Fedde Scheele, VU university medical center, Amsterdam, Netherlands
Pim Teunissen, School of health professions education, Maastricht University, Maastricht, Netherlands

Presenter: Chris Rietmeijer, VU university medical center, Amsterdam, Netherlands

Background: Direct observation (DO) of residents' performance, despite the importance that is ascribed to it, is infrequent and the quality of observation may be poor. DO tends to be seen as just a means to gather information on the performance of residents for purposes of feedback and assessment. We explored the possible complexity of DO in workplace learning.

Research question: What are the manifestations, meanings and effects of DO in developing post-graduate training relationships?

Method: Constructivist grounded theory informed our data collection and analysis. Data collection involved focus group sessions with clinical supervisors in Dutch general practice. Prompt questions were on manifestations of DO, the supervisor's thoughts and feelings with regard to observing his or her resident, the assumed thoughts and feelings of residents with regard to being observed by a supervisor, the importance and benefits of DO, the initiative to observe, and the influence of the relationship between supervisor and resident on DO and vice versa. Theoretical sufficiency was achieved after 4 focus groups with a total of 28 participants being included. A theoretical framework was developed through a process of constant comparative analysis.

Results: Supervisors strongly connected DO to not observing directly (NOD). We found five patterns: initial planned direct DO sessions, NOD, resident-initiated ad hoc DO, supervisor-initiated ad hoc DO and prolonged planned DO sessions. Different patterns of DO/NOD related to a multiplicity of varying meanings and effects, all of them concerning the training relationship, patient safety and/or residents' learning.

Discussion & Conclusions: DO, to supervisors, meant much more than gathering information for purposes of feedback and assessment. Planned, mostly bi-directional, DO sessions were an important routine during the initiation phase of a training relationship. Continued planned bi-directional DO sessions, although infrequently practised, potentially combine most benefits with least side-effects of DO. Ad hoc DO, although much relied upon, was often hampered by internal tensions in supervisors, residents or both. Our findings help us understand why simply requiring more frequent DO for purposes of feedback and assessment can lead to tensions that hamper learning rather than promoting it.

10R: Round Table: Student Stress and Burnout

Location: Hong Kong, 2nd Floor, CCB

Time: 0830-1015 hrs

10R1 (3589)
Higher prevalence of psychiatric ill-health amongst medical students in Sweden: A survey-based study

Authors
Luwam Zewenghiel
Axel Risinger Liljegren
Christine Chidiac

Presenter: Luwam Zewenghiel, Swedish Medical Association for Students, Stockholm, Sweden

Background: One of the interests of the Swedish Medical Association for Students is the well-being of its constituents. In recent years there have been indications of a substantial increase in psychiatric ill-health in the mentioned population, why a survey-based study was performed amongst medical students in Sweden during the fall of 2017.
Method: A survey was sent out to all students at the seven medical institutions in Sweden, irrespective of affiliation to the Swedish Medical Association for Students. The survey was based on a national survey developed by the Swedish Public Health Authority. Questions regarding the work environment were included while sections regarding life-style and family situation were excluded to focus the study on factors involving education and its surroundings. Phone interviews were performed with randomly selected volunteering survey respondents.
Results: The survey reached a total response rate of 41.3% and the results show a higher prevalence of psychiatric ill-health among medical students in Sweden compared to the general population. A higher percentage was seen for both serious suicide thoughts and suicide attempts during the previous year, as it measured 7.7% and 0.77% for medical students and 3% and 0% for the general population, respectively.
Conclusion: There is a clear trend showing a higher prevalence of psychiatric ill-health and a higher percentage of serious suicide thoughts and attempts in the recent year amongst medical students in Sweden. The material gathered from the one-on-one phone interviews indicated high work load and pace and hostile environments in the clinics as possible factors for this observation.

10R3 (3643)
Anxiety and the different coping methods of medical students

Authors
Abdullah Ahmed Alkhani, Alfaisal University, Riyadh, Saudi Arabia
Ayla Barakat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Ayla Barakat, Alfaisal University, Riyadh, Saudi Arabia

Background: Medical students are exposed to different types of stress during their university time span. Consequently, stress may cause deteriorating effects on a student's mental and physical health status which can affect his academic performance. However, each medical student usually has a different coping method to help relieve his/her stress, and in order for institutions to help their students, we need to figure out what is the optimum coping method. Research have shown many coping methods like exercise, music, recreational drugs, or religion, but establishment of the most suitable coping method remains a burden. The aim of this research is to find the most prevalent coping method and its reflection on medical students.
Method: A cross-sectional questionnaire study design was conducted on 408 medical students. The questionnaire was adapted from GAD7 (Generalized Anxiety Disorder 7-item) scale as well as additional questions to know student's anxiety levels and their different forms of coping methods. We also wanted to investigate the effectiveness of their coping methods and whether they'll be willing to change to other coping methods.
Results & Discussion: Data has been collected but statistical analysis hasn't been finalized yet. After conducting the survey, we've noticed a relatively good number of students that consider exercise as a good coping methods. Therefore, we decided to integrate more activities and sports in the campus to help students alleviate their worries.
We also noticed a few who consider smoking and recreational drugs as favorable coping methods even though, they will cause disastrous consequences later on. Thus, finding an alternative method is crucial for their cessation. Ultimately, we can later establish support program in our university that can be directed toward promoting the most beneficial methods and stopping the harmful ones.
Conclusion: As medical students, we will always face all sorts of stress and we inevitably can't escape from them. Therefore, we need to find the ultimate coping method of relieving stress, so that students will feel more calm which will correlate to better academic performance and social intercourse.

10R4 (2542)
Psychological effects of internet addiction among undergraduates in a state university of Sri Lanka

Authors
Nimna Senanayaka, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Binara Senanayake, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Dumith Senavirathna, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Deshan Serasinghe, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Chanaka Silva, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Madhawa Chandrathilake, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka

Presenter: Nimna Senanayaka, Faculty of medicine, University of Kelaniya, Ragama, Sri Lanka

Background: Stress levels among medical students may be higher than their counterparts in other disciplines. Today, internet use is a common practice in tertiary education and the use of internet may be facilitative or detrimental to the psychological health of undergraduates. The aim of this project was to explore internet addiction and its possible psychological effects on medical students.
Method: 107 medical students and 277 students from non-healthcare disciplines in University of Kelaniya, Sri Lanka, participated. Internet addition (Young's internet addition scale), psychological distress (Kessler 10) and health well-being (Rand SF 36Questionnaire) of the participants were measured using validated tools. The responses of medical students were correlated between three constructs and they were compared with non-medical undergraduates.
Results: 98% of medical and non-medical students have access to internet at home and in the campus.57.2% of the study population browsed internet using mobile phones. Medial students were not in the 'high risk' category of internet addiction (38.86/100). Internet addiction among males (42.5/100) was significantly were higher than females (35.7/100). They surf internet for 2.5 hours/day and 21.5% of such surfers showed 'frequent problems in their lives' due to internet addiction. Mental health well-being (score) and psychological distress (score) of medical students were not alarming. A significant negative correlation was observed between internet addiction and mental health scores (-0.328, p=0.013). The correlation between psychological distress and internet addiction was moderate and significant (0.326, p=0.001). Although non-medical students showed similar patterns of internet use none of the groups showed similar correlations with psychological distress or mental health well-being.
Conclusion: Patterns of internet use, addiction and psychological well-being of medical and non-medical undergraduates are almost similar. Although medical students have high level of access their surfing time is short. Amidst various conducive factors they have not addicted to it. However, the findings suggest that, with increased use, medical students are more vulnerable to significant psychological adverse effects than others.
Take-home message: Increased use of internet can be a significant cause for psychological ill-health among medical students. They may be helped with counselling on limited internet surfing.

10R5 (2346)
Depression and suicide in medical schools: What can we learn from the black dog?

Authors
Daniel Fernandes Mello de Oliveira, Federal University of Rio Grande do Norte, Natal, Brazil
Tatyane Ribeiro de Castro Palitot, Federal University of Rio Grande do Norte, Natal, Brazil
Ana Luísa Fernandes Vital, Federal University of Rio Grande do Norte, Natal, Brazil
Simone da Nóbrega Tomaz Moreira, Federal University of Rio Grande do Norte, Natal, Brazil

Presenter: Daniel De Oliveira, Federal University of Rio Grande do Norte, Natal, Brazil

Background: Medical education has grown steadily throughout the past years. We have been able to create new methods, improve our curricula and use sophisticated approaches to assess students and graduates along the continuum of their education. But there is one thing we keep failing at: preventing the increase of depression and suicide among medical schools. But even before we can blame ourselves for these painful statistic data, there is a world of subjects to understand: which factors are supposedly responsible for increasing one's risk of committing suicide along the medical career? How depression among medical students is linked to educational attributes? And how are we able to identify at-risk students, act upon them and reverse the dreadful reputation that medicine has been gaining? For there is no prescribed solution and a randomized clinical trial to inform us which best practices should avoid suicide in medical schools, a voice from a former medical students who has suffered from depression and has reached the edge of the cliff - and has been rescued by several unstructured elements of medical education - could humbly inform the new generation of medical educators not only which factors have been responsible for increasing our vulnerability to suicide, but also shed a new light on a topic which appears to be the future puzzle for medical education.
No answers are promised here, but the questions I propose will definitely prompt our minds to consider what needs to be changed in order to make medical schools become more welfare-friendly environments and acknowledge vulnerable students before it is too late.

10R6 (2212)
A Week for Well-being

Authors
Zoe Boulot
Camille Bac
Caroline Combes
Sophie Pelloux
Gilles Rode
Jerome Etienne

Presenter: Zoe Boulot, Faculté de Médecine Lyon-Est, Lyon, France

Background: Medical students are not doing very well, and students from Lyon-Est Faculty of Medicine are no exception. Recent international studies and local investigations have indeed shown that stress and anxiety are high among medical students. In 2016, with the Faculty's support, a group of students created a structure that could be contacted in difficult situations.
Before launching the structure, the creators built a solid support system thanks to a network of professionals, to provide the best help possible to their fellow students. Launching the structure enabled to reduce the lack of information on who to contact for help, and diminish the taboo that surrounds students' malaise. After a year of existence, students in charge of the structure decided it was necessary to steer projects towards promoting well-being. Thus, they organised a "Week for Well-being".
During four days, students were offered 18 workshops of various activities: yoga, sophrology, relaxation, hypnosis, knitting, movie, cooking, concerts and a few others.
Activities took place during lunch breaks and evenings to be compatible with students' timetables and not impinge on classes or internships. Thanks to a dozen volunteer students, Student Healthcare Centre and independent professionals over 250 students were able to take part in activities.
A survey has been sent to these participants to evaluate their satisfaction and demands concerning the reiteration of this project, and/or of the various activities. Results have not yet been fully analysed, but students' spontaneous reactions after the workshops were positive. Seeing this first edition, the aim is to develop the project with Student Healthcare Centre, in particular by extending it to other health students on campus.
Students' well-being should remain a priority. Paying attention to students' comfort is a pathway to more relaxed and human learners. Could this be a step towards more empathetic doctors?

10S: Workshop: Use of Generalizability Theory in Designing and Analyzing OSCEs and Performance-based Tests (102)

Location: Wettstein, 2nd Floor, Swissotel
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenter:
David B Swanson, American Board of Medical Specialties, Chicago, USA and University of Melbourne Medical School, Melbourne, Australia

Summary of theme and why it is important:
Performance-based testing methods (eg, OSCEs, MMIs, oral exams, workplace-based assessments) are commonly used in health professions education. Because these methods involve multiple sources of measurement error (eg, examiner stringency/agreement, station/case/task difficulty, content specificity), classical reliability theory does not furnish the conceptual and statistical tools needed to investigate their measurement characteristics. Generalizability theory (g-theory) provides the necessary tools for estimation of the reproducibility (reliability, precision) of scores and for evaluating the impact of alternate approaches to test design and administration on the reproducibility of scores.
Who should participate: The intended audience is health professions faculty and members of Royal Colleges and other groups involved in designing and implementing assessment procedures. The workshop does not assume any familiarity with g-theory or classical reliability theory; however, participants should be comfortable with analysis of variance.
What will they gain from participating? At the conclusion of this interactive, seminar-style workshop participants will be able to:
1. Identify advantages of g-theory over classical test theory
2. View OSCEs and performance-based assessment situations from a g-theory perspective
3. Identify procedures/software and reference material for conducting generalizability analyses
4. Interpret commonly used indices of reproducibility (generalizability coefficients and standard errors of measurement)
Level of workshop: Intermediate

10T: Workshop: Meeting the Challenges for Faculty in Global Surgical Education

Location: Helvetia 3, 1st Floor, Swissotel
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Wa'el S Taha, King Abdulaziz Medical City, Al-Madinah, Saudi Arabia
Miriam Uhlmann, AO Foundation - AO Education Institute, Switzerland

Background: Implementing best practices in professional education is often a difficult concept to faculty. Let's face it, your faculty are often the most renowned thought leaders in their field; they are endowed faculty from the country's leading organizations – chairs of residency and fellowship programs and they often comprise your organizations' educational leadership. How many of us would like them to know the answers to the following questions: "…tell me how adult learning principles will be incorporated into your global activities… how do you consider different cultural backgrounds in delivering your learning activities... what are your recommended measurement and evaluation strategies?"
Who should attend:
1. Leaders of medical education institutes/organization
2. Deans
3. Medical educators especially involved in faculty development
4. Curriculum developers/planners
Structure of workshop: The workshop will start off with discussing actual problems and challenges for teaching faculty in global surgical education, eg, cultural diversity of faculty and participants. Based on these identified problems performance gap areas are identified and through a backward planning process a faculty development program designed. After sharing the programs and getting feedback from peer participants and the presenters, implementations plans are designed, and roll-out challenges discussed. The presenters share best practices from their own experience.
Intended outcomes: At the end of this highly interactive and hands-on session, you will be able to:
- Identify their most urgent and complex problems in creating and implementing international (or national/regional/local) faculty development programs
- Implement best practices among your faculty in defining needs and outcomes, design, implementation, and measurement and evaluation
- Demonstrate to your faculty the connections and interactions between best practices in professional education and their application to their role in your education program
Level of workshop: Introductory, intermediate

10U: Workshop: "Of Course I can Teach…" - Using Entrustable Professional Activities to develop and assess surgical educators

Location: Helvetia 4, 1st Floor, Swissotel
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Craig McIlhenny, Faculty of Surgical Trainers, Royal College of Surgeons of Edinburgh, UK
Jennifer Cleland, University of Aberdeen, UK

Background: There is a worldwide move towards developing competency based programmes in all aspects of medical education, including surgical training. Entrustable Professional Activities (EPAs) have been developed to help operationalise competency based training programmes. EPAs describe units of work to be carried out by the trainee and should be independently executable, observable, and measurable. We have expanded this concept and developed an EPA for use with trainers or faculty members, that describes the tasks required for being an educational supervisor.
Who should attend: All those with an interest in surgical training, and those from other disciplines interested in developing a competency based approach to faculty development and assessment using EPAs.
Structure of workshop: This small group workshop will use the example of educational supervision in surgical training to demonstrate how Entrustable Professional Activities (EPAs) can be used in faculty development. Participants will draw on their own experience to develop an EPA that is relevant to their own discipline and formulate strategies for using this EPA in their own setting. The workshop will use a combination of small group work and interactive discussion.
Intended outcomes: This highly interactive workshop will-
- Discuss the key features of EPAs
- Provide participants with hands-on experience on how to develop an EPA for educators within their own discipline
- Create opportunities for participants to formulate strategies for using their EPA in developing and assessing medical educators

Level of workshop: Introductory

10V: Workshop: Global Mobility and Preparedness of Medical Graduates and Students for Clinical Transitions: the case for an international medical curriculum (2049)

Location: Helvetia 5, 1st Floor, Swissotel
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters
Vishna Devi V Nadarajah, IMU, Kuala Lumpur, Malaysia
Richard Fuller, University of Leeds, UK
Wendy Hu, University of Western Sydney, Australia
Emmaline Brouwer, University of Maastricht, Netherlands
Sowmith Rangu, Memorial University, Newfoundland, Canada
Trudie Roberts, University of Leeds, UK

Background: The global mobility of doctors raises interesting questions about the design of the medical curriculum so that graduates are prepared and ready to transition into healthcare services and systems that are markedly different from their medical training. In the era of "internationalised" medical students and programs, the learning opportunities afforded when students transition to learning in clinical environments are even more complex in delivery models which require clinical learning in different countries. The challenges faced in international clinical transitions can have a significant impact on the individual, donor and recipient institutions, healthcare services and patient care. Identifying factors for preparedness and successful transition for both the medical graduate and student provide opportunities to address the need, relevance and development of an international medical curriculum. Perspectives offered in this workshop are from practitioners and educators with contextual experience in training and working with international medical graduates and students who transition across borders and nations for their learning and training. Challenges and enablers for preparedness and successful transition will be shared from the perspectives of an individual in transition, curriculum design, future technologies, faculty development, host and receiving institutions in transnational cross border collaborations.
Who should attend: Faculty members, clinicians, students, regulators, clinical administrators and educationists involved or interested in the design, delivery, assessment and learning environments of clinical transitions and international medical curriculum.
Structure of workshop: Case Studies developed from the perspectives of practitioners with contextual experience in international clinical transitions, will be shared with participants for analysis and reflection. These case studies will highlight concepts, enablers and challenges for global mobility, clinical preparedness and international curriculum. Participants will also have the opportunity to engage and share their own experiences with others.
Intended outcomes: Awareness of the challenges faced for clinical transitions from various stakeholder perspectives. Identify enablers for successful international

clinical transitions that can be contextualised to own settings and needs. Describe concepts that are necessary towards building a framework for international medical curriculum

10W: Workshop: Managing & Supporting the Educator in Trouble (3746)

Location: Helvetia 7, 1st Floor, Swissotel
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenter:
Linda Hacking, NACT, UK

Background: This workshop will explore the reasons why those involved in teaching and assessing medical students and trainees find themselves in trouble. It is often the most diligent and courageous educator who gets challenged by their learners and reported to senior faculty.
Intended Outcomes: Consider ways to provide support to the educators both in the hospital & centrally in the University / Deanery with consistency and collaboration, particularly when there have been concerns raised about the educator's performance.
Structure: The new NACT UK guidelines "Supporting the Educator 2016" will be shared and applied in small groups to some real scenarios, which have arisen from UK practice. It is hoped that these guidelines will be introduced into faculty development programmes.
Who should attend: This is relevant for all educational leaders, supervisors, educators and those involved in faculty development. The context will be postgraduate but the principles would be relevant to those involved in undergraduate education.

10X: Workshop: How to run a successful clinical school (1238)

Location: Osaka, 3rd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Martin Veysey, Hull York Medical School, York, UK
Vijay Jayagopal, Hull York Medical School, York, UK
David Hepburn, Hull York Medical School, Hull, UK
Jo Brown, Hull York Medical School, Scunthorpe, UK
Amanda Dawson, University of Newcastle, Gosford, Australia

Background: Increasingly health professional education is being delivered in clinical environments, where there is an increasing tension between the priorities of service delivery and education. The Clinical School is one mode of delivery, which has been adopted globally. With early clinical exposure, this now extends across the continuum of undergraduate and postgraduate health professions education. Running a clinical school can be a challenging task and the aim of the workshop will be to equip

participants to develop and operate their own clinical schools optimally. The presenters have a range of experience across the UK and Australia in managing clinical schools and will bring this to the workshop to share with the participants.
Who should attend? Clinical Deans, Programme Directors, Phase Leads, academics involved in the delivery of curricula at clinical sites, professional staff involved in the delivery of health professional education.
Structure of workshop: Using an interactive workshop format, participants will be presented with possible priorities for running a successful clinical school and asked to explore in groups which of these they have used, what has worked and what had not been so successful. Examples of this will include clinician engagement, the nexus between undergraduate and postgraduate education, promoting student and trainee-led programs, management engagement and support, shelf-ready projects, managing finances, investing in simulation, identifying your niche, inter-professional education opportunities, managing expansion and change, development of staff, programs to assist mental wellbeing of staff and students, the virtual classroom and critical professional staff.
Having been presented with the options, participants will be asked to rank the priorities and develop a strategy for their own school based on the discussion.
Intended Outcomes: At the end of the workshop, participants will have benefited from the experience of the presenters, and their fellow attendees, and be able to take home key lessons to their respective clinical schools for implementation. They will have a set of strategic priorities that will assist them in optimizing the experience for students in their respective settings.
Level: Introductory/Intermediate

10Y: Workshop: Resources, Research, and Reality: Developing and applying Behavioural and Scenario based questions in your Interview process from MMI to Standardized interviews (2714)

Location: Samarkand, 3rd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Kelly L Dore, McMaster University, Hamilton ON, Canada
Lyndal Parker-Newlyn, University of Wollongong, NSW, Australia

Background: This session will explore implications of resources and research and how to operationalize the most effective and efficient station/question format for selection interviews, screening and professionalism assessment. Participants will learn aspects of question development which influence the quality of the applicant information obtained. In addition, how these principles

relate to the measurement of professionalism and other intrinsic values in training will be highlighted. Through this interactive session, participants will develop an understanding of the research of situational judgement assessments and behavioural descriptor questions used in selection and training.

Issues for exploration:

• Applying frameworks to developing questions that assess personal professional qualities.

• Incorporating program specific missions, values and personal attributes in the process through the application of a selection blueprint

• Developing a program specific selection model with the understanding of the potential incremental value the different measures.

• Understand how the principles can be applied in programmatic assessmet in training in both medical school and speciality training.

Who should attend: This session is intended for health profession faculty and staff who are involved at all levels of learner's trajectory in selection or the measurement of personal/professional qualities whether they use interviews or MMIs or in training.

Structure of workshop: In an interactive small group style, the participants will workshop blueprinting methods, practice developing questions, discuss the evidence and share their experiences, while brainstorming solutions to potential barriers to implementation.

Intended Outcomes: By the end of this session participants will:

1. Understand the evidence regarding question format and various selection measures

2. Apply aspects of question format to develop more effective questions

3. Integrate the principles from selection across in-program assessments

4. Apply principles taught to develop their own selection blueprint

Level: Intermediate

10Z: Workshop: Medical Student Mistreatment - A Multi-Specialty Perspective (90)

Location: Guangzhou, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:

Kevin O'Brien, University of South Florida Morsani College of Medicine, Tampa, Florida, USA
Alex Mechaber, University of Miami Miller School of Medicine, Miami, Florida, USA
Cynthia Ledford, The Ohio State University College of Medicine, Columbus, Ohio, USA

Background: Medical student mistreatment is often a symptom of burnout, depression, anxiety, or a manifestation of a prior event that happened to the perpetrator. Sadly, the culture that allows medical student mistreatment is handed down from one

generation to the next, and is a significant contributor to ongoing burnout, lack of empathy, substance misuse, and even suicide for those that have been mistreated. The culture that allows this cycle of degradation to continue will only be broken when the behavior is identified by those who witness it and/or use it, and we address the problem in a proactive rather than a reactive manner. The Medical Student Mistreatment Project is being conducted at 9 medical schools across the United States with over 1,000 participants. We presented our work with preliminary findings at the 2017 AAMC Meeting in Boston during the Arnold P. Gold Humanism Forum. The response to the session was inspiring.

An additional twenty-two additional institutions would like to join our project, including schools from Canada and Mexico. We would like to extend our work to an even more international audience. During our 90 minute session, we will show three to four illustrative 3- to 4-minute videos of potential mistreatment scenarios and then ask attendees to vote on them using audience response technology (similar to how we are actually conducting the study). Participants will be asked if the scenarios constitute mistreatment, rate their severity, and determine to whom the event should be reported. At the conclusion of the workshop, we will have a 30 minute question and answer session. The response at AAMC was overwhelming and humbling at the same time. Medical student mistreatment is an international problem, and AMEE would provide an opportune forum to address this prevalent player in the hidden curriculum seen at most, if not all, institutions across the globe.

Who should attend? Students, residents in training, faculty, and educational leaders will all find the session informative. We had 100-200 attendees at our session in Boston. The dialogue that occurred during the session was robust and highly informative.

10AA: Workshop: Determining a "fit" between your education work and publication venues - A Society of Directors of Research in Medical Education (SDRME) Workshop (656)

Location: Nairobi, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:

Jorie Colbert-Getz, University of Utah School of Medicine, Salt Lake City, USA
Maria Blanco, Tufts University School of Medicine, Boston, USA
Carol Capello, Weill Cornell Medical College, New York City, USA
Anne McKee, King's College, London, UK
Kathryn Huggett, University of Vermont College of Medicine, Burlington, USA

Background: Medical education has been evolving to include new forms of scholarship, new research

methodologies, and more rigorous standards for reporting the evidence about teaching, learning and assessment. Thus medical education literature is a developing interdisciplinary field straddling positivist and interpretive paradigms. As a result, in the past decade journals have been accepting fewer manuscripts reporting descriptions, comparing curricular interventions to no intervention, or reporting just satisfaction data. Instead, authors and journals are applying quality standards such as Best Evidence Medical Education (BEME) reviews, the Medical Education Research Quality Instrument (MERSQI) criteria, and Standards for Reporting Qualitative Research (SRQR). This effort has improved the quality of research in journals, but left some clinician educators and students challenged with where to publish educational scholarship. The past decade has also seen an increase in types of venues for disseminating scholarship beyond the traditional peer-reviewed journal such as teaching resource repositories, YouTube, podcasts, open access journals etc. Yet, approximately 10,000 open-access journals are considered "predator" journals.1 Currently, no guidelines exist for faculty and trainees to determine a "fit" between their work and where to disseminate their work. The goal of this workshop is to "crowdsource" the experience and wisdom of participants to develop an algorithm for deciding when and where to disseminate different types of scholarship.

Who should attend: Research directors, attendees who disseminate scholarship in any venue

Structure of workshop: We will begin the workshop by briefly discussing types of educational scholarship and venues for dissemination. Participants will work in small groups to determine where to disseminate different scholarship types using scenarios and structured questions including, but not limited to:

What is the intended audience for your work?

How generalizable/transferable are the results and who do they generalize to?

Is the work novel/does it fill a gap in the literature?

Presenters will facilitate discussions with participants when disagreements arise regarding fit between a scholarship type and dissemination venue to understand factors that limit consensus.

Intended Outcomes: To develop an algorithm for when and where to publish educational scholarship. We propose to share this algorithm via future presentation and publication.

Level: Intermediate, Advanced

10BB: Workshop: Striving for Excellence: How to stretch and challenge the more able Student/Trainee (324)

Location: Mexico, 2nd Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Helen Goodyear, Health Education England (West Midlands), Birmingham, UK
Taruna Bindal, Worcestershire Acute Hospitals NHS Trust, Worcester, UK

Background: There tends to be a lot of focus on the student/doctor in difficulty. However the able trainee may pose an equal challenge. They may not be achieving their full potential which can lead to problems of lack of direction, discontentment and confusion regarding career direction and even if medicine is the correct choice. Student/trainees may also feel isolated, misunderstood and rejected by peers. E Portfolio in the UK is judged on minimum standards and there has been a focus on the minimum number of work place based assessments to pass the annual review of competence progression (ARCP). Often there can be ARCP checklists and rather than promoting excellence these encourage trainees to do only what is necessary to pass to the next year of training.

Who should attend: This workshop is designed for those working in undergraduate or postgraduate medical education who have responsibility for the supervision of students or doctors in training

Structure of workshop: A highly interactive workshop which looks at the experience of trainers in dealing with able students/trainees using small group work. Particular focus will include considering who is the able student/trainee and the challenges encountered when supporting them. Some common issues and pitfalls when working with able students/trainees will be discussed as will ways in which to support those who are excelling. The workshop will include case scenarios, including those encountered by participants.

Intended outcomes: At the end of the workshop participants will understand and appreciate that able students and trainees need support and guidance to ensure that they grow and develop to full potential and feel their careers are satisfying.

Level: Introductory

10CC: ePosters: Curriculum and Faculty Development - identifying & meeting educational needs

Location: Kairo 2, Ground Floor, CCB
Date: Wednesday 29th August
Time: 0830-1015 hrs

Marcelo Yorio Universidad de Córdoba, Argentina
Ivan Toro, Universidad de Campinas, Brasil
Guido Zambrana, Universidad Mayor de San Andrés, Bolivia
Freddy Meinard, UNAN, Nicaragua
Luis Pichs, Universidad de Ciencias Médicas, Cuba
Ramiro López, Universidad Central del Ecuador
Patricio Yepez, UDUAL, Ecuador
Ana Carolina Sepulveda, IMSS México

Presenter: Germán Fajard-Dolci, ALAFEM-UNAM, México

Background: Medical education is a social process necessary to achieve universal health coverage. In the Region of the Americas, there is a lack of studies that report on its characteristics and it is unknown if it meets its social function and the needs of the population.
Method: A cross-sectional and quantitative study was conducted in 105 medical schools in the Region of the Americas to know their characteristics and their relationship with the socioeconomic context, regional health objectives and health needs. The systemic approach of Von Bertalanffy was used as a theoretical framework and six dimensions and 24 variables were explored using a structured questionnaire with Likert type response options validated with Cronbach's Alpha. Descriptive analysis was done with frequencies, bivariate analysis with Chi square and a p equal or less than 0.05 was determined.
Results: 36% of schools think there are no national policies to train human resources in health and 63% report insufficient public funds. Only 31% of schools consider there are Mechanisms to Regulate Medical Education and 78% think there are insufficient regulatory instruments. In the Educational Structure, 81% of schools claim there are National Physical Infrastructure Standards, 85% believe these resources are sufficient, 80% refer sufficiency of teachers, but academic excellence is achieved in only 32% of them. 88% of schools plan admission of students but only 54% satisfy the demand of applicants. 88% in the terminal efficiency, 94% in the insertion to the labor market and 65% in the practice oriented to the PHC. In Social Impact, 96% of schools believe their graduates contribute to the control of prevalent morbidity and to health services access.

Conclusion: There are strengths and weaknesses of medical education in the Region of the Americas, as a example we have a shortage of public policies and public funds. Teacher training is insufficient as well as the orientation towards Primary Health Care. Terminal efficiency and the graduates insertion in the labor market are favorable but they must not be neglected.

An Integrated Clinical Apprenticeship: Identifying Central Tenets Needed in our Education Systems

Authors
Arabella L. Simpkin, Massachusetts General Hospital, Boston, USA
Andrew McKeown, Imperial College, London, UK
Ravi Parekh, Imperial College, London, UK
Sonia Kumar, Imperial College, London, UK
Gareth Tudor-Williams, Imperial College, London, UK

Presenter: Arabella Simpkin, Massachusetts General Hospital, Boston, USA

Background: The ability of healthcare systems to deliver world-class compassionate care depends on quality of training and education of staff. Matching student-centered learning with delivery of patient-centered care is the focus for much curricula reform. This study explores the effect a novel longitudinal curriculum had on medical students' attitudes and experiences regarding important aspects of their education as they prepare to be doctors of tomorrow.
Method/Results: A single-center, qualitative focus group study was conducted in 2017 of students in a longitudinally integrated clinical apprenticeship. Students were randomly assigned to one of two focus groups, near the end of their clerkship year. Each student described their journey through the system: for themselves, their patients, and their professional development. Questions explored understanding how learning in this way prepared them to become doctors of tomorrow – addressing barriers and challenges, and their unique position as students in the healthcare system. Four themes emerged from students' experiences: navigating the patient journey; navigating their professional development; navigating their learning journey; and navigating the healthcare system.
Discussion & Conclusion: Listening to the student voice lends new insights for educators to refine educational models to produce the doctors of tomorrow. Our pilot project has identified the educational value of students having an authentic role in helping patients longitudinally navigate the healthcare system and the benefits of consistent mentorship and greater autonomy. It is essential that students see the world of healthcare through different lenses, with patients as focus both in community and in hospital settings. Students benefit from seeing themselves as integral members of a healthcare team, able to form effective relationships with patients, and deliver high value care. The gulf between gaining skills as a future doctor and gaining skills to pass final exams calls into question our assessment methods.

Take-home message: As we move forwards through an age of educational challenge and transformation, we need to prioritize curiosity and rethink our principles. We advocate the need to develop educational models that prioritize student-centered education within patient-centered healthcare, embracing a symbiotic relationship between student and patient, which is where authentic, life-long learning will occur.

An overview of the first year Undergraduate Medical Students' Feedback on the Point of Care Ultrasound Curriculum

Authors
Vian Mohialdin
Ari Shali
Bruce Wainman

Presenter: Vian Mohialdin, McMaster University, Hamilton, Canada

Background: With the technological progress of portable Ultrasound machines, there is growing demand by all health care providers to perform bedside Ultrasonography. Also known as point of care Ultrasound (POCUS), this technique is becoming extremely useful as a part of Clinical Skills/Anatomy teaching in the Undergraduate Medical field Curriculum.
Method: The research we report in this manuscript is a preliminary qualitative study. It provides the template for future model for teaching a hand on ultrasound for all health care providers in different learning institutions. McMaster Undergraduate Medical school is a 3-year program where we introduced (POCUS) in the first year curriculum. Each tutorial group has 20 students, one ultrasound machine; students spend 90 minutes with their tutor. Students will have the chance to scan their peers at least one time during the session.
Results: Students valued their experience to see and or/scan each other and even asked for more scanning/teaching time to be added into their curriculum. All students agreed that this experience had increased their basic ultrasound and scanning knowledge and believed it is appropriate to integrate and complement their Anatomy/Clinical Skills learning.
Discussion: Incorporating bedside ultrasound into Undergraduate Medical Education Curriculum can complement their physical examination findings. This also adds more safety measurement to every diagnostic/therapeutic procedure done under ultrasound guide. This leads to a reduced hospital stay and better improvement in the patient's outcome.
Conclusion: A questionnaire was handed to medical students to evaluate their hands on ultrasound sessions experience. Answers were collected and data analyzed into multiple graphs (as illustrated on this poster). POCUS has shown to be an extremely important diagnostic and or/therapeutic tool for different medical specialities. The learning environment has become more interactive because the Medical students were able to practice scanning their peers as part of their experience.
Take-home message: Students have found that interpreting ultrasound images can be a very challenging task. The introduction of bedside ultrasound training into the first year Undergraduate medical school curriculum at McMaster University has been very successful. Students were strongly engaged and it has significantly impacted their sonogram and probe orientation knowledge.

Development of a National Neonatal-Perinatal Medicine Physiology Curriculum Pilot Based Upon a Flipped Classroom

Authors
Heather French, Perelman School of Medicine at the University of Pennsylvania, Philadelphia PA, USA
Megan Gray, University of Washington School of Medicine, Seattle WA, USA
Maria Gillam-Krakauer, Vanderbilt University Medical Center, Nashville TN, USA
Rita Dadiz, University of Rochester Medical Center, Rochester NY, USA
Susan Izatt, Duke University Medical Center, Durham NC, USA

Presenter: Susan Izatt, Duke University Medical Center, Durham NC, USA

Background: Neonatal-Perinatal Medicine (NPM) training programs in the United States rely heavily on didactic teaching (DT) to cover physiology content specified by the American Board of Pediatrics (ABP). DT fosters knowledge acquisition through passive learning, but typically does not include active learner engagement. Recognizing the potential benefits of a standardized national physiology curriculum based on adult learning principles, we developed and piloted a new curriculum using a flipped classroom (FC) model.
Method: A prospective, observational pilot study was performed with NPM fellows (learners) and faculty educators at five institutions. Two FC educational programs were created based on ABP physiology content specifications. Programs included peer-reviewed online videos and case-based FC discussion guides. Videos were independently viewed by learners and educators prior to FC discussions which were facilitated by educators. After participation in FC sessions, learners completed surveys. Learners and educators shared their experiences in semi-structured focus groups which employed standardized interview guides with open-ended questions. Descriptive statistics were obtained. Focus group transcripts were coded using grounded theory and organized into themes and subthemes.
Results: 35 out of 48 fellows (73%) responded to the survey. Over 90% of respondents felt that the programs' relevance, quality of the FC discussions, and learner engagement were very good to excellent. 41 fellows (85%) and 6 educators (100%) participated in the focus groups, with thematic analysis reaching saturation. Six major themes emerged, including the role of FC programs in

decreasing the burden on educators, fostering knowledge acquisition and application, and creating a learning community. Fellows preferred the FC program over DT.

Conclusion: The pilot NPM physiology FC programs created an active learning environment which supported knowledge acquisition and application. The preference of FC learning over DT may be related to its foundation in adult learning theory and promotion of higher-level cognitive skills. The favorable responses of fellows and educators towards the FC modality supports further development and dissemination of a standardized NPM physiology national curriculum using this educational model.

Take-home message: Incorporation of FC programs into standardized curriculums fosters the development of learning communities that promote knowledge acquisition and application.

Evaluation of Perceptions of Hand-off Communication Among Internal Medicine Residents

Authors
Sandra Tan, National University Hospital, Singapore
Rhea Chatterjea, National University Hospital, Singapore
Jerold Loh, National University Hospital, Singapore
Lim Zhen Yu, National University Hospital, Singapore
Koh Teng Kiat, National University Hospital, Singapore
Lim Tow Keang, National University Hospital, Singapore

Presenter: Rhea Chatterjea, National University Hospital, Singapore

Background: Multiple studies have identified miscommunications among healthcare staff as one of the leading causes of serious medical errors. The US Accreditation Council for Graduate Education (ACGME) requires monitoring of effective and structured hand-off processes. However, at present, no formal hand-off training is provided to our residents. This study aimed to evaluate the perceptions of Internal Medicine residents of day-team to on-call hand-offs in our institute.

Method: A survey was developed by a resident after a focus-group discussion and literature search on hand-off communication. It was then reviewed by a group of residents and a senior consultant for editing and approval. The survey included both multiple choice and open-ended questions that queried adequacy and structure of hand-offs among our Internal Medicine residents. Adequacy of hand-off was assessed using a Likert scoring system and important hand-off components with multiple choice questioning. Key categories that were considered were those mentioned by >50% of residents. Demographics were also recorded.

Results: Of 100 Internal Medicine residents, 65 responded to the online survey. Of all responders, 23 (35.4%) deemed their own Hand-offs as very /extremely adequate whereas only 11 (16.9%) deemed that the Hand-offs they received were very/extremely adequate. Only 19 (29.2%) reported to follow a structured hand-off format. Of 49 residents who

deem Hand-off training as necessary, only 16 (24.6%) had received hand-off training before. 5 (10.2%) felt that 81-100% of vital information essential to patient care on-call but not handed over was available on Electronic Health Records(EHR). Components deemed important by residents in their hand-offs were Patient identifiers (76.9%), Illness Severity (81.5%), Active Medical Issues (81.5%), Contingency Planning (81.%) and Outstanding tasks and action plan (73.8%).

Conclusion: There is a mismatch between proportion of residents who deem hand-off training as necessary and proportion of residents who have received hand-off training. Further studies on barriers to effective hand-off communication and interventions to develop a structured hand-off education program based on the above components are required.

Take-home message: Formal residency training and assessment are necessary to ensure hand-off competency in residents for continuity of care and patient safety.

