### Abstract

Chromosome counts of 193 taxa including wild taxa in the *Prunus* subg. *Cerasus* in Japan were reported. Among 193 taxa, the chromosome counts of 148 taxa were determined for the first time. The taxa studied included 161 diploids, 30 triploids, one tetraploid, and one hexaploid. This study showed that the majority of the cultivated *Prunus* subg. *Cerasus* taxa of Japan are diploid.

**Key words:** chromosome number, cultivar, Japan, *Prunus* subg. *Cerasus*, Rosaceae.

*Prunus* L. (Pruinoideae, Rosaceae), a diverse group constituting of deciduous and evergreen trees and shrubs, is distributed in the temperate zones and tropical mountains, and comprises more than 200 species divided into seven subgenera being recognized in sensu stricto as discrete genera: *Prunus* L., s. str., *Cerasus* Mill., *Armeniaca* Mill., *Persica* Mill., *Amygdalus* L., *Padus* Mill. and *Laurocerasus* Duhamel (Mabberley 1997). At present, including *Prunus* taxa introduced from China and other countries, 25 species (Ohwi and Kitagawa 1992) and hundreds of cultivated taxa grown chiefly as garden flowers (Nihon Hana no Kai 1982) are found in Japan.

In *Prunus*, various chromosome numbers,  $2n=16, 17, 18, 19, 24, 25, 32, 34, 36, 40, 48, 64, 144$ , and so on, were known (Fedorov 1969). In Japan, the first cytological study of this genus gave  $2n=16$  for *P. ×yedoensis* 'Yedoensis' (Ishikawa 1916). Thereafter,  $2n=16, 24, 25$  and  $32$  were reported for the *Prunus* taxa in Japan (Okabe 1927, 1928; Sax 1931; Tanaka and Oginuma 1975; Oginuma and Tanaka 1976; Nishikawa 1985; Oginuma 1987 a,b, 1988, 1993; Somego 2000, and so on). The majority of the cultivated *Prunus* taxa in Japan, however, remained up to now unexamined. We present here somatic chromosome counts of 193 taxa including wild taxa

in the subg. *Cerasus*.

### Materials and methods

Chromosome counts were made from somatic cells undergoing mitosis in the meristems of leaf buds collected from the plants preserved both in the Tama Forest Science Garden at Hachioji in Tokyo Metropolis and in the Yuki Experimental Station of the Flower Association of Japan (Nihon Hana no Kai), Ibaraki Prefecture. After being collected, the leaf buds were readily pre-treated in a 2 mM 8-hydroxyquinoline solution for a few hours at room temperature and then at ca. 5°C for about 15 h. They were then fixed and kept in Newcomer's fluid at room temperature until used. After being immersed in 1 N HCl for a few hours, the leaf buds were macerated in 1 N HCl at 60°C for 10 minutes, and then washed in tap water. They were stained in 1.5% lacto-propionic orcein, and the usual squashing method was applied for the examination of chromosomes. Voucher specimens are kept in TNS.

### Results and discussion

Including wild taxa, a total of 193 taxa in the *Prunus* subg. *Cerasus* found in Japan were used for the chromosome study. A list of the taxa studied, the number of plants examined, and their voucher specimens are presented in Table

Table 1. List of studied taxa of *Prunus* subg. *Cerasus*, Japanese name, number of individuals examined, voucher specimen numbers, and present and previous chromosome counts

<sup>1</sup> Material of 'Komatsunagi' (2n=16) of Oginuma and Tanaka (1976) is a cultivar belongs to *P. pendula* f. *ascendens*.

<sup>r</sup> Material from the Tama Forest Science Garden at Hachioji in Tokyo Metropolis.

<sup>y</sup> Material from the Yuki Experimental Station of the Flower Association of Japan (Nihon Hana no Kai), Ibaraki Prefecture.