Jennifer Walton, Department of Pediatrics, University of Alberta, Edmonton, Canada

Presenter: Bonnie Islam, University of Alberta, Edmonton, Canada

Background: Triaging outpatient referrals is a critical skill in independent medical practice. Effective triage ensures patient safety and appropriate resource allocation. Principles of triage are well described in emergency and inpatient contexts, but little is known of triage in outpatient settings.

Method: We distributed an online needs assessment to all internal medicine (IM) and paediatrics residents at our institution to gauge awareness of and experience performing outpatient triage. We also surveyed IM and paediatrics faculty about their own triage practices and experiences teaching triage to learners.

Results: Forty-nine residents (47% IM, 53% paediatrics) responded: 29% had triaged referrals, 86% had no process for triage and 96% felt triage should be taught during training. While 20% had "not thought about it", 35% expected to triage in practice, and 25% were worried they would not be equipped to do so. Residents desired to

learn triage through didactic sessions and experiential learning with supervision.

Fifty-eight faculty (43% paediatrics, 57% IM) responded: 72% reported no formal teaching on managing outpatient referrals and 64% first triaged upon starting independent practice. Faculty learned this skill primarily "on the job"; through trial and error, adjusting practice to patient outcomes; and, from colleagues. Most (86%) felt triage should be formally taught, suggesting intentional role-modelling and workshops as potential strategies. In clinical practice, over half (53%) of faculty did not involve learners in triage.

Discussion: The majority of faculty reporting no exposure to outpatient triage before entering practice, along with low numbers of residents exposed to triage during training, highlights a gap in postgraduate medical training. Many respondents recognized the importance of this skill, and identified lost opportunities to involve learners in triage. Implementing educational interventions to teach triage may impart a practical skill while raising awareness around patient safety and resource allocation in ambulatory care.

Conclusion: Development of skills to effectively triage outpatient referrals is a significant gap within current residency education. Making this skill an entrustable professional activity for transition to practice in competency-based programs may prompt incorporation of educational activities to ensure graduates are appropriately prepared for this task.

360° Feedback: Developing an assessment and faculty development culture in Venezuela

Authors
Tatiana Giusti, Universidad Central de Venezuela, Caracas, Venezuela
Miguel Ortiz, Universidad Central de Venezuela, Caracas, Venezuela
Marcela Aburto, Universidad Central de Venezuela, Caracas, Venezuela
Jacqueline Torcat, Universidad Central de Venezuela, Caracas, Venezuela
Minaret Sandrea, Universidad Central de Venezuela, Caracas, Venezuela

Presenter: Tatiana Giusti, Universidad Central de Venezuela, Caracas, Venezuela

Background: In a traditional medical school, where teachers are not used to give and receive feedback, we developed a methodology to introduce a 360° teacher feedback system in order to develop self-reflection on teaching and improve teacher performance in Luis Razetti school of medicine.

The philosophy of the work was centered on developing an automated, anonymous and confidential system that students, teacher and superiors could feed continuously, to generate an anual report for each teacher, as well as an institutional overview of the strengths and weaknesses of the faculty, so that an evidence based Faculty

Development Program can be developed and really impact on teacher performance.

Method: A feasibility study was developed prior to curriculum transformation. Motivation to work on teacher performance was generated on Faculty. The project was presented and approved by university authorities. A working team for 360° feedback was formed. Reliable instruments, based on google forms, were developed and statistically validated. A pilot study was developed looking for applicability of the system for students and teachers. Generation of automatic reports and emails was programmed on google drive. A general meeting with stakeholders was conducted to present "Razetti 360° System".

Results: Acceptable psychometric properties of the questionnaires were statistically proved with Lawshe test. 24 individuals participated in the pilot study. 90% thought the instrument to be useful to give teacher feedback. 98% found it easy to compliment the instrument. 64% would respond the instrument for all teachers.

Discussion & Conclusion: Teaching performance was found to be a cornerstone in curriculum transformation in "Luis Razetti" School of Medicine, on the feasibility study that was driven. As university authorities understood the crucial role of teachers, enough motivation was generated to work on this institutional project. Content and face validity of the instruments was achieved by consensus of a panel of experts. High acceptance and feasibility was demonstrated in the pilot study as well as in the general meeting with stakeholders.

Take-home message: Accepting drawbacks and analyzing in high resolution, has become the most important step to start working on them and improve Luis Razetti School of Medicine.

Validation of the Questionnaire MEDUC-PG-14 to Evaluate Teaching Performance in Medical Residency Programs

Authors
Ana C. Olascoaga, Universidad Peruana Cayetano Heredia, Lima, Perú
Meylin Aphang, Universidad Peruana Cayetano Heredia, Lima, Perú
José Caballero, Universidad Peruana Cayetano Heredia, Lima, Perú
Yolanda Prevost, Universidad Peruana Cayetano Heredia, Lima, Perú

Presenter: Ana Olascoaga, Universidad Peruana Cayetano Heredia, Lima, Peru

Background: There are few tools to evaluate teaching performance in medical postgraduate school in Spanish language.

We intend to determine the validity and reliability of MEDUCPG-14 instrument to evaluate the performance of teachers in medical residency programs.

Method: MEDUCPG-14 instrument consists of 14 questions. We added an open question on the positive aspects that characterize a good teacher. A pilot test of the instrument was made in fifteen residents to explore the

comprehensibility of the questions. Subsequently, the survey was applied by email to residents of the Department of Medical Clinics, Faculty of Medicine, Universidad Peruana Cayetano Heredia, Lima. The reliability of the instrument was measured by Cronbach's alpha. The construct validity was assessed using factorial analysis, and the validity of content by a qualitative analysis of the answers to question 15.

Results: Seventy residents answered the survey. Forty-six teachers were evaluated. Each resident assessed one teacher. Factorial analysis showed that there were two factors or dimensions: "Teaching" Factor, of 11 items, and "Conduct" Factor, of 3 items.

The global Cronbach's alpha was 0.9718, Teaching Factor was 0.9714 and Conduct Factor was 0.9575. Qualitative analysis of responses to item N° 15 rescued the concept of "professional competence as a specialist of medicine". The instrument reliability (internal consistency) was very high, which means that all items in the instrument pointed to measure the same concept that is to be a good teacher. We found two constructs inside the instrument that we have denominated "Teaching", that is education methodology and "Conduct", which refers to the empathetic and respectful treatment of the teacher.

Discussion: The qualitative analysis rescued a concept not included in the original instrument, which is the concept of professional competence, and we think it is important to incorporate it because a teacher should be an expert.

Conclusion: MEDUCPG-14 was a useful and easy to use instrument to evaluate postgraduate teaching performance and we recommend to use it in programs of medical residency in Spanish speaking countries, however it is suggested to include a fifteenth item concerning the professional competence of the teacher.

10CC16 (605)
Medical students' attitudes toward a Good Death in North Eastern part of Thailand

Authors
Panita Limpawattana, Khon Kaen University, Khon Kaen, Thailand
Srivieng Pirojkul, Khon Kaen University, Khon Kaen, Thailand
Varalak Srinonprasert, Mahidol University, Bangkok, Thailand
Jarin Chindaprasirt, Khon Kaen University, Khon Kaen, Thailand

Presenter: Panita Limpawattana, Khon Kaen University, Khon Kaen, Thailand

Background: Caring for older patients with terminal illnesses requires a comprehensive medical education, including knowledge, skills and attitudes. Medical students are the future healthcare providers. Understanding their attitudes toward wishes of those patients is one of the important key to improve medical education. The objectives of this study were to explore medical students' attitudes regarding a Good Death in older adults and to demonstrate factors associated with decision of not prolonged suffering in view of medical students toward older adults' wishes.

Method: A sample of the first-to sixth-year medical students of Khon Kaen University, Thailand were recruited and was provided with electronic questionnaires regarding the opinion of older patients concerning circumstances around end-of-life period. The survey was conducted from September 1st, 2017 to January 31st, 2018. These questionnaires were distributed to all medical students.

Results: A total of 442 out of 913 questionnaires were returned (48.4%). The median age of participants was 21 years. The majority of them was Buddhism (96.2%). From their prospective toward the end-of-life of older adults' wishes, having families around when needed was the most important thing (26.2%), followed by completing unfinished business, be prepared to die (13.6%) and being respected, not being treated only for diseases but having spiritual needs (12.7%). Factors associated with opinion regarding older patients' wishes not to receive treatments to prolong life when having low chance of surviving were age (adjusted odds ratio (AOD) of 0.48, female (AOD 1.59), 3rd to 6th year medical students (AOD 11.2, 17.14, 40.42, 78.45, respectively), and prior experience of watching someone dying (AOD 1.98).

Discussion: Thai medical students' prospective regarding wishes toward the end-of-life of older adults were mainly in the domains of a good relationship with family, having planned arrangements, being respected and spiritual comfort whereas autonomy and self-dependency were less concern. Age, years of medical student, and prior experience of watching someone dying were associated with being unwilling to prolong suffering.

Conclusion: Thai medical students recognized aspects of palliative care concepts. However, developing concepts for improved care in medical curriculum is recommended particularly in the domain of autonomy and self-dependency.

Excellence through Engagement: a Foundation experience

Authors
Jennifer A Simpson, Medical Education Directorate, NHS Lothian, Edinburgh, UK
Hannah Monaghan, Medical Education Directorate, NHS Lothian, Edinburgh, UK
Simon Edgar, Medical Education Directorate, NHS Lothian, Edinburgh, UK
Karen A Adamson, Medical Education Directorate, NHS Lothian, Edinburgh, UK

Presenter: Jennifer Simpson, Medical Education Directorate, NHS Lothian, Edinburgh, UK

Background: Providing an excellent clinical and developmental experience for all foundation trainees can be a challenge. Recent General Medical Council survey data highlighted areas for improvement. To explore ways of improving our Foundation experience (FE), we invited all staff involved in the support and delivery of the FE to an engagement event with the Medical Education Directorate (MED).
Method: The MED team designed a half-day session for clinicians who work with, organise or deliver teaching to Foundation Doctors within NHS Lothian (LEP), alongside non-clinical managers responsible for the hosting services. Attendees had the opportunity to discuss the challenges of delivering high quality teaching in a busy clinical environment and consider ideas for change to improve training quality and experience. Speakers discussed various components of the foundation programme including the Foundation Simulation Programme and Foundation Curriculum development(1). After each session, attendees discussed ways to develop these components within their clinical unit. Feedback was collated using an "offers" (we can do) and "wants" (we need help with) structure. Common themes were identified and disseminated to all attendees and the wider educational team.
Results: During the session, the MED team realised that many attendees were unaware of the wide range of educational activities supported centrally and in specific clinical departments. Attendees (including Foundation Doctors) commented that they wanted to know more about the current programmes and how to access and benefit from these learning experiences.
Discussion & Conclusions: Peter Senge described the five components of a learning system(2): one of these being shared vision where people excel and learn because they want to. Using this excellence workshop model has helped to create a shared purpose and promote intrinsic motivation for learner and educator in Lothian.

Take-home message: Engaging healthcare professionals to create a shared vision will promote team learning and support a collective approach to delivering the FE.

10DD2 (2699)
How should we be preparing students for out of hours work as junior doctors?

Authors
Cathryn Mainwaring

Presenter: Cathryn Mainwaring, Guy's and St Thomas' NHS Trust, London, UK

Background: Graduates feel under-prepared for out of hours (OOH) work. During OOH work (nights, evenings, weekends) junior doctors move from the heavily supervised ward environment to one where they must practice more autonomously with less readily available senior support. They must put classroom knowledge into practice, integrating both technical and non-technical skills. Shadowing has been proposed as a beneficial teaching method; indeed it is now a mandatory part of induction. Other teaching modalities to prepare students for OOH work such as simulation have also been described. Overall, what are the features of these approaches that help to prepare students for out of hours work?
Method: King's College Hospital NHS Foundation Trust is a large trust in South East London. In 2016 they employed 88 Foundation Year 1 doctors. A mixed methods study using questionnaires and semi-structured interviews was designed to establish trainees' experiences of training for OOH work. The UCL Research Ethics Committee deemed this project service evaluation.
Results: The questionnaire response rate was 17% (n=15). Simulation, induction and shadowing were the most common methods of preparation for OOH work. Some had also experienced lectures and small group teaching. Simulation and shadowing were felt to be the most useful. 23% (n=5) felt they had no training to prepare them for OOH work. 3 interviews were conducted. Generally it was felt difficult to fully prepare students for OOH work. Preparation for OOH work was felt to be useful when;
- Students were encouraged to actively participate and make independent clinical decisions.
- Opportunities were repeated to facilitate increasing participation and breadth of exposure to clinical cases.
- Students were closely supervised and received feedback
- There was opportunity to share "Tips and Tricks of the Trade" with near-peers.
Discussion: Preparation for OOH work should be in a real or simulated environment and promote supervised active

participation that increases learner's responsibility and accountability over time.

Take-home messages: Interventions to prepare students for OOH work should encourage graded, repetitive practice.

Near- peer facilitators should be used to give feedback and share "insider" knowledge.

10DD3 (691)
Senior House Officer (SHO) Satisfaction with the Taranaki Base Hospital (TBH) Emergency Medicine education program from 2011-2017

Authors
Susie Flink

Presenter: Susie Flink, Taranaki District Health Board, New Plymouth, New Zealand

Background: Most training programs must have a structured education program to complement the practical learning that occurs at the bedside. There are only a handful of studies that assess SHO satisfaction with certain aspects of the education program; none in their entirety.

Method: A four question survey was sent via email to the 77 SHOs who came through the TBH education program from 2011-2017. Forty-eight SHOs (62%) responded to the survey. Each question could be answered with strongly agree, agree, neutral, disagree or strongly disagree.

Results: Percentage of SHOs who agreed and strongly agreed with the following statements:
Question asked:

2011	2012	2013	2014	2015	2016	2017

I learned a lot from the education program

67%	67%	67%	100%	100%	50%	100%

Teaching was well organized

56%	0%	44%	100%	86%	75%	86%

I received feedback on how to improve my performance

33%	33%	33%	100%	86%	100%	100%

I felt encouraged and supported in my future career aspirations

44%	33%	44%	25%	71%	100%	86%

Overall there is an improving trend over the 7 years. This improved perception of the TBH education program is likely multifactorial. The changes that occured can be divided into 3 groups: motivation of staff, improved feedback and curricular changes.

Motivation of staff: one colleague stepped forward to be our education champion and others have pursued courses in medical education.

Improved feedback: feedback forms were introduced for teaching sessions, feedback was provided to each SHO at the end of their rotation, and confidential peer-to-peer feedback was introduced.

Curricular changes: flipped classroom ultrasound teaching and other alternative teaching formats were introduced.

Conclusions: The help of colleagues was important in implementing these changes and other minor improvements. It gives great satisfaction to know that we are delivering an improved program and better meeting the needs of the future generations of doctors.

Take-home message: Take small steps and enlist the help of others to address the educational needs in your teaching environment.

10DD4 (3234)
Perception of histopathology amongst junior doctors

Authors
Lorelle Brownlee, Maidstone Hospital, Maidstone, UK
Rohaila Ahmed, Maidstone Hospital, Maidstone, UK
Isabel Woodman, Maidstone Hospital, Maidstone, UK
Dominic Chambers, Maidstone Hospital, Maidstone, UK
Johanna Wall, Maidstone Hospital, Maidstone, UK

Presenter: Lorelle Brownlee, The Maidstone Hospital, Maidstone, UK

Background: Histopathology is not a visible front-line speciality but it does inform front-line decisions. The role of the histopathologist is becoming more pivotal within the clinical landscape as the molecular age of medicine arrives vis-à-vis personalised treatments. Due to the relative invisibility of histopathology, an apparent air of mystery seems to surround the speciality, and what is understood regarding the nature of pathology, beyond the media's portrayal of post-mortems, is unclear. With reduced exposure in medical school, interaction with pathologists limited to request forms and multi-disciplinary-meetings, it is perhaps not surprising there is a shortage of histopathologists. A survey was thus conducted to investigate the perception of histopathology amongst junior doctors.

Method: A SurveyMonkey was distributed to junior doctors across four hospital sites in Kent. The questions focused on various aspects of the histopathologist's job, including post-mortem examinations, specimen handling, report generation and training requirements. Results were collated and analysed.

Results: 40 responses were received. On average, the respondents underestimated the percentage of histopathologists who perform post-mortem examinations. 87% correctly identified the specimen processing pathway, and 64% knew the role of immunohistochemistry. 86% recognised clinical history was important for accurate histological diagnosis with the remainder unaware that more information, other than clinical site, was required. 43% had experienced difficulty completing histology request forms. The commonest reason given was being unsure of what information was required. 41% did not know the purpose of a frozen section, and a further 15% gave incorrect explanations for the use of frozen sections.5% were unaware a medical degree was a pre-requisite for histopathology training.

Discussion & Conclusions: Junior doctors demonstrate some understanding of histopathology, however, this snapshot study has revealed substantive knowledge gaps. It is crucial that a better understanding of histopathology is encouraged amongst clinicians in order to promote clinical effectiveness as part of an interdisciplinary team and optimise patient management.

Take-home message: Junior doctors would benefit from having more exposure to histopathology at an early stage in training.

10DD5 (1800)
Belief Vs. Reality: A discourse analysis of "Junior Doctors: your life in their hands"

Authors
Tania Rajendran, Barts and the London University, Whitechapel, UK
Esther Murray, Barts and the London University, Whitechapel, UK

Presenter: Tania Rajendran, Barts and the London University, Whitechapel, UK

Background: Data collected in 2014 suggests that around 38% of people in F1 posts feel unprepared for their job as a doctor [GMC, 2011]. Why is this the case? Certainly, becoming a doctor is more than the acquisition of scientific knowledge. To what degree is it the responsibility of the medical school to prepare students for the realities of life as an F1? Some students graduate from medical school, without grasping the full idea of what their life is going to be like as a doctor. This is despite the fact that they have been on wards and may have been exposed to television shows, blogs and other media about working as a doctor. This research explores some of the discourses in the public realm surrounding life as an F1 doctor.
Method: A discourse analysis of the documentary series 'Junior Doctors: Your Life in Their Hands' was undertaken. This documentary follows the journey of newly graduated doctors exploring the similarities and differences between their expectations and the realities of the job.
Results: Preliminary analysis shows a variety of discourses that arise within the programme. One being the burden of administrative work, which threatened their desire to carry on in the job. Another recurrent discourse was 'the emotional roll-coaster' of the working day from happiness due to success of a task, such as cannulation of a vein, to the distresses of dealing with the death of a patient and the newfound responsibility over a person's life.
Discussion & Conclusions: A discourse analysis allowed for some of the issues and misconstrued views to be explored. This could contribute to the development of interventions to better prepare students for the realities of working life as a doctor.
Take-home messages: The medical school has some responsibility to support their students by preparing them for the demands and the realities of the job rather than allowing the individuals to fend for themselves after graduation; but the extent to which this issue is implemented within the curriculum is to be determined.

10DD6 (327)
Perceptions of a night float system for post-graduate year one junior doctors (interns) in an Internal Medicine program – an Asian perspective

Authors
Benjamin YQ Tan, Internal Medicine Residency Program, National University Health System, Singapore
Zi Yun Chang, Internal Medicine Residency Program, National University Health System, Singapore
Nicholas JH Ngiam, Internal Medicine Residency Program, National University Health System, Singapore
Sandra MY Tan, Internal Medicine Residency Program, National University Health System, Singapore
Shirley BS Ooi, Designated Institutional Official, Residency, National University Health System, Singapore
Adrian CL Kee, Internal Medicine Residency Program, National University Health System, Singapore

Presenter: Zi Yun Chang, Internal Medicine Residency Program, National University Health System, Singapore

Background: Long night duty hours and sleep deprivation have been associated with medical errors, adverse events and physician "burn-out". An innovative night float system (NFS) has been implemented in our institution's internal medicine program to negate the effects of long duty hours associated with conventional full-call systems. However, concerns remain if the NFS would result in inadequate training, especially for post-graduate year one (intern) doctors.
Method: We examined perceptions of our NFS in this cohort of interns. We developed a structured questionnaire to assess our junior doctors' perceptions of the NFS compared to full-call system, in areas of patient safety, medical training and well-being.
Results: 97/137 (71%) of junior doctors participated in this study. Of these, 44 (45%) had experienced both the NFS and full-call system (in another rotation) during their intern year. 91 (94%) doctors felt the NFS was superior to the full-call system, and 83 (86%) felt that presence of a NFS would influence their choice of training institution. Majority felt that NFS was beneficial for patient safety compared to full-call (94% vs 2%, p<0.001) and reduced medical errors (94% vs 2%, p<0.001). The NFS was perceived to reduce physician "burn-out" compared to full-call (95% vs 5%, p<0.001). Only 5 (5%) doctors felt the NFS was less adequate in producing competent trainees. Subgroup analysis of 44 participants who had experienced both NFS and full-call system in their intern year showed that all but one (n=43, 98%) favoured the NFS. In fact, 39 (88%) felt they were more likely to make mistakes after a full-call, and only 7 (16%) felt confident to function safely.
Discussion & Conclusions: Beyond being a practical solution to duty-hour restrictions, there was a significant perceived benefit of the NFS compared to the full-call system in improving patient safety, reducing medical errors and physician "burn-out". Most felt that education and training were not compromised with NFS.
Take-home message: NFS is perceived by junior doctors to be a superior call system in intern year. Longitudinal studies to evaluate patient safety outcomes and assess

interns' competency in these 2 distinct systems are warranted.

10DD7 (3439)
A Survey-Based Investigation on the Research Activity and Incentives for Increasing Research Activity Among Junior Physicians at the Sahlgrenska University Hospital

Authors
Li Jin Yang, Sahlgrenska University Hospital, Gothenburg, Sweden
Cecilia Lagging, Sahlgrenska University Hospital, Gothenburg, Sweden
Erik Hulegårdh, Sahlgrenska University Hospital, Gothenburg, Sweden

Presenter: Li Jin Yang, Sahlgrenska University Hospital, Gothenburg, Sweden

Background: Physicians with academic training has been long considered a crucial resource as a link between research and good clinical practice. However, national statistics in Sweden show that during the past decade the number of clinically active M.D. Ph.D. physicians have decreased in number. To encourage an increase in research activity early in junior physician careers, the Sahlgrenska University Hospital (SU) provides academic track foundation training positions for junior physicians with six months of funded research time in addition to the obligatory Swedish foundation training period (21 months at SU).
Method: We aim to investigate the current level of research activity as well as long term plans among junior physicians in foundation training at SU and additionally survey opinions on the present policy for conducting research during foundation training and collect suggestions for improvements. All active foundation-level junior physicians (n=96) at SU were surveyed during May 2017 using a 15-question form created through Google Forms, a free online survey-creation tool.
Results: A total of 69 junior physicians responded to the survey (72%). A clear majority of respondents answered that they are currently active in research (n=55, 80%). Among the respondents not currently active in research, half had previous experience of research. Respondents also answered questions pertaining to current time spent on research, career plans after completing foundation training and suggestions to improve conditions for conducting research during foundation training.
Discussion & Conclusions: Within the framework of our current investigation we were able to demonstrate that a large majority of junior physicians at SU are currently active in research and that a significant portion has plans to continue with a career in academics after completion of foundation training. We also learned what junior physicians at SU want to see as improvements and incentives for conducting research during foundation training.
Take-home message: A survey-based study was used to analyze the research activity among junior physicians at the Sahlgrenska University Hospital. This method can be used to investigate aspects of the current research

financial support system and local clinic scheduling policies in search of further areas for improvement.

10DD8 (593)
An Annual Urology Tutorial for Junior Doctors: Results of UK Based Multi-Centre Study

Authors
Saqib Javed
Lina Yow
Asif Ansari
Magaret Lyttle
Rafal Turo
Rono Mukherjee

Presenter: Lina Yow, UK

Background: Our AMEE 2016 and 2017 posters reflected a well-received response amongst foundation doctors for the inclusion of a single urology tutorial into the postgraduate foundation training. The participants felt the knowledge and skills gained will improve their confidence in managing urological conditions. To validate our results, we introduced the similar urology tutorial to 4 other teaching hospitals.
Method: A multi-centre study was carried out among foundation doctors and core surgical trainees across 4 hospitals. With the aid of questionnaires, our study aims to observe any improvement in junior doctor's perceived confidence level in management of urological condition after the inclusion of a urology teaching session in the postgraduate programme.
Results: 68 junior doctors took part in an interactive tutorial. 62% (n=42) were foundation year 1 doctors, 31% (n=21) were foundation year 2 doctors while 7% (n=5) were core surgical trainee. 80% (n=54) of the cohort had no previous urology job. 4% (n=3) of the cohort reported to have received adequate urology teaching previously. Only 1 person felt confident to competently manage all urological problems while 34% (n=23) felt capable to manage most urological presentations. All participants were keen on extra urology teaching, with 97% (n=66) wanted the teaching to focus on emergency urology conditions. 62% (n=42) felt the tutorial would help to improve patient care and aid their future training jobs. Positive feedbacks were received after the teaching, with 93% (n=63) finding it very useful and 97% (n=66) reported an increased in confidence level.
Discussion & Conclusions: Our multi-centre study provided supporting evidence that junior doctors do not feel adequately prepared to manage urological conditions in the acute setting. We observed positive feedback from the participating junior doctors, indicating the inclusion of urology supplementation has helped to increase their level of confidence in managing such presentations. We propose the inclusion of urology teaching in the foundation programme teaching curriculum.
Take-home messages: We recognize the benefits of providing urological teaching sessions to junior doctors and would recommend implementing this programme in more deaneries across the UK to better support our junior doctors in providing good care for our patients.

10DD9 (110)

Do foundation year doctors perceive large group teaching as an effective method of learning for their stage in training?

Authors
Rebecca Stout
Orhan Orhan

Presenter: Rebecca Stout, UCL, London, UK

Background: Foundation doctors in the UK currently must receive generic foundation teaching on a regular basis. Most of this teaching is delivered within a large group, didactic setting. There are currently no published studies which examine teaching delivered to foundation doctors within a large group setting, and whether these doctors perceive this as an effective method of learning.
Method: All foundation year doctors working at a single NHS trust had the opportunity to take part in a questionnaire study. All of these doctors are exposed to fortnightly large group didactic teaching as a part of their generic foundation teaching. This amounted to 99 doctors. The questionnaire was distributed by the postgraduate department via e-mail and via a private facebook page specifically for foundation doctors at the trust. The questionnaire yielded an 18% response rate. Likert scales were analysed and reviewed with percentage responses and free text answers were coded for thematic analysis.
Results: 50% of participants found large group teaching an effective method of learning for foundation year teaching. 67% found it effective as a method of acquiring new information, however only 11% found it an effective way of improving clinical skills.
Discussion & Conclusions: Themes that emerged included that the format of teaching was important, and that this could be improved with 'question and answer' sessions and case examples. A further theme was that the content of teaching must be aimed at the correct level, and that this is a particularly good way of delivering information about protocols and referral pathways. Final theme was around the skill of the tutor being key, with good qualities being 'enthusiastic,' 'engaging,' and 'knowledgable'.
In this cohort of foundation year doctors there was differing opinion about whether large group didactic teaching is effective. Limitations of this study include that it included a relatively small sample size and that it was a single-centre study.
Take-home messages: This study highlights a number of important factors for education departments when they are designing teaching for foundation doctors; teaching should hold relevant content; have engaged and enthusiastic teachers; and have an interactive component throughout.

Diversity of Education in Foundation Year 2 Teaching

Authors
J.A.G Purdell-Lewis
M.J Aldridge
K Finucane

Presenter: Matthew Aldridge, North Bristol NBT, Bristol, UK

Background: The Foundation Year 2 (FY2) curriculum provides guidance for educational delivery of teaching programmes at a local level. This includes hospital teaching, as well as regional denary education. The FY2 programme delivered by most institutions reflects common specialties encountered by foundation trainees, as well as the resources available for education and the need to maintain service provision.
There is good evidence that diversity of educational modalities improves educational outcomes, irrespective of perceived learning style preference. However, despite the educational benefit of integrating diverse teaching methodologies within a programme, there are no specific requirements within the FY2 curriculum to deliver this.
Context: At Southmead Hospital, North Bristol NHS Trust, the FY2 programme has traditionally been a weekly lecture-based structure led by a senior clinician. This quality improvement project integrated a range of teaching modalities within the established programme to diversify the educational methods.
Innovation: Lecture based educational sessions have been reduced in frequency and peer-to-peer group sessions introduced into the programme. These sessions run alternately every fortnight. The lecture based topics are defined by the previous FY2 year's feedback. The peep to peer teaching subject matter is instigated by the present FY2 cohort, provided it meets curriculum requirements. The simulation programme has also been expanded to include sessions every 1-2 weeks to allow improved access.
FY2 feedback for the different educational formats has identified that FY2 doctors were successfully able to access the new programme despite ongoing service provision pressures. The feedback also underlined the individual variation in personal preferences for different educational formats. Simulation was reported to provide the biggest learning opportunity, followed by peer to peer teaching and then lecture based sessions.
Implications: The diversification of the FY2 educational programme demonstrated positive engagement with all the modalities introduced. FY2 doctors recorded a preference for the new programme over the previously established lecture format. Although not directly assessed, the integration of a number of educational modalities has the theoretical benefit of improving overall learning.

10DD11 (603)
How the youngest doctors perceive a national formal advisory program: A SWOT-analysis

Authors
Anita Sørensen, Randers Regional Hospital, Randers, Denmark
Marianne Kleis Møller, Aarhus University Hospital, Aarhus, Denmark
Pernille Andreassen, CESU, University of Aarhus, Aarhhus, Denmark
Bente Malling, CESU, University of Aarhus, Aarhus, Denmark

Presenter: Anita Sørensen, Centre for Health Sciences Education, University of Aarhus, Denmark

Background: In Denmark a national formal advisory program (NFAP) was introduced in 1998. According to this, all doctors in each rotation of postgraduate medical education must be appointed an advisor, who must conduct at least three appraisal meetings and ensure the preparation of a personal learning plan. This study investigates the implementation of the NFAP and areas of improvement.
Method: In March 2017 a survey was conducted among all 129 doctors, who were employed in their first 6-month rotation in Central Denmark Region. Items matched the rules set out by the Danish Health Authority.Mean score and standard deviation were calculated, and through driver-performance analysis strengths, weaknesses, opportunities and threats (SWOT) were appointed.
The response rate was 67%, and the questionnaire showed good reliability and discriminant validity.
Results: Almost all respondents had the recommended appraisal meetings and a personal learning plan, both of which - in contrast to the NFAP's coherence to everyday clinical practice - showed to be of great influence to the overall value of the NFAP. Strengths found were, that appraisal meetings and learning plans support development of clinical competencies, the latter identifying learning objectives and how to achieve them. Threats found were, that learning plans are not prepared early enough and not regularly adjusted. Also learning plans do not describe, when each learning objective shall be achieved, nor when, by whom, or how assessment will take place.
Discussion & Conclusions: Appraisal meetings and learning plans seem well implemented, have great influence on the overall value of the NFAP, and support the development of clinical competencies. Suggested improvements would be to ensure earlier preparation, inclusion of plans for assessment, and regular adjustments of the learning plans. Further investigation is needed to clarify, why the coherence between the NFAP and everyday clinical practice showed to be less influential.
Take-home messages: Appraisal meetings and personal learning plans support the development of clinical competencies. Learning plans must be prepared early in each rotation and adjusted regularly. Also they must identify learning objectives, and how and when to achieve them as well as plans for assessment.

10DD12 (2126)
The Model for Improvement is a useful tool for junior doctors when implementing sustainably educational initiatives in the clinical setting

Authors
Trine Silkjaer
Karina Thorhauge Johansen

Presenter: Trine Silkjaer, Aarhus University Hospital, Aarhus, Denmark

Background: Implementing new educational initiatives in the clinical setting can be troublesome due to busy clinical activities and production demands. The Model for Improvement is a model developed by Langley et al. from the Institute for Healthcare Improvement in Boston to be used in healthcare quality work. We presented the model for young medical doctors and motivated them to apply the model to develop a sustainably and applicable form for having short conferences in a busy hematological admission ward. Medical doctors often work alone, and this can compromise the medical education they can get from daily clinical work. A conference in the admission ward would have the aim to increase the supervision and the post graduate medical education.
Method: Young doctors at the Department of Haematology, Aarhus University Hospital used the Model for Improvement to find a sustainably and optimal form and time for a short conference at the haematology admission ward. They found that the Model for Improvement creates a sustainably improvement and can be applied when new initiatives are planned in the setting of postgraduate medical education in the daily clinic.
Results: The young doctors found a sustainably and optimal form for how and when the short conferences could take place at the admission ward. They used the Model for Improvement to try several forms, e.g. choice of conference responsibly doctor and timing, by using the plan-do-study-act (PDSA) cycles. In this way we finally implemented a conference that was sustainable, before implementing it.
Discussion: In a busy clinical setting it can be difficult to implement new initiatives that are sustainable. Often new initiatives are implemented without knowledge about the applicability and without confirming that the change is an improvement.
Conclusion: The Model for Improvement is a useful and meaningful method to apply in the postgraduate medical education when new initiatives are launched.
Take-home message: The Model for Improvement can help new initiatives in postgraduate medical education to become sustainably and applicable.

10DD13 (782)
Factors that affect junior doctor attendances during teaching sessions

Authors
Maulik Patel, Barts and the London, London, UK
Celia Woolf, Institute of Health Sciences Education QMUL, London, UK
Julian Emmanuel, Barts Health NHS Trust, London, UK

Presenter: Maulik Patel, Barts and The London, London, UK

Background: Medical education continues beyond university. The Royal London Hospital (RLH) offers at 5 different methods of teaching; Ad-hoc (AH), Grand Round (GR), Hot Cases (HC), Didactic Teaching (DT) and Journal Clubs (JC). Previous studies have critiqued these methods and assessed the factors that influence their attendances. However, these have not been evaluated from the junior doctor's perspective.
Method: This study explored junior doctors' perceptions of different teaching methods through semi-structured interviews, questionnaires and teaching session attendance records. Phase 1 involved interviews that were carried out with 5 junior doctors, recorded, transcribed and analysed. Phase 2 involved a questionnaire that was produced based on the thematic analysis of the interviews and released to all junior doctors in the hospital. Phase 3 involved analysing teaching attendance records. Data from interviews, questionnaires and attendance records were compared to explore which teaching method juniors find most beneficial and why.
Results: Interviews highlighted many advantages and disadvantages that junior doctors recognised for each teaching method. Questionnaires returned (n=47) provided generalised information on attendance rates, perceptions and rankings of the most to least beneficial teaching method for their roles. Attendance records showed that juniors had the lowest attendance per session in Grand Round and highest in Didactic Teaching.
Discussion & Conclusions: This study supported previously known factors that increase attendances such as the clinical relevance, the interaction that exists between the teacher and learner and the presence of free lunch. Similarly, known negative factors were reported such as the balance between clinical, educational and personal commitments and the intimidating environment created due to the presence of senior professionals in the audience. Additional information uncovered in this study showed that juniors would rather prefer teaching sessions that are clinically relevant independent of the teaching quality and that juniors would like to have some control over topics that are taught locally.
Take-home message: Educational planners must be aware of the factors that affect attendances and should take these into consideration when organising teaching sessions. A list of recommendations to improve attendances has been produced based on the results of this study.

10DD14 (3678)
Engineering the Educational Experience (E3): Creating a Genuine Clinical Experience for Trainee Learning and Assessment

Authors
Elizabeth Wooster, OISE/University of Toronto, Toronto, Canada
Douglas Wooster, University of Toronto, Toronto, Canada
Justin Hsu, University of Toronto, Canada
Jerry Maniate, University of Ottawa, Canada

Presenter: Elizabeth Wooster, OISE/University of Toronto, Canada

Background: Providing genuine clinical experiences that allow trainees to learn in a safe and secure environment is a task that continues to daunt medical educators. Creating opportunities for the assessment of the impact of these experiences for trainees and the health care team further complicates their development.
Method: Recently the opportunity to develop an outpatient, ambulatory care clinic to offer genuine experiences to a variety of trainees arose. To ensure that the experiences maximized quality and value to the trainees while allowing for opportunities for assessment in a variety of formats, we created an engineered educational experience (E3).
Results: To date, 75 medical trainees have experienced the educational opportunities offered by the E3 clinic. In addition to providing unique clinical experiences to trainees, the clinic has provided the opportunity to develop a 360-degree assessment protocol. This protocol includes feedback from trainees, patients, staff physicians and support staff.
Discussion & Conclusions: Implementing the E3 curriculum has led to greater clinical exposure for medical trainees. To date, feedback from those involved in the clinic has been positive. Additionally, with the move to competency based medical education, E3 has provided numerous opportunities for assessment of skills that were not previously accessible.
The E3 design has been successful at our hospital. It has provided learning and assessment opportunities that were not previously available. E3 has also allowed trainees to further understand the interactions of the health care team for patient care. Moving forward the E3 design will be implemented in additional clinics.
Take-home messages: In order for trainees to have genuine learning experiences during their clinical rotations, attention must be given to the development and assessment of the curriculum. The successful implementation of the E3 curriculum design demonstrates that it is possible to create such learning and assessment experiences in ambulatory clinical settings. Additionally, the creation of the E3 clinic has provided clinical experiences beyond those normally available to medical trainees.

Participation in question-writing revision sessions for medical students supports continued professional development for postgraduate medical trainees

Authors
Alex Riding, Cambridge University School of Clinical Medicine, Cambridge, UK
Michelle Arora, Cambridge University School of Clinical Medicine, Cambridge, UK
Mark Gurnell, Cambridge University School of Clinical Medicine, Cambridge, UK
Diana Wood, Cambridge University School of Clinical Medicine, Cambridge, UK

Presenter: Alex Riding, Cambridge University School of Clinical Medicine, Cambridge, UK

Background: Assessment drives learning in learners but whether it drives learning in creators of assessment is less well explored. Quantitative studies suggest question-writing improves examination performance in authors, but there is relatively little qualitative research exploring its impact on learning.

With the introduction of the UK Medical Licensing Assessment (UKMLA) expected in 2022, it is imperative to create a robust bank of excellent single best answer (SBA) questions, requiring several highly skilled authors. Postgraduate medical trainees are well placed to meet this need.

Many postgraduate trainees take time out of clinical practice for research, education fellowships and maternity leave. With ever-evolving changes in medicine, trainees need innovative ways of remaining up-to-date with evidence-based practice.

Method: We developed a trainee-led SBA authoring group to write formative SBAs for undergraduate medical students. Questions were reviewed by experienced assessment leads. Authors received feedback on their question-writing and presented them to students in an interactive revision session. A questionnaire was sent to authors exploring the benefits of writing SBAs (83% response rate).

Results: Thematic analysis of free-text comments was performed. Participants felt question-writing identified knowledge gaps, motivating them to seek learning resources to improve patient care. Typical feedback for changing clinical practice included, "Encouraging me to stay current with knowledge in areas not in my usual specialty". Furthermore, the sessions enabled deeper reflection and improved understanding of challenging clinical cases. Sixty-seven percent felt more confident teaching students, encouraging most (80%) to volunteer for more teaching activities. For those approaching postgraduate exams, question-writing brought increased confidence (44%).

Students gave extremely positive feedback after the interactive trainee-led sessions and felt they addressed misconceptions with clinical scenarios.

Discussion & Conclusions: Formative, interactive, trainee-led SBA sessions benefit students by demystifying assessment and providing a useful revision tool.

Participating in SBA writing is an effective way to enable continued professional development for trainees and maintain current knowledge (especially those outwith clinical programmes). For trainees approaching postgraduate examinations, it enables clarity of reasoning and increased confidence mastering examination technique.

Take-home message: Question-writing can drive self-regulated learning in authors, promoting self-confidence and maintenance of clinical knowledge.

Understanding role modelling in Palliative Medicine: A Thematic Review of Role Modelling in Postgraduate Internal Medicine between 2000-2015

Authors
Yaazhini Renganathan, Yong Loo Lin School of Medicine, Singapore
Jia Yan Chong, Yong Loo Lin School of Medicine, Singapore
Ann Hui Ching, Yong Loo Lin School of Medicine, Singapore
Ying Pin Toh National University Health System, Singapore
Lalit KR Krishna, Duke-NUS Graduate Medical School, the Yong Loo Lin School of Medicine and the Centre for BioMedical Ethics, National University of Singapore

Presenter: Yaazhini Renganathan, Yong Loo Lin School of Medicine, Singapore

Background: Role modelling is an integral component of training in Palliative Medicine, providing guidance for trainees on the art and science of Palliative Medicine, which includes bereavement counselling, professionalism and empathy. Despite its importance, role modelling in Palliative Medicine is poorly understood and frequently conflated with mentoring and supervision. To address the subsequent lack of data, this review will study role modelling in the closely related domain of training in postgraduate Internal Medicine on the premise that the lessons learnt can be effectively extrapolated to the Palliative Medicine context.

Method: Three reviewers carried out independent literature searches of PubMed, ERIC, Cochrane Database of Systematic Reviews and Scopus for articles on role modelling published between 1 January 2000 and 31 December 2015 in Internal Medicine.

Results: 2950 abstracts were retrieved; 75 full text articles were independently evaluated by the 3 authors. 28 articles were included. Thematic analysis using Braun and Clarke's (2006) approach revealed 6 themes. These include definitions of role-modelling, the role modelling environment, the process of role modelling, characteristics of the role models, obstacles to role modelling and negative role modelling.

Discussion & Conclusions: This thematic review reiterates the importance of role modelling in Palliative Medicine, especially given its multidisciplinary nature. In addition, this review forwards the first evidence-based definition of role modelling. It also explicates the complex process of role modelling comprising of conscious observing, reflecting, experimenting, assembling and assimilating on the part of the trainee and conscious adoption of role

modelling stances on the part of the trainer. In addition, this thematic review highlights that role modelling may occur in any setting and at any time emphasize the importance of training all staff for this role. This review also signposts the direction of further research and faculty development programs to facilitate the recognition and development of role modeling as an effective teaching and learning strategy.

Take-home messages: 1. Role modelling involves conscious observing, reflecting, experimenting, assembling and assimilating on the part of the learner

2. Role modelling requires the conscious adoption of role modelling stances on the part of the trainer

Evaluate the teamwork in Taiwanese junior healthcare practitioners - a pilot study

Authors
Wei-Chun Cheng, Hualien Tzu-Chi Medica lCenter/Tzu-Chi University, Hualien, Taiwan
Tsung-Ying Chen, Hualien Tzu-Chi Medical Center/Tzu-Chi University, Hualien, Taiwan
Hsiu-Chen Yeh, Hualien Tzu-Chi Medical Center/Tzu-Chi University, Hualien, Taiwan
Sin-Yi Huang, Hualien Tzu-Chi Medical Center/Tzu-Chi University, Hualien, Taiwan
Chen-Pei Ho, Hualien Tzu-Chi Medical Center/Tzu-Chi University, Hualien, Taiwan

Presenter: Wei-Chun Cheng, Hualien Tzu-Chi Medical Center/ Tzu-Chi University, Hualien, Taiwan

Background: The stakeholder and educators devoted into inter-professional education (IPE) since 2012 in Hualien Tzu-Chi Medical Center. Post-graduate curriculum designers from physicians, nurses, nutritionists, pharmacists, radiologists and medical technologists were enrolled and implanted IPE curriculum into existing programs since then. Formatively assessment was adopted to evaluate the training program.

Method: The objective of this project is to establish a valid and reliable assessment tool for practitioners during PGY. This project was approved by institutional review board in Tzu-Chi Medical Center (IRB106-52-B). Based on literature review, collaborative practice assessment tool (CPAT), developed from the Queen's University, was adopted since November, 2017. Taiwan version of the CPAT(T-CPAT) was validated. Data was analyzed with SPSS version 22 and Microsoft Excel.

Results: We excluded one item after expert validation (CVI> 0.78). Pilot test was performed. (n=40) Reliability of the T-CPAT (7-point scale) is analyzed with the Cronbach's Alpha. (8 domains, all domains between 0.57 and 0.95). Satisfaction survey about the T-CPAT (5-point scale) was collected (N=37) and analyzed. The average scored 4.4(± 0.66, SD) in specific statement; 3.6 (± 0.87) in time-spending; 4.3(± 0.66) in correlation to purpose; 4.4(± 0.66) in related to their clinical practice; 4.4(± 0.70) in appropriate instructions; 4.3(± 0.64) in design of the 7-point scale; 3.0(± 0.83) in easy to answer. Subjects stated the T-CPAT was clarified the details about inter-professional collaborative practice (IPCP). Subjects

expressed abundant opinions to point out the difficulties about communication between physicians and non-physicians. The vague orders, tight schedule, medical terminology in English and emotional conflict obstacle the team interaction and function.

Discussion & Conclusions: Junior healthcare practitioners approved the T-CPAT to assess their performance about IPCP. Based on Cronbach's Alpha is > 0.9 in four domains and < 0.7 in one domain. Further validation process, through delphi method and confirmation factor analysis of 55 items and 3 open questions about the perceptive effectiveness is proceeding.

Take-home messages: Due to few clinical experience of healthcare practitioners in PGY. As for culture difference and instructional design are quite different from English-speaking population, the T-CPAT is thoroughly viewed and studied.

10DD18 (2108)
Implementation of KPI to stimulate the quality of practical training at the level of internship and residency

Authors
Vitaliy Koikov, Republican Center for Health Development, Astana, Kazakhstan
Aiman Iskakova, Republican Center for Health Development, Astana, Kazakhstan
Zaure Baigozhina, Republican Center for Health Development, Astana, Kazakhstan
Ayagyoz Umbetzhanova, Republican Center for Health Development, Astana, Kazakhstan
Aigul Abdrakhmanova, Republican Center for Health Development, Astana, Kazakhstan
Aigul Mergentai, Republican Center for Health Development, Astana, Kazakhstan

Presenter: Zaure Baigozhina, Republican Center for Health Development, Astana, Kazakhstan

Background: One of the goals of the national project for the medical education modernization (implemented by the Ministry of Health of Kazakhstan since 2016) is to improve the quality of practical training, including at the level of residency. The complex of activities implemented within the framework of the project includes the introduction of mentoring interns and residents by doctors of clinical bases, the introduction of rotation of residents in organizations of various levels of health care (regional, city and republican level).

Method: 8 medical universities were included in this project. Evaluation of the project effectiveness was carried out in accordance with KPI including - ratio «doctor-mentor : intern», ratio «doctor-mentor : resident», «share of residency programs with the rotation of residents in organizations of different levels» (regional, city and republican). We also assessed the correlation of these indicators with the average value of the final assessment of knowledge and skills of interns and residents conducted by the national center for the evaluation of knowledge and skills.

Results: During the project implementation period, medical universities provided training mentors for interns

and residents, conditions for rotation of residents. At the same time, the ratio «doctor-mentor : intern» was 1:7,6, the ratio «doctor-mentor : resident» - 1:4,5, the share of residency programs with the rotation of residents in organizations of various levels was 24.7%. At the same time, we found a direct correlation between the average value of the final assessment of the knowledge and skills of residents in the university with the share of residency programs with the rotation of residents in health organizations of various levels and the inverse correlation with the number of residents assigned to 1 mentor

Discussion & Conclusions: The introduction of mentoring interns and residents by doctors at clinical bases and the rotation of residents in health organizations at various levels have a direct impact on the quality of training of doctors at the medical university..

Take-home message: The introduction of KPIs concerning mentoring and rotation of residents contributes to stimulating the quality of practical training at the level of internship and residency

Committee for Students and Course Evaluation (CAEC) – Report of the experience of the first four years of a medical school in implementation

Authors
Elisângela de Mattos e Silva,Faculdades Pequeno Príncipe, Curitiba, Brazil
Elaine Rossi Ribeiro, Faculdades Pequeno Príncipe, Curitiba, Brazil
Carlos Eduardo Cardoso, Faculdades Pequeno Príncipe, Curitiba, Brazil
Juliano Mendes de Souza, Faculdades Pequeno Príncipe, Curitiba, Brazil
Christiane Luiza Santos, Faculdades Pequeno Príncipe, Curitiba, Brazil
Izabel Cristina Meister Martins Coelho, Faculdades Pequeno Príncipe, Curitiba, Brazil

Presenter: Elisangela Mattos e Silva, Faculdades Pequeno Príncipe, Curitiba, Brazil

Background: The learning process evaluation of Medical students is considered a great challenge, especially in courses that are based on syllabus integration and the use of Active Methodologies. The Medical School at "Faculdade Pequeno Príncipe" in the city of Curitiba, Brazil, is being implemented and, since its beginning, it was clear that a Committee for the Students and Course Evaluation (CAEC) needed to be created.
Aim: To report the experience by CAEC in the first four years of a medical course in implementation.
Method: The challenge of the faculty was to enhance the knowledge on methods of evaluation, to implement them, and to evaluate the results obtained by the students in order to improve the elaboration of evaluation tools. For these tools to reliably reflect the teaching-learning process, weekly meetings were held along the four years, with the study and discussion of articles, the exchange of experiences among teachers, the analysis of the objectives that were expected and reached by students in the multiple choice test (Angoff), as well as the elaboration and constant revision of the practice classes evaluation tools, and the OSCE-like evaluations. CAEC sees the evaluation as a continuous learning process, the ultimate objective of which is to understand the quality of the student's performance and the need for intervention.
Results: CAEC meetings allowed the improvement of the quality of multiple-choice tests, the preparation of a checklist for the teachers reviewing the questions, and the analysis of Angoff results. The meetings allowed the preparation and review of the checklist for evaluating students and tutors during the Tutorial Moments, of the OSCE-specific evaluation tools, teamwork and practical activities.

Discussion & Conclusions: The experience during the CAEC meetings allowed the improvement of the methods for evaluating learning that was already evidenced in the first four years of the course, emphasizing the importance of permanent education and regular faculty meetings for this purpose. It is believed that teachers are moving forward in terms of sedimentation of concepts related to the evaluation process, evidenced in the daily pedagogical practice that supports the innovative curriculum.

10EE2 (1555)
Study guide encouraging medical students to achieve learning objectives

Authors
Sudarat Wijitsetthakul, Medical Education Center, Ratchaburi Hospital, Ratchaburi, Thailand

Presenter: Sudarat Wijitsetthakul, Medical Education Center, Ratchaburi Hospital, Ratchaburi, Thailand

Background: Because of medical information overload, curriculum change, complexity of spiral curriculum, increased work-based learning and variety of learning sites and contexts, therefore study guide (SG) is an essential tool to assist students in educational process to achieve learning objectives. This study aims to evaluate the effectiveness of the SG.
Method: This retrospective quasi-experimental study was conducted for total of 65 fourth-year medical students in 2016 (33 students) and 2017 (32 students) at Family Medicine (FM) department, Medical Education Center, Ratchaburi Hospital, Thailand. The SG was implemented particularly for fourth-year students in 2017. Students in 2016 and 2017 were similar baseline characteristics in age, gender and grade point average. FM grade point was determined as achievement to learning objectives. Learning outcomes regarding to knowledge (examination and medical report) and skills (home visit and teamwork) were assessed by subgroup analysis. Reliability of assessment tools including medical report, home visit skills and teamwork skills were 0.889, 0.876 and 0.912, respectively.
Results: FM grade point of students with SG was significantly better than students without SG (3.5±0.3 vs 3.2±0.5; p=0.003). Subgroup analysis for (i) examination, (ii) medical report and (iii) home visit skills were presented outcomes of students with SG better than outcomes of students without SG in percent-scores of (i) 78.2±6.0 vs 70.5±6.0; p<0.001, (ii) 86.8±10.6 vs 78.5±15.2; p=0.013, and (iii) 97.0±3.4 vs 92.9±4.5; p<0.001, respectively. On the contrary, teamwork skills of students without SG was better than another (94.7±1.2 vs 92.0±7.1; p=0.036).
Discussion & Conclusions: The SG encouraged medical students to improve FM knowledge. Also, it developed the skills of home visit which was individual skills, but it reversed the result of teamwork skills.
Take-home message: A well-written SG encouraged medical students to achieve learning objectives that depended on the purpose of SG.
The composition of a SG depends on its purpose by triangle model which are (i) provision of content

information, (ii) management of learning and (iii) student activities.

10EE3 (702)
The effects of retrieval practice and feedback on the kinds of diagnostic errors made by medical students

Authors

Leah T. Braun, Medical Education Unit, University of Munich Hospital, Munich, Germany

Katharina F. Borrmann, Medical Education Unit, University of Munich Hospital, Munich, Germany

Christian Lottspeich, Department of Internal Medicine, University Hospital, Ludwig-Maximilian University (LMU), Munich, Germany

Daniel A. Heinrich, Department of Internal Medicine, University Hospital, Ludwig-Maximilian University (LMU), Munich, Germany

Martin R. Fischer, Medical Education Unit, University of Munich Hospital, Munich, Germany

Ralf Schmidmaier, Department of Internal Medicine, University Hospital, Ludwig-Maximilian University (LMU), Munich, Germany

Presenter: Leah Braun, Medical Education Unit, University of Munich Hospital, Munich, Germany

Background: Understanding diagnostic competence and how it can be fostered is a major challenge in medical education research. Although different strategies to improve diagnostic accuracy have been investigated, little is known about the influence of interventions on diagnostic error distribution. The aim of this study was to measure effects of retrieval practice and feedback on the nature and frequency of diagnostic errors made by medical students.

Method: 148 advanced medical students worked on 15 clinical cases (5 learning cases, 5 assessment cases immediately afterwards and 5 assessment cases one week later) in an electronic learning environment (CASUS). Their reasoning process was analyzed in a controlled study. Students were randomly assigned to one of five groups (representation scaffold with or without feedback, structured reflection with or without feedback, control group). After each case, they had to state their presumed diagnosis and had to explain their diagnostic conclusion.

Results: The diagnostic accuracy did not differ significantly between groups in the two assessment phases (p = .078, respectively p = .266). Medical students make diverse diagnostic errors (814 errors in 2080 reasoning processes), that can be subdivided into 8 categories: inadequate knowledge, inadequate diagnostic skills (e.g. interpretation of electrocardiograms), faulty context generation, faulty triggering, premature closure, over- and underestimating, misidentification and cluelessness. The most common cause for errors in the representation and reflection group with additional feedback was premature closure (42 errors in both assessments, respectively). In the groups without feedback, a lack of skills was the main-reason for errors (42/37 errors in the assessment). The control group misdiagnosed mostly due to a lack of knowledge and due to premature closure.

Discussion & Conclusions: Retrieval practice did not improve diagnostic accuracy of medical students compared to a control group without any intervention. However, feedback in the learning phase may have caused an increase of premature closure in the assessment.

Take-home messages: Measuring diagnostic errors is a promising means of assessment to better understand diagnostic competence of medical students. However, dichotomous assessment of the final diagnosis seems to be of low validity as an outcome parameter of diagnostic competence.

10EE4 (854)
Intolerance to uncertainty after an educational intervention: A pre-post study in medical students

Authors

Melchor Sánchez-Mendiola, UNAM Faculty of Medicine, Mexico City, Mexico

M Hernández-Victoria, UNAM Faculty of Medicine, Mexico City, Mexico

T Vives-Varela, UNAM Faculty of Medicine, Mexico City, Mexico

A Alpuche-Hernández, UNAM Faculty of Medicine, Mexico City, Mexico

A Trejo-Mejía, UNAM Faculty of Medicine, Mexico City, Mexico

Presenter: Melchor Sánchez-Mendiola, UNAM Faculty of Medicine, Mexico City, Mexico

Background: Uncertainty is a complex construct that requires attention in undergraduate medical education, due to its effects in medical decision making and patient communication. Intolerance to uncertainty (IU) has psychological and educational implications, and this construct can be measured with appropriate tools. There is a scarcity of data about uncertainty in medical students in developing countries. The goal of the study was to compare IU in medical students, before and after an educational intervention.

Method: A one-group pre-test post-test quasiexperimental research design was used. The study was done in second year medical students at the National Autonomous University of Mexico (UNAM) Faculty of Medicine in Mexico City. The intervention was a Biomedical Informatics (BMI) one-semester course that explicitly included medical uncertainty in its curricular content, as well as educational activities related to coping with uncertainty. IU was measured with IUS (Intolerance to Uncertainty Scale), an instrument with evidence of validity that has been translated and used in Spanish-speaking populations. The instrument was applied in three moments: before the BMI course, at the end (immediate post-test), and six months later (delayed post-test).

Results: There were 1,132 students in the course. 673 Students (59.5%) completed the three applications of the instrument. 58.5% women and 41.5% men. The measures had a Cronbach's alpha above 0.90. The IUS scale pretest was 50.6, the immediate post-test 48.7 and the six-month posttest was 48.3 (p<0.05). The effect size was 0.15. Four factors were identified with principal component factor

analysis in the three measures. The percentage of explained variance with the four factors ranged from 55.9% to 59.9%.

Discussion & Conclusions: The IU measurements were similar to other studies in developed countries, demonstrating evidence of validity of the use of the instrument in our setting. The slight decrease in IU after the intervention could be due to the educational impact of the course, although there are threats to internal validity.

Take-home message: Educational interventions that make uncertainty visible and explicit, can prepare future physicians for self-regulation and help them to cope effectively with this pervasive construct.

10EE5 (1368)
Understanding Coaching in Palliative Medicine through a thematic review of coaching in Internal Medicine between 2000 and 2015

Authors
Ann Hui Ching, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
Yaazhini Renganathan, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
Chong Jia Yan, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
Toh Ying Pin, Department of Family Medicine, National University Hospital, Singapore
Lalit Radha Kumar Krishna, Department of Palliative Medicine, National Cancer Center / Yong Loo Lin School of Medicine, National University of Singapore & Center for BioMedical Ethics, Duke- NUS Graduate Medical School, Singapore

Presenter: Ann Hui Ching, Yong Loo Lin School of Medicine, National University of Singapore, Singapore

Background: Coaching provides opportunity for trainees in to master specific clinical, communication and 'soft' skills. Despite coaching's enormous promise within medical training, literature on coaching in medicine remain lacking, particularly in specialties requiring multi-professional team approach. Diverse understanding of coaching and conflation with mentoring, supervision and role modelling inhibit coaching's effective employ. A shortage of coaches, increasing demand for personalized education support and concerns about the quality of training has stoked a sense of urgency in advancing understanding of this educational role.

Method: The authors carried out a literature search for articles on coaching in Internal Medicine using ERIC, Scopus, PubMed, Cochrane Database of Systematic Reviews databases for publications between 2000-2016. Thematic analysis was used to circumnavigate coaching's context-specific, goal-sensitive, coach-, trainee-, organization- and relationship dependent nature.

Results: A total of 2168 abstracts were retrieved, 65 full text articles were independently reviewed and 24 articles were included. Six themes were identified including definition of coaching, the coaching relationship, the coaching process, the coaching environment, obstacles to effective coaching and the role of the host organization.

Discussion & Conclusions: This review provides the first evidenced-based definition of coaching and forwards a deeper understanding of the coaching process. Coaching has explicitly determined goals that guide the coaching process. Coaching involves a cycle of deliberate teaching, practice under the observation of a coach and through individualized feedback until mastery is achieved. To sustain improvements the trainee is taught to self-monitor their practice.

Coaching in should be formally introduced as part of medical training, with strong institutional support to ensure sustainability of the program, oversight of the coaching process and consistent training of coaches. This review also signposts the direction of further research and faculty development programs to enhance coaching in medicine.

Take-home messages: 1. Coaching provides opportunity for trainees in to master specific clinical, communication and 'soft' skills.
2. Coaching involves a cycle of deliberate teaching, practice under the observation of a coach and through individualized feedback until mastery is achieved.

10EE6 (690)
Which learning method can prolong the retention of knowledge in medical students?

Authors
Piyarat Rojsanga

Presenter: Piyarat Rojsanga, Udonthani Medical Education Center, Udonthani, Thailand

Background: Team-based learning (TBL) is an active learning method that we described initial use since 2014 at Udonthani medical education center. The study was conducted to compare the learning outcome and the retention of knowledge in TBL with lecture-based learning (LBL).

Method: TBL and LBL were used in two topics for 4th and 5th-year medical students. About 2 weeks before attended, all students had pretest and then received a study guide. In TBL group, after completed pretest, the students were assigned to self-study from website. At the TBL class session, the students were tested and then divided into groups. They re-examined the same test and made the consensus of the answer. The teacher immediately feedbacks and summarized core concepts. The last step, all groups received case-based scenario to get the discussion. After cessation of class, 3 months and 6 months later, all students had posttest and completed the questionnaires to evaluate the satisfaction.

Results: 56 students were enrolled: 29 students in LBL group and 27 students in TBL group. The pretest scores were not different between groups. The learning outcomes were significantly improved in both groups but TBL group had higher posttest scores at after class session, 3rd month and 6th month than LBL group. The levels of satisfaction were higher in TBL group included encourage self-learning before attending class, increase student engagement, promote teamwork, improve problem-solving skill and retention of knowledge.

Conclusion: TBL can enhance the learning outcomes and student's memory by the students stimulate each other's thought process by working within small groups and create brainstorm of ideas

Take-home message: Team-based learning is effective active learning method to improve learning outcome and maintain the retention of knowledge.

An Application of Three Educational Models to Develop a Focused Cardiac Ultrasound Educational Program

Authors
Kyle Brown, Baylor College of Medicine, Houston, TX, USA
Alan Riley, Baylor College of Medicine, Houston, TX, USA
Danny Castro, Baylor College of Medicine, Houston, TX, USA
Adam Adler, Baylor College of Medicine, Houston, TX, USA
Kiyetta Alade, Baylor College of Medicine, Houston, TX, USA
Satid Thamamsitboon, Baylor College of Medicine, Houston, TX, USA

Presenter: M. Hossein Tcharmtchi, Baylor College of Medicine, Houston, USA

Background: Focused cardiac ultrasound (FOCUS) allows rapid integration of clinical exam findings with real-time imaging at the bedside. Many pediatric critical care (PCC) providers attend FOCUS workshops and yet only a small percentage use FOCUS regularly for patient care. When surveyed, providers who previously attended a workshop rarely felt confident in their ability to interpret FOCUS images and cited a self-perceived lack of competence as a primary barrier to its implementation.

Method: A team of cardiology, PCC and point-of-care ultrasound experts was formed to develop a five-unit FOCUS program that is structured according to Fitts and Posner's (F&P) Three-Stage Model of Skill Acquisition. We determined that a key unit in this program would be for developing competence in image interpretation. Based on a targeted needs assessment, we used Mastery Learning (ML) as a construct and Deliberate Practice (DP) as an instructional method.

Results: The unit comprised of two online lectures for asynchronous learning and 90 questions of cardiac images with pericardial effusions and varying degrees of ventricular systolic function. The questions were organized into increasing levels of difficulty. Learners answer questions in sets of 10 and repeat an additional set of questions in the same difficulty if they do not achieve a pre-defined mastery. A pilot with end-users confirmed the ML structure based on percent correct and time spent on each level of difficulty.

Discussion & Conclusions: This image interpretation unit aims to address gaps in the "cognitive" phase of F&P model. The module allows an error-focused repetition of image interpretation with immediate, specific feedback aligning with DP principles. This competency is a crucial step to entering "associative" and "autonomous" phases in subsequent units, and achieving FOCUS mastery
We integrated three educational models to guide the development of a Web-based FOCUS image interpretation unit.

Take-home message: An explicit application of educational models can facilitate identification of learning needs, instructional approaches and development of a novel educational program.

Core Mechanics for Learning are not Enough: Designing with Engagement in Mind

Authors
Remi Wolf, AIM laboratory, Stanford University School of Medicine, Stanford, California, USA
Juliette Piot, AIM laboratory, Stanford University School of Medicine, Stanford, California, USA
Nirupan Vipulananthan, AIM laboratory, Stanford University School of Medicine, Stanford, California, USA
Larry Chu, AIM laboratory, Stanford University School of Medicine, Stanford, California, USA

Presenter: Remi Wolf, AIM laboratory, Stanford University School of Medicine, Stanford, USA

Background: Modern theories in education emphasize that integration and elaboration of knowledge can be enhanced by two processes: retrieval practice effect and contextualization. Focusing on these, we developed an online curriculum for anesthesiology CA-1s, Learnly. It combines an algorithm based on Ebinghaus' forgetting curve for spaced-repetition, and clinical cases for active learning. Our objective is to analyze learners' behavior on this platform.

Method: We analyzed 2017-2018 weekly activity reports for the students using Learnly, including the number of read topics, reviewed flashcards (suggested based on the forgetting curve for each topic) and completed cases, the student's average confidence for each reviewed topic, and the percentage of correct cases. This analysis helped us identify gaps in the platform use and design future interventions to correct them.

Results: 1150 anesthesia CA-1 students from 45 US residency programs have connected at least once to Learnly since August 2017, for a total of 529883 activities. The median number of topics marked per student increased from a median of 33 (IQR:[16-33]) to 120 (IQR:[103-120]). However, half of the students are not using the innovative learning tools (flashcards and cases). The students who engage (49% of the population) continue to use these regularly (419 students using flashcards on week 1 to 558 currently, completing on average 10 flashcards every week). The average confidence and percentage of correct cases are stable across time (medians 3.6/5 and 58%).

Discussion & Conclusions: Students report re-reading is one of their preferred learning methods, although being highly ineffective. Implementing modern educational concepts on e-learning platforms is a first step to promote efficient learning, but we need to help students to engage with them. It is therefore critical that we design platforms with engagement in mind ; our next step is to unveil the triggers that can increase it, and design two types of interventions to test them, one for "non-hooked" students, one for "hooked" students.

Take-home messages: Implementing modern tools in medical education is critical to increase learning but not enough; we also need to understand the triggers of students' engagement and activate them.

10EE9 (3325)
Comparing three modes of learning-teaching in the acute coronary syndrome (ACS) topic for the fourth-year medical students at Lampang Hospital, Thailand

Authors
Yotsawee Chotechuang
Ravin Sony

Presenter: Yotsawee Chotechuang, Lampang Hospital, Lampang, Thailand

Background: The most common learning-teaching mode is a teacher-centered one with one-way communication between the teacher and medical students. However, interactive learning by teacher-coaching with group discussion is self-directed learning, with self-planned thinking and two-way communication between the teacher and students. This study aimed to evaluate the efficacy of the different modes of learning-teaching in the acute coronary syndrome (ACS) topic at Lampang Hospital.

Method: We assigned three different modes of learning in the ACS topic to three groups of fourth-year medical students, who were studying in internal medicine. The students in group A were assigned a lecture-based teaching-learning mode (teacher-centered). The students in group B were assigned a guideline-based topic presentation with group discussion learning (student self-directed learning). The students in group C were assigned an electrocardiogram (ECG)-based learning mode with interactive discussion (student- and teacher-centered). The efficacy of the learning-teaching modes was evaluated by assessment questionnaires which consisted of three topics including knowledge, the attitude towards learning, and application in real-life practice.

Results: Among 33 students evaluated, 10 students were in each of groups A and B and 13 students were in group C. Sixty percent were female. The students were aged between 21 and 23 years old. The mean scores for the knowledge in groups A, B and C were 17.8 ± 2.3, 17.3 ± 1.7 and 17.3 ± 2.2, respectively ($P = 0.480$). The mean scores for the attitude towards learning in groups A, B and C were 16.9 ± 1.6, 17.7 ± 1.5, and 18.0 ± 3.7, respectively ($P = 0.900$). The mean scores for the application in real-life practice in groups A, B and C were 17.3 ± 1.8, 18.5 ± 1.4, and 18.5 ± 2.7, respectively ($P = 0.294$).

Discussion & Conclusions: There was no difference in the knowledge, attitude and application in practice between the three learning-teaching modes of the ACS topic. The ECG-based learning with interactive discussion may be the most suitable for learning-teaching in the fourth-year medical students with the ACS topic.

Take-home message: An interactive learning mode using teacher coaching with group discussion seems to be the most appropriate for teaching a medical topic.

How are medical students actually thinking of questioning in teaching class? Medical teachers must know

Authors
Narongwit Nakwan, Hatyai Medical Education Centre, Hatyai Hospital, Songkhla, Thailand
Sirikade Usaha, Hatyai Medical Education Centre, Hatyai Hospital, Songkhla, Thailand
Suwapak Thongwong, Hatyai Medical Education Centre, Hatyai Hospital, Songkhla, Thailand

Presenter: Narongwit Nakwan, Hatyai Medical Education Center, Songkhla, Thailand

Background: Questioning helps the students leading to learning outcome, active-learning and high-ordered critical thinking. The aim of study is to evaluate the perspectives of questioning in the medical students.

Method: We conducted questionnaire: the qualitative evaluation of perspective in questioning and an interview of question number, timing of question occurrence, and desired question type.

Results: 87 students completed the questionnaire. 74.7% liked student-generated question. 89.6% thought questioning helps them achievement in learning objective. 49.4% felt anxious during questioning and 40% has good feeling if no any question. 73% experienced a class without any question. 87.5% is not bored on questioning but 73% felt shy. 81% dislike an impolite question. 70.1% thought enthusiasm helps questioning in class. 74.7% liked to question after a class finished. The mean question number per hour was 5.02. The waiting time for response was 36.97 seconds. The most students preferred the open question.

Discussion: Although most students have a positive thinking of the questioning, there are so many involved factors on questioning such as the question characteristic, class environment and enthusiasm. Despite the questioning helping learner, it still has a negative feeling such as anxiety and bashfulness. A lack of confidence and asian culture could be reasons. So, the medical teachers need to understand what the student think of questioning and directly and indirectly facilitate the student generated-question because of questioning promoting much more deep learning and long run self-active learning. No study has been reported what proper question number should be, while waiting time at least 10 seconds is a proper time for answer.

Conclusion: The questioning in medical student leads them to learning outcome and develops critical thinking. Although multiple factors effect on questioning in the medical students, the medical teacher should strengthen their confidence on questioning in class.

Take-home message: The medical students have a positive thinking of the question which is the another crucial way to accomplish learning outcomes. The medical teacher should promote and facilitate the student generated-question, because they might enhance learning in depth and self-active learning.

10EE11 (1900)

Differentiating the Learning Needs and Style in High-school Direct Entry versus Non-direct Entry Medical Students: Use of VARK and Quantitative Survey

Authors

Wai Yin Leung
Rachel WC Lai
Isabel Hwang

Presenter: Wai Yin Leung, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong

Background: Currently, many medical schools, especially in Hong Kong and UK, have a growing trend of admitting mature students with a first-degree or working experience into Bachelor of Medicine programs. These students of more mature age and background mark significant contrast to the rest of their classmates. Their presence constitutes important diversity to a medical school, yet there is hardly any research on better understanding mature students' learning needs.

Method: Our study describes unprecedented work that reveals insights on the learning needs and style of these non-direct entry preclinical MBChB students, in comparison to high-school direct entry students. A standardized VARK Questionnaire and a 16-item learning preference survey on Likert scale were administered to preclinical-year medical students. Results were analyzed using SPSS ver. 24.0.

Results: Comparing mature students (n=22, mean age: 23) and high school-direct-entry students (n=47, mean age: 18), major differences include non-direct-entry students appreciating certain teaching methods more: flipped classroom (p=0.01), recorded lectures as opposed to traditional classroom setting (p=0.01). Each VARK modality (visual, auditory, read/write, kinesthetic, multi-modal), irrespective of admission stream, prefers different learning channels: kinesthetics enjoy practical labs (p=0.02), visuals prefer lectures (p=0.003).

Discussion & Conclusions: Mature students tend to enjoy unconventional teaching methods at their own pace, in their own home setting. Distribution of VARK modality is of similar pattern in both groups, but individual learning modalities do have different learning preferences. We postulate that mature students, because of previous tertiary education and work experience, prefer flexible learning more.

By conducting similar quantitative evaluation and qualitative analysis, medical schools, especially those composed of students from a wide spectrum, can better understand their students' education needs. Faculty education policies can hence adjust to be student-centered and maximize all students' learning capability and effectiveness.

Take-home message: Research on learning needs remains a cornerstone of medical education improvement, particularly with future vision of personalized learning. This niche of non-direct-entry students will likely continue to grow in number, especially in countries where MD programs are uncommon or unavailable. It is imperative to pay careful attention to different subgroups of students and obtain continuous feedback.

10EE12 (2583)

Dynamics of students' learning approaches throughout medical training: relationships with students' personal characteristics

Authors

Anne Baroffio, University of Geneva Faculty of Medicine, Geneva, Switzerland
Giovanni Piumatti, University of Geneva Faculty of Medicine, Geneva, Switzerland
Milena Abbiati, University of Geneva Faculty of Medicine, Geneva, Switzerland
Margaret W Gerbase, University of Geneva Faculty of Medicine, Geneva, Switzerland

Presenter: Anne Baroffio, University of Geneva Faculty of Medicine, Geneva, Switzerland

Background: Students' approaches to learning are central to the process of learning. The educational context can influence students' use of learning approaches. Previous research has shown that stimulating deep approaches seemed much more difficult than expected, even in student-activating learning environments. In addition, the educational context might act differently on individual students depending on their initial profile.

Method: We used growth curve modeling and multi-trajectory analysis to test and trace trajectories of deep (DLA) and surface (SLA) learning approaches over time in a sample of 189 medical students along a 5-year PBL-based and clinically-oriented curriculum. Longitudinal measures included learning approaches (Revised-Study-Process-Questionnaire), perception of educational environment (Dundee-Ready-Educational-Environment-Measure) and level of motivation for studying medicine (administered in year 2, 3, and 5). Cross-sectional measures included Personality (NEO-Inventory administered in year 1) and reasoning ability (Raven-Test administered in year 2).

Results: Two longitudinal trajectory groups of learning approaches were found. Group 1 (n=113, 60%) and Group 2 (n=76, 40%) differed by their initial level of DLA (31.4±4.4 vs 38.6±3.5; p<0.001) and SLA (23.3±4.6 vs 18.2±4.0; p<0.001) and by their evolution along the curriculum (decreasing DLA-increasing SLA vs stable DLA-SLA). Both groups showed differences in the personality traits conscientiousness (32.9±6.9 vs 38.7±5.2; p<0.001) and extraversion (29.5±5.1 vs 32.5± 5.6; p<0.001) but not in reasoning ability. Both groups' level of motivation and perception of educational environment were good but regularly decreased along the curriculum.

Discussion & Conclusions: Our analysis suggests the existence of multiple longitudinal learning profiles among students. This implies that individual students although confronted to the same educational context might or not modulate their learning approaches. More precisely, it suggests that students using preferably SLA tend to reinforce this strategy, whereas those using preferably DLA stay stable. In addition these learning profiles are

associated with differences in students' personality, motivation and perception of the educational context.
Take-home message: Influencing students' use of learning approaches is a complex process, depending not only on the educational context, but also on the initial profile of individual students.

Learner Traits and Voluntary Attendance in Pre-Clinical Medical Courses

Authors
Megan Derazin
Jonathan Kibble
Christine A. Kauffman
Abdo Asmar

Presenter: Megan Derazin, University of Central Florida College of Medicine, Orlando, USA

Background: Historical data from the pre-Internet era demonstrated that classroom attendance was positively associated with better learning outcomes. In recent years we have noticed a marked decline in classroom attendance within medical school as lectures are recorded and other learning materials are available online. The trend of lower attendance appears to be accelerating. Perhaps this is in part due to the intense focus US students have on the USA Medical Licensing Examination (USMLE) Step 1, allied to the emergence of several commercial learning resources.
Method: The goals of this study are to describe classroom attendance patterns and determine learner traits associated with voluntary attendance using self-regulated learning theory as a theoretical framework. The study observed second-year medical students throughout a 6-week course covering gastrointestinal and renal pathology. Following an IRB-approved protocol, classroom attendance was monitored using an electronic system (TealPass) and students voluntarily completed the Motivated Strategies for Learning Questionnaire (MSLQ). Spearman's rho correlation coefficients were calculated to assess the relationships between percentage of classes attended and each of the 15 subscales for motivation and learning strategies measured by the MSLQ.
Results: Of 114 students who completed the course, 78 consented for attendance tracking, of which 48 completed the MLSQ. High levels of self-efficacy ($r = -.311$, $p = .032$) and the ability to self-regulate effort ($r = -.333$, $p = .021$) was predictive of low attendance. Attendance was positively predicted by an orientation towards peer-learning ($r = .314$, $p = .030$) and help-seeking ($r = .474$, $p = .001$). Additionally, 95% of the sample reported using the external Board review resources: UWorld, Pathoma and First Aid.
Discussion & Conclusions: We conclude that different facets of self-regulated learning predict attendance, with highly confident students being the least likely to attend.
Take-home message: Low attendance and competition between formal and informal curricula raises concern about the learning environment and calls for a reexamination of attendance policies and the role of faculty.

10EE14 (2885)
Medical Students' familiarity with learning processes and their effect on academic performance

Authors
Maya Othman, Alfaisal University, Riyadh, Saudi Arabia
Abdullatif Barkoumi, Alfaisal University, Riyadh, Saudi Arabia
Yara Al-Souss, Alfaisal University, Riyadh, Saudi Arabia
Abeer Al-Alwan, Alfaisal University, Riyadh, Saudi Arabia
Rakan Ghanameh, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Abeer Al-Alwan, Alfaisal University, Riyadh, Saudi Arabia

Background: There is no defined perfect study technique for any student. Different students undertake different means of studying, with varying habits and outcomes. The purpose of this study is to look at many different studying habits of medical students, how many of them implement effective strategies, and to see if there are any correlations between those familiar with such strategies and the students' academic performance.
Method: An online, anonymous survey was distributed to 201 medical students of all years. Apart from disclosing their GPA and gender, students answered questions on several study strategies and habits (12 items), average daily time spent studying, including both weekdays and weekends, exam preparation skills, preferences between study sources, and many more. Students were also required to provide their TOEFL and IELTS scores; a mandatory exam for all medical students at the University, as a basis to know their English proficiency.
Results: Students studying more than 4 hours daily (26% of students) do not have a statistically significant higher GPA compared to those studying 2-4 hours (40% of students) a day. Multiple regression involving the 12 strategies together with gender and year of study showed that Summarizing ($p < .001$) and starting by memorizing ($p = .021$) were negatively predictive of GPA and Mapping ($p = .041$) was weakly positively predictive. Level of English was not correlated with GPA performance ($p = .805$). Several other correlations have been looked at and identified.
Discussion: Many students studying more than 4 hours a day do not seem to do better than those studying just 2-4 hours a day. This may be because those studying 2-4 hours are able to identify relevant information and use their time efficiently and effectively, ridding of the myth that more studying results in better grades.
Conclusion: Specific study strategies are far more valuable in affecting academic performance as opposed to the amount of time spent studying.
Take-home message: It is the responsibility of the university and faculty to guide students toward correct and effective methods of academic learning in order for them to achieve at their potential.

10EE15 (1245)

The effect of productive failure on learning of a novel concept in health professions education

Authors

Naomi Steenhof, The Wilson Centre, Toronto, Canada
Nicole N Woods, The Wilson Centre, Toronto, Canada
Pascal WM Van Gerven, School of Health Professions Education - Maastricht University, Maastricht, Netherlands
Maria Mylopoulos, The Wilson Centre, Toronto, Canada

Presenter: Naomi Steenhof, The Wilson Centre, University of Toronto & University Health Network, Toronto, Canada

Background: Productive failure (PF) is an instructional approach that requires learners to struggle as they attempt to generate solutions to complex problems before, rather than after, receiving relevant instruction. Studies demonstrate that PF prepares students for later learning of new, related knowledge. However, existing research showing PF efficacy is largely limited to high school settings. Accordingly, the objectives of this study were to compare the effectiveness of PF instruction with direct instruction (DI) in health professions education with respect to (1) acquisition and application of a novel concept, and (2) a 'preparation for future learning' assessment.

Method: Year 1 students (N=43) enrolled in the Doctor of Pharmacy program at the University of Toronto were randomly assigned to a DI or PF learning condition. Participants in the PF learning condition were given a description of the problem of estimating renal function based on serum creatinine and were asked to invent a solution. Participants in the DI condition learned about the same problem and were given the Cockcroft-Gault formula to calculate creatinine clearance. Both groups then completed the same practice phase, during which they were given the correct formula. Finally, the participants completed a series of tests designed to assess procedural knowledge (acquisition), near transfer (application), and preparation for future learning (new learning is required for successful problem solving).

Results: As expected, no difference was seen between the two learning conditions when comparing acquisition and application of the novel concept. However, participants in the PF condition (M=.75) outperformed those in the DI condition (M=.67) on the preparation for future learning assessment. A one-way ANCOVA was conducted with practice phase performance as a covariate. A significant effect of learning condition was found, $F_{(1,38)}=6.53$, p=.015.

Discussion & Conclusions: These results emphasize the crucial role of struggle in learning, and support the theory that problem solving prior to instruction may be more effective than direct instruction when preparing novice students to learn new knowledge in the future.

Take-home message: Productive failure may be a method of instruction that can enhance health professions students' effectiveness in their future learning.

10EE16 (3320)

Enhancing Teacher Education to Promote Academic Activities through the Adoption of Active Methodologies and the Use of English as an Additional Language

Authors

Ana Luiza Freitas, Federal University of Health Sciences of Porto Alegre, Porto Alegre/RS, Brazil
Margaret Gerbase, Federal University of Health Sciences of Porto Alegre, Porto Alegre/RS, Brazil

Presenter: Ana Luiza Freitas, Federal University of Health Sciences of Porto Alegre, Brazil

Background: As much as the adoption of active methodologies as a way to foster learner autonomy is a component of a comprehensive specialized education, not all medical schools are in the same level in terms of promoting such competences along their teaching. Likewise, an effective command of the English language as an international code of communication is also a feature of an interconnected medical community. Nevertheless, endorsing language education to foment the development of a bilingual medical community is still a challenge in public universities in the Southern hemisphere.

Method: Embedded in such realm, this presentation reports on the experience of a teacher development course implemented in a health sciences university in Brazil, by means of a collaborative work between two lecturers: a medical doctor specialized in active methodologies, and an English language educator specialized in teacher development. This paper highlights the theoretical and educational views that subsume the course.

Results: The program is a forerunner in its kind in Brazil, and has given shape to a number of department seminars regularly held in English through the adoption of active methodologies to teach specialized content. The course content emphasises the use of student-centred teaching practices, content and language integrated learning and the sharing of teaching experiences.

Discussion & Conclusions: Skill in taking an active role along their learning and professional practices, in negotiating decisions and in an effective improvement in the applied use of English as a tool for international medical communication are competences inextricably related to the range of practical opportunities medical students are provided with by their teachers. As most medical educators in Brazil were not required to develop pedagogical teaching skills, neither were they mostly thought through the adoption of student-centered teaching modes, participants have revealed that they feel privileged for the opportunity of rethinking their practices, sharing pedagogical decisions, and adopting English on a regular basis, an aspect which contributes to the internationalization of Brazilian universities.

Take-home message: When it comes to academic medical development, new forms of teaching will contribute to challenge lecturers, expand their professional opportunities and enrich learners' education.

10EE17 (871)

Challenges in Conducting a Community Psychiatry Class in English for Medical Students in a Non-English-Speaking Country

Authors
Wachiraporn Arunothong

Presenter: Wachiraporn Arunothong, Lampang Regional Hospital, Lampang, Thailand

Background: Lampang Medical Education center has launched a new policy for integrating English into the medical curriculum. It requires at least one rotation block to have one English class. Challenges, debates, and frustrations occurred among instructors and students. In the psychiatry rotation, community psychiatry class is a suitable candidate for an English class. This class is designed as a case discussion. Students integrate their knowledge from previous lectures and rotations to handle a case involving community collaboration.
Method: Before the class, students were divided into two groups, each of 6-7 students. Each group was given the details of one case, written in Thai. Students were then required to summarize the case, plan short- and long-term treatment strategies involving community-based care, and then prepare a presentation and discussion. Language consultation with a native English-speaking teacher was provided. During the class, an English teacher observed. Students led the class and a Thai instructor assisted. All of the students evaluated the class at the end of the year using an online survey. The survey covered knowledge of community psychiatry, class atmosphere, and students' satisfaction.
Results: All of the students completed the survey. Almost all of the students acquired core concepts of community psychiatry. The majority of the students agreed that running a class in English didn't diminish their learning of the core concepts of community psychiatry and didn't lessen the chance for a discussion. One third of the students felt more stress during preparation and one-fifth of them felt nervous when doing the English presentation. Students said they felt that the benefits outweighed the difficulties.
Discussion & Conclusions: Integrating English into a usual class did not diminish the students' learning of the core concepts. English and Thai instructors sitting together in a class help to clarify the concepts for the students. Case discussion is a very suitable format for these classes since the students can exercise their 4 language skills.
Take-home message: The main challenge in integrating English into a usual class is the attitude of the instructor. The language barrier itself is not the major obstacle.

10EE18 (176)

Reliability of English medical article translation among fourth and fifth year medical students

Authors
Sucheera Amornmahaphun
Weerajit Thipprasert
Narongchai Sangsa

Presenter: Sucheera Amornmahaphun, Roi et Hospital Medical Education Center, Roiet, Thailand

Background: According to most of Thai Medical School's curriculum,textbooks and English journals are being used as major class materials or references. This due to the advancement of medical knowledge in the Western world and limited textbook in Thai, so English is the significant language tool for medical students.
Method: The research uses a descriptive study, 54 of fourth and fifth year medical students are enrolled. The questionnaires was composed of 1) general information; 2) selected medical article in English which every students will be asked to translate into Thai. The translated article will be evaluated by a specializing medical doctor. Each sentence will be given 1 score if it can cover 50 percent of the original meaning and will be marked 0 score for less than 50 percent of meaning accuracy.
Results: The students can translate the article with reliability rate at 3 levels; Medium Accuracy rate accounted for 46.3 percents, High for 31.5 and low for 22.2, respectively. The two influential factors are 1) the early start in learning English, especially from kindergarten year, 2) the year in medical school whereas 51.6 percent of fourth year medical students have the medium translation reliability rate while fifth year student equally has high and medium rate at 39.1 percent each. 84.6 percents use both Thai and English textbooks while 81 percents mainly rely on Thai books first. 72.2 percent believe that they have average skill in English. 66.4 percents call for the medical school to increase more English classes. Other factors show no statistical significance.
Discussion & Conclusions: Medical courses are based on English textbooks but students prefer using Thai material. Mostly,students 'skill on English translation is at medium level but 88.9 percent can achieve A score in pre-clinic English subject, there should be a further evaluation of English class effectiveness in order to improve both the curriculum and the students' skill. The students' experience is needed to be considered because the significant difference between the fourth and fifth year student ability.
Take-home message: The suggestion for further research is to consider the entrance GPA score and other language skills.The medical school curriculum should encourage students to use English study materials more often plus with more optional English class to develop their skill.

Robert Kupis, Student's Scientific Group of Teaching and Examining Methodology JUMC, Cracow, Poland
MIchał Nowakowski, Jagiellonian University Medical College, Cracow, Poland

Presenter: Sebastian Janiec, Student's Scientific Group of Teaching and Examining Methodology JUMC, Cracow, Poland

Background: Hidden curriculum may be defined as an additional set of competencies, that students acquire outside of the formal medical school curriculum. It may influence on students' beliefs, behaviors and future career choices. However, it is usually not taken into consideration while planning students' medical education.
Method: A multi-theme survey was performed among medical students from 11 different Polish universities, using a pre-tested on-line questionnaire. Our work focused on extra-curricular activities of polish medical students.
Results: The survey was completed by 452 medical students. As many as 76.5% of students were involved in scientific work, but only in 23.5% cases it ended with a scientific publication. At the same time, 72.2% of students took part in at least one scientific conference a year. A significant proportion of students (44.5%) participated in activities related to the work of student self-government. 8.4% declared active participation in the curriculum evaluation process. As many as 32.7% of students conducted classes for other students – most commonly practical workshops (53%), lectures or presentations (32%), and clinical classes (10%). 60% of students were involved in volunteering for people in need.
Students are eager to take part in additional training in practical skills (50.9%) and medical communication (27.4%). 76.3% students spent their free time on extracurricular clinical activities. A large proportion of them assisted in on-call medical services at the surgical ward (47%) or ER (41.5%). The largest number of students (31%) declared taking part in 25-100 hours of those activities, and 3.8% even in >500 hours. 75.8% of students agreed with the statement that without extra-curricular activities they would not learn many skills which are relevant to them. Surgical stitching (55.7%), filling in medical records (49.9%) and ultrasound examination (46.9%) were the most frequently mentioned. 21.7% think that they learnt most of the skills outside planned classes.
Conclusion: A large proportion of students exhibit extra-curricular activity that enriches their learning outcomes.

For many students, it is as important as classes in the basic study program.
Take-home message: Planned curriculum does not take into account a large part of student's activity.

"Nice to have a reason to read books" - On literature and films in medical studies

Authors
Lena Sjöberg
Merja K Laine

Presenter: Lena Sjöberg, University of Helsinki, Department of General Practice and Primary Health Care, Helsinki, Finland

Background: The aim of this study was to explore learning on an elective course called Literature and films (2.5 ECTS). The official aims of the course are to broaden medical students´ perspective on clinical work and medicine through literature, films, book presentations and group discussions. The course is bilingual (Finnish/Swedish) and one aim is also to promote skills of the non-native language of the students.
Method: The participant group consisted of twenty students from all study years, twelve Finnish-speaking and eight Swedish-speaking.
All students chose three books and at least one film from given lists. We had four seminars: during the first, we watched a film together and analysed its main characters. During the next two seminars, students presented four books per seminar and during the last seminar two books were presented. Two named students commented on each book presentation. During the last seminar, the films were discussed.
On the last day of the course, we collected anonymous feedback using a structured form with eight Likert-scale and five open-text questions.
Results: The overall rating of the course was 4.7/5. All students reported that they would recommend the course to other students. The students generally agreed that their interest in both books and films increased during the course. They also agreed that it is beneficial for doctors and dentists to read fiction and watch films. They generally thought that the course promoted understanding of patients, but not equally understanding of doctors.
From the replies to the open-ended questions on what the students learned, four main themes emerged: increase in cultural literacy, identifying oneself with patients, learning stress management and development of the professional identity (the last reported by students from earlier study years).
The bilinguality of the course was experienced as positive. Part of the learning experiences could be a result of the group discussions during the course, where both teachers participated "as equals".
Conclusion: The students experienced that the course promoted cultural literacy and stress management. The younger students also reported that the course had contributed to forming their professional identity.

Mandatory basic laparoscopic skills course: a 4-year follow-up

Authors
Nynne Dose, Department of Obstetrics and Gynecology Holbæk Hospital, Holbæk, Denmark
Jette Led Sørensen, Department of Obstetrics and Gynecology, Juliane Marie Center, Center for Children, Women and Reproduction, Rigshospitalet University Hospital, Copenhagen, Denmark
Flemming Bjerrum, Department of Surgery, Herlev & Gentofte Hospital, Copenhagen, Denmark
Jeanett Strandbygaard, Department of Obstetrics and Gynecology, Juliane Marie Center, Center for Children, Women and Reproduction, Rigshospitalet University Hospital, Copenhagen, Denmark

Presenter: Nynne Dose, Department of Obstetrics and Gynecology, Holbæk Hospital, Denmark, Holbæk, Denmark

Background: Educational theory describes active learning process as a step-wise progression of competencies and a prolonged learning curve amongst novice trainees. Competency-based learning through operative simulation training under protected optimal conditions provides the possibility of gradually achieving cognitive, technical and nontechnical skills before advancing to real procedures. Additionally, simulation-based training has proved to improve patient safety by increasing performance in the operating room. Denmark was one of the first countries to introduce a validated mandatory laparoscopic training program inclusive of above-mentioned components among first-year residents in OBGYN, which was implemented in November 2013. This article will focus on a 4-year follow-up in participation of the validated training program.
Method: The validated training program 'Basic Laparoscopic Skills Course' consists of three steps (1st step 1 day of theoretical knowledge, 2nd step MCQ test and 3rd step 1-3 days of virtual reality training with gradually increasing difficulty ending with salpingectomy due to a bleeding ectopic pregnancy). All first-year residents in one of the seven obstetrics and gynecological departments in eastern Denmark from January 2014 till January 2018 were offered the training program at CAMES, Copenhagen Academy for Medical Education and Simulation. All attendee demography was obtained prior to participation.
Results: In a period from January 2014 to January 2018 approximately 120 first year residents were offered the mandatory 'Laparoscopic Basic Skills Course'. Results on attendees and drop outs are to follow.
Discussion: Based on the results and reason for drop out we will discuss whether mandatory training and protected training time increases participation rate compared to existing laparoscopic curricula literature. Furthermore, we will discuss mastery learning as a way of designing an optimal educational environment and continuous improvement of the training program.

The Invention of Low Cost Obstetric Ultrasound Training Model for Medical Students from Simple Materials

Authors
Sapachai Saingtong
Phanporn Meekaew
Pathom Yachaw
Pornpirun Leeyangyuen
Pornpirun Leeyangyuen
Supassarang Chanpen

Presenter: Sapachai Saingtong, Medical Education Center Vachira Phuket Hospital, Walailak University, Phuket, Thailand

Background: Ultrasound in pregnancy is now available in almost hospital in Thailand. Nowadays we use ultrasound as a routine checkup in pregnant women, so using ultrasound is an essential skill for general practitioner to detect fetal's health, development and position to plan the delivery route. To training this skill is limited, because it has to be done with pregnant women and commercial ultrasound training model is high cost. The invention of ultrasound training model can improve ultrasound skill in general practitioner.
Method: Many simple materials were tested the echogenicity that proper to be represent each fetal organ. Head with falc cerebri, skeletal(spine, extremities), umbilical cord, urinary bladder were built from plastic football, wooden sticks, Foley's catheter and table tennis plastic ball respectively and covered fetal organ by saline bag. Then put the fetal model in plastic bag filled with water that represent amniotic fluid.
Results: The finished ultrasound training model was used for teaching medical student, extern and intern before real practice with pregnancy. Comparing virtual reality of the model with real pregnancy is 82% . Reporting the accuracy and level of satisfaction in the ultrasound training model are 86% and 92% respectively. Cost of this model was less than USS3 compare with commercial model respectively that normally cost US$ 5,000–20,000. Using ultrasound training model is safety and avoid disturbing pregnancy.
Discussion & Conclusions: The invention of ultrasound training model is made from the simple and low cost materials. It can be actual practices by medical students, extern and intern. It is easy to understand the model training and rehearse until they have confidence to do with real pregnancy without disturbing them.
Take-home message: Every medical school can make this ultrasound training model for training, effectively and realistically at a very low cost

Simulation-based assessments of ultrasound skills: A comparison of validity evidence from three different procedures

Authors
Liv Dyre
Jesper Krørup Jensen
Mette Madsen
Martin Tolsgaard

Presenter: Liv Dyre, Copenhagen Academy for Medical Education and Simulation, Rigshospitalet, Copenhagen, Denmark

Background: To compare validity evidence supporting simulation-based assessments of ultrasound skills across different types of procedures (i.e. gynecological and obstetric ultrasound and Focused Assessment with Sonography for Trauma (FAST)).
Method: Validity evidence was gathered on the assessment of gynecological and obstetric ultrasound, and the FAST examination using the same type of simulator (Scantrainer, Medaphor, Cardiff, UK). The assessments included automated simulator metrics that were either passed or failed. For each of the procedures validity evidence was gathered according to Messick's framework: 1) Content evidence: identification of modules with relevance to the ultrasound procedure (e.g. content selected by experts/researchers or with a pre-test), 2) Response process: participants interaction with the simulator (e.g. introduction to the equipment), 3) Relations to other variables: metrics' ability to discriminate between expert and novice trainees, 4) Internal structure: reliability of the final simulator test and the performers' variance in test scores 5) Consequences: comparing expert performance levels and metrics that processed validity evidence in the studies.
Results: In terms of relations to other variables, 31.4% of transvaginal, 31.7% of obstetric, and 61.8% of FAST metrics were supported by validity evidence. Image optimization was represented most frequently (41.7%, 47.5%, and 59% for gynecological, obstetric and FAST modules) compared to metrics that evaluated the systematic approach (35.4%, 25%, and 23% for gynecological, obstetric, and FAST modules) or correct measurements or appropriate time (22.9%, 27.5%, and 18% for gynecological, obstetric, and FAST modules).
Discussion & Conclusions: We found validity evidence to support the use of simulation-based assessment in ultrasound performance. However, we also found the metrics with validity evidence to be unequally distributed between the different aspects of performance. Consequently, certain critical aspects of the ultrasound procedure may be missed when relying on automated simulator metrics alone, which questions whether they alone can be used for evaluating mastery learning in the simulated setting.
Take-home message: Simulator metrics with validity evidence are unequally distributed between different aspects of performance (i.e. image optimization, systematic approach, correct measurements and appropriate time).

CHEAP and CHEERFUL: Using locally invented simulators to teach physical examination of a neonatal scalp hematoma to medical students

Authors
Kultida Pongdetudom
Rawee Ausawakittipong
Win Techakehakit

Presenter: Kultida Pongdetudom, Lampang Hospital, Lampang, Thailand

Background: Subgaleal hemorrhage (SH) is a serious scalp hematoma in newborn that requires early detection with close monitoring. However, SH is not easily detected as its manifestation, as scalp swelling, looks similar to other types of scalp hematoma which are more commonly found: cephalhematoma (CH) and caput succedaneum (CS). This makes it especially difficult when teaching medical students about these hematomas, as using lectures alone does not allow students to gain hands-on experience in differentiating these conditions. However, there is currently no simulator for students to practice physical examination of these conditions.
Method: We invented simulators at an affordable price using sponges and rubber gloves filled with water, for students to practice physical examination of SH, CH, and CS. As a rubber-like consistency is present when palpating CS, sponge was used for this. A rubber glove fully filled with water was used to represent CH, which has the consistency of a tense cystic mass. In contrast, a SH simulator was created from a rubber glove half-filled with water to give the consistency of a soft cystic mass. These simulators were used to teach physical examination of neonatal scalp hematoma to 4th and 5th year medical students. Students were tested using the simulators before the lecture started, and then again after class. Then students were asked to answer a questionnaire about their attitudes towards these simulations.
Results: Of 38 students, the mean post-test score markedly increased, compared with that of the pre-test (pre-test = 33.1%, post-test = 96.5%). Results from the study indicated that 98.4% agreed that using simulation helps increase their understanding. Moreover, 93.6% believed that this practice gave them confidence in differentiating between these 3 conditions.
Discussion & Conclusions: Our locally invented simulators appear to be effective tools to provide students with hands-on experience in examining a neonatal scalp hematoma. Given the practicality and affordability, using these locally invented simulators should be encouraged in other medical schools that do not, as yet, have simulation practice.
Take-home message: Locally invented simulators are practical and effective equipment in teaching neonatal scalp hematoma to medical students.

The experience of creating a simulator for carrying out spinal puncture

Authors

Elena Taptygina, Krasnoyarsk State Medical University named after Prof. V.F. Voino-Yasenetsky, Krasnoyarsk, Russia
Elena Myagkova, Krasnoyarsk State Medical University named after Prof. V.F. Voino-Yasenetsky, Krasnoyarsk, Russia
Igor Bolshakov, Krasnoyarsk State Medical University named after Prof. V.F. Voino-Yasenetsky, Krasnoyarsk, Russia
Elmira Akhmedova, Krasnoyarsk State Medical University named after Prof. V.F. Voino-Yasenetsky, Krasnoyarsk, Russia

Presenter: Elena Taptygina, Krasnoyarsk State Medical University named after Prof. V.F. Voino-Yasenetsky, Krasnoyarsk, Russia

Background: Simulation training is an integral part of the educational process of medical Universities, which remains the main problem of accessibility of education: expensive simulators and supplies that transmit anatomical characteristics of the object of influence. In Krasnoyarsk state medical University annually holding a competition "Innovation in simulation training", which aim to promote of students in the development and use of simulation technologies in medical education.
The aim of our work was to create a simulator for carrying out spinal puncture of the available materials, while maintaining the realistic feeling when performing manipulation.
Method: The first step in the project was the creation of drawings and selection of materials. Materials were selected based on accessibility in their purchase, and the opportunity to work with them independently. The developed model is a flat rectangular box-panel thickness 8 cm, which laid a replacement unit with a lumbar spine, the spinous processes of which the exact casts of the applicator of transparent elastic silicone rubber, imitating at the same time the anatomical ligament and the outer leaf of the Dura mater. To create the most realistic anatomical model of the lumbar vertebrae was created STL – model using the 3D – print was made manufacturer of the lumbar spine.
Results: One of the main advantages of the created simulation is affordability. The developed simulator has several differences from analogs: made from available materials, has realistic properties of the tissues, compact, mobile, durable and comfortable in use, has a long life, easy to use, including the replacement of components. After fabrication of the component parts of model, it was built, having in the complete set replaceable consumables.
Discussion & Conclusions: Our simulator was the winner at the contest in the framework of the VI international conference "Innovative educational technologies in medicine" (Moscow, 2015).
Take-home message: The simulator was proposed for testing to doctors, for which making of spinal puncture is the skill with which they regularly face. Was obtained high evaluation of the developed model, noted the differences and advantages it from other similar simulators.

Development and Validation of Multi-material Three-dimensional Printed Airway Training Models for Bronchoscopy Simulation

Authors

Sreenivasulu Reddy Mogali, Lee Kong Chian School of Medicine, Singapore
Brian Ho Han Khai, Lee Kong Chian School of Medicine, Singapore
Cecilia Chen Jiayu, Lee Kong Chian School of Medicine, Singapore
Wai Yee Yeong, Nanyang Technological University School of Mechanical & Aerospace Engineering, Singapore

Presenter: Sreenivasulu Reddy Mogali, Lee Kong Chian School of Medicine, Singapore

Background: Bronchoscopy is an important endoscopic airway procedure in respiratory medicine with numerous diagnostic and therapeutic applications. Sound understanding of segmental bronchial anatomy as well as ample training experience is mandatory for technical mastery. Although simulated modalities facilitate safe training for inexperienced operators, current training models are expensive or deficient in anatomic fidelity, functionality and patient representation. Three-dimensional (3D) printed airway models offer a high-fidelity, patient-specific and cost-effective means of bronchoscopy training.
Method: We developed patient-specific airway models using multi-material 3D printing of segmented airways from human thoracic computed tomography scans. Expert bronchoscopists performed bronchoscopy on the airway model and completed a standardized evaluation questionnaire to validate its efficacy as an airway trainer.
Results: Four expert respiratory physicians participated in validation of the airway model. Anatomic fidelity was deemed satisfactory, but participants suggested further refinement of colour and texture, as well as simulation of dynamic upper airway structures. All participants supported the suitability of the model as a bronchoscopic trainer.
Discussion & Conclusions: We have developed a patient-specific multi-material 3D printed airway model and validated its use in bronchoscopic training. The results indicate directions for further improvement of the model, and promote its evaluation in a training context.
Take-home message: 3D printed models are patient-specific, realistic and cost-effective. The developed airway models were validated for their suitability for simulation training.

Haematology/Oncology simulation training: combining clinical skills, prioritisation and human factors to improve confidence

Authors
Emily Millen, University Hospitals of Leicester NHS Trust, Leicester, UK
Shelina Sachedina, University Hospitals of Leicester NHS Trust, Leicester, UK
Katherine Hodgson, University Hospitals of Leicester NHS Trust, Leicester, UK

Presenter: Emily Millen, University Hospitals of Leicester NHS Trust, Leicester, UK

Background: Induction for junior doctors allows them to gain knowledge, confidence and integration into the hospital team. There are no standards regarding content or delivery methods [1]. Our previous departmental induction had become cumbersome and didactic, resulting in little engagement and failed to adequately prepare juniors for the wards.
Method: We redesigned an interactive induction to include clinical skills, human factors and a prioritisation exercise to prepare the doctors to work and learn more effectively in our department. Simulation (SIMS) training was used to improve their confidence in handling haematology/oncology emergencies and provided clinical context for specialty specific learning. A prioritisation exercise developed skills for lone working overnight with non-resident registrars. Questionnaires using a Likert scale (0=not very confident, 5=very confident) evaluated junior doctors' self-reported confidence at managing a variety of scenarios. Primary outcomes were evaluated immediately following SIMS and secondary outcomes evaluated confidence one month after.
Results: At time of abstract submission, 21 junior doctors have completed SIMS training. Paired t-test analysis have shown a statistically significant improvement (p<0.00001) in confidence at managing haematology/oncology emergencies immediately following the SIMS and this was maintained in 84% of juniors one month following the SIMS (p<0.00001).
Discussion & Conclusions: Overall feedback from SIMS has been positive; doctors felt that the induction helped prepare them for working in the department. 95% of doctors rated this induction programme as excellent compared to other departmental inductions. Future innovative projects include inter-professional simulations and consolidation of learning with micro-SIMS throughout the rotation.
We have shown that delivering an interactive induction significantly increased doctors' confidence and thereby improves their ability at managing a complex patient population.
Take-home message: Simulation provides a safe environment to learn specialty specific skills and can be used not only to test clinical skills but also prioritisation skills, human and ethical factors.

The effect of training with ear examination model on medical students' clinical skill

Authors
Panchanok Kaewkul, Maharajnakhonsithammarat Hospital, Nakhonsithammarat Province, Thailand

Presenter: Panchanok Kaewkul, Maharajnakhonsithammarat Hospital, Nakhonsithammarat Province, Thailand

Background: Ear examination is the important and difficult skill for medical students. Many students have problems in otoscopic skill, describe lesion and diagnosis. Training with ear examination model in the class, may promote clinical skill. This study assessed the effectiveness of learning with them. For apply to medical students in the future.
Method: The 5th year medical students were divided into two groups. An intervention group of 14 students received routine lecture and training with ear examination models. A non-intervention group of 14 students received only routine lecture. After finished class, the student performed ear examination in real patients. Outcome measurement included patient assessment [comfortable score], teacher assessment [ability and posture in otoscope usage, time for examination per patient] and student assessment [satisfaction of learning with ear examination models, confidence of ear examination].
Results: We found that, our medical students in intervention group had significantly higher score in ability and posture during otoscopic usage, accuracy and time [p-value =0.029, 0.02, 0.020] than non-intervention group. In patients' comfortable score, intervention group was also had higher mean score compared with non-intervention group but there was no statistical significant [p-value=0.138]. From student assessment, most of the students in intervention group had excellent [79%] and good [21%] satisfaction in learning with ear examination models and also had excellent [50%] and good [43%] confidence of ear examination.
Discussion & Conclusions: Training with ear examination models had effectiveness in ability and postures aspect, which lead to better performance, shorter examination time and improve accuracy in diagnosis. The medical students also had satisfaction in learning with the models and gained more confidence in ear examination.
Take-home message: Training with Ear examination models is an effective additional method for medical students in ear examination practice. This method can enhance the satisfaction, confidence and accuracy in real patients.

Randomized and prospective study of simulated training vs opportunistic learning in paracentesis: standardization of learning curve and transfer to real patients in undergraduate medical students

Authors

Martin Inzunza, Pontificia Universidad Católica de Chile, Santiago, Chile

Julian Varas, Pontificia Universidad Católica de Chile, Santiago, Chile

Rodrigo Tejos, Pontificia Universidad Católica de Chile, Santiago, Chile

Alex Arenas, Pontificia Universidad Católica de Chile, Santiago, Chile

Ignacio Villagran, Pontificia Universidad Católica de Chile, Santiago, Chile

Arnoldo Riquelme, Pontificia Universidad Católica de Chile, Santiago, Chile

Presenter: Arnoldo Riquelme, Pontificia Universidad Católica de Chile, Santiago, Chile

Background: Simulation generates an enabling environment for learning due to the presence of predictable, consistent, standardized and reproducible activities in a safe setting. Abdominal paracentesis is an essential competence for graduate medical students in Chile. A Simulated Paracentesis Training Program was created prior to transfer to real patients.

The aims of this study were: 1. To determine the learning curve required to reach mastery of the procedure; 2. To compare performance of students under simulated training with students using traditional opportunistic learning; 3. To evaluate the transfer to real patients.

Method: A randomized controlled trial was designed including three groups: Group A was composed of clerks taught using the Simulated Training Program; Group B was composed of clerks taught using opportunistic learning, without simulation; Group C was composed of Gastroenterology and Internal Medicine residents, who are exposed daily to paracentesis. The training program includes sessions with effective feedback by experts. A pilot study was performed to determine the number of sessions required to reach mastery in paracentesis. Mastery was defined as ≥95% checklist (≥23 points) and ≥ 24 OSATS score.

Results: The pilot study showed flattening of the learning curve between 3rd and 4th sessions. The randomized trial showed a significant difference in the achievement of mastery between Group A (n=16) and B (n=17) [87.5% vs 5.9%; p<0.01] at the end of the 4th session. No significant differences were observed when comparing the 4th session of Group A with a simulated paracentesis performed by Group C (n = 9). Seven participants from Group A have now been transferred to the real patient phase with 100% mastery.

Discussion & Conclusions: A Simulated Paracentesis Training Program based on a learning curve with four sessions, achieves a significant difference in terms of mastery and transfer to real patients in undergraduate medical students. The results are comparable to the clinical skills of Internal Medicine and Gastroenterology residents trained under the traditional opportunistic method.

Take-home message: This study demonstrates that a simulated training program for abdominal paracentesis is an effective and safe alternative for the acquisition and transfer of skills in medical students.

10FF12 (800)

Effectiveness of surrogate eye models for training of corneal foreign body removal

Authors

Crystal Harn Wei Soh

Jingping Lin

Jia Ying Yeo Denise

Woei Perng Soo

Mui Teng Chua

Win Sen Kuan

Presenter: Crystal Harn Wei Soh, National University Health System, Singapore

Background: Corneal foreign body (FB) is a common presenting complaint to the emergency department (ED). Junior doctors without prior experience lack confidence and skills in managing this. We aim to evaluate effectiveness of our surrogate eye models for teaching hands-on training of FB removal.

Method: We used 2 models in a randomized crossover design. The first was made of agar, using a globe-shaped mould. The second model (Connie) was fabricated in collaboration with the Division of Industrial Design, National University of Singapore, using 3D-scanning and computer design to print a face with eye sockets to accommodate globes made of gelatin, glycerine and water. Pencil lead shavings were used to simulate corneal FBs.

Groups of 4 participants were randomly assigned to commence training on 1 model before crossing over. Self-administered 7-point Likert scale questionnaires were used to rate their responses. Effectiveness between the two models was compared and objective assessment was done using a procedure competency checklist, which all participants completed. Participants were also given identical pre-training and post-training tests, to compare their knowledge of FB removal and slit lamp interpretation.

Results: We included 12 medical officers, 12 junior and 4 senior residents from the Emergency Department. The median post-graduate year was 3 (interquartile range [IQR] 2 to 4.25). Higher scores for confidence and knowledge in removal of corneal FB were attained post-training. Knowledge increased from 4 (IQR 2 to 5) to 6 (IQR 5 to 6); and confidence in assessing depth of FB and removal of FB increased from 3 (IQR 2 to 4) to 6 (IQR 5 to 6), and 3 (IQR 2 to 4) to 5.5 (IQR 5 to 6) respectively (p<0.001 for all categories). The effectiveness of training sessions was rated with a median score of 6 (IQR 6 to 7). The median pre-training test score was 76.9% (IQR 71.2-92.3%) compared to the median post-training score of 100% (IQR 92.3-100%) (p=0.008).

Discussion & Conclusions: Hands-on training sessions using surrogate eye models are effective in increasing the confidence and knowledge of corneal FB removal among junior doctors. 26 out of 28 participants preferred Connie for the simulation of FB removal.

Challenges of Self-Directed Learning: Experiences Using the Eyesi Direct Fundoscopy Simulator by Core Medical and General Practitioner Trainees

Authors

Samantha Hunt, Gloucestershire NHS Foundation Trust, Cheltenham, UK
Emily Darvill, Gloucestershire NHS Foundation Trust, Cheltenham, UK
John Ferris, Gloucestershire NHS Foundation Trust, Cheltenham, UK

Presenter: Samantha Hunt, Gloucestershire NHS Foundation Trust, Cheltenham, UK

Background: Fundal examination is an essential part of the clinical examination of a patient, but in one survey of physicians, only 4% performed it routinely; a lack of technical skill and confidence is often cited as reason for this. We studied the impact of using the Eyesi virtual reality direct fundoscopy simulator on the confidence and technical skills of core medical, and general practitioner, trainees within Gloucestershire.

Method: Two rounds of recruitment initially focused on core medical trainees, the second also incorporating general practitioner trainees. Refinements to study logistics were made between rounds after disappointing engagement in round one. Participants completed a questionnaire, then a test on the simulator to evaluate their baseline skills. They could then access the simulator's course; upon completion another test assessed for any change. The simulator was always accessible for 5 weeks and participants were encouraged to utilise study sessions to undertake the study. After this, data was extracted. Advanced booking was possible online. Recruited trainees were contacted by email weekly to encourage them to complete the course.

Results: Round 1: 28 volunteers, 10 completed questionnaires, 3 completed initial test, 1 completed all. Round 2: 54 volunteers, all completed questionnaires, 11 completed initial test, 2 completed initial and end tests but not all Course modules, 5 completed all.

Discussion & Conclusions: Even with careful planning, extensive time input to optimise engagement, and initial participant enthusiasm, study completion rates were exceedingly low, such that meaningful conclusions from the study were impossible. Feedback from those who did complete the study, however, was extremely positive.

Take-home messages: Multiple barriers exist to self-directed learning in post-graduate education despite a perceived need by educators and learners alike. Access to novel technologies fails to address these. Competency-based learning within the curriculum and allocated study time may be necessary to optimise engagement with learning opportunities.

Operating Room General Minimally Invasive Surgery-related Situation Simulative Teaching Program to Improve the Retention Rates of New Nursing Staff in a Hospital

Authors

Mah Chun
Wen Hsiao-Yun

Presenter: Chun Mah, Department of Nursing ,Taipei medical University – Shuang Ho Hospital, Taipei, Taiwan

Background: Beginning at 2010 that only 50% retention rate of new staff in our operating room , based on the fact of difficulty surgical preparation and follow-up operative procedure work. It is planned to use situation simulative teaching program to make the operating room new staff guidance and diversity support helps to adapt their work to retention.

Method: The purpose of this study is to investigate the effectiveness of new nursing staff's retention rate after the intervention of new nurse practitioners through the introduction of minimally invasive surgery-related situation simulative program. During the three months prior to their employment, new nurses face a difficult role-playing process, and effective guidance and diversified support can help to adapt their work. Due to new staff without adaptation difficulties in surgical procedure preparation. This research method is experimental research design to take a total sample of 20 new staffs in the operating room of a regional hospital in New Taipei City.

Results: It fully a total of 20 new nursing staff accepts the teaching of the situation simulation film and uses the new staffs retention rate as a measure of the effectiveness of the intervention program, in the operating room, the experimental group involved in simulation teaching environment, including watching videos, discussions and simulation exercises. SPSS19.0 data archiving and analysis, mining times, distribution, percentage, average, standard deviation, p-value for statistical analysis. The results showed that: (1) After intervention of endoscopic scene simulation teaching, the experimental group's retention rate increased to 85% at 3 months, significantly better than that of 2016's 50%. (B) endoscopic scene simulation teaching intervention, the subjects consciously in the "ability to prepare endoscopic surgical objects," and "assist in the ability to work out endoscopic surgery" have made progress.

Discussion & Conclusions: The results of this study can provide references for nursing clinic teachers in pre-service education and training courses.

Take-home message: According to this project we could continue to provide training program for new nurses and thus enhance retention rate.

Impact of clinical context on accuracy of simulator-based blood pressure assessment performed by medical students after first simulator-based learning

Authors

Yuka Yamazaki
Iku Hiyamizu
Kyoko Joyner
Yukie Abe

Presenter: Yuka Yamazaki, Tokyo Medical University, Shinjuku-ku, Japan

Background: Although Simulation-Based Education (SBE) is an innovative educational strategy to provide medical students instruction and practice in procedures, its effectiveness in teaching correct technique and ensuring accurate readings has not yet been scientifically evaluated. We investigated whether different clinical contexts on three manikin arms would affect blood pressure readings by first-year medical students after first SBE trainings.
Method: After completion of first SBE training for taking blood pressure, 121 first-year medical students reported blood pressures for three manikin arms with three different clinical contexts. The contexts were: Case 1: healthy 20-year-old male college student; Case 2: 18-year-old female high school student diagnosed with hypotension; Case 3: 80-year-old male diagnosed with diabetes and hypertension for 30 years. The systolic (SBP) and diastolic (DBP) blood pressures were set at the same values in all three cases. Student responses with both SBP and DBP falling within ±5 mmHg of the target were considered as correct. Between-case differences of correct answers were analyzed with the Chi-squared test. In addition, the one-way ANOVA test was used to analyze the differences of (reported SBP - set SBP) in the three cases. The Bonferroni test was used as a Post Hoc Test.
Results: There were no significant differences in the proportions of correct answers among the three cases (Case 1: 52%; Case 2: 47%; Case3: 53%; p=.71). However, on average, the reported SBP of Case 2 was significantly lower than the SBPs of Case 1 and 3 (p<.05).
Discussion & Conclusions: After first SBE, about 50% of first-year students performed well. The significantly lower SBP for Case 2 implies that first-year students might be more familiar with characteristics of hypotension than hypertension from their daily experience. Therefore, repeated practice and addressing external factors that may produce a subjective result are important for skill improvement.
Take-home messages: Using SBE for first-year students is an effective method for medical students to learn and practice correct blood pressure taking skills. First-year students can be influenced by subjective characteristics that can interfere with assessing quantitative results.

Daniela Ostatnikova, Faculty of Medicine, Comenius University, Bratislava, Slovakia

Presenter: Silvia Hnilicova, Comenius University in Bratislava, Faculty of Medicine, Bratislava, Slovakia

Background: In Slovakia, in the first two years medical students are taught Basic Science without any clinical experience. Traditional curriculum in Human Physiology at Faculty of Medicine, Comenius University in Bratislava, Slovakia involves lectures for all students and direct teaching in small group labs, all taught in traditional classrooms.
Method: After the establishment of the Simulation Center, Institute of Physiology was the first to include high fidelity simulations in our MD program curriculum. Four clinical scenarios for 2nd Year students were developed. They involve high fidelity manikin clinical scenarios (Case of Bleeding, Asthma, Myocardial Infarction and Hemorrhagic Shock) with teaching objectives of Human Physiology course (Blood physiology, Respiratory Physiology, Cardiovascular Physiology and Integrative Physiology, respectively). They are mandatory for all students. The aim of our study was to analyze, if adding Simulation into teaching would increase motivation and improve test results among our students.
Results: 63 anonymous self-reported detailed Likert-style questionnaires (1: disagree, 5: totally agree) were collected from sample of students (n=63, 40 females and 23 males). 98% of them reported that simulation program increased their knowledge and improved results in final tests. Simulations motivated them to study Physiology (mean 4,72 ± SD 0,3), helped them in understanding clinical significance of study material (mean 4,83 ± SD 0,2), improved understanding of the topic (mean 4,59 ± SD 0,4), and enhanced critical clinical thinking of students.
Discussion & Conclusions: Simulation program in Slovakia was found to be beneficial for students by increasing motivation and improving performance, and found to be valuable addition to traditional Physiology classes.
Take-home message: High Fidelity Manikin Simulations can be used in Basic Sciences and preclinical subjects to increase motivation and help students to identify clinical significance of studied material.
Contribution was supported by project GOING GLOBAL No. 002UK-2/2016, Ministry of Education, Slovakia.

Changes in performance during repeated in situ simulation with three different cases

Authors
Helen Berg, NTNU, Ålesund, Norway
Marianne Louise Frilund, NTNU, Ålesund, Norway
Ronald Båtnes, Simcare Ltd, Ålesund,Norway
Aslak Steinsbekk, NTNU, Trondheim, Norway

Presenter: Helen Berg, NTNU, Ålesund, Norway

Background: In Situ Simulation is simulation training in the actual patient care environment, using equipment and resources from that unit and involving actual members of the healthcare team (Patterson, Geis, Falcone, Lemaster, & Wears, 2013). However, little is known about whether performance improve with repetition. The aim was to investigate changes in performance of the same teams performing the same in situ simulation with three different cases.

Method: Three departments, typically involved in the medical chain of an elder patient, joined in an in situ simulation project. All cases, a SimMan 3G with pulmonary embolism, heart failure or sepsis, started in a public nursing home, before being brought by an ambulance team to a public emergency department before finally being moved by the same ambulance team to a hospital emergency unit. All cases had the same learning focus; clinical observations, clinical treatment and tasks skills based on the ABCDE-methodology, and cooperation in multiprofessional teams based on the ISBAR communication model.

Results: There was no improvement in performance from case one to case three in clinical observations skills, clinical treatment or tasks skills or cooperation skills in multiprofessional teams in unit or across unit and medical levels. There was some improvement after the first case in that the units had changed their working environments to better accommodate acute situations. The teams in the public level had some improvements by doing the clinical observations more systematically.

Discussion & Conclusions: It was surprising that there was no clear improvement from the first to the third in situ simulation. This indicates that the staff was not able to apply their newly won experience from one case to a different case. One reason may be that the staff tended to seek for medical diagnosis and focusing on initiating treatment instead of stabilising the patient.

Take-home messages: It is feasible to do repeated in situ simulation along a medical Chain.
Repetition in itself does not necessarily lead to improved performance.
More focus should be placed on learning from one case to another.

10FF18 (2499)
High-fidelity patient simulator-assisted teaching is more beneficial for active students with higher motivation and prior knowledge

Presenter: Yu-Chun Chiu, Department of Medical Education, National Taiwan University Hospital Department of Pediatrics, National Taiwan University Hospital, Taipei City, Taiwan

Background: Medical students feel unfamiliar in assessing and managing sick children. We aimed to study the feasibility of using high-fidelity patient simulator in teaching medical students the pediatric assessment and management, and whether or not help them accelerate learning.

Method: A whole semester year(2014.09- 2015.08) of students rotated pediatric clerkship in the National Taiwan University Hospital were enrolled. Conventional group S(-) received video/manikin-assisted teaching of primary assessment and management. Simulation group S(+) had additional 30-minutes of practice+debriefing with high-fidelity simulator SimBaby® after conventional course. Self-evaluated ability and confidence for pediatric assessment and management, attitude for learning, and appraisal/ satisfaction for this course were assessed by pre/post-course questionnaires not included into semester score. Questions were scored with Likert scale 1-5. A p value<0.05 was considered statistically significant.

Results: A total of 141 students were enrolled with 108(76.6%) questionnaires were valid. Forty-four students were in the S(-) group with 37 (84.1%) valid questionnaires while 97 students were in the S(+) group with 71(73.2%) valid questionnaires (p value=0.23). The "simulation increases learning motivation" scale pre-coursely had positive association with "this course is helpful for learning" (p value 3 pre-coursely scaled significantly higher

for "this course is helpful for learning"(4.55 v.s. 4.31, p value=0.04). For students' "overall clinical capacity" scale improvement≧2, "overall clinical capacity" scale pre-coursely had borderline association with "this course is helpful for learning" (p value=0.06) but significant association for students in the S(+) group(p value=0.03). Students with higher "overall clinical capacity" scale pre-coursely scored significantly higher in "this course is helpful for learning"(p value=0.03) after-coursely.

Discussion & Conclusions: High-fidelity simulator reduces error made during training and is feasible in the training of medical students to learn pediatric assessment and management. Students' satisfaction were high in both group. Learning and teaching method meets the learner's preference and attracts their motivation is crucial for the course satisfaction and learning outcome. Moreover, learner's prior knowledge and ability are important for gaining learning effectiveness.

Take-home message: High-fidelity patient simulator helps students to learn pediatric assessment and management, especially for those with higher motivation and prior knowledge.

Which Simulators do Residents Really Use? Plan a Resource-efficient Self-directed Procedural Simulation

Authors
Alexandre Lafleur, Université Laval, Québec, Canada
Gabriel Demchuk, Université Laval, Québec, Canada
Caroline Simard, Université Laval, Québec, Canada
Étienne Rivière, CHU de Bordeaux, Pessac, France
Marie-Laurence Tremblay, Université Laval, Québec, Canada

Presenter: Alexandre Lafleur, Université Laval, Québec, Canada

Background: Programs and residents have expressed a need for directed self-regulated learning of core procedures, with access to many simulators. In this type of procedural simulation, the learning environment is predetermined, however learners are allowed to move freely between the simulators and manage their time. When planning self-directed practice, educators aim to provide an optimal ratio of each type of simulator to answer residents' needs, while maximizing group size and limiting cost. However, current needs assessment methods hardly predict residents' use of simulators in this context.

Method: We designed self-directed guided procedural sessions for internal medicine residents, 51 in phase one and 24 in phase two. During six 90-minute sessions, 8.5 residents/group could use 22 simulators (69 925 $), exceeding their needs: ultrasound-guided central (6) and peripheral (2) venous catheterization, thoracocentesis (2) and paracentesis (2); lumbar puncture (6) and arthrocentesis (4). We calculated minimal ratios of simulators from time-of-use to plan resource-efficient sessions in phase two.

Results: Calculated from time-of-use (83 min in total) the optimal ratio of simulators for 10 residents were: 3.7 simulators for jugular and sub-clavian venous

catheterization (33 min), 1.5 for thoracocentesis (13 min), 1 for femoral venous catheterization (9 min), 1 for lumbar puncture (9 min), 0.8 for peripheral venous catheterization (8 min), 0.7 for paracentesis (6 min) and 0.5 for arthrocentesis (5 min). In phase two, by selecting 14 simulators based on those ratios (48 720 $), use of simulators increased from 36 to 77 %, accommodating 12 residents/group. Time-of-use remained similar (80 min), in particular for jugular and sub-clavian venous catheterization (35,1 min) and thoracocentesis (16,3 min).

Discussion & Conclusions: Measuring time-of-use of simulators is a practical method to plan resource-effective self-directed procedural simulations. Availability of central venous catheterization and thoracocentesis simulators determined group size in our cohort of internal medicine residents.

Take-home message: Calculating the time-of-use of simulators in self-directed practice will optimise material and human resources, allowing programs to strategically increase group size. Expressed as ratios, this information can be shared with other programs and inform purchase decisions.

Comparing the effects of "lecture" and "simulated patient" teaching methods on promoting the knowledge and performance of healthcare providers

Authors
Fariba Haghani, Isfahan University of Medical Sciences, Isfahan, Iran
Jalal Hashemi, Isfahan University of Medical Sciences, Isfahan, Iran
Sepideh Jamshidian, Isfahan University of Medical Sciences, Isfahan, Iran

Presenter: Fariba Haghani, Isfahan University of Medical Sciences, Isfahan, Iran

Background: Postpartum depression is a common disorder among women in Iran. Therefore, proper and efficient training of healthcare providers for this disorder is of great importance. The purpose of this study was to compare the effects of "lecture" and "simulated patient" teaching methods in teaching postpartum depression to healthcare providers.

Summary of Work: This quasi -experimental study employed a pretest-posttest design with intervention and control groups and it was carried out in one of the health and treatment networks of Isfahan University of Medical Sciences in 2016. Eighty subjects who met inclusion criteria were selected by census method among 86 healthcare providers and divided randomly into two groups of 40. Postpartum depression was taught to the intervention group and the control group using the "simulated patient" and "lecture" methods respectively. Both groups were given a valid and reliable test before and after the intervention to measure their knowledge and performance. Data were analyzed using descriptive statistics, independent t-tests and paired t-test.

Summary of Results: In both groups, the posttest mean score was significantly higher than the pretest mean score (p<0.00001). The changes in the post-test compared to the

pretest scores were significantly higher in the intervention group (p<0.00001). Based on the survey questionnaire, 87% of the intervention group believed that the simulated patient was an appropriate teaching method and 85% preferred it to the lecture method.

Discussion & Conclusion: The results showed that the simulated patient method in teaching postpartum depression had a greater effect on healthcare providers' knowledge and performance than the lecture method and participants preferred this method to the lecture.

Take-home Messages: Based on the greater effect of simulation method compared to lecture, we recommend using this method for teaching subjects like depression to simulate real practice.

Mohammed Balilah, King abdulaziz University, Rabigh Faculty of Medicine, Jeddah, Saudi Arabia
Ayman Althubity, King abdulaziz University, Rabigh Faculty of Medicine, Jeddah, Saudi Arabia

Presenter: Waleed Alghamdi, King abdulaziz University, Rabigh Faculty of Medicine, Jeddah, Saudi Arabia

Background: At the Rabigh Medical college, Saudi Arabia, fourth year medical students participate in an innovative series of clinical reasoning coaching sessions over a period of 4 months. The sessions are introduced at the beginning of their clerkship when students typically had no previous clinical exposure.
Method: This study asks whether early exposure to clinical reasoning training would improve clinical decision making. Students were also exposed to other teaching methods during the course that included lectures, bedside teaching sessions and small group discussions. In order to detect an improvement in diagnostic ability, the Diagnostic Thinking Inventory (DTI) was applied. The research hypothesis was assuming that DTI scores will be higher after the coaching sessions compared to other teaching methods as rated by the students.
In the academic year 2017, a series of 8 coaching sessions were held. At the beginning of the first session and at the end of the whole series 40 students completed the DTI. The DTI measures two main domains of diagnostic thinking: the degree of flexibility in thinking and making diagnostic decisions, and how knowledge is structured and organized in the student's memory.
The coaching sessions were designed using structured tools of clinical reasoning teaching and assessment that included the puzzle test, extended matching questions and Patient Notes with immediate feedback from the coaching faculty staff.
Results: The mean DTI scores for the coaching sessions were significantly higher in the degree of flexibility in thinking (p value = 0.011) and how knowledge is structured and organized in memory (p value = 0.044) as compared to other teaching methods.

Discussion & Conclusions: Exposure to diversified clinical reasoning coaching tools during the early stages of the clinical clerkship improves diagnostic thinking in medical students, as measured by DTI scores.
Take-home messages: Teaching clinical reasoning skills is an important component in medical school curricula. Early utilization of clinical reasoning coaching tools during the clerkship can improve medical student's diagnostic thinking skills.
Clinical reasoning skills can be objectively measured using validated tools such as the DTI.

Can Machine Learning Assess Students' Clinical Reasoning?....Using Natural Language Processing To Grade Medical Students' Written Assessment and Plan

Authors
Michael Cole, University of Michigan Medical School, Ann Arbor, Michigan, USA
Vinod Vydiswaran, University of Michigan Medical School, Ann Arbor, Michigan, USA
Ann Zhang, University of Michigan, Ann Arbor, Michigan, USA
Sandro Cinit, University of Michigan Health System, Ann Arbor, Michigan, USA
Prashant Mahajan, MS University of Michigan Health System, Ann Arbor, Michigan, USA

Presenter: Michael Cole, University of Michigan Medical School, Ann Arbor, Michigan, USA

Background: Clinical reasoning (CR) is documented in the assessment and plan (A/P) section of a patient's health record. Improving CR skills among medical students can potentially mitigate diagnostic errors. Natural language processing (NLP) can be used to analyze unstructured notes. We studied the ability of NLP analyze medical students' A/P in order to assess their CR.
Method: First-year medical students (n = 157) electronically completed an A/P on a standardized case for our institution's mandatory CR course. These were graded by faculty using the validated IDEA tool, which evaluates CR outlined in an A/P through 5 individually scored categories: interpretive summary, differential diagnoses, explanation clarity, considering alternatives, and well-reasoned plan. We defined NLP features, including concept mentions, semantic types of concepts, and readability to discern which A/P elements are associated with low, average, or high IDEA scores. The NLP models were trained on 126 A/Ps from a pulmonary embolism case. They were then validated on a test set consisting of 31 A/Ps from the same case.
Results: When used to evaluate the test set, our models achieved an overall accuracy (agreement with IDEA score assigned by faculty) of 67.4% (range 65.6% to 72%, specificity (sp)). Categories: 0.84, sensitivity (sn): .67, ROC: .84) for interpretive summary; 90.6% (90%-90.6%, sp: .95, sn: .91, ROC: .94) on differential diagnosis; 72% (sp: .86, sn: .72, ROC: .77) on explanation clarity; 68% (65.6%-69%, sp: .84, sn: .68, ROC: .84) on considering alternatives, and 78% (75%-81.3%, sp: .78, sn: .78, ROC: .9) on well-reasoned plans.

These are all on par or better than weighted majority baselines expected from baseline distribution of faculty IDEA scores. Additionally, the NLP algorithm had better inter-rater reliability (IRR) when compared to prior studies on human IRR using the IDEA tool.

Discussion & Conclusions: Graded A/Ps from standardized cases have the potential to train NLP algorithms regarding appropriate Clinical Reasoning. Future studies may focus on the feasibility of using NLP for formative or summative assessment of student's CR.

Take-home message: This study offers a novel method to train NLP to reliably assesses CR presented in student's A/P.

"5x5 Approach": New framework for clinical reasoning

Authors

Hisashi Shimozono, Tokyo Medical and Dental University, Tokyo, Japan

Yujiro Tanaka, Tokyo Medical and Dental University, Tokyo, Japan

Makoto Takahashi, Tokyo Medical and Dental University, Tokyo, Japan

Presenter: Hisashi Shimozono, Tokyo Medical and Dental University, Tokyo, Japan

Background: Clinical reasoning is an essential competence of a physician. Dual process theory suggests that this skill is a combination of two systems: System 1 (intuitive and quick), and System 2 (analytical and slow). This theory, however, has no specific underlying method. We, therefore, propose a new "5x5 Approach". Two dimensions of 5 organs (brain, heart, lung, liver/intestine, and kidney) and 5 systems (metabolism, endocrine, blood/tumor, infection, and autoimmune) enable residents to visualize whole image of patients' pathophysiology from symptoms to diagnoses and treatments. The primary hypothesis is that 5x5 Approach improves residents' capacity for clinical reasoning.

Method: Participants were PGY1 residents (n=100). The intervention was one-hour lecture of "5x5 Approach". Forty-five residents attended a live lecture and the other 55 viewed the same lecture through a video feed. Before and after the lecture, the residents had multiple examinations which included questions about differential diagnoses for a case summary. We checked for the use of 5x5 Approach by each resident during the posttest.

Results: We divided the participants according to their scores for differential diagnoses on the pretest, which could show their knowledge level, into two groups: high-level (n=59) and low-level (n=41). In the high-level group, the change of scores from the pretest to the posttest was higher in 5x5 users (n=33) than non-users (n=26) (-1.58 (95%CI: -4.09 ~ 0.94) vs -4.92 (95%CI: -6.9 ~ -2.93), p=0.046) by repeated measures ANOVA. Use of 5x5 Approach during the posttest was related to neither the knowledge level nor the lecture style.

Discussion: 5x5 Approach is useful for residents with high-level knowledge to make differential diagnoses. That is to

say, 5x5 Approach can provide a clinical model upon which for making differential diagnoses.

Conclusion: 5x5 Approach has a potential for residents to structure knowledge systematically and to improve their clinical reasoning, particularly System 2 reasoning.

Take-home message: "5x5 Approach" which is a combination of 5 organs and 5 systems could be a new framework for clinical reasoning.

Effects of teaching critical thinking on medical students' skills: results from a three-year longitudinal study

Authors

Akbar Soltani, Tehran University of Medical Sciences, Tehran, Iran

Mahboobeh Khabaz Mafinejad, Tehran University of Medical Sciences, Tehran, Iran

Taha Bayat, Tehran University of Medical Sciences, Tehran, Iran

Maryam Tajik, Tehran University of Medical Sciences, Tehran, Iran

Hamideh Moosapour, Tehran University of Medical Sciences, Tehran, Iran

Ahmadreza Dorri, Science and Research Branch, Islamic Azad University, Tehran, Iran

Presenter: Mahboobeh Khabaz Mafinejad, Tehran University of Medical Sciences, Tehran, Iran

Background: Integration of critical thinking into medical school programs is crucial in order to ensure that future physicians are able to put their knowledge into practice. Research indicates that in most medical curricula there is a lack of emphasis on improving the critical thinking ability. The aim of the study was to evaluate the effects of holding a longitudinal critical thinking course on medical students' skills at Tehran University of Medical Sciences in Iran.

Method: A prospective, one-group, longitudinal pretest-posttest design was used with a convenience sample of 103 students; 91 medical students participated two times in completing a questionnaire each March from 2011 to 2014. The valid responses rate was 57%. So, sixty-eight percent of students were excluded because of deciding not to participate in the study or not completing both of the tests. The California Critical Thinking Skill Test (CCTST) was administered as pretest and posttest. Participants were asked to complete the CCTST in the week before their first educational session and posttest data were collected 8 weeks after the program.

Results: Ninety-one medical students with the mean age of 20±2.8 years participated in this study. Forty-three of them were male (%47.3) and 48 others were female (%52.7). The highest score in both pre and post-test was for the deductive part. While the lowest mark in both is for analysis. We have a positive difference in all the fields but the difference is not significantly meaningful for inference and deductive part (P-value= 0.287 and 0.421). We found no significant difference between the scores of male and female participants in any of the fields (P=0.77).

Discussion & Conclusions: There was no significant difference between the scores in male and female

students. Students performed the best in the deductive part of the questionnaire and their weakest skill was analysis in both pre- and post-tests. A similar study showed no difference between genders in total scores and a stronger deductive skill among others.

Take-home message: Teaching clinical thinking to undergraduate medical students could improve their critical thinking skills especially in analysis, inductive and evaluation parts.

10GG5 (3369)
Developing Interviewing and Clinical Reasoning Skills with a Novel Low-Cost Virtual Patient Simulator

Authors
Malgorzata E. Kaminska, Northern Medical Program, University of Northern British Columbia, Prince George, Canada
Richard C. Franke, Athabasca University, Prince George, Canada

Presenter: Malgorzata Kaminska, Northern Medical Program, University of Northern British Columbia, Prince George, British Columbia, Canada

Background: Good interview skills are crucial in medicine. In our medical school, interview skills are taught and developed during physical examination Clinical Skills (CS) sessions, however these group interviews do not allow students to access their own unique knowledge base, nor do they allow students to reflect on their clinical reasoning patterns. Yet Vygotsky's zone of proximal development stages, widely recognized in medicine, requires that self-regulated learning must occur for effective skills development.

Method: A low-cost virtual patient history-taking simulator operating in PowerPoint 2013 with custom Visual Basic programming was piloted during a Respiratory Exam session. The simulator mimicked a Jeopardy format, incorporated multimedia, and required no prior preparation by students. It was used by student dyads playing the role of interviewer and patient. Only the patient-student was able to see the computer screen and relied on the software to provide answers to questions asked. The program provided feedback to the interviewer-student regarding areas that should have been addressed but were missed.

Results: A post-intervention anchored Likert-scale survey was completed by 15 students (100% response rate) who used this software. Student responses indicated the software was of educational value (100%), a useful tool for practicing history-taking (86%), and an efficient use of their time during the session (93%). Overall, 93% requested that this software be part of future CS sessions.

Discussion: Dyad training and use of virtual patients are well researched, widely accepted, and utilized as viable teaching methods within medical education. This novel tool maximized students' CS time and enabled acquisition of clinical reasoning skills through self-learning and the application of previous skills such as chest x-ray interpretation.

Conclusion: Students valued using this novel simulator to practice interviewing in an individual, guided manner, with immediate feedback, and without need for additional preceptor or preparation. Future studies will examine assessment outcomes following the use of this tool.

Take-home message: A simple, low-cost virtual patient history-taking simulator is an efficient and useful way to increase interviewing and clinical reasoning skills in a way that promotes individual expertise development while incorporating differential diagnosis, data interpretation, and management skills.

A debate forum curriculum for teaching critical thinking skills to medical students

Authors
Hsin-Hui Chen, National Defense Medical Center, Taipei, Taiwan
Hsueh-Hsing Pan, National Defense Medical Center, Taipei, Taiwan
Wei-Shiang Lin, National Defense Medical Center, Taipei, Taiwan
Shih-Hua Lin, National Defense Medical Center, Taipei, Taiwan
Cheng-Yi Cheng, National Defense Medical Center, Taipei, Taiwan
Chin-Sheng Lin, National Defense Medical Center, Taipei, Taiwan

Presenter: Chin-Sheng Lin, National Defense Medical Center, Taipei, Taiwan

Background: Critical thinking (CT) is defined as the use of higher cognitive skills to determine appropriate action, which is essential for health care professionals and medical students. However, evidence supporting the effectiveness of strategies for developing CT remains scarce, especially in medical students. We designed a novel forum curriculum to teach CT to medical students through academic debate.

Method: In our study, 131 fourth-year medical students were recruited and divided into 10 groups. The developed forum curriculum included a background knowledge test, student group debate, expert debate demonstration, and discussion. Before and after experiencing the forum curriculum, students completed a questionnaire that measured learning attitude, learning motivation, collective efficacy, and CT. Students also answered open-ended questions after experiencing the forum curriculum. During the forum curriculum, both teachers and classmates evaluated group debate performance. We analyzed the differences in the pre- and post-forum questionnaires and group debate scores using paired t tests.

Results: The overall satisfaction with the forum curriculum was 8.8 points (standard deviation = 1.2) out of 10 points. The mean scores of learning attitude, learning motivation, collective efficacy, and CT, as measured after the forum curriculum, were significantly higher than those measured before the forum curriculum ($p < 0.001$). In the regression model, we found that participants who had experience of team-based learning (TBL) classes had higher CT scores

than those who had no experience of TBL, with a mean difference of 1.53 points [95% CI (0.51, 2.54), p < 0.05]. Moreover, the mean of previous academic grades was a significant predictor of debate performance score after adjustment for potential confounders.

Discussion & Conclusions: Our study demonstrated that academic debate as part of a forum curriculum may help medical students develop CT skills, which will equip them to deal with clinical uncertainty. Further large-scale, randomized studies are necessary to confirm the beneficial effects of the forum curriculum.

Take-home message: We proposed a promising forum curriculum to teach CT by debate, which not only significantly improved curriculum satisfaction, but also enhanced learning attitude, learning motivation, collective efficacy, and CT of medical students.

Presenter: Ching-Yi Lee, Chang Gung Medical Education Research Center, Taoyuan, Taiwan

Background: Clinical reasoning is "the thought process that guides practice". Psychological research highlights cultural differences in thinking and reasoning between Asian and European American countries. As the majority of clinical reasoning studies have been undertaken in Western contexts, we aimed to clarify the status of clinical reasoning research in Asian countries.

Method: A scoping review of clinical reasoning research was undertaken. Three databases were searched. Inclusion criteria: English or Asian language; full text available; January 2007 to December 2016. Search terms: clinical reasoning, thinking process, differential diagnosis, decision making, problem-based learning, critical thinking, heath care profession, institution, medical students, nursing students.

Results: 14,255 references retrieved from 86 key journals. First: two researchers screened abstracts for duplicates and criteria. Second: from remaining 177 manuscripts, 1 conference and 2 without full text were excluded. All 174 references were coding with context and divided into seven themes, and the majority is evaluation of teaching. The numbers of publications almost doubled at the interval from 2011 to 2012 (n=11; n=20); then steadily increased (23 average yearly publications). The majority are published in Nurse Education Today. BMC Medical Education is secondly highly published journal. Evaluation of teaching using problem-based learning is the most researched topic.

Discussion & Conclusions: In our scoping review we illuminate key concepts and sources of evidence to fully grasp the potential of further research in clinical reasoning for local needs. Knowing the current status of research in Asian countries may assist medical education system to improve current status of clinical reasoning research.

Take-home message: Clinical reasoning in Asian countries has developed in recent years. Rigorous research in this field is required for us to engage in meaningful dialogue with researchers internationally.

10GG9 (1331)
Using Effective Teaching to improve clinical reasoning in pre-clerkship curriculum

Authors
Peiying Pai
LiChi Huang
Chia-Der Lin
Yih-Ming Yang

Presenter: Peiying Pai, China Medical University Hospital, Taichung, Taiwan

Background: To improve the effectiveness of clinical diagnosis course in the fourth academic year (pre-clerk year) according to the effective teaching principles and the new teaching steps and methods. Special attention will be given to case-oriented clinical skills teaching and learning to guide the effective learning in clinical reasoning.

Method: Through our previous study and practical training in developing clinical reasoning methods, we use clinical reasoning group discussion in combination with clinical diagnostic methods to guide students learning clinical diagnosis. In fact, this is physician's general clinical thinking and problem-solving process. Effective teaching methods to be used include: (1) case-oriented teaching, (2) the construction of the concept map (Concept map), (3) Buzz group discussion (4) group of interactive exercises and discussion, (5) reflective learning, which will focus on case-oriented clinical skills teaching and learning, to guide clinical skills and clinical reasoning of effective learning. We applied The California Critical Thinking Disposition Inventory-Chinese Version (CCTDI-CV), a total of 70 questions, tested changes in students' critical thinking traits before and after intervening in the course.

Results: After two semesters of clinical medical diagnostics and clinical reasoning, we performed two tests, the first pretest (September, 2016) and the post-test (June, 2017), using paired sample pair-T statistical analysis. The only statistically significant analysis of the category is "confident in reasoning" (p <.05).

Discussion & Conclusions: This clinical course is expected to inspire and guide medical students to learn critical thinking and modern clinical reasoning. Case-oriented clinical skills teaching and learning can lead students to active learning and activate the learning process. Thus,

students have the ability to learn actual application on the patient and to achieve effective goals of clinical education. Students learn in different ways (more effective) and find out their lack of ability in clinical reasoning after the intervention.

Take-home message: Using effective teaching method with case-oriented clinical skills teaching and learning to guide clinical skills and clinical reasoning of effective learning lead students to active learning and activate their learning process.

10GG10 (1346)
Reflecting on reflection: medical students' perspectives

Authors
Nipaporn Hanpitakpong, Buddhachinaraj Medical Education Center, Phitsanuloke, Thailand

Presenter: Nipaporn Hanpitakpong, Buddhachinaraj Medical Education Center, Phitsanuloke, Thailand

Background: Reflection is an important process for medical students to create lifelong learning. Many instructors facilitate students to do reflection in various ways. Little is known about medical students' perspectives on reflection. The objective of this study was to explore the medical students' attitudes toward their writing reflection.

Method: The online questionnaires (5-point Likert scale) were administered to 48 fourth-year Buddhachinaraj medical students to survey about their satisfaction, benefits and feeling of burden to their writing reflection. The data were analyzed by using percentage, mean, and standard deviation.

Results: The total of 40 medical students (83% response rate) participated the study. The findings showed overall satisfaction of writing reflection was 82.5%. The highest satisfaction was reflection about taking care of patients (3.87±0.78), followed by personal matters (3.60±0.84) and generalize matters in daily life (3.50±0.96). The student' preferences to the forms of reflection were as follows: handwritten paper (3.77±0.78), Line@ mobile application (3.75±1.08) and email (3.55±0.78). The students gained the benefits by reflective learning from mistakes (3.97±0.89), pondering the past events (3.95±0.95), and understanding human being (3.90±1.03) whereas the least benefits was venting their feelings (3.52±1.01). Many students thought writing reflection were their burden (3.37±1.05) and should be done once a month.

The medical students (77.5%) highly satisfied with the teachers' feedback (3.82±0.87) and highly gained benefits (3.77±0.89) from the feedback, especially through talking with their teachers in a reading portfolio hour (3.75±0.86) and talking via Line@ mobile application (3.72±1.08).

Discussion & Conclusions: The majority of medical students satisfied with writing reflection about taking care of patients which encouraged them to learn from their mistakes and pondering the past events. They mostly satisfied with the writing reflection via handwritten paper and Line@ mobile application because of being simple, convenient and able to receive feedback from teachers

quickly. However, since they had to study hard, it should be done once a month.

Take-home message: Reflective practice is very useful learning process in the medical student's perspectives. However, the teachers should recognize about the effect of reflection fatigue to the medical students.

Educational impact and benefit of clinical apprenticeships in West Africa on UK graduate entry medical students

Authors
Jon Morris, Swansea University Medical School, Swansea, UK
Paul Jones, Swansea University Medical School, Swansea, UK
Steve Capey, Swansea University Medical School, Swansea, UK

Presenter: Jon Morris, Swansea University Medical School, Swansea, UK

Background: Swansea University has a well-established link with the Edward Francis Small Teaching Hospital, Banjul, The Gambia. Annually 20 graduate entry medical students take part in a clinical apprenticeship in the region, experiencing all aspects of hospital, rural, traditional and public health medicine whilst simultaneously becoming immersed in the local culture.

Method: Students complete a reflective writing assignment immediately after the apprenticeship which was analysed, along with that of a supervising tutor's reflective journal. The aim of the project was to assess what the students gained from their participation and whether the facilitator's role enhanced their learning opportunities.

Results: More than 100 student responses were analysed with multiple categories noted. All students commented favourably on the experience citing clinical exposure and local culture as the most positive outcomes. Almost all students had the desire to contribute more to the local population in a health care setting and felt that it would make them a better doctor in the future. A small number of responses stated that cultural and organisational differences hindered the overall learning experience but that the facilitators approach had bigger impact on students' experience. Further evaluation of students who have taken part in the apprenticeships would be useful.

Conclusion: Gambia Link apprenticeship program is a valuable one with varied student experiences, but overwhelmingly the exposure to different clinical presentations in a resource reduced environment whilst immersed in an unfamiliar culture is a rewarding and enriching one. Knowledge on whether it enhances clinical preparedness for foundation doctors or increases the likelihood of working in a similar environment in the future would require long term follow up. Educational impact and long term benefit of placements such as these is difficult to measure as influence is personalised and introspective.

Take-home messages: Students found the experience to be of great educational benefit to them and facilitator role can have big impact on student experiences. As some students expressed frustration, expectations may need to

be managed prior to placements with problems managed effectively by the facilitating tutor as they happen.

Perks and Woes: Integrating Reflective Practice into Family Medicine Residency Program in Qatar

Authors
Noora Al-Mutawa
Mohamed Hashim
Saleh Attal
Hisham Elmahdi

Presenter: Noora Al-Mutawa, Primary Health Care Corporation, Doha, Qatar

Background: Reflective practice is increasingly used in medical education to enhance self-awareness, enable better understanding of new learning experiences and assess one's decision-making skills. In 2015, the Department of Family and Community Medicine started to integrate reflective practice into the training curriculum. The aim of this study was to assess implications of introducing reflective practice into Family Medicine Residency Program as perceived by residents in Qatar.
Method: An action research using cross-sectional study design was done from July 2015 to June 2016. Purposive sample included 26 residents (PGY1, PGY2 and PGY3) and questionnaires were provided during orientation session on reflective practice. Residents chose challenging cases from the continuity of care clinic, reflected on the cases and discussed them with peers and faculty mentors. Following reflective case-based activities, residents submitted essays using Gibbs model to their e-portfolios. Faculty mentors provided formative feedback on residents' progress, covering strengths, exploring development needs and agreeing on action plans. Data was analysed using Stata Intercooled 9.0 software.
Results: More than 80% of residents thought sessions were useful and enjoyable. Over 90% believed that engaging in reflective practice would boost their interest in Family Medicine, improve patient outcomes and promote continuous learning throughout their career. However, 27% thought they did not have time to reflect on their experiences. Results generally showed significantly higher positive influence of exposure to other residents' experiences for PGY2 and PGY3 compared to PGY1. Assessment of written reflective case-based essays showed moderate level of reflective writing skills with slight superiority for PGY2.
Discussion & Conclusion: By integrating reflective practice into Family Medicine Residency Program, residents were equipped with enhanced knowledge, skills and attitudes needed to improve their insight about strengths and weaknesses, and develop action plans to take better care of similar cases in future.
Take-home message: Whether involvement in reflective practice will lead to better and sustainable improved patient outcomes, longer-term studies are required.

10GG14 (2652)
Can a linguistics software program be used to evaluate emotional content of reflective writing?

Authors
Diluxshy Elangaratnam, Imperial College, London, UK
Lubna Ghani, Imperial College, London, UK
Nina Salooja, Imperial College, London, UK

Presenter: Diluxshy Elangaratnam, Imperial College, London, UK

Background: The GMC (2013) highlights the value and importance of reflective work. In literature there is a lack of clarity about the role and importance of emotions in reflective work. We investigated the use of emotional language in the reflective writing of medical students to inform our teaching on the subject.
Method: We have investigated 50 reflective accounts (25 female, 25 male) created in the context of a teaching skills course. Students were asked to write about something that impacted on them during the week. We compared two different methodological approaches. In the first, two co-researchers coded use of emotion using the wheel of emotions: trust, anger, sadness, surprise, joy, anticipation, disgust and fear (Plutchik, 1980). In the second, a software program: Linguistic Inquiry Word Count (LIWC2015) was used to calculate percentages of words used in various categories including anxiety, anger, sadness.
Results: Overall expression of emotion was low as measured by either method. Textual analysis by co-researchers found females [10/25] more likely to express emotion than men [4/25]. Amongst the females, 20 expressions of emotion were used including joy [6], trust [5], fear [4], sadness [2], surprise [2] and disgust [1]. In contrast, males there were 7 expressions of emotion: anger [3], sadness [2], joy [2] and disgust [1]. LIWC2015 also identified females were more likely to express emotions than males. LIWC2015 indicated anxiety was more frequent in females [8/25 vs 5/25] and anger more frequent in males [3/25 vs 1/25].
Discussion & Conclusion: There were several discrepancies between the calculations of emotional language between the co-researchers and LIWC2015. The latter identified 5 examples of anxiety –related words in male students, none of which were considered to express anxiety by the co-researchers. Similarly an example of anger-related language identified by LIWC2015 in a female student was categorized as despondency/sadness by both co-researchers. Use of emotional language was low in this study.
Take-home message: Although the LIWC can analyse large data sets in short periods of time compared to manual review by researchers it is limited in its ability to identify individual emotions.

10GG15 (769)

Effect of structured reflection on accuracy, confidence and diagnostic calibration of medical students

Authors

Galileu Bonifácio Da Costa Filho, Universidade Jose do Rosario Vellano, Belo Horizonte, Brazil

Paulo Raymundo Brandão, Universidade Jose do Rosario Vellano, Belo Horizonte, Brazil

Alexandre Sampaio Moura, Universidade Jose do Rosario Vellano, Belo Horizonte, Brazil

Sílvia Mamede, Erasmus University Rotterdam, Netherlands

Presenter: Galileu Costa Filho, Universidade Jose do Rosario Vellano, Belo Horizonte, Brazil

Background: Diagnostic calibration, the relationship between diagnostic accuracy and confidence in that accuracy, may influence diagnostic performance.[1] Deliberate reflection upon initial diagnoses provides insight on performance and may therefore improve diagnostic calibration. Although deliberate reflection has been shown to improve diagnostic accuracy,[2,3] its effect on diagnostic calibration has not been assessed yet. This experiment evaluated the impact of deliberate reflection on diagnostic calibration in dermatological cases.

Method: Sixth-year medical students from Universidade José do Rosário Vellano, Brazil, were randomly allocated to either a reflection group (RG) or a control group (CG). In both groups, students worked with the same 12 dermatological images, one-by-one. First, students provided an initial diagnosis and their confidence in that diagnostic. Subsequently, while RG students reflected on the case using a structured tool, CG students performed a time-filler activity. Finally, all students provided a final diagnosis and confidence in that diagnosis. Outcome measurements: diagnostic accuracy, confidence, and diagnostic calibration, overall and stratified by case difficulty.

Results: 61 students participated (RG: 33; CG: 28). Reflection increased diagnostic accuracy ($p < .01$) but did not affect confidence ($p=.228$) or calibration ($p=.197$).

Discussion & Conclusion: Calibration was associated with case difficulty, with both groups showing more overconfidence when solving more difficult cases ($p < .001$). Deliberate reflection increased diagnostic accuracy in dermatology, which had been not shown yet, but didn't affected confidence and calibration. Calibration was worse while solving more difficult cases, and reflection was not sufficient to improve it.

Take-home message: A single intervention using deliberate reflection didn't improve diagnostic calibration possibly due to its lack of effect on diagnostic confidence.

The Effect of Attitude, Motivation, and Anxiety on the Academic Performance of Medical Students

Authors
Walaa Elsekaily, Alfaisal University, Riyadh, Saudi Arabai
Maram Alrefai, Alfaisal University, Riyadh, Saudi Arabai
Sara Ahmed, Alfaisal University, Riyadh, Saudi Arabai
Lamya Alrayes, Alfaisal University, Riyadh, Saudi Arabai
Mohammed Sharique, Alfaisal University, Riyadh, Saudi Arabai
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabai

Presenter: Walaa Elsekaily, Alfaisal University, Riyadh, Saudi Arabia

Background: A students' receptivity to learning new information, diligence and self-discipline, and willingness to exert the effort to complete tasks and requirements, along with the level to which they worry about their performance, all play a role in their academic performance. This study looks at and compares all these variables and correlates them with academic achievement.
Method: A validated online survey was administered to medical students from years 1 to 5. Students chose their preferred answers on a 5-point Likert-scale (1 = not at all typical of me, 5 = very typical of me) on topics of determination, character, and discipline. 18 Questions were split into sub-categories of attitude towards academia, anxiety factors, and motivational factors. Additionally, each participant was required to provide their gender, current GPA, and high school education system that they graduated from.
Results: 109 responses were collected. Students showed poor anxiety management skills all round, regardless of gender or academic year. In particular, the fear of failing (83% of students) and panicking during test taking (72%) scored very high. Attitude and motivation towards Medical subjects and learning in general also scored poorly, with many students (80%) agreeing that they dislike most of the workload that comes with being a medical student. There was a significant difference in motivational subscales, with highly-motivated students having a much higher GPA (3.60 vs 3.51). Several other anxiety, attitude, and motivational factor variables were compared.
Discussion & Conclusion: Academic motivation is quite low, which may be due to the constant stress the students are faced with. Disciplined students with set goals outperform others significantly. Those under-performing must be helped and given adequate resources to combat anxiety and other detrimental factors.
Take-home message: Lack of adequate resources to help students with coping mechanisms towards academic anxiety and stress may be leading to reduced motivation among students. Classes on how to manage anxiety, and programs that support students with identified deficiencies can adequately help support them perform to their desired level.

10HH2 (3456)
Motivational Advising: Utilizing the theory of Motivational Interviewing to facilitate and engage intrinsic motivation within our learner in order to change behavior

Authors
Amy Fleming, Vanderbilt University, Nashville, USA
Sharon Kileny, University of Michigan, Ann Arbor, MI
Chris Golden, Johns Hopkins University, Baltimore, USA
Tom Klink, Vanderbilt University School of Medicine, Nashville, USA
Kendra Parekh, Vanderbilt University School of Medicine, USA
Meg Benningfield, Vanderbilt University, Nashville, USA

Presenter: Amy Fleming, Vanderbilt University School of Medicine, Nashville, USA

Background: Motivational interviewing (MI) is a method of counselling that utilizes a patient's own motivation to affect personal change. While applied routinely and successfully in the management of medical conditions (e.g. substance abuse), employing MI techniques to engage medical learners (termed motivational advising [MA]), may help learners in the health professions overcome professional and/or personal challenges limiting their career development. MI has been gaining momentum with increased discussion in the medical literature and broader implementation in provider-patient interactions. MI purports that patients approach care with different levels of readiness to change their behavior. Learners, particularly learners facing challenges, may benefit from a similar style of advising, utilizing techniques of MI to help the learner make internally motivated decisions to change.
Method: Medical educators from four academic medical centers developed an educational module focused on teaching fellow educators MI theory and techniques for MA. The innovative, interactive workshop used techniques including role-play, think-pair-share, large-group discussion, didactics, and small-group work. Participants actively practiced MA delivery techniques and observed role-play videos of a traditional advisor-advisee interaction as well as an MA-focused engagement.
Results: In a survey of 48 educators attending the workshop at two medical conferences, over 80% of respondents demonstrated an interest in learning more about MA. Additionally, over 60% of respondents indicated that they would seek opportunities to practice and/or implement MA with their advisees. Knowledge of the technical components of MA (techniques of MA, change talk, and sustain talk) also increased significantly ($p<0.001$) in pre-/post-test analysis.
Discussion & Conclusion: This educational module introducing the concept of MA was well-received by medical educators and viewed as a valuable tool in advising medical learners, particularly those

demonstrating ambivalence or difficulties making change. The participants were also provided tools to replicate this workshop in other settings with or without an expert in MI techniques. Although the workshop has been conducted with physicians involved in medical education, it would be applicable to other health professionals involved in advising trainees such as nursing, dentistry, pharmacy, or veterinary medicine.

10HH3 (2066)
Factors affecting motivation toward learning in clinical years

Authors
Nattaphorn Sriwicha
Chaowaphon Ittiphanitphong

Presenter: Nattaphorn Sriwicha, Sawanpracharak Hospital, Nakhon Sawan, Thailand

Background: Medicine is the art, science and practice of the diagnosis, treatment, and prevention of disease, so studying in medicine is extremely challenging for all students. Medical students need to have proficient medical knowledge, take responsibility and be good at working with people. The path is quite difficult and take time, therefore motivation and passion are needed to overcome many obstacles and succeed in medical courses. The aim of this study is to explore the factors that affect student's motivation in learning medicine, and to study the relationship between student motivation for learning and influencing factors including those arising from personal, familial and workplace environments.
Methods: A cross-sectional analytic study was conducted among medical students at Sawanpracharak Hospital,Thailand, from March - September, 2017. A total of 87 male and female medical students in the last three clinical years participated in the study by completing a questionnaire.
Results: There were a total of 87 male and female medical students in the clinical course.41 students were found to have high motivation (47.1%) while 46 students had low motivation (59.2%). The factors that most significantly affects motivation in studying medicine are future orientation and relationship between medical students and attending staffs. Medical students who are psychologically characterized by future orientation have high motivation while studying, meanwhile medical students who have a negative relationship with attending staffs have low motivation to study. Age, gender, type of personality, faith in institution, expectation of parents, physical environment of workplace and relationship between colleagues do not affect on motivation in studying medicine.
Discussion & Conclusion: The factors affecting student motivation in clinical medical students of the medical education center at Sawanpracharak hospital are future orientation and negative relationship between medical students and attending staffs.
Take-home messageS: Negative relationship does not affect only motivation but also the quality of life of medical student. This feeling impacts their professional life, personal life and overall happiness, and can prevent reaching success in the future. We should transform negative relationships to be positive relationships to increase motivation and enhance the ability to study medicine.

Adaptation and validation of the Academic Self-Regulation Scale (SRQ-A) for measuring motivation in Portuguese medical students

Authors
Rafael Vasconcelos, School of Medicine, University of Minho, Braga, Portugal
Alexandra M. Araújo, Department of Psychology and Education, The Portucalense Institute for Human Development (INPP), Portucalense University, Porto, Portugal
Fátima Texeira, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Braga, Portugal
Anouk Wouters, Department of Research in Education, VUmc School of Medical Sciences, Amsterdam, Netherlands. LEARN! research institute for learning and education. Faculty of Psychology and Education, VU University Amsterdam, Netherlands
Rashmi Kusurkar, Department of Research in Education, VUmc School of Medical Sciences, Amsterdam, Netherlands. LEARN! research institute for learning and education. Faculty of Psychology and Education, VU University Amsterdam, Netherlands
Manuel João Costa, School of Medicine, Life and Health Sciences Research Institute (ICVS), University of Minho, Braga, Portugal

Presenter: Rafael Vasconcelos, School of Medicine, University of Minho, Braga, Portugal

Background: Students' motivation is seen as a valuable resource for learning and academic performance. The Academic Self-Regulation Scale is a 16-item self-report tool, based on the Self-Determination Theory (SDT), measuring intrinsic motivation, external regulation, introjected regulation, and identified regulation.
Method: This study assessed the psychometric properties of a freshly developed European Portuguese adaptation of the SRQ-A in a sample of 781 Portuguese medical students covering all 6 undergraduate years. Three models (original four factors, two factors of autonomous vs. controlled motivation, and a second-order model) were analysed through confirmatory factor analysis.
Results: The response rate was 59% (460 students). Item sensitivity was suitable. The second order model exhibited better fit (CFI=.89; GFI=.90; RMSEA=.09 [.08-.10]) than the other two tested models. Factor loadings were generally significant (.40-.88). Good reliability was found for the total scale (Cronbach's α =.75; CR = .94) and factor (Cronbach's α =.78-.79; CR=.78-.82) scores.
Discussion & Conclusion: The translated tool showed satisfactory psychometric properties, validating its use to

assess the motivation of Portuguese medical students in a scalable way, either in a subject-specific fashion or in a broader analysis. Given that the original SRQ-A is one of the main instruments used to measure motivation in the educational context, having a validated translation allows for regional, national, and international studies to be done in Portugal in this research field.

Take-home messageS: The European Portuguese adaptation of the SRQ-A is a reliable and valid tool to assess motivation in Portuguese medical students. Thus, it will enable motivation-related medical education research in Portugal, including its association with selection processes, curriculum structure, teaching, and assessment styles, as well as clinical training, extra-curricular involvement, stress, and burnout among medical students.

10HH6 (2425)
Curiosity drives learning, a simply inspirational way for medical students' research engagement through extra-curriculum activity

Authors
Preecha Wanichsetakul
Panadda Rojpibulstit

Presenter: Preecha Wanichsetakul, Faculty of Medicine, Thammasat University, Pathumthani, Thailand

Background: To encourage medical students to participate in an original research in response to global standard medical curriculum accreditation criteria is started since 2015. It was kicked off without expanding the curriculum through "Dome-Med-Star (DMS) extra-curriculum activity Project". This study therefore aims to (1) retrospectively review of two-year management, and (2) to demonstrate the outcomes and students 'satisfaction.

Method: DMS project started annually with 2-month period processes as followed: ignitable-, voluntary students' recruitment-, inspiration-, mapping-, proposal development-, and proposal validation- phase. Afterward, the students would be involved in experimental-, follow-up - and presentation-phase. After arrangement, the number of (A) participants, (B) projects, (C) awards, (D) poster/oral presentation and (E) manuscript were collected. The students were then rated two parts of self-developed questionnaires with a five rating scale. The first part comprised of 10-question asking about what they got after attending this project with an open-ended question. The second one was 6-item emphasized on the satisfaction/benefits of attending. Data was analyzed using mean SD and statistical analysis by pair t test.

Results: For two-year approach, an increasing number of (A) (24 to 27) and (B) (10 to 11) was presented. Interestingly, the number of (C) (0 to 5), (D) (3 to 18) and (E) (1 to 5) were dramatically illustrated. The remainders is in the process of finalizing the abstract/manuscript. From 100% response data, comparing before and after attending this project, critical thinking skill, learning the study design, taking role as clinical researcher and gain more confidently were clearly the most drive that students' were ignited (p-value <0.05).

Discussion & Conclusion: This report demonstrated the easiest way to engage medical students in research productivity. Neither intercalated Ph.D. degree nor mandatory in-curriculum research was needed. International presentation opportunities were providing the good memories, the good lesson and modelling for the juniors to follow as well.

Take-home message: To upsurge medical school graduates to be able to use research skills to influence their practice can be successfully achieved through extra-curriculum arrangement. Though, it might be got better to improve the recruitment process to uphill percent of students' involvement.

10HH7 (3120)
Student Motivation at a School of Health Sciences

Authors
Asta B. Schram, University of Iceland, Reykjavík, Iceland

Presenter: Asta B Schram, University of Iceland, School of Health Sciences, Reykjavík, Iceland

Background: It is important that health care students are motivated to learn. However, some students lack motivation, especially in difficult courses. The MUSIC Model of Motivation was developed by Jones (2009) through the study of motivation theories and research. It is comprised of five factors that have been shown to be highly correlated with motivation. The acronym MUSIC spells out the factors: M for eMpowerment, U for Usefulness, S for Success, I for Interest, and C for Caring. The MUSIC Model of Academic Motivation Inventory (MMAMI) measures students´ perceptions of these five components and was developed to assist teachers in assessing their students motivation with the goal of reflecting on, and subsequently, modifying their teaching strategies.

Method: An Icelandic translation of the inventory was submitted to students at two departments at a school of health sciences at a university in Iceland. The inventory had been translated to Icelandic, translation equivalence acquired, and factor structure confirmed through back-translation, CFA and model tests (Schram & Jones, 2016). Four hundred and twenty responses were received.

Results: Students´ ratings in both departments followed a pattern: On a Likert scale from one to six, students rated the caring aspect the highest (m=4.97). Most perceived their teacher as helpful and caring. Usefulness was the second (m=4,66). Most believed courses were or would be useful. Next was success (m=4.43). Students believed that they could be relatively successful. Interest came second lowest (4.21). Students thought the coursework was interesting but found it hard to keep attention. Empowerment had the lowest mean (m=3.98). Students did not experience a high level of autonomy in the classroom.

Discussion & Conclusion: The results inform the teacher of his/her performance and s/he can respond accordingly by explaining why the course is useful, giving more support to promote success, making lectures more interactive or use cooperative learning to increase interest, etc.

Take-home message: The inventory is useful both for researchers to assess motivation, in general, and teachers to assess their students´motivation. The inventory is free and can be found at www.themusicmodel.com

10HH8 (2662)
Medicine in Portugal – perceptions and motivations of medical students

Authors
Joana Martins
Isabel Fonseca
Daniela Gomes
Idalina Beirão

Presenter: Idalina Beirão, Portugal

Background: The motivations underlying the choice for learning medicine are essential components for medical education success and an important predictor of learning, academic success and well-being of medical students. There are a lot of reasons why people chose to study Medicine, ranging from personal calling to familiar pressures. The aim of this study was to evaluate the motivations underlying the choice and the study of medicine and the expectations for the course of Portuguese students.
Method: Based on the literature, a questionnaire about students' backgrounds, their motivation for and interest in the study of medicine and their career intentions was developed and applied to students of the first, third and sixth years of medicine at one medical school in Portugal. Data was analyzed with SPSS using descriptive statistics.
Results: Of the total of 540 students, 324 (60%) answered the questionnaire. Of the 324 students, when asked about what motivated them to study medicine, 30.9% answered "fit my interests" and 29% answered "providing care for people with diseases". When asked about the advantages of studying medicine, the majority replied that it is to acquire knowledge about the human body and diseases and 24.4% reported working with people. As a disadvantage, 43.2% answered "too much to memorize". Almost half of sample (49.4%) believes it is necessary for medical school to offer education in subjects outside the medicine field and 42.3% of students in the third and sixth year believe that some areas in medicine at ICBAS could be expendable.
About career intentions, 25.3% elect hospital clinical fields and 25.3% medical-surgical careers. In the future, most students aspire to work in a public hospital. The majority of students (65.1%) believe that the greatest merit of being doctor is the humanitarian nature of work.
Conclusions: Thy study allowed to know the perceptions and motivations of students to choose Medicine and became a doctor in a Portuguese medical school. This knowledge will allow the development of strategies to enhance academic performance.

10HH9 (1079)
Incorporation of resilience into medical school curriculum

Authors
Chaya Prasad, Western University of Health Sciences, Pomona, USA

Presenter: Chaya Prasad, Western University of Health Sciences, Pomona, USA

Background: Burnout, depression and suicide rates are on the rise in medical students. Current curriculum fails to address this difficult topic. The author, having personally faced burnout, was determined to share her experience and make a change to the medical school curriculum. Integration of a resilience course may be an effective intervention and allow students to be proactive.
Method: A resilience course was integrated into the medical school curriculum for OMS 1 through 4 students. Sessions included definitions, signs and symptoms and data regarding burnout in the medical profession, with the author sharing her personal story of burnout. Resiliency building tools including time management, nutrition, exercise, mindfulness activities. Peers who had faced burnout and had subsequently developed resiliency skills shared their experiences. Students completed pre and post session surveys.
Results: 300 students, at each grade level participated. Prior to the sessions students were more familiar with the term burnout (95 %) than resilience (82 %). This number increased to 99 % and 95 % at the end of the sessions. 72 % could self-identify burnout prior to the sessions and 99 % after sessions. 50 % did not know how to address a burnout prior to sessions. After presentation 85% were actively taking proactive steps. 68% of students wanted resiliency topics to be incorporated into curriculum. OMS 4 students stated that the sessions would have been more beneficial if offered at start of medical school. Free text comments were emotional and heartfelt.
Discussion & Conclusion: Stress and burnout are on the rise in medical students, with carry over into residency training. Education and provision of resiliency building skills is the first step towards wellness. We successfully incorporated a course on burnout/resiliency into our medical school curriculum. Student knowledge level rose significantly with education with students taking proactive measures. Additional efforts, including longitudinal studies, enhanced student participation and institutional support are necessary to better understand long term effects.
Take-home messageS: Medical institutions are socially accountable to foster resilience during medical school continuum. Integration of wellness lectures is the first step towards achieving this goal.

10HH10 (2404)
Enhancing Healthcare Undergraduates' Emotional Intelligence through a Psycho-educational intervention

Authors
Mandakini Mohan, International Medical University, Kuala Lumpur, Malaysia
Seow Hui Yean, International Medical University, Kuala Lumpur, Malaysia
Mabel Wu Huey Lu, International Medical University, Kuala Lumpur, Malaysia
Allan Pau Kah Heng, International Medical University, Kuala Lumpur, Malaysia
Hildegunn Ellinor Kutzsche, International Medical University, Kuala Lumpur, Malaysia
Norul Hidayah Binti Mamat, International Medical University, Kuala Lumpur, Malaysia

Presenter: Mandakini Mohan, International Medical University, Kuala Lumpur, Malaysia

Background: Emotional Intelligence (EI) is defined as the ability to recognize, understand, and manage emotions while Transactional Analysis (TA) is a model for understanding human behavior by analysing ego states. The objective of this study was to compare the baseline, 4-week and 6-month follow-up (EI) scores between healthcare undergraduates receiving a psycho-educational training (PET) based on TA, and those receiving information leaflets alone. Participants' experience and impact of the intervention was also evaluated.
Method: A four week PET programme was designed by two education psychologists. Each weekly 90-minutes session allowed discussion on concepts of EI and TA, role-plays and experiential sharing. Thirty-four Health professions students at one university volunteered to participate, with 17 receiving the PET and reading material on EI and TA while 17 receiving only the reading material.
Results: All participants completed the 16-item Wong and Law EI Scale at baseline, at completion of the 4-week training and at 6 month follow-up. The paired T-test was carried out to test for differences in EI scores. Following training, intervention participants were interviewed which was audio-recorded, transcribed and analyzed.
The mean EI score at baseline was 72.9 (SD=14.0) for the intervention and 82.4 (SD=7.7) for the control group, and 88.5 (SD=11.3) and 86.5 (SD=8.6) for the 4 week and 6 month follow-up respectively. Paired samples test indicated that the mean difference between baseline and follow-up EI scores for the intervention group (15.6, SD=12.0, p=0.001) was higher than the mean difference for the control group (4.06, SD=5.7, p=0.10). Participants found that they had improved in all four domains of EI through this training.
Discussion & Conclusion: Various EI-enhancing interventions have been reported. The design of the intervention in the present study, based on well-established psychological and behavioral concepts, accounts for its strength in enhancing EI. The use of the controlled trial study design and tested EI measurement provided strong support for the findings.

The results suggest that EI scores in undergraduates may be enhanced through a psycho-educational training. However, further research is need to test this intervention in different samples and also its longer term effect.

They Like Me, They Like Me Not? How Medical Students Can Gain Trust from Residents and their Teams during Clinical Education

Authors
Xinuo Guo, Ross University School of Medicine, Miramar, USA
Madhura Manjunath, Ross University School of Medicine, Miramar, USA
Vijay Rajput, Ross University School of Medicine, Miramar, USA

Presenter: Vijay Rajput, Ross University School of Medicine, Miramar, Florida, USA

Background: Trust between students and their supervising residents and attending physicians is key to an effective clinical education in patient care environment. Medical students are constantly trying to fit into the clinical hierarchy and organized chaos that predominate teaching hospitals. In an era of inter-professional education the entrustment of medical students within these teams during their clinical education has not been extensively studied.
Method: We conducted a narrative review of the current literature in the English language regarding trust and autonomy in medical education. We analyzed the literature from the last two decades and explored the role of entrustment in medicinal students. Narrative experiences and observations during clinical clerkships were also taken into account in an attempt to evaluate factors that enhance the engenderment of trust.
Results: Lack of interest, disregarding responsibilities and the short duration of clinical rotations can negatively impact the development of trust between medical students and their residents. The following factors allow medical students to build trust during their clinical clerkships: (1) fostering a positive relationship with other medical students throughout clinical education, (2) taking ownership of their patients on the team, (3) establishing expectations and clearly communicating them at the beginning of the clerkship, (4) demonstrating an ability to be dependable, and (5) showing a willingness to work hard.
Discussion & Conclusion: Establishment of trust within team members will allow students to gain autonomy and strengthen their experience and independence when taking care of patients. This also enhances the development of a professional identity during their clinical experience. Emerging research show interpersonal and inter-professional trust is critical in patient care. Trust, accountability and autonomy are complex dynamic factors that interplay during a medical student's transition into residency. The formation of trust between medical

students is a characteristic that should be fostered early in medical education. Medical students can develop required skills and behaviors to form trust with their residents and medical teams when undergoing their clinical education.
Take-home messageS: Medical education community should promote these qualities in students during their training in pre-clerkship and clinical clerkships, particularly in fostering a positive relationship between students.

The role of medical student mind-set in the achievement of early academic success

Authors
Tanya Tolmachova, Medical Education Research Unit, School of Medicine, Imperial College London,UK
Michael Emerson, National Heart and Lung Institute, Faculty of Medicine, Imperial College London, UK
Susan F Smith, Medical Education Research Unit, School of Medicine, Imperial College London, UK

Presenter: Susan Smith, Medical Education Research Unit, School of Medicine, Imperial College, London, UK

Background: Many students find the transition from school to university challenging, despite having performed extremely well in their prior studies. In this investigation we explore the factors which are perceived by staff and students to contribute to academic success in the first two years of an undergraduate medicine programme.
Method: We undertook semi-structured interviews with ten second year medical students and eight personal tutors to first and second year students about their perceptions of academic success. We specifically asked about the factors which assisted students achieve success in their first year of study. Interviews were recorded, transcribed and thematically coded.
Results: Whilst students perceived academic success as a combination of knowledge acquisition and achievement, staff perceived engagement with the programme as the essential foundation on which knowledge and skills were founded and which, in turn, gave rise to achievement and thus academic success. The factors driving engagement and the acquisition of knowledge and skills were the external pressure of examinations and rankings, social background and prior life experiences and individual personality traits. Students with an incremental mind-set (1) and with both performance goals (orientated towards attaining external validation) and learning goals (orientated towards a desire to learn) were more likely to engage fully with the programme, deal more effectively with difficulty and achieve greater academic success than their peers. Although performance goals stimulated motivation, students who focused exclusively on these were lacking in resilience.
Discussion & Conclusion: The importance of student mind-set is a major factor in student achievement in the early years of the programme. In order to facilitate the development of an incremental mind-set the School of

Medicine is providing coaching skills training to its staff so they can help students develop greater self-management.
Take-home message: Coaching medical students to maintain or develop an incremental mind-set is likely to help them achieve academic success in the early years of their programme of study.

Self-Regulation Skills and its Role in Academic Success in Medical Students

Authors
Lamya Alrayes, Alfaisal University, Riyadh, Saudi Arabia
Walaa Elsekaily, Alfaisal University, Riyadh, Saudi Arabia
Maram Alrefai, Alfaisal University, Riyadh, Saudi Arabia
Sara Ahmed, Alfaisal University, Riyadh, Saudi Arabia
Mohammad Sharique Ahmad, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Lamya Alrayes, Alfaisal University, Riyadh, Saudi Arabia

Background: It is believed that learning processes are aided with the right use of time management skills, focus of attention and concentration on the right aspects of any learning objective, self-testing, and the usage of proper resources. This study looks at the correlation between self-regulation skills and academic success in medical students, along with comparisons between gender, academic level, and the high school education system.
Method: An online survey was administered to year 1 to 5 medical students. Students chose their answers on a 5-point Likert-scale (1 = not at all typical of me, 5 = very typical of me) on several topics of self-regulation. 24 Questions were split into sub-categories of concentration, time management, self-testing, and usage of academic resources. Additionally, each participant was required to provide their gender, GPA, and high school education system.
Results: Of the 109 students that responded, 63% showed adequate skills (4 or 5 on the Likert-scale) for the concentration and attention variables, 38% for usage of available resources, and just 22% for self-testing methodologies. Those that do appropriately carry out self-testing methodologies had a higher GPA (3.52 vs 3.40). Females tend to be more focused, whereas males tend to be more resourceful. Varying results were also seen depending on whether the student graduated from an American, British, or Saudi education system.
Discussion & Conclusion: The ability to self-regulate is an important factor to improve students' grades. Most students are already self-trained in concentration and attention, from several years of studying in school and college. Self-testing and the usage of resources are low in our study and cannot be blamed on the students themselves as these are not as important in high school as they are during college years. Being well oriented with

self-regulation skills is important in academic success for students.

Take-home message: Educational interventions are needed to make students aware of the of self-testing and be oriented about the resources available to them. Students good at self-regulation are likely to be successful academically.

10HH16 (1863)
Academic integrity: attitudes and perceptions of teachers and medical students

Authors
Isabel Neto
Inês Barroca

Presenter: Isabel Neto, Faculty of Health Sciences, University of Beira Interior, Covilhã, Portugal

Background: Academic honesty is an ethical requirement for any Medical practitioner. However, dishonest academic behaviours are practiced around the world, increasing concern about the lack of students' skills in their professional future. Nevertheless, little is known on this subject in Portugal, particularly among Medical students. The objective of this work was to analyse the perspective of students and teachers on the students' academic conduct.
Method: 580 students from years 1st to 6th of the medical course and 32 teachers (from basic and clinical sciences) completed a questionnaire about their perceptions of students' dishonest behaviours. We compared students and teachers answers about students' behaviours and the seriousness they attribute to them.
Results: The mean value of dishonest academic behaviour declared by students was very low ($1,41\pm0,46$) but teachers believe that they have these behaviours more often ($1,78\pm0,46$) ($p<0,005$). The most common dishonest attitudes were "asking a colleague to sign for themselves the class attendance record", "change a class attendance record" and "copy answers by a colleague during an exam" which teachers and students agreed are the less serious behaviours. The less common was "to pay an examiner to pass an exam" and was considered the more serious by the two groups. However, almost all behaviours were considered more severe by teachers ($3,45\pm0,32$) then by students ($2,96\pm0,48$) ($p<0,001$).
Discussion & Conclusion: It was found that the level of prevalence of dishonest behaviour that Medical students declare to practice is very low despite teachers believe this prevalence is higher. However, medical students' perceptions about the seriousness of that behaviours are lower than desirable since they can influence their future professional attitudes. Medical educators must be aware of this issues and work with students to develop the appropriate attitudes related to medical profession.
Take-home message: Medical schools should take the necessary measures to prevent the practice of less ethical attitudes by future doctors.

Learning styles in an international classroom

Authors
Tiina Immonen

Presenter: Tiina Immonen, University of Helsinki, Finland

Background: Deep approach to learning has been connected to better learning outcomes. Studies across disciplines and different educational systems have shown learning approaches to be dynamic and related to educational contexts, rather than to be rigid and predictable. We studied the approaches to learning among multicultural Translational medicine students "in situ".
Method: A questionnaire was sent to all students in Master's Programme in Translational medicine (TRANSMED). The questionnaire was based on two internationally validated question sets: Learn and RoLi (Reflections of learning inventory). Student's learning styles were analysed across five variables represented in the questionnaire using an individual-oriented approach.
Results: The students were grouped based on their scores for deep approach and organized studying. Three different profiles were identified: those with high scores for both, those with high score for deep approach but medium score for organized studying, and those with medium scores for both deep approach and organized studying. In contrast to previous studies, surface approach -oriented students were completely absent. Much of the current literature studies first-year university students, and the results should not be applied to Master's students. On the other hand, only medium scores for self-regulation were common among students with deep orientation to learning.
Discussion & Conclusion: It has been shown that discordance of the educational design with deep learning style impairs the correlation between deep orientation and study success. Thus the assessment, teaching methods and constructive alignment within curriculum and courses should be aligned with deep approach to learning, while simultaneously supporting their self-regulation skills.
Take-home message: Studies comparing the learning styles of various demographic groups of students are of little help in designing the curriculum and methods of teaching and assessment in international education. Instead, the learning styles of the often highly selected students in each programme should be studied in their actual learning environment.

10HH19 (345)
Comparisons of the learning styles among medical students of different application methods

Authors

Hsiang-Chin Hsu, National Cheng Kung University Hospital, Tainan, Taiwan

Hsin-I Shih, National Cheng Kung University Hospital, Tainan, Taiwan

Chih-Hsien Chi, National Cheng Kung University Hospital, Tainan, Taiwan

Chih-Hao Lin, National Cheng Kung University Hospital, Tainan, Taiwan

Wei-Jen Yao, National Cheng Kung University Hospital, Tainan, Taiwan

Presenter: Hsiang-Chin Hsu, National Cheng Kung University Hospital, Tainan, Taiwan

Background: A learning style is the complex manner in which learners prefer in learning materials most efficiently and effectively. Learning style is a good predicator for individual's preferred learner's learning behaviors. The identification of learner's learning styles helps educational planners and teachers provide learners necessary educational support and design. However, there are limited study of medical students' learning patterns which is compared between different admission methods to medical college. The study was to explore the status of new medical students' learning patterns.
Method: This is a retrospective questionnaire-based analysis of learning style in new enrolled medical students. Memletic Learning Style Inventory (LSI) was provided for medical students those who entered the college in three academic years from September 2014 (academic year 2014) to September 2016 (academic year 2016). The seven types of learning style were analyzed.
Results: During the three consecutive academic years, there were 77, 77, 86 students admitting College of Medicine, National Cheng Kung University, respectively. 87 medical students were through national college entrance examination and 133 were through application. Visual style, verbal style, and physical style were significant in application admission group and logical style was significant in examination admission group. All medical students can be divided into 4 classes according to learning styles and admission methods.
Discussion & Conclusion: The learning styles of medical students was different between different admission methods. It can be divided into four categories of students' characteristics. This study can provide us a better understanding of the student learning patterns to helps educational planners and teachers provide learners necessary educational support and design learner-specific courses and effective curriculum.

10HH20 (1953)
Motivational Profile and Learning Strategies of Students from 1st to 4th Year of Medical School at Universidad Andres Bello Viña del Mar, Chile

Authors

Veronica Silva, Universidad Andrés Bello, Viña del Mar, Chile

Valentina Pérez, Universidad Andrés Bello, Viña del Mar, Chile

Sebastián Aroca, Universidad Andrés Bello, Viña del Mar, Chile

Constanza Pefaur, Universidad Andrés Bello, Viña del Mar, Chile

Pedro Soriano, Universidad Andrés Bello, Viña del Mar, Chile

Denissa Gálvez, Universidad Andrés Bello, Viña del Mar, Chile

Presenter: Veronica Silva, Escuela de Medicina Universidad Andrés Bello, Viña del Mar, Chile

Background: Motivation and learning strategies are two important areas to achieve a significant learning experience. Objective: determine the motivational profile and learning strategies of students from 1st to 4th year of medical school.
Method: A cross-sectional study with 185 students. Informed consent was obtained. The Motivated Strategies for Learning Questionnaire (MSLQ) was applied, which measures motivation (intrinsic (IM) and extrinsic (EM)) and learning strategies (LS). Statistical analysis: mean and Anova test p < 5%.
Results: IM (5,34) is higher than EM (4,38) p <0.0001; and higher in men (5.54) than women (5.23) p <0.01. EM from 1st to 4th year is 5.48; 4.01; 4.38; and 3.65 respectively (p <0.0001).
IM from 1st to 4th year is 5.76; 5.27; 5.38; and 4.91 respectively (p <0.0001). In the motivational subdimension self-efficacy, average men is 5,54 and women 5,23 p <0,01. In the resource management dimension of LS, the scores decrease from 1st to 4th. In the dimension congnition and metacognition of LS, the subdimentions organization, critical thinking and self-regulation, decrease from 1st to 4th year p <0.001. In LS, organizational subdimension obtained an average of 5.88 in women and 4.94 in men, p <0.0001.
Discussion & Conclusion: IM and EM decrease as courses progress, could be explained by academic demands, subjects complexity, study load, beginning clinical practice and decreased free time. LS consistently decreases as global motivation does. Self-efficacy (higher in men) and organization (higher in women), may explain inherent gender differences. Elaboration is an important strategy however it decreases over time, although it should be maintained or increased.
Intrinsic motivation is greater than extrinsic motivation. Both decrease with course progress. Learning strategies also suffer a decrease. Both situations are alarming, as they do not favor a comprehensive development of the student.
Take-home message: A cohort study should be developed to obtain more accurate information on the observed changes. Strategies should be developed to maintain

stable motivation and strengthen learning strategies at different levels.

10HH21 (1672)
"Su-Ji-Pu-Li" appreciating learning styles in clinical years of medical students

Authors
Rungnapa Pengprakhon
Yada Siriphannon
Narin Chindavech
Surasak Aumkaew
Thanatpong Thienwuttiwong

Presenter: Rungnapa Pengprakhon, Buriram Medical Education Center, Buriram, Thailand

Background: In general, the skills of students for learning new things have many variation. In oriental way, the heart of the philosopher called in Bali word "Su- Ji –Pu- Li" is mean "listening-thinking-ask-writing", that leading to make the wise man.
Different skills to recognize will change according to life learning experience. In 2011, Franklynn Chernin introduced appreciating learning style differences and preference for help in planning and implementing personal learning strategies.
Understanding in appreciating learning styles can apply the appropriate learning method and suitable environment for medical student in clinical years.
Method: Electronic questionnaires and online self assessment were sent to 4th-6th clinical medical students before and after medicine rotation. The ten questionnaires contained of three parts. Each question has four choices of skills to classified students in four different learning styles as "A=visual", "B=reading", "C=auditory" and "D=kinesthetic" by rating scales. The data were analyzed individually, in pre and post and then compared to each student years. Mean of sum scores of each items were calculated.
Results: Seventy-seven questionnaires were collected. The more appreciate learning style of 4th year students was kinesthetic, visual, reading and auditory (3.67, 2.73, 1.83, 1.77) respectively. For 5th year students was visual, kinesthetic, reading and auditory (3.79, 3.0, 2.46, 0.75) respectively. And 6th year students was kinesthetic, visual, reading and auditory(4.13, 2.83, 2.04, 1.0) respectively. There were no difference in pre-post evaluations but individually student changed their styles while growing with the year.
Discussion & Conclusion: The most appreciate learning style in 4th and 6th year students were the same of kinesthetic while 5th students like visual learning style. These may result from "mind mapping concept" to understand much medical core content in 5th year meanwhile the4th year students, they learning new things by doing first time in clinical ward. And for 6th year medical students, they preferred kinesthetic learner because they had some skill in practice to gained experience and kept in training to become real doctors.
Take-home message: The appreciating learning styles is a dynamic patterns that medical teacher should provide

appropriate leaning materials and learning environment with each student groups.

The Hidden Curriculum in Peer-Assisted Learning: a study of final year students in a Thai medical school

Authors

Amnuayporn Apiraksakorn, Khon Kaen Medical Education Centre, Khon Kaen Hospital, Khon Kaen, Thailand
Stella Howden, The Centre for Medical Education, University of Dundee, Dundee, UK
Bryan Roderick Hamman, The Research Affairs, Publication Clinic, Faculty of Medicine, Khon Kaen University, Thailand
Janice Loewen-Hamman, The Research Affairs, Publication Clinic, Faculty of Medicine, Khon Kaen University, Thailand

Presenter: Amnuayporn Apiraksakorn, Khon Kaen Medical Education Centre, Khon Kaen Hospital, Khon Kaen, Thailand

Background: Peer-assisted learning (PAL) is defined as learning from and teaching others who are from a similar society but who are not engaged in a teaching career. PAL is accepted worldwide as an important learning experience for undergraduate medical students. The hidden curriculum is defined as a set of influences that function at the organisational, structural, and cultural level. The hidden curriculum is the knowledge that students absorb in addition to the formal and informal curriculum, which shapes their views vis-à-vis their career path.
Method: The aim of the current research was to explore the hidden curriculum associated with PAL among fourteen final-year medical students and their perspective of this hidden curriculum using a qualitative case study approach, through direct observation and individual interviews.
Results: The students reported both positive and negative experiences with PAL. Four core themes emerged from the thematic analysis of student interviews which were then triangulated with observational data: (i) developing empathy, (ii) developing self, (iii) tension between feedback needs and eliciting dialogue, and (iv) barriers to deeper learning. This research adds new insights into the hidden curriculum associated with PAL, such as: (a) student concerns about peers presenting incorrect information during teaching sessions; (b) difficulties experienced by students in comprehending English journal articles and statistics; and, (c) students plagiarising presentations.
Discussion & Conclusion: The hidden curriculum can affect the entire educational system; from what and how students are being taught and what is being learnt in the medical habitus, which then informs and shapes the medical curriculum and curricular development. The findings in the current study on hidden curriculum highlight the importance of considering the formal, informal, and hidden curriculum as an integral part of curriculum evaluation. The implications of the study are discussed in relation to the use of PAL as part of medical school teaching and learning strategies.
Take-home message: The policy makers and all stakeholders of medical schools involved in curriculum development and delivery need to consider addressing formal, informal, and hidden curricula to best suit medical graduates and the needs of the patients they will ultimately serve.

10II2 (2607)
Peer-teaching for hifi simulation aimed at clinical reasoning training

Authors

Lucile Morgan
Robin Jouan
Patrick Baqué
Jean Paul Fournier

Presenter: Jean Paul Fournier, Faculte de Medecine de Nice Sophia Antipolis, Nice, France

Background: Tutors shortage is a major limiting factor of simulation. Peer-teaching is an efficient way of training both students or mentors but scarcely used in simulation programs.
Method: Voluntary 4th and 5th-year medical students (4-5 YMS) were trained to prepare and rule 4 hifi simulation sessions with 8 scenarii aimed at clinical reasoning training for 2nd and 3rd-year medical students (2-3-YMS). Students were randomized to attend sessions with peers or faculty in a 2/1 fashion. They took a specifically-designed Script Concordance Test (SCT) before sessions and after a 3 week-wash-out (same questions in a random order). Demographic data, pre-simulation academic examinations scores were compared, as were SCT scores before and after simulation sessions between the 2 groups, year by year. Peers' demographic data and academic examinations scores before and after sessions were compared with non-participating 4-5 YMS. All analysis were conducted for each academic year. Fisher and Wilcoxon tests were used, with significance being defined for $p < 0.05$.
Results: 86 2-YMS, and 141 3-YMS attended both simulation sessions and SCT. 17 4-YMS and 14 5-YMS prepared and ruled the sessions. Pre-simulation data were not different for all participating students (attendees and peers). 2 and 3-YMS significantly improved their SCT scores, with no difference in progression for peers-trained students vs faculty-trained students : respectively : 10.22 ± 12.25 vs 10.15 ± 7.26 and 4.68 ± 6.61 vs 4.06 ± 9.07. Post-simulation academic scores were significantly higher for 4-YMS ($11,42 \pm 1,13$ vs $10,60 \pm 1,36$, $p = 0,01$) and 5-YMS peers ($12,63 \pm 0,94$ vs $11,84 \pm 1,37$, $p = 0,01$), compared with non participating students.
Discussion: Results were reproducible for attendees and peers whatever was their academic year, with a significant improvement in both cases.
Conclusion: Hifi sessions aimed at clinical reasoning training were efficient whatever the tutors were (faculty

vs peers). Peers significantly improved their academic results.

Take-home message: Introducing peer-teaching in hifi simulation is a promising way of circumventing tutors shortage in simulation centers, for both attendees and tutors.

10II3 (1249)
Perception of Paired Learning in Speech Therapy Fresh Graduates

Authors

Chok See San
Tng Kuan Chen
Eileen Fong

Presenter: See San Chok, Tan Tock Seng Hospital, Singapore

Background: This education research is to study learners' perception of paired learning model. Tan Tock Seng hospital (TTSH) has been actively recruiting speech therapists to provide care to a rapidly aging population in Singapore and all fresh graduates are required to undergo clinical education. Therefore, the Speech Therapy department has adopted 1 clinical educator (CE) to 2 learners supervision model with newly developed structures in place since 2017 to promote efficiency and effectiveness in learning.

Method: An online survey was carried out for 9 learners who joined TTSH Speech Therapy department in 2017 with less than 1 year of working experience. The survey includes 10 questions with a 5-point Likert scale, and three open-ended questions.

Results: All learners agreed that they benefited from observing their peers receiving feedback from their supervisors. Almost all of them learnt from peers' feedback pertaining to their performance and in return they have also contributed to their peers' learning. However, 25% of the learners felt that paired learning was stressful. 12.5% of them found it difficult to provide feedback to each other. 12.5% of them felt that they did not receive adequate education from their CEs.

Discussion & Conclusion: Two main challenges that were mentioned frequently by the learners are:
1. Difficulty catching up with peers due to differences in learning style and clinical competencies.
2. Too reliant on each other.
Almost all respondents suggested having individual sessions at certain stage of their learning journey.

Discussion: Paired learning has contributed to the learning of speech therapy fresh graduates. However there are a few factors we need to consider for further improvement. Having individual training session might be useful towards the end of learning journey to facilitate learners in achieving full competency independently.

Conclusion: The feedback solicited was important for the department to evaluate effectiveness of this model. More specific feedback will be needed to further refine the structures and guidelines supporting this learning model so that it can cater to different learners' needs.

Take-home message: Paired learning model promotes effective learning experience among the speech therapy fresh graduates.

10II4 (556)
Same grade peer-to-peer tutoring experiences for clinical skills among the 2nd year undergraduate medical students

Authors

Sang Hui Moon, Seoul National University College of Medicine, Seoul, South Korea
Sun Jung Myung, Seoul National University College of Medicine, Seoul, South Korea
Choong Ho Shin, Seoul National University College of Medicine, Seoul, South Korea
Hyun Bae Yoon, Seoul National University College of Medicine, Seoul, South Korea
Jun-Bean Park, Seoul National University College of Medicine, Seoul, South Korea
Kyung Duk Park, Chonbuk National University Medical School, Jeonju-si, South Korea

Presenter: Sang Hui Moon, Seoul National University, Seoul, South Korea

Background: Seoul National University college of Medicine launched new curriculum in March 2016. In preparation for clinical clerkship, Introduction to Clinical Medicine course was scheduled as one-year longitudinal course instead of the previous 3 weeks block. To foster active learning and team approach, we introduced innovative same grade peer-to-peer tutoring for clinical skill classes.

Method: One hundred fifty one 2nd-year students were divided into 6 groups and learned 2 sets of six clinical skills. Each set of classes continued for consecutive 4 weeks; one week for mastering one skill with a faculty tutor and 3 weeks for peer-to-peer tutoring. Every student had one session to teach peers and five to be taught by peers. While small group of student tutors led the class, a fellow or resident doctor supervised the whole process and helped tutors on request. Students underwent two OSCEs, one of which was course evaluation and the second was progress test. We surveyed students' opinion about peer tutoring.

Results: Tutor student got a little better scores in the first OSCE, however, the result did not chance the grade. In the progress test, the score was not statistically different between tutor students and others. The mean students' satisfaction for the overall course and the way of operation was 4.3 and 4.6, respectively (Likert scale, 6 is very satisfied). Practice itself was chosen as the most helpful method to improve clinical skill, followed by peer-teaching and being taught by peers. Even though students slightly preferred expert tutors for coming classes, more than half of all student were willing to learn from peers. Students showed positive response to being an educator and working together. On the other hand, peer tutors had difficulties in answering questions due to lack of clinical experience.

Conclusion: Same grade peer-to-peer tutoring was feasible and gained positive educational effect of active learning and team work. Less faculty staffs were needed for the course running, however, more study is needed to compare expert and peer tutoring.

Take-home message: Peer tutoring can be a solution for shortage of faculty tutors.

10II5 (3359)
Collaborative Learning for Histopathology Education

Authors

James L. Fishback, Department of Pathology & Laboratory Medicine, University of Kansas, School of Medicine, Kansas City, USA
Robert M. Klein, Department of Anatomy & Cell Biology, University of Kansas, School of Medicine, Kansas City, USA

Presenter: James Fishback, University of Kansas, School of Medicine, Kansas City, USA

Background: Over the course of our combined 70+ years of teaching histology and histopathology in the pre-clinical phase of medical school, we have observed that histology, and closely-related histopathology, seem to be difficult subjects for most medical students to master. In traditional curricula, the disciplines of histology and pathology are often taught in separate years with the promise to students that the normal microanatomy will be important during the pathology course to follow.
We combined histology and histopathology as we initiated an integrated basic science curriculum about a decade ago. Our initial teaching paradigm, upon selecting the Aperio Scanscope® (now Leica®) system to digitize our respective histology and histopathology slide sets into "virtual microscopy" slides, was that each individual student would examine the assigned slides, take photomicrographs, and generate their own atlas. The teaching style still remained passive and dominated by the instructor leading the class. We have now modified our pedagogical approach, to a team-based, collaborative learning model.

Method: To accomplish this aim, we assigned the students into small groups of "microdissection" teams, mirroring the approach we use in human anatomy dissection. These collaborative groups of 3 or 4 students would then present the case, including the history, relative labs, imaging, gross pathology, and microanatomy to their classmates. The VINDICATE acronym was used to organize a differential diagnosis framework for case collaboration, and to enhance differential diagnostic and clinical reasoning skills. The exercise mimicked clinical students on rounds with the facilitator serving as attending physician. Each clinical case contained hyperlinked references to the medical literature (a pathology textbook or general medical journal, e.g., The New England Journal of Medicine®). In order to facilitate this collaborative process, we decided to use Microsoft Office 365® and the included OneNote® program.

Take-home message: Students adapted to the collaborative learning experience and improved dramatically in their case presentations and felt better prepared for their clinical years where they will present patients on clinical rounds. The use of collaborative groups also leveraged the diversity of adult learning skills seen in most medical school classes, and use that diversity in styles to enable deeper learning.

Measuring social interdependence in collaborative learning: Instrument development and validation

Authors

Ikuo Shimizu, Shinshu University, Matsumoto, Japan
Makoto Kikukawa, Kyushu University, Fukuoka, Japan
Teiji Kimura, Shinshu University, Matsumoto, Japan
Tsuyoshi Tada, Shinshu University, Matsumoto, Japan
Robbert Duvivier, University of Newcastle, Callaghan, Australia
Cees van der Vleuten, Maastricht University, Maastricht, Netherlands

Presenter: Ikuo Shimizu, Shinshu University, Matsumoto, Japan

Background: In medical education, several collaborative learning approaches such as problem-based learning and team-based learning have been used. Collaborative learning has a theoretical background of social interdependence theory (SIT). In other words, collaborative learning is a learning method to engage students in positive social interdependence. To evaluate and compare several learning approaches, a valid instrument to measure social interdependence is required.

Method: Firstly, a draft instrument was prepared based on a theoretical construct of SIT. Then a modified Delphi procedure was conducted with three types of international stakeholders (10 medical students, 10 education experts, and 10 medical faculties with any experience of collaborative learning) in 8 countries (Australia, Czech Republic, Japan, Malaysia, Netherlands, Singapore, Thailand, the USA). Secondly, fourth-year health professions students in Shinshu University with experience of collaborative learning were asked (n=239) to answer the instrument. Then a confirmatory factor analysis of the data was conducted to establish construct validity. Finally, to test a model of the factors, the fit of a structural linear model to the data was tested.

Results: Two rounds of Delphi were conducted to revise the instrument. Confirmatory factor analysis yielded a three-factor model with 16 items, which fitted the data well. The three factors were considered to represent the categories in SIT; outcome, means and boundary, respectively. Cronbach's alpha of these factors showed high values (outcome=.854; means =.803; boundary=.873).

Discussion & Conclusion: A structural linear model revealed that the three factors affected each other, and the model was consistent with the concept of SIT.
This study describes the development and construct validation of an instrument for measuring social interdependence in collaborative learning. This instrument will provide individual faculties with feedback about their classroom environment.

Take-home message: When faculties try to design and implement a collaborative learning approach, the three categories in SIT should be considered.

Measuring Social Interdependence in Collaborative Project-Based Learning

Authors

Tsan-Hon Liou, Shuang Ho Hospital; School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan
Po-Fang Tsai, Graduate Institute of Humanities in Medicine, College of Humanities and Social Sciences, Taipei Medical University, Taipei, Taiwan
Chien-Yu Chen, Department of Anesthesiology, School of Medicine, College of Medicine, Taipei Medical University; Department of Medical Education, Taipei Medical University Hospital, Taipei, Taiwan
Chien-Chih Wu, Department of Medical Education, Taipei Medical University Hospital; Department of Education and Humanities in Medicine, School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan
Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan

Presenter: Tsan-Hon Liou, Shuang Ho Hospital; School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan

Background: This study aims at identifying a collaborative project-based learning path to help maintain students' positive social interdependence (PSI). To conduct the study, we considered the physicians' role as collaborators and provided four types of medical-humanities collaborative learning projects to 160 year-3 medical students to select from (40 students per model).
Method: A scale based on cooperative learning theory was conducted to measure students' appreciation of cooperative learning, psychological process within PSI, and confidence in Teamwork Effectiveness among the four groups: A) study group for community-based medicine, B) open information working group, C) consensus conference working group, D) clinical stimulation for informed consent. 95 students participated in this survey.
Results: The ANOVA of psychological process within PSI was significant (p=.01<.05). The post hoc tests (Scheffe's procedure) indicated the significant differences existed between group A and group C (p=.0.0263.075).
Discussion & Conclusion: Among the four projects, differences in three areas were noted: autonomy, required learning engagement, and group size. The team size in group A was 2 members, in group D was 10, while the group size in other models was 20. Group A had completely autonomy to plan their works but under structured schedule.
Students in the small group size with full autonomy to choose their project topics, but within a rigid timeframe demonstrated a stronger attitude towards positive social interdependence.

Take-home message: According to Johnson and Johnson (2005), the positive social interdependence lead students to the successful collaborative learning. To help student maintaining PSI, instructors should provide small group size for team project, rigid working schedule, and empower them to conceive the idea of their final outcome.
Johnson, D. W., & Johnson, R. T. (2005). New developments in social interdependence theory. Genetic, social, and general psychology monographs, 131(4), 285-358.

What are the teaching strategies that promote self-regulated learning among the pre-clinical medical students?

Authors

Shuh Shing Lee, National University of Singapore, Singapore
Dujeepa Samarasekera, National University of Singapore, Singapore
Shing Chuan Hooi, National University of Singapore, Singapore
Kong Bing Tan, National University of Singapore, Singapore

Presenter: Shuh Shing Lee, National University of Singapore, Singapore

Background: Self-regulated learning (SRL) ability is an important core attribute for students to develop. This is essential to instill lifelong learning. However, most medical programmes have yet to grapple with this concept in a systematic and uniform way. Hence, this project aims to investigate the teaching-learning activities which support the development of SRL at NUS Medicine, Singapore.
Method: This research employs an exploratory qualitative approach in collecting data. A focus group discussion to seek teachers' views on the teaching-learning strategies in pre-clinical years was conducted. This presentation will focus on the qualitative data from teachers' interview.
Results & Discussion: There are four themes emerged from the qualitative data: pedagogies preferences, need-supportive teaching environment, teachers' attitudes towards teaching and students as the driver. Under pedagogies preferences, teachers believe that there is a need to move away from controlling teaching approach in promoting SRL. Some approaches that are useful in encouraging SRL are thinking approach, connecting approach and flipped teaching approach whereby students take over as the role of teaching. Apart from pedagogies preferences, a need-supportive teaching environment is required by interacting with students in an autonomy-supportive way. Students must be given the opportunity and to nurture their psychological needs. Teachers' attitudes towards teaching must be positive especially having strong self-efficacy which is currently lacking. In addition, there is a strong perception that research still holds the prime as compared to teaching. Coping with multiple tasks such as clinical work and research, teaching has becoming secondary to the teachers. Besides actively promoting SRL by the teachers, students are crucial in engaging themselves in learning. As mentioned by the interviewees, it takes two hands to clap.

Discussion & Conclusion: As conclusion, while teachers recognize the importance of implementing SRL in the teaching and learning environment, there are more effort need to be done to prepare students to achieved this.

Take-home message: We understand from the data that strategies alone is not sufficient in promoting SRL. Providing a supportive environment coupled with appropriate attitude from the teachers and students are essential.

Educating for self-directed learning: a longitudinal study of learning strategy development

Authors
Tamara van Woezik, Radboud University Medical Centre, Nijmegen, Netherlands
Jur Koksma, Radboud University Medical Centre, Nijmegen, Netherlands
Rob Reuzel, Radboud University Medical Centre, Nijmegen, Netherlands
Debbie Jaarsma, Universitair Medisch Centrum Groningen, Groningen, Netherlands
Gert Jan van der Wilt, Radboud University Medical Centre, Nijmegen, Netherlands

Presenter: Tamara van Woezik, Radboudumc, Nijmegen, Netherlands

Background: Self-directed learning (SDL) is implemented in education to foster lifelong learning. It is also believed to promote better study results. We tested whether students of Radboudumc developed SDL using the Motivated Strategies for Learning Questionnaire (MSLQ). In their curriculum, SDL is encouraged through project-based courses and monthly coaching groups.

Method: The MSLQ was administered to first and second year medical and biomedical sciences students. The learning strategy scales of the MSLQ were used. The Organisation, Elaboration, Critical thinking and Metacognitive self-regulation scales were considered indicators of self-directed learning; the Rehearsal scale indicated a surface learning strategy. T-tests were conducted to detect differences in means between cohorts and within cohorts.

Results: Cohorts of 2016 (n=218) and 2017 (n=258) were followed up over a two-year period. They filled out the MSLQ twice, in January of their first and second study year. For the 2016 cohort, we found an increase in Elaboration (4.82 to 5.06, p<0.01), Organisation (4.69 to 4.92, p<0.05), and Metacognitive self-regulation (4.34 to 4.51, p<0.01). The effect was similar for the 2017 cohort, except for Elaboration, which did not increase significantly. Furthermore, the 2017 cohort started with significantly higher mean scores on Elaboration than the 2016 cohort (4.82 vs. 5.05, p<0.01).

Discussion: Surprisingly, critical thinking did not increase and was in fact quite underused compared to other learning strategies in a curriculum targeted at Self-directed learning. We found that students did improve on related learning strategies: Elaboration, Organisation and Metacognitive self-regulation. These findings are in line

with previous research. Apparently, critical thinking needs specific attention, even a self-directed learning environment.

Conclusion: Our findings suggest that a self-directed learning curriculum can positively influence associated learning strategies, although the development of critical thinking lags behind. Factors influencing increased scores or lack thereof should be researched qualitatively, especially with regard to critical thinking.

Take-home message: As critical thinking is important for the development of lifelong learning, it is important to pay more attention to the development of this learning strategy. Even in a self-directed learning environment, this is not self-evident.

10II10 (3553)
Self-directed learning Readiness Among Pakistani MBBS students of University College of Medicine & Dentistry (UCM&D)

Authors
Tayyaba Azhar
Maimona Nasreen

Presenter: Tayyaba Azhar, University College of Medicine & Dentistry, The University of Lahore, Pakistan

Background: SDL is defined as a learning methodology in which students take the initiative of identifying their own learning needs, preparing their learning outcomes and learning resources. Students choose appropriate learning strategies and evaluate the learning outcomes. SDL is an embedded component of Medical curricula that adapt problem based learning (PBL).

Method: The students were given a pre-validated questionnaire on "Self-Directed Learning Readiness Scale" a self-assessment tool that aims to assess three main components: self-management, desire for learning and self-control. The students responded to each item on a 5-point likert scale.This study aims to identify the effect of SDL on students' performance in PBL and the students' readiness regarding SDL.

Results: According to the Self-Directed Learning Readiness Scale the mean scores for the three components was almost the same, with the highest aptitude for self-control (4±0.069) followed by self-management (3.99±0.071) and the mean score for the desire of learning was (3.997±0.068).

Discussion & Conclusion: In the present study SDL readiness showed that the students had the ability for self-control, they were highly motivated for self-learning and had self-management skills. Life-long learning involves the development of skills in self-directedness (SDL), critical thinking and effective group process. Incorporating SDL in the curriculum would help students in better and deeper understanding and learning of the content

Take-home message: SDL is a skill for the students to become life-long learners. Lifelong SDL is essential to meet the growing challenges in healthcare imparted by a rapid increase in knowledge of health problems.

10II11 (2192)
Longitudinal monitoring of self-directed learning skills: do novice and returning students score comparably?

Authors
Monika Sobocan
Erika Zelko

Presenter: Vanja Zamuda, Faculty of Medicine, University of Maribor, Slovenia

Background: Self-directed learning (SDL) is a skill students acquire during formal studies to support them in unstructured educational environments and foster their learning beyond university level. SDL is especially important in medicine as a high educational demand is put on students in residency through less structured learning. Longitudinal studies on SDL are rare, as they are time-consuming, but represent the basis for any intervention to enhances students' SDL abilities as well as evaluate any curricular changes. We present our 2-year progress on understanding SDL progress.

Method: In the academic years 2016-17 and 2017-18 students at the Faculty of Medicine, University of Maribor participated in the SDL study. The study used the validated self-rating scale for self-directed learning (SRSSDL). In year one 100 students participated. 84 of them returned to participate in the second research year, providing us with valuable baseline SDL progress information. Next to the returning participants, the study recruited additional 52 students. Compiling data from 136 different students over two years. Data analysis was done using the Mann Whitney U-test and descriptive statistics.

Results: Among the students, 43 participants from the 2nd and 3rd year of undergraduate medical studies were involved. Data was analyzed to understand differences in returning and novice study participants in a sensitive transition from pre-clinical to clinical education. Returning participants scored on the questionnaire comparably to novice participants. There was no significant difference in mean awareness (44.4 vs. 44.1; $p>0.268$), study strategy (43.3 vs. 44.0; $p>0.835$), study activity (43.2 vs. 42.9; $p>0.482$) and evaluation (40.3 vs. 40.7; $p>0.189$).

Discussion & Conclusion: Our data shows, that SRSSDL is reliable in long term, as returning and novice students in the same year score comparably. Furthermore, detailed data analysis shows moving from pre-clinical to clinical education in our school doesn't result in significant changes in study strategies and self-evaluation, enabling us now to form decision making on SDL enhancement.

Take-home message: SRSSDL is a reliable tool for long-term skill evaluation and enables us a detailed understanding of impactful events such as educational transitions.

10II12 (2053)
The attitude toward teaching technique in medical students at Chaiyaphum Medical Education Center

Authors
Paweena Kaladee, Chaiyaphum Medical Education Center, Chaiyaphum, Thailand
Wichunun Kunchai, Chaiyaphum Medical Education Center, Chaiyaphum, Thailand

Presenter: Paweena Kaladee, Chaiyaphum Medical Education Center, Chaiyaphum, Thailand

Background: Medical education is comprised of many teaching techniques such as lecture, self-directed learning (SDL), problem-based learning (PBL), bedside teaching, etc. Despite effective teaching, learning is very important in medical education. The aim of this study was to investigate the least appreciated teaching technique according to medical student's opinion.

Method: A cross sectional descriptive study in Chaiyaphum Medical Education Center. Thirty four 4th-5th year undergraduate medical students completed the questionnaire about teaching technique. Dermographic data and attitude data were collected. The collected data was analyzed using descriptive statistics.

Results: The least appreciated teaching technique according to medical student's opinion was SDL (66.7%), followed by lecturing (16.7%), PBL (11.1%), and bedside teaching (5.5%). Most students in this study thought SDL was the least effective teaching technique with their given reasons as following; lack of clarity about the purpose 46%, distraction by environment 30%, lack of motivation 15% and lack of skill for data accessibility 9%.

Discussion & Conclusion: The study reveals most of the undergraduate medical students in Chaiyaphum Medical Education Center thought SDL was the least useful medical teaching technique because SDL put students under pressure to find their own way to learn. Effectiveness of SDL is multifactorial and depends on individual.

Take-home message: SDL is an essential tool for developing lifelong learning and improving academic performance. Encouraging medical students to recognize the importance of SDL was needed. Medical staffs need to guide and encourage students to set learning goal, choose learning strategies and assess progression toward their goals.

Utilizing of Logbook - Medical Students' Viewpoint

Authors
Chonakarn Niyomthong, Surin Medical Education Center, Surin, Thailand
Pakarat Sangkla, Surin Medical Education Center, Surin, Thailand
Mantapond Ittarat, Surin Medical Education Center, Surin, Thailand

Presenter: Chonakarn Niyomthong, Surin Medical Education Center, Surin, Thailand

Background: According to the assessment process of the medical education, the self-assessment by using logbook was become an alternative tool for evaluating the potential of the medical students. The purpose of this study was to appraise the objective of logbook.
Method: The descriptive cross sectional study was conducted in the Surin Medical Education Center, Thailand. Ninety-Three medical students were included. Research questionnaire is composed of 15 multiple checklist questions. This study was analyzed about logbook's purpose, the requirements in logbook, how to use logbook guided their learning and form of logbook
Results: The top three ranking answers for logbook's purpose were to record learning experience, assess learning abilities by themselves and estimate their attitude, that were 71.1%, 62.4%, 38.7% respectively. 87.1 % of medical students required lesson's instruction in logbook, 67.7% required logbook guideline and 38.7 % would like to use logbook to express their opinions. However, only 45.2% of medical students use logbook guided and prepared their lesson. The handy, non-electronic logbook was the best choice for the medical student from questionnaire.
Discussion: Most of medical students understood the logbook's purpose but only a half of the medical students had used it properly. Interestingly, the medical students would like to participate in the lesson via the logbook feedback. The new logbook form that will be used by hand writing, tiny in size and also can be carried comfortably, might be an appropriate logbook for medical students.
Conclusion: Logbook was an effective tool for evaluating the potential of the medical students. The logbook design as medical students' viewpoint were raising their competency.
Take-home message: Facilitating in logbook form will help medical students use it more comfortable. Moreover, the new design of logbook, students' viewpoint, also encourage them to use it properly.

Design and development of mobile-based portfolio for medical sciences students: A portable tool for objective assessment in the modern world

Authors
Saeed Abdollahifard
Leili Mosalanejad

Presenter: Saeed Abdollahifard, Shiraz University of Medical Science, Shiraz, Iran

Background: In view of the recent interest in the use of mobile technologies for assessing people's work and career, tools such as personal digital assistants (PDAs) and cellphones can not only make data collection possible at anytime and anywhere, but also improve this process by allowing for the collection of multimedia data. This study was conducted to design and develop a mobile portfolio and evaluate its efficacy in assessing the performance of nursing students in clinical wards.
Method: The graduate nursing students of Jahrom University of Medical Sciences were recommended to draft a clinical portfolio of their clinical experience in written, audio and video formats in various media. Mobile e-portfolios have been developed to synchronize wirelessly with the user's personal webpage over Wi-Fi and cellular networks. Data on the students' duration and type of training, time, learning opportunities, work performance, resources and clinical experiences were recorded on the ward's website. The teachers were also able to access the students' portfolios for adding notes and comments. The teachers' assessments were both qualitative and quantitative. Each student was given a PDA or clinical software to use for three weeks during a psychology course and received training on the tools and then prepared a report on his experience. The focus group discussions were held to explore the advantages and disadvantages of this software. The quantitative questionnaire given to the students contained 20 items scored on a 3-point Likert scale for the quantitative items.. The total score obtainable was 60.
Results: Mobile e-portfolios are a user-friendly, accessible and attractive method for the objective assessment of students that enable the careful assessment of the students by encouraging their Improving information literacy and feedback. This tool satisfied 70% of the students.
Conclusion: Smartphone-based e-portfolios can facilitate the continuity of work and create uniform frameworks for the students to display their performance and learning efficiency, invite others to interpret and evaluate their work and selectively publish online documents of their clinical achievements (through careful planning and support). These software also help with the targeted assessment of the students' performance.

10II15 (3379)

The Relationship Between Electronic Portfolio Participation and Residency Upgrading Examination Outcome in Family Medicine Residency Program

Authors
Shun-Chin Chang
Ming-Nan Lin

Presenter: Shun-Chin Chang, The Department of Family Medicine, Dalin Tzu Chi Hospital, Dalin, Taiwan

Background: Electronic portfolios (E-portfolios) have been shown to be a valid way to document residents progress, encourage resident involvement in the learning process, and provide feedback for improvement. E-portfolios also represents a method of learning outcomes assessment and curriculum evaluation.
Method: We studied 20 residents who were trained in our family medicine residency program and completed the whole course at the time of data collection. The numbers of electronic portfolio articles of every individual resident were monitored throughout 3 years of residency program and then compared to their residency upgrading examination results.
Results: There was a trend with slightly positive correlation between numbers of electronic portfolio articles and scores of residency upgrading examination, but was not statistically significant (r=0.21, P>0.05). The trend was more obvious compared with oral test(r=0.19) than written test(r=0.17) in the residency upgrading examination.
Discussion: Electronic portfolios participation which was assessed by numbers of electronic portfolio articles might be a predictor of residents' examination performance. We also found a peer effect of numbers of electronic portfolio articles which the residents trained in the same year had similar numbers of published articles.
Conclusion: It is unclear what the factors maybe plays an important role in portfolio management. For family medicine residents who spends more efforts in electronic portfolio might have better performance in other examination.
Take-home message: Residents' participation in e-portfolios can provide a lens to look at trends in residents' learning and outcome assessment, and can also detect the need of early intervention and an opportunity to provide support.

10II16 (195)

Reflections of postgraduate medical students during their clinical years - a qualitative study of logbook entries

Authors
Laurel Weaver, Deakin University, Geelong, Australia.
Anita Phillips, Deakin University, Geelong, Australia
Ryan Spencer, Deakin University, Geelong, Australia

Presenter: Laurel Weaver, Deakin University, Geelong, Australia

Background: This study aimed to identify themes within postgraduate medical students' logbook reflections, intended to inform future decisions regarding the value of the logbook.
In 2017 the logbook for postgraduate medical students at our institution changed focus to encourage reflective practice. Anecdotally the quality of student's logbook entries improved, however no systematic analysis of entries had occurred. It is uncertain what themes were covered in these entries and indeed whether the majority of entries were in fact reflective. Consequently, the ability of the logbook to promote reflective practice was unknown and its value as an assessment tool unclear.
Method: A qualitative approach with thematic analysis methodology was implemented for this study. A literature review was conducted using the concepts of reflective writing, medical students and clinical experience. Participants were current year 4 students of a postgraduate medical course (Year 3 students in 2017). Data were collected from logbook entries completed in 2017 as a compulsory requirement of intra-rotational assessment. Logbook entries were randomly selected, coded and analysed using an inductive approach to provide an overall description of recurring themes. Thematic analysis of the data was aligned with Borton's Developmental Framework.
Results: The findings indicated the majority of logbook entries were indeed reflective. Within the categories of knowledge, skills and attitudes, the students reflected on clinical competency (consolidating learning, planning for future learning), professional competency (teamwork, interprofessional communication) and emotional responses to clinical and professional situations.
Discussion & Conclusion: This study sought to explore the logbook entries, aligned with a reflective theoretical framework, to identify and group common themes to allow further discussion. The literature suggests reflective practice is beneficial to the medical profession. Consistent with findings in the literature supporting reflective writing as valuable to medical students overall learning, thematic analysis of the logbook confirmed its value in development of reflective practice in postgraduate medical students. These findings support the logbook as an important assessment tool within the curriculum.
Take-home message: The logbook encourages medical students to reflect on their learning experiences, enabling development of reflective practice, a necessary skill for life-long learning and professional growth.

10II17 (2088)

Using clinical case E-portfolios to support case-based learning and assessment in orthodontic postgraduate education

Authors

Richard Cure
Liz Hopkins

Presenter: Richard Cure, University of Warwick, Coventry, UK

Background: Historically, postgraduate orthodontic students have prepared hard-copy log-diaries of treated clinical cases for specialty examinations. This process occurs towards the end of three years of study, and requires subsequent transportation of documents and artefacts to assessment centres, giving examiners little viewing time, and minimal opportunity for formative assessment, tutor feedback and reflective learning during patient treatment.

Online e-portfolios allow students to upload clinical material contemporaneously, and to reflect upon all aspects of clinical care, propose subsequent actions, and receive formative assessment and feedback from tutors. The e-portfolio clinical cases are subsequently summatively assessed as part of specialty examinations.

Method: Warwick Medical School has developed a clinical-case E-portfolio, using 'Sitebuilder' web-publishing tool, having a template structure, which requires relevant patient data to be uploaded prior to, during, and post-treatment, allowing continuing interaction between students and tutors. Internet access to the University Virtual Learning Environment facilitates outreach-centre education and patient-care delivery. Each student logs-in to their personal e-portfolio, uploading clinical-case material, together with a reflective commentary, at each patient visit. Tutors are simultaneously alerted by auto email feed and provide feedback and/or formative assessment. Clinical E-portfolios are used by Masters level Orthodontic, Orthodontic Therapy and Orthodontic nurse students to support case-based learning; by tutors for support provision, and for assessment.

Discussion: E-portfolios enhance clinical case-based learning, feedback and assessment, by requiring students to contemporaneously log data, analyse case progression and interact with tutors, thus facilitating reflective learning. Clinical case presentation is enhanced and examiners given increased flexibility for summative assessment.

Conclusion: Clinical case e-portfolios are valuable learning and assessment tools allowing immediate tutor feedback and enhance examination processes. They facilitate interactive clinical education and mentoring in outreach centres and are integral to case-based learning. They enable interactive, peer group case-based discussion and are significant in developing understanding of orthodontic case assessment, diagnosis and treatment mechanics.

Take-home messages: Clinical E-portfolios:

- Enhance case-based learning
- Encourage reflective learning
- Facilitate tutor feedback and mentoring
- Allow flexible formative assessment
- Simplify case presentations
- Support outreach treatment provision
- Enable examiners to interact to summatively assess clinical cases and deliver appropriate reports.

10II18 (3454)

Use of portfolio of residents in the training of the Medical Institute of NEFU

Authors

Aitalina Maksimova, Medical Institute, NEFU, Yakutia, Russia
Nadezhda Savvina, Medical Institute, NEFU, Yakutia, Russia
Nikolai Gogolev, Medical Institute, NEFU, Yakutia, Russia
Anna Protopopova, Medical Institute, NEFU, Yakutia, Russia

Presenter: Aitalina Maksimova, NEFU, Yakutia, Russia

Background: Portfolio of the resident, developed by the North-Eastern Federal University, as a new tool for training in residency.

Since 2014, the NFUU medical institute has started using the "Portfolio of student" programs to use it as an additional tool for training in residency.

Discussion: The purpose of creating the "Portfolio of the student" program is to develop the ideal, maximally effective model for the improvement and development of the resident, based on the method of individual cumulative assessment, the main strategy of which is to monitor the progress of the resident's training in his professional activity.

For the first time the theme of the portfolio in the Russian educational community was voiced in 2003. According to the general opinion of teachers and trainees, the portfolio increases the motivation of the latter, their responsibility for the results of the educational process, and promotes the development of the students' conscious attitude to the learning process and its results.

The idea of using a portfolio in the education system has recently become widespread. As part of the federal experiment to improve the structure and content of general education, which says that the change that has occurred in the state of modern education over the past decade, entails a change in the assessment system.

The portfolio model developed at the university is a fundamentally new learning strategy in a higher medical education institution. This model is able to demonstrate educational activity, level of self-organization, opportunities and practical achievements of the resident. From the point of view of teaching, the developed model of the portfolio allows you to select an individual approach to each resident, determine its strengths and weaknesses, and use the step-by-step assessment of the learning process to achieve result maintenance. Also, a teacher or curator can easily control the learning process.

Conclusion: Thus, the use of the portfolio as an additional method of education in higher educational institutions is gaining popularity in Russia. In domestic and foreign education, the portfolio is one of the most commonly used varieties of results-oriented technologies.

Using videos from human medicine to reinforce application of diagnostic error concepts in veterinary students

Authors
Regina Schoenfeld-Tacher, North Carolina State University College of Veterinary Medicine, Raleigh, NC USA
Lori Kogan, Colorado State University College of Veterinary Medicine and Biomedical Sciences, Fort Collins, CO USA

Presenter: Regina Schoenfeld-Tacher, North Carolina State University, College of Veterinary Medicine, Raleigh, NC, USA

Background: Diagnostic errors are significant causes of morbidity and mortality, in both human and veterinary medicine. To address this issue, we developed a didactic course entitled "Veterinary Medical Decision-Making" as part of a required course sequence in veterinary clinical reasoning. Topics covered include: dual process theory, types of clinical errors, cognitive biases, heuristics, and illness scripts. In addition to lectures, students complete assigned relevant readings from the veterinary literature and engage with online veterinary cases specifically designed to lead them to commit diagnostic errors. In-class debriefing sessions encourage students to name the types of cognitive biases involved and discuss preventive strategies.

Results: In order to examine students' abilities to transfer and apply knowledge from a veterinary course to a novel environment, we used a video produced by the University of Pennsylvania School of Medicine, designed for resident education, as a stimulus for analysis and reflection. Veterinary students (n = 102) were asked to watch the video depicting a medical team engaged in patient rounds. Their tasks were to: a) identify two cognitive biases displayed in the video, b) identify the key information that helped the team recognize their error(s), and 3) describe strategies used to rescue the situation.

Results: Most veterinary students in the study were able to complete all three tasks satisfactorily, as measured by scores on the assignment (average = 95.3%, SD = 0.82). The most commonly identified cognitive errors were anchoring, confirmation and availability bias. Students had difficulty applying/understanding the concept of outcome bias. Additionally, some students struggled with differentiating anchoring from availability bias.

Discussion & Conclusion: Given the success of veterinary students in identifying cognitive errors and rescue strategies employed by a medical team; this study provides preliminary evidence to support the assertion that clinical reasoning skills are species-independent, and can be transferred across health-care settings.

Take-home message: Educational materials created for use in human health professions can be leveraged for veterinary education. This opens the door for further initiatives utilizing clinical reasoning exercises as a stimulus for fostering shared learning and collaboration in inter-professional settings.

10II20 (3402)
The effects of on-line video supported self-directed learning for three common clinical skills: a comparative study

Authors
Chun-Chao Chang, TMUH, Taipei, Taiwan
Yi-No Kang, TMUH, Taipei, Taiwan

Presenter: Chun-Chao Chang, Taipei Medical University Hospital, Taipei, Taiwan

Background: The purpose of this study was to explore the effects on-line video supported self-directed learning for three common clinical skills including nasogastric tube insertion (NG), electrocardiogram (EKG), and Foley catheterization (Foley).

Method: Taipei Medical University Hospital designed a series on-line video supported self-directed learning activities of clinical skills (SLAOCS) for year-7 undergraduate medical students. Each SLAOCS consists of an on-line video, simulated practice, and discussion on-line platform with a medical doctor response. All the medical students can practice clinical skills that they would like to learn by simulation in the Clinical Skills Center during day-time according to their time management. The students who learn in SLAOCS were asked to fill short 5-point Likert questionnaires before and after each SLAOCS. The questionnaires consist of self-efficacy regarding to knowledge and skill of a specific clinical skill. The post questionnaire has one more question about how is help from the SLAOCS. We reviewed 67 learning records of three common clinical skills including nasogastric tube insertion, electrocardiogram, and Foley catheterization. Around 20 year-7 medical students participate in each SLAOCS.

Results: The results of one-sample t-test (test value: 4) showed that students had no sufficient self-efficacy of knowledge (M±SD=3.84±0.771) and skills (M±SD=4.00±0.759) in pre-SLAOCS (t=-1.744, p=.086; t=0.000, p=1.000). The paired t-test showed that students had strong self-efficacy of knowledge and skills after EKG (MD=1.269, t=3.892, p=.001), NG (MD=1.053, t=3.705, p=.001), and Foley (MD=1.227, t=3.983, p=.001) SLAOCS. Moreover, no difference in improvements of self-efficacies were observed among nasogastric tube insertion, electrocardiogram, and Foley catheterization in one-way analysis of variance (F=.0.068; F=.0.099).

Discussion & Conclusion: The SLAOCS provides clinical students a flexible way to learn clinical skills. Clinical students can self-directly practice clinical skills according to their own schedule with on-line video and feedback from a medical doctor. Further large scale of comparison of learning satisfaction and skills performance between SLAOCS and traditional clinical skills course is needed.

Take-home message: The SLAOCS might be a flexible and effective approach for clinical students in learning clinical skills.

Teaching Mental State Examination (MSE) - a new contemporary approach

Authors
Jessica Roberts Hansen, Psychiatry West Region Zealand, Slagelse, Denmark
Erica Høegh, Psychiatry West Region Zealand, Slagelse, Denmark
Ralf Hemmingsen, Department of Clinical Medicine, University of Copenhagen, Copenhagen, Denmark
Maria Gefke, Psychiatry West Region Zealand, Slagelse, Denmark
August Wang, Center of Psychiatry Amager, Copenhagen, Denmark
Sidse Arnfred, Psychiatry West Region Zealand, Slagelse, Denmark

Presenter: Jessica Roberts Hansen, Psychiatry West Region Zealand, Slagelse, Denmark

Background: A psychiatric video library containing short interviews was produced with the aim of assisting undergraduate students' training of MSE.
Method: In a case-control study, students were assigned to an intervention group (video/V, n = 40) with access to the video library for three weeks, or to a control group (no-video/N-V, n = 27) without access to the library. After the three weeks, both groups were tested with a multiple choice questionnaire after watching three videos. The questionnaires each consisted of 20 descriptive phrases, which might occur in a MSE; five out of these phrases were correct. Specialist trainees/specialists in psychiatry (n = 57) were tested with the same three videos and MC questionnaires – this to provide a "golden standard". The data was analyzed by one-way ANOVA and chi-square analyses with SPSS©v.24.
Results: The pilot study revealed a higher average-score by the specialist group (mean 12,6 SD 1,6) on all 3 videos compared to both groups of students (mean for student average all videos = 10,5 SD 2,7). The group of students (V) with access to the video library (mean 10,5 SD 3,3) was better at assessing the patient's mental status in one of the videos compared to the N-V student group (mean 8,7 SD 3,8; p<0.02). The test results of the two other videos showed no difference.
Discussion & Conclusion: The results are promising, and can help with the implementation of a video library as a new standard way to teach undergraduates how to conduct a thorough mental status examination. The available literature, on ways to use videos in the teaching of standardized MSE, is sparse and therefore, it is unknown to the authors, if the use of a video library already is standard practice in other countries.
Take-home message: A video library might be a way to teach medical students the art of MSE. An easy-to-distribute sensitive quantitative assessment of MSE competence has been developed.

10JJ: Posters: Threshold Concepts / Clinical Teaching / Simulation

Threshold Concepts in Medical Education: Similarities between the USA and UK

Authors
Virginia Randall, Uniformed Services University of the Health Sciences, Bethesda, USA
Robert Brooks, Uniformed Services University of the Health Sciences, Bethesa, USA

Presenter: Virginia Randall, Uniformed Services University of the Health Sciences, Bethesda, USA

Background: The theory of Threshold Concepts (TC) proposes that there are ideas necessary for a student to learn which enable them to think like a professional. Studies of TC in higher education have appeared since 2003. Studies in medical education are more recent.
Method: We studied TC using a qualitative analysis approach (grounded theory) to produce a thematic analysis of 135 de-identified reflective practice essays from students in the pediatric clerkship at our medical school. This study was approved by our IRB.
Results: Seven themes met our criteria for a threshold concept; they were transformative (caused an ontological shift) and troublesome (caused angst). 2 TC in our students' work were identical with those found by authors from the UK ("Medicine isn't black and white," and "Sometimes there isn't a right answer,") 4 TC were similar and 2 were distinct.
Discussion & Conclusion: Our findings suggest that there are some TC inherent (maybe essential) in personal and professional identify formation for a student moving from layperson to physician-hood, regardless of the setting of the medical school.
Take-home message: "Medicine isn't black and white" and "Sometimes there isn't a right answer" are concepts essential for medical students to understand as they move into clinical medicine.

10JJ2 (3360)
Definition of educational objectives of medical students in a history of medicine class

Authors
Jorge E. Valdez-García, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Mildred Vanessa López Cabrera, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Silvia Lizett Olivares Olivares, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Presenter: Jorge E. Valdez-García, Tecnologico de Monterrey, School of Medicine and Health Sciences, Monterrey, Mexico

Background: New educational student-centered models require a self-directed learner that is able to define learning strategies, managing emotions and achieve continuous improvement. Self-direction can occur in diverse situations that vary from the classroom to self-planned and self-directed learning projects developed as a response to personal interests or individual or collective needs. There are certain personal characteristics such as attitudes, values and skills that determine the level of enthusiasm and responsibility for the learning objectives and the learning activities.
Method: The objective of this study is to assess the self-direction approach of the learner by analyzing the learning goals designed from a self-diagnosis performed on the first day of classes. The method of this study is mixed, descriptive and cross-sectional. A sample of 47 students of the History of Medicine course were assessed using an instrument that assess the definition of their learning strategies. The information collected was contrasted with the designed objectives of the class. The learning goals were catalogued using Olivares and López (2016) proposal for self-directed learner that classifies in: learning strategies, managing emotions and continuous improvement.
Results: Considering the definition of educational objectives, 64% correspond to the dimension of learning strategies, 15% managing emotions, and 21% to continuous improvement. The course design maintains a 50% development-oriented learning strategies, 25% in managing emotions, and 25% in continuous improvement.
Discussion & Conclusion: There is some correspondence between the definition of learning goals of students and those part of the course design. The emphasis on the acquisition of study habits show that students do not identify their own motivation for learning, this requires that medical schools review their educational intentions, and that they foster reflection to develop lifelong learning habits.
Take-home messages: In the context of the theory of andragogy of Knowles et al, adults should have the autonomy to make decisions about what they want to learn, as well as the method to achieve it. This theory considers the individual as the center of the system, with a proposed method towards personal change.

10JJ3 (3512)

The effectiveness of blended learning on performance of medical students in back school program

Authors
Radchada Sahaworakulsak
Chatchai Kraysubun

Presenter: Radchada Sahaworakulsak, Chaophyaabhaibhubejhr Hospital, Prachinburi, Thailand

Background: Back school is the educational program about back care, posture, body mechanics, back exercises, and how to prevent long-term back problems in patient with low back pain. Medical students should appropriately demonstrate back school education program to patient.The aim of this study is to compare the effectiveness of traditional lecture and traditional lecture with hand-on back school program on performance of medical students in back school program.
Method: A quasi-experimental study was obtained in this study. Fifth year medical students of Chaophyaabhaibhubejhr Medical Education Center were divided into two groups which is traditional lecture and traditional traditional lecture with hand-on back school program group. Performance of medical student on back school program was measured by using Objective Structured Clinical Examination(OSCE).
Results: 15 medical students were assigned in each group. A traditional lecture with hand-on back school groups demonstrated significantly higher score compared with traditional lecture group(Mean±SD: 96.93±4.04 vs. 82.27±11.15; p =0.003).
Conclusion: Traditional lecture with hand-on back school program improve performance of medical student in back school program.
Take-home message: Combined learning method with traditional lecture with hand-on back school program is better way to improve performance of medical students in back school program.

10JJ4 (1525)

Improve PALS learning of final-year medical students with simulation scenarios

Authors
Natthachai Muangyod

Presenter: Natthachai Muangyod, Cardiovascular Unit, Pediatrics Division, Lampang Medical Student Center, Lampang Hospital, Lampang, Thailand

Background: Final-year medical students are required to complete pediatric advanced life support (PALS) module. This class is conducted in a 2-hours period. A new study guide has been developed to maximize learning experience.
Method: In the class, a group of 8 to 10 students were assigned to watch 15-minutes PALS video, attended 15-minutes lecture, practiced pediatric basic life support (PBLS) with a cardiopulmonary resuscitation (CPR) model individually for 30 minutes. Then, for the last hour, they were assigned to practice in a small group with 2 or 3 simulation scenarios. For PBLS, instructor observed students performed chest compression, basic and advanced airway management, and foreign body removal. For the simulation scenarios, students were assigned their specific role in each case and then they had to take turn with their classmates in other cases. Students were evaluated by their pre and post-test scores.
Results: Fifty-three medical students joined the PALS practice, July to December, 2016. The post-test scores of the students increased more than 10%. Almost of the students got core concepts of PALS and could practice accurately. Students enjoyed the class and felt enthusiastic to learn.
Conclusion: A new study guide that includes simulation scenarios made the 2 hours-class very fruitful. Students could achieve both PBLS and PALS within a limited time.
Take-home message: Simulation scenarios can improve students' learning.

10JJ5 (2618)

The Application of 3-dimensional Printing Tools Added in IPE/IPP Teaching Courses in a Resources-limited Hospital in Taiwan

Authors

Cheng-Hsi Liao
Chin-Hu Lai
Deng-Ho Yang
Chih-Hung Wang

Presenter: Cheng-Hsi Liao, Department of Surgery, Taichung Armed Forces General Hospital, Taichung City, Taiwan

Background: For the past 7 years, 3D-printing technology has become a new teaching trend to those clinical teachers. Today, we catch up with the trend to develop the 3D-printing skills and cooperate with the professional company to design teaching tools, teach new-coming stuffs to improve their clinical skills.
Our IPE team creates clinical tools, using the 3D unique software "3-matic", that combines CAD tools with pre-processing capabilities, and use MIMICS, an image-processing package that provides an interface between 2D image data (such as CT,MRI,3D ultrasound,etc). After learning, we design suitable tools for a better teaching environment. Then we use the tools to demonstrate a simulation scenario (Ex.Dentist's tooth model), and do more practices to teach the new-coming stuff, not directly on real patients.
Results: Since 2017 Dec., we cooperated with the professional company to create our own 3D-printing tools, and bought their software and basic 3D-printing machine, called FDM. Then we hold conferences,workshops and a master lecture to teach our hospital members from 2018. Jan. to June. Then our IPE team will design their own 3D tools in teaching. And we hold regular meetings monthly and perform clinical scenarios by using the 3D-printing tools, Ex. A dentist's tooth model, and a human heart model.
Discussion & Conclusions: 3D-printing technology is not hard to learn. Fortunately, our hospital supports the plan. Therefore, we need the IPE members to be well-educated about how to design teaching tools, and operate the 3D tools. In hospital, patient's safety is always the first priority, so we don't practice immature skills on patients. We have confidence to use the 3D-printing tools, and IPE team members can make their teaching quality better. Then we'll trace the teaching and learning effects monthly. Rapid changes in health care systems esp.the new trend in using 3D-printing technology. We catch up with the trend to develop our own 3D-printing skills to let our IPE members design suitable clinical teaching tools.
Take-home messages: 1. Teach the IPE members to use the 3D software/machine to design,and create their own particular teaching tools,and hold conference monthly to trace the teaching and learning effects.
2. Perform simulation scenarios with IPE teams to teach stuff by using those tools.

3. Let hospital managers know how we perform the tools and keep on supporting the plans,even the resources are limited.

10JJ6 (944)

3D Printing Technology Applications in Clinical Teaching

Authors

Wen-Lung Liang
Bo-yu Tsai
Yi-Chun Tsai
Wan-Meng Lee
Chia-Hsin Chen
Hui-Ching Pan

Presenter: Wen-Lung Liang, Kaohsiung Medical University Chung-Ho Memorial Hospital, Kaohsiung, Taiwan

Background: The clinical teaching aids manufactured using 3D printing technologies have been the replacement of traditional teaching aids nowadays, not only help achieve cost savings but also offer customized assistive devices for patients in different clinical cases. Since August, 2016, Kaohsiung Medical University Hospital has created a database containing the data of applications of more than twenty 3D printed teaching materials in clinical teaching, diagnosis and treatment.
Method: The images of 3D printed teaching aids are provided by the academic department, and the manufacturing application should be submitted in accordance with "Standard Operating Procedures for 3D Printed Teaching Materials". Subsequently, the department of production will convert CT scans to 3D printable files, thereby printing the teaching aids and creating an image database for future reference. Afterward, a follow-up survey on the satisfaction with applications of 3D printed teaching aids and the analysis thereof will be done by following the process improvement cycle- PDCA.
Results: There are more than twenty 3D printed organs models in the database as follows: pelvis and lumbar (low back pain lecture), nose (large), liver, gall and pancreas (liver function lecture), eyes (eye movements lecture), hands (hand function lecture), heart (ventricular septal defect lecture), lungs (respiratory therapist training), upper and lower jaws (dentistry lecture), breasts (breast lump exam) and baby's foot (blood collection lecture). After two-year follow-up of the satisfaction with the applications of teaching aids, the average satisfaction reaches the degree between 88.1%~95%.
Discussion & Conclusion: Whereas the characteristics of 3D printing technologies are low cost, low risk (teaching aids) and the rapid manufacturing of customization, which correspond to the convenience and high-level satisfaction with teaching performances provided by applications of modern simulation teaching aids in clinical teaching , hence such applications in medical science (clinical diagnosis, treatment and teaching) have been widely used day by day.
Take-home messages: Since solid models ignites learners' interest in learning and thereby enhances the clinical teaching performance, whereby 3D printing technology

applications in clinical teaching have been well approved by instructors and learners.

Development of large-scale simulation-based education programs to accomplish early exposure to clinical medicine for year one medical students

Authors
Kazunobu Ishikawa, IUHW, Narita, Japan
Gen Kobayashi, IUHW, Narita, Japan

Presenter: Kazunobu Ishikawa, International University of Health and Welfare (IUHW), Narita, Japan

Background: Although medical students have strong motivation and interest to real world of clinical medicine, not a few of them lose their desire to learn because of long-term education curriculum consisted of natural science, human studies and art. This condition is currently leading increasing numbers of holdover and declining academic standards among junior medical students in Japan.
Method: After lifting 38 year-long ban establishing medical school in Japan, our medical school has approved to reinvent medical education in April 2017. We have launched educational practice to cultivate aspirational learners aiming a good doctor. To accomplish this, we have developed large-scale simulation-based education programs for year one medical students.
Results: We have installed a Simulation Center for Outstanding Professional Education (SCOPE), which spaces over 5,300 m2 with multi-functional training and debriefing rooms to conduct large scale simulation. One hundred forty medical students had the following simulation-based programs; "Welcome BLS (basic life support) training" soon after they enter medical school, "Case-based pharmacology exercise with advanced patient simulator to learn the relationship between vital sign and drug action", "Clinical anatomy training with labor and delivery patient simulator", "Basic medical interview skills with simulated patients", "Basic task trainings for physical assessment and auscultation in cardiovascular and respiratory medicine". All of these have come to fruition.
Discussion: A significant number of students commented that these simulation-based programs grow up with the sense of a doctor through the physical senses such as touch, hearing and eyesight. Students also answered that hands-on learning highly motivated passion to become a doctor.
Conclusion: To implement large-scale simulation-based programs, we needed to make considerable efforts to design a new curriculum, develop an appropriate track system, recruit significant numbers of teachers and facilitators, and install spacious facilities. However, these efforts seem to inspire a deeper commitment from novice learners.
Take-home message: A novel large-scale simulation-based education programs to foster aspiring doctors

accomplished early exposure to clinical medicine for year one medical students.

10JJ9 (1475)
Enhancing Clinical Competence of Novice Nursing Practitioners: Use of Interactive Situated and Simulated Teaching Program

Authors
Sue-Hsien Chen, Department of Nursing Management, Chang Gung Memorial Hospital, Taiwan
Kun-Yun Yeh, Department of Internal Medicine, Chang Gung Memorial Hospital, Keelung, Taiwan
Shu-Ching Chen, Department of Medical Research, National Taiwan University Hospital, Taipei,Taiwan
Yo-Ping Lai, Department of Internal medicine National Taiwan University Hospital, Taipei, Taiwan
Tzu-Yun Huang, Department of Nursing, Chang Gung Memorial Hospital, Keelung, Taiwan
Yi-ling Chang, Department of Nursing, Chang Gung Memorial Hospital, Keelung, Taiwan

Presenter: Sue-Hsien Chen, Chang Gung Memorial Hospital, Taoyuan County, Taiwan

Background: Healthcare organizations require a proficient but less turnover nursing staff to maintain high quality of patient care. Novice nursing practitioners (NNPs) may have difficulty in practicing competently, consequently compromising the quality of care. It is therefore important to investigate if the program integrating interactive situated and simulated teaching (ISST) facilitates successful transition of NNPs to competent practitioners. We thus evaluate the effects of the ISST program on developing competency in NNPs, which may promote their self-confidence and reduce the number of work-related stressors.
Method: We randomly allocated 31 newly graduated NNPs into interactive situated and simulated teaching and non-ISST groups. The ISST program comprised six follow-up interactive face-to-face support sessions over a three-month period following the standard orientation training course. We assessed the participants' competency, stress, and confidence levels in professional competence before and at the end of the study.
Results: At the end of the three-month study period, the ISST group demonstrated superior nursing competency, as well as reported lower stress levels, and increased confidence in professional competence as compared with those in the control group. A multiple regression analysis revealed that clinical nursing competence was positively correlated with the use of ISST and negatively correlated with stress (p<0.05).
Discussion: The ISST program for NNPs significantly improved their clinical competence in terms of medical knowledge, physical assessment skills, and critical thinking abilities. Situation-based teaching can be a platform providing a valuable learning tool to mitigate care-related strains and resolve practical dilemmas in a controlled environment.
Conclusion: This study delivered a practical and useful strategy to nursing educators and healthcare

administrators. The ISST program may enhance the acquisition of knowledge, cultivate a positive attitude toward work, and motivate NNPs to take an active and collaborative role in teamwork.

Take-home message: The key to a successful interactive situated and simulated teaching approach is effective teaching materials and learning activities. Trainees can rehearse practical procedures and can receive feedback from facilitators and peers.

10JJ10 (3607)
The Input-Output model: a simple tool to structure causes of clinical problems

Authors
Arnout Jan de Beaufort, LUMC, Netherlands
Moon J Spanjer, LUMC (formerly), Netherlands
Floris M van Blankenstein, LUMC, Netherlands

Presenter: Arnout Jan de Beaufort, LUMC, Leiden, Netherlands

Background: Application of basic science knowledge in the clinical setting remains a challenge for medical students. Medical disciplines teach their content differently, using a variety of organizing concepts. These variations make memorization of pathophysiological knowledge complicated for students. In addition, the pathophysiological concepts do not always fit patient problems in clinical practice.

The input-output model (IO-model) is a general applicable model that aims to organise causes of clinical problems pathophysiologically. The basic concept of the IO-model is the perturbation of an input- output balance. For example, in anaemia the imbalance is either the result of a decrease input, i.e. a decreased erythrocyte production, e.g. by iron deficiency, or an increased output, e.g. by internal or external erythrocyte loss. Similarly, obesity is due to an increased intake (too much food) or decreased output, resulting from various causes like inactivity, hypothyroidism etc.

We hypothesized that the input- output model, as a general organising principle of pathophysiologic knowledge, facilitates application of pathophysiological knowledge in clinical practice.

Method: Six interns applied the IO-model in a voluntary session. They used the model on anaemia (provided clinical problem), and a self-selected clinical problem.

Results: The IO-model helped the interns to organize causes of anaemia. Use of the model yielded even an additional cause, earlier not identified. They could use the model in most self-selected clinical issues, low weight, swollen testis and actinic keratosis. They found the model less suitable for incontinence, hypertension and stomach ache.

The interns described their first experiences with the IO-model as 'an useful tool to organize and memorize causes of clinical problems pathophysiologically', and 'it stimulated to think deeply on the problem'.

Discussion & Conclusion: The participating interns found the IO-model an useful tool to effectively organise causes of clinical problems, although it may be not applicable to every clinical problem. This may be in part explained by unfamiliarity with the model.

Take-home messages: Interns considered the IO-model an useful tool in organizing causes of clinical problems pathophysiologically. The IO model may not be applicable to every clinical problem. Future studies will show the effect on knowledge retention.

10JJ12 (3115)
Examining the characteristics of the diagnostic justification among residents and medical students and the effect of scheme-inductive learning

Authors
Kuo-Inn Tsou, Fu Jen Catholic University, School of Medicine; Catholic Tien Hospital, Department of Pediatrics; New Taipei City, Taiwan
Chaou-Shune Lin, Hsinchu Cathay General Hospital, Department of Emergency Medicine; Hsinchu City, Taiwan

Presenter: Kuo-Inn Tsou, Fu Jen Catholic University, School of Medicine; Catholic Tien Hospital, Department of Pediatrics, New Taipei City, Taiwan

Background: In a previous study, we found that medical students and residents differed from experts in the process of problem-solving. We further examining the characteristics of their diagnostic justification abilities.

Method: Six clinical vignettes from three common clinical presentations in Neurology (cognitive impairment, dizziness/vertigo, weakness) were presented to residents in Neurology and medical students in clinical and pre-clinical years, for think aloud task. The diagnostic justification questionnaire was adopted to analyze the transcripts of the interview recordings. Data from attending physicians in Neurology were also obtained as the standard.

Results: Residents did not differ from attending physicians in either component scores or total score. As comparison, medical students had lower component scores and total scores. Clinical training could improve medical students' diagnostic justification abilities. Scheme-inductive learning in the pre-clinical education was also noted to improve the diagnostic justification abilities, but not to a great extent.

Discussion: Clinical reasoning is essential for the daily practice of a physician. Both content knowledge and clinical experiences are important for clinical reasoning. It remains a challenge of teaching knowledge that is integrated, organized and usable for clinical reasoning. Scheme-inductive learning maybe used to scaffold students' structure of knowledge and diagnostic reasoning strategies. However, identifying the student's deficit in knowledge and gaps in clinical reasoning might make the cultivation of clinical reasoning ability more effective.

Conclusion: Although it is important to develop medical trainees' clinical reasoning ability, there is still a lot to be done. Using appropriate tool to identify deficit in medical knowledge and gaps in clinical reasoning in medical

students is important for the cultivation of medical students' clinical reasoning ability.

10JJ14 (3668)
How can approaches of different medical systems be made visible, brought into dialogue, and reflected? - Real Patient Study Days Integrative Medicine

Authors
Diethard Tauschel, Integrated Curriculum for Anthroposophic Medicine & Institute for Integrative Medicine, Faculty of Health, Department of Medicine, Witten/Herdecke University, Witten, Germany
Friedrich Edelhäuser, Integrated Curriculum for Anthroposophic Medicine & Institute for Integrative Medicine, Faculty of Health, Department of Medicine, Witten/Herdecke University, Witten, Germany
Christian Scheffer, Integrated Curriculum for Anthroposophic Medicine & Institute for Integrative Medicine, Faculty of Health, Department of Medicine, Witten/Herdecke University, Witten, Germany

Presenter: Diethard Tauschel, Integrated Curriculum for Anthroposophic Medicine & Institute for Integrative Medicine, Faculty of Health, Department of Medicine, Witten/Herdecke University, Witten, Germany

Background: Integrative Medicine (IM) is regarded as a potential solution for health care challenges and to contribute to patient-centered care (Maizes 2009). Within its definition, IM "(…) focuses on the whole person, is informed by evidence, and makes use of all appropriate therapeutic and lifestyle approaches, (…) to achieve optimal health and healing" (The Consortium of Academic Health Centers for Integrative Medicine 2017). Yet, care providers and students do often neither know how different medical systems approach patients, nor are aware of underlying principles like concepts of anthropology, disease, health and healing, type of relationship to the patient, or usage of patient´s resources.
Method: Real Patient Study Days Integrative Medicine (RPSD IM) with a present patient were developed as a teaching and learning model for undergraduate medical education. To promote the above mentioned awareness on approaches of different medical systems and their methodologies, didactic means like observational and reflective tasks and interactivity with expert groups and group puzzle were applied in order to allow deep learning. A mixed-methods evaluation was conducted.
Results: Implementation was carried out as an elective course in the clinical phase of the medical model curriculum of Witten/Herdecke University. From 2008-2017, N = 8 RPSD were conducted. Usually, Conventional, Homeopathic, Anthroposophic, and Traditional Chinese Medicine were represented.
N = 166 students evaluated overall judgment, promotion of understanding of IM and positive changes in attitude to different medical systems with median scores between 5.0 and 6.0 [6-point scale: 1 = does not apply; 6 = fully applies].

A focus group discussion pointed out adjustability and transferability to different settings.
Discussion & Conclusion: In contrast to the Casuistic Case Conferences Integrative Medicine (Brinkhaus 2011), RPSDs IM enable live experiences of approaches of different medical systems to a present patient. RPSDs IM seem to be a suitable experiential teaching and learning model for promoting awareness and reflection of different approaches in Integrative Medicine. Adjustment to e.g. an interprofessional setting is yet to be tested.
Take-home message: Real Patient Study Days Integrative Medicine enable high-rated live experiences of approaches of different medical systems with a present patient.

10JJ15 (1524)
Final year medical students' perceptions of hospital ward rounds and the implications for teaching and learning

Authors
Ibrahim Ali
Mumtaz Patel

Presenter: Ibrahim Ali, University of Manchester, Manchester, UK

Background: The hospital ward round is a potential treasure trove for learning clinical medicine. However, many factors can inhibit the educational experience. This study sought to explore final year medical students' perceptions of ward rounds, the factors that impact on their learning and how the learning experience can be improved.
Method: Final year students based in a UK hospital were recruited to complete a validated questionnaire and participate in a 1-hour focus group. Qualitative data was subjected to an inductive thematic analysis. Eleven out of thirty students completed the questionnaire (37% response) whilst ten participated in the focus group.
Results: Students' preferred methods of participation included being asked questions and presenting patients on ward rounds. A lack of time was the most inhibitory learning factor. Three positive factors were identified: firstly, a final year student identity exists that results in a better experience compared with earlier clinical years; secondly, organisation of final year placements results in better learning opportunities; finally, and most importantly, were the doctors' ability to teach and foster learning.
Discussion & Conclusion: A differential learning experience exists for final year students compared with their younger counterparts who face liminality in the clinical environment. Firstly, final year students perceived themselves as knowledgeable, self-directed learners. Secondly, hospital placements in final year provided students with increased time on ward rounds and in smaller numbers. Both these factors allowed final year students to better integrate within the clinical team and assume roles and responsibilities, which promoted learning. Ultimately, however, students acknowledged the dependency of doctors' attitudes to teaching and their ability to create a positive learning environment that supports student participation.

Take-home messages: Strategies to improve learning on hospital ward rounds include:
1. Incentivising doctors to teach.
2. Embedding a few students within each clinical team.
3. Routinely assigning roles and responsibilities to students.

10JJ16 (1300)
How might medical teachers enhance the transfer of basic physiological knowledge into clinical applications? A Case Analysis of SWU Medical Students' Fluid Therapy in Paediatric Patients

Authors
Achara Wuttiprasittipol, Panyananthaphikkhu Chonprathan Medical Centre (PCMC), Srinakharinwirot University (SWU), Nonthaburi, Thailand
Stuart Cable, CME, University of Dundee, Dundee, UK

Presenter: Achara Wuttiprasittipol, Panyananthaphikkhu Chonprathan Medical Centre (PCMC), Srinakharinwirot University (SWU), Nonthaburi, Thailand

Background: Transferring knowledge from theory to practice is a historical challenge in medical education, however, evidence of recommended strategies to enhance knowledge transfer in medical education is limited. Students' and teachers' perspectives on transferring theory to practice were explored to identify key challenges and derive potential strategies to enhance knowledge transfer.
Method: To elicit experiences in knowledge transfer on fluid therapy, three focus groups were performed to five higher-scored students, six lower-scored students, and nine clinical instructors at Panyananthaphikkhu Chonprathan Medical Centre (PCMC) campus of Srinakharinwirot University (SWU). Additionally, the other two teachers from other campuses were individually interviewed. A thematic framework analysis was undertaken of participants' experiences in transferring preclinical knowledge to clinical application and of their insights of potential strategies to enhance knowledge transfer.
Results: Knowledge retention, ability to apply preclinical concepts into clinical contexts, and learning skills in a clinical clerkship, were major issues in transferring theoretical knowledge to clinical application. Suggested strategies to enhance knowledge transfer included revising current curriculum design, developing faculty collaborations, modifying content delivery, and enhancing learning skills in a clinical clerkship.
Discussion & Conclusion: Students and teachers reported similar key influences on knowledge transfer, i.e. knowledge retention, ability to apply preclinical concepts into clinical contexts, and learning skills in a clinical clerkship. However, there were gaps of these influences between students' experiences and teachers' expectations. Major issues to narrow these gaps, i.e. curriculum design, development faculty collaborations, content delivery, and enhancing learning skills, could articulate strategies to enhance knowledge transfer.

There is a disparity between students' experiences and teachers' expectations regarding knowledge transfer. Medical teachers might enhance the transfer of theoretical knowledge into clinical applications by developing strategies to bridge these gaps.
Identifying gaps between students' experiences and teachers' expectations helps address key challenges in knowledge transfer.
Take-home message: Narrowing these gaps through strategies identified might enhance knowledge transfer. Further study is required on the implementation of knowledge transfer strategies in different contexts.

10JJ17 (1544)
Centennials arrived! The challenges of teaching anamnesis to the digital native student through active methodologies

Authors
Bruna Leite Moreira Alves, Faculdades Pequeno Príncipe, Curitiba, Brazil
Gabriela Esmanhoto Rodrigues, Faculade Evangélica do Paraná, Curitiba, Brazil
Andrea Mora De Marco Novellino, Faculdades Pequeno Príncipe, Curitiba, Brazil

Presenter: Bruna Leite Moreira Alves, Faculdades Pequeno Príncipe, Curitiba, Brazil

Background: The digital natives (born after 1995) are now our medical students. They are proactive online and want the educator to teach what they cannot find quickly on Google. On the teaching of anamnesis it is fundamental knowing how to communicate with patients in order to obtain precise information. To favour students' motivation and learning, without jeopardizing the verbal communication, is necessary to perfect the teaching dynamics allying active methodologies to the online student.
Method: Aiming to attract the students by making the teaching of anamnesis more interesting they were encouraged to research, by digital means, different ways of performing anamnesis on selected clinical cases. The research results were presented by the students through simulations in pairs (physician and patient). A debriefing session addressed the correct and incorrect ways, considering the ideal structure of anamnesis described in the literature.
Results: The students felt instigated by the way of approaching the topic, as the digital world is part of their daily lives. Watching videos showing different anamnesis models made the perception of right and wrong wider and easier. They reported that simulating the physician or the patient helped the ethical-professional development improving theoretical-practical learning and the critical view over medical assistance.
Discussion & Conclusion: Generation Z's medical student was born immersed in the digital world, a click away from answers. While treating a patient, the first step is being capable of gathering accurate information, which can only be obtained through a careful anamnesis, face-to-face, creating a good link and empathy. Instead of tiring lessons

about the topic, an active research of anamnesis models on digital means and a discussion after role-playing showed the importance of formulating an adequate question and organizing information to get to a diagnostic hypothesis, thus improving the capacity of synthesis and analysis of collected data on anamnesis.

Take-home messages: Associating active methodologies to the digital world optimizes the training of communication skills. This approach is well accepted by digital native medical student, turning the learning process more interesting and closer to their reality without diminishing the doctor-patient bond

Digital Pedagogy Using Digital Classroom Response System (DCRS) with Poll Everywhere is an Effective Method in Teaching Oncology Module for Undergraduate Medical Students: Experience from Singapore

Authors
Hon-Lyn Tan, Department of Hematology-Oncology, National University Cancer Institute, Singapore
Angela Pang, Department of Hematology-Oncology, National University Cancer Institute, Singapore
Samuel Ow, Department of Hematology-Oncology, National University Cancer Institute, Singapore
Eng-Soo Yap, Department of Hematology-Oncology, National University Cancer Institute, Singapore
Chee-Seng Tan, Department of Hematology-Oncology, National University Cancer Institute, Singapore

Presenter: Hon Lyn Tan, Department of Hematology-Oncology, National University Cancer Institute, Singapore

Background: The use of personal mobile devices (phones, tablets, laptops) is prevalent in medical education classes in Singapore. We aim to capitalize on this with teaching of the Oncology Module for undergraduate medical students using a novel digital pedagogy.
Method: National University of Singapore Yong Loo Lin School of Medicine (NUS YLLSOM) started utilizing Poll Everywhere, a digital classroom response system (DCRS), in 2017 to enhance teaching and interactivity with students. A pilot study using Poll Everywhere to teach second-year medical students the Oncology Module was conducted. Each student was given an individual unique Poll Everywhere account to participate actively. We aim to evaluate the effectiveness of teaching via digital pedagogy using DCRS with Poll Everywhere.
DCRS using Poll Everywhere was conducted for the cohort of 100 Phase II medical students. 85-90% responses were recorded. All students had web-based live access to Poll Everywhere via personal mobile devices.
Results: 74% of students reported that they were able to maintain their concentration during the teaching sessions. 95% agreed that Poll Everywhere promotes active participation and 93% felt it provided a safe space for active participation. 92% agreed that it is an effective pedagogy and helps them understand the subject matter better. 86% agreed that Poll Everywhere allows instant

feedback on their knowledge gaps. 88% reported that the facilitator was able to summarize important points with Poll Everywhere and 87% of them would recommend DCRS as a tool for teaching.
Discussion & Conclusion: DCRS using Poll Everywhere is shown to be an effective pedagogy in the Oncology Module for second year medical students in Singapore in this pilot study. Students feel safe to participate actively and appreciate instant feedback on their understanding of the subject matter. Majority of students would recommend this as part of teaching in the future.
Take-home message: Poll Everywhere is a useful digital pedagogy in the Oncology Module for second year medical students.

Framing effects on medical student diagnostic testing and therapeutic decision-making judgements

Larry Gruppen

Presenter:
Michelle Daniel, University of Michigan, Ann Arbor, USA

Background: Research demonstrating the way in which a decision is framed, as a loss or a gain, can bias response. This study examines the impact of framing bias on decisions students make under conditions of uncertainty.
Method: 175 fourth year medical students were presented a patient with viral pneumonia and a possible superimposed bacterial infection. Students were told they could either empirically treat with antibiotics, not treat, or order a test prior to deciding. Students were randomly allocated to two versions of the case. Version A asked students to indicate the range of disease probabilities for which they felt it WOULD be necessary to order a test prior to deciding. Version B asked students to indicate the range of disease probabilities for which they felt it would NOT be necessary to order a test prior to deciding.
Results: Framing manipulation had no effect on mean threshold values that students estimated. The threshold for treating without additional testing was 74.9% (version A) vs. 72.6% (version B) and the threshold for not treating vs. wanting additional testing was 17.5% (version A) and 20.0% (version B). The framing condition was associated with a difference in testing decisions when an actual patient probability (20%) of having the superimposed infection was provided. Students given Version A were significantly more likely to request a test (78.1%) and less likely to forego treatment (11.0%) than students given Version B, where 62.8% requested a test and 29.1% decided to forego treatment.
Discussion & Conclusion: Focusing student attention on the range of uncertainty versus the range of certainty did not alter the testing and treatment thresholds. Framing manipulation did influence actual treatment vs testing

decisions when a specific pretest probability of disease was defined. The dynamics of the framing effect are complex, but often involve changes in risk tolerance. Care must be taken to understand how learners interpret such cases, because seemingly trivial word changes may have a major impact on decision making.

Take-home message: These results suggest that the framing of a decision may affect how students respond to choices they are given.

10LL: Workshop: Reviewing for AMEE MedEdPublish – enhancing scholarship

Location: MCH Lounge, Event Hall
Date: Wednesday 29th August
Time: 0830-1015 hrs

Presenters:
Richard Hays (Editor)
Trevor Gibbs (Associate Editor)
Ken Masters (Associate Editor)
Subha Ramani (Associate Editor)
Kerrie McKay (MedEdPublish Administrator)
Elizabeth Beattie (Technology Administrator)

Background:
AMEE MedEdPublish is an exciting new venture in academic publishing, combining post-publication review, rapid processing, low submission costs and academic mentoring for AMEE members wishing to contribute to learning within the medical education community. Reviewing papers is an important academic task, but how to compose a review is a skill that needs to be developed. This workshop will introduce AMEE conference attendees to the process of conducting a review, aiming to improve skills and confidence as we expand our pool of reviewers.

Who should attend
All conference participants who would like to learn about how to conduct a review of an academic paper are welcome to attend. We are particularly keen to welcome new potential reviewers, as well as to meet with those who have already provided some reviews.

Structure of the workshop
The session will begin with a brief overview of the requirements of a review for a paper published in AMEE MedEdPublish. We will then work either in small groups or individually to write a review of a recently published paper that we will provide. You may bring your laptops and tablets with you as you will be able to compose and submit reviews during the workshop.

Intended outcomes
Participants should gain a better understanding of how to write a review of an academic paper and should feel more confident in doing this.

SESSION 11: Plenary/PechaKucha™ Presentations

Wednesday 29th August

1045-1245 hrs

11A: Plenary: Broadening the Curriculum Beyond Bioscience

Location: Event Hall
Date: Wednesday 29th August
Time: 1045-1245 hrs

Ayelet Kuper
Wilson Center, University of Toronto, Canada

Summary: Medical curricula have traditionally been comprised of bioscientific knowledge but widely-accepted competency frameworks now require physicians to be trained in areas beyond biomedical knowledge and technical skills. The roles that physicians are now being called upon to perform depend on concepts, theories, and ways of knowing from the social sciences and humanities. Is it any wonder that medical educators continue to express uncertainty about what and how to teach in these areas?

Biography: Ayelet Kuper is a Scientist and Associate Director at the Wilson Centre as well as a Clinician-Scientist and Associate Professor in the Department of Medicine at the University of Toronto. She obtained her DPhil from Oxford University as a Rhodes Scholar in 1997 and her MD from the University of Toronto in 2001. She has authored over 50 peer-reviewed publications and regularly presents her research nationally and internationally. Her research program focuses on the legitimacy of different forms of medical knowledge, with a particular interest in challenging taken-for-granted assumptions and in foregrounding ways of knowing that promote equity and reflexivity.

amee 2019

Scottish Charity No SC031618

AN INTERNATIONAL ASSOCIATION FOR MEDICAL EDUCATION

Austria Centre Vienna

Vienna

24th to 28th August

ANNUAL CONFERENCE

AUSTRIA
CENTER
VIENNA

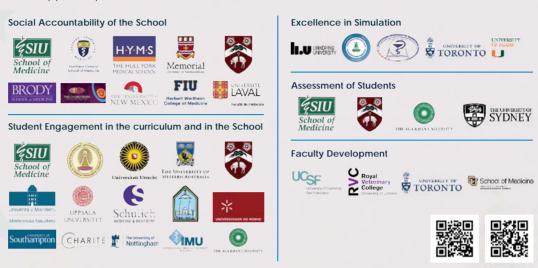
Featured topics:

- The patient as educator
- Activity Theory and the facilitation of learning
- Threshold concepts
- The continuum of education
- ... and much, much more!

Abstract deadlines:

30 September 2018 : Preconference workshops and Symposia
5 December 2018 : Research Papers
14 December 2018 : Doctoral Reports
6 February 2019 : All other abstracts

amee@dundee.ac.uk   www.amee.org

An ASPIRE award allows dental, medical and veterinary schools to be recognised internationally for their excellence in education


ASPIRE-to-Excellence

ASPIRE awards are made in the following areas:

* Assessment of students   * Student engagement in the curriculum   * Simulation
* Faculty development   * Social accountability of the school   * Curriculum - new for 2018

ASPIRE INTERNATIONAL RECOGNITION OF EXCELLENCE IN MEDICAL EDUCATION

AMEE applauds previous ASPIRE Award winners for their commitment to excellence in education:

Social Accountability of the School

SIU School of Medicine · Northern Ontario School of Medicine · H·Y·M·S THE HULL YORK MEDICAL SCHOOL · Memorial University of Newfoundland

BRODY SCHOOL OF MEDICINE · THE NETWORK · THE UNIVERSITY OF NEW MEXICO · FIU Herbert Wertheim College of Medicine · UNIVERSITÉ LAVAL Faculté de médecine

Student Engagement in the curriculum and in the School

SIU School of Medicine · Universiteit Utrecht · THE UNIVERSITY OF WESTERN AUSTRALIA

Univerza v Mariboru Medicinska fakulteta · UPPSALA UNIVERSITET · Schulich MEDICINE & DENTISTRY · UNIVERSIDADE DO MINHO

University of Southampton · CHARITÉ · The University of Nottingham · IMU · THE AGA KHAN UNIVERSITY

Excellence in Simulation

LiU LINKÖPING UNIVERSITY · UNIVERSITY OF TORONTO · UNIVERSITY OF MIAMI

Assessment of Students

SIU School of Medicine · THE AGA KHAN UNIVERSITY · THE UNIVERSITY OF SYDNEY

Faculty Development

UCSF University of California San Francisco · RVC Royal Veterinary College University of London · UNIVERSITY OF TORONTO · School of Medicine

For information on how your School can apply for an ASPIRE award please see www.aspire-to-excellence.org or contact aspire@dundee.ac.uk

The 2018 ASPIRE Award winners will be presented on Monday 27 August at AMEE 2018

Join AMEE to

• become part of an international network of educators committed to the advancement of medical and health professions education
• apply for Associate Fellow or Fellow status to demonstrate scholarship (see http://www.amee.org/fellowship)
• take advantage of the special conference registration rate for members
• receive the many other benefits of membership (see www.amee.org/membership)

Join online or contact amee@dundee.ac.uk for more information.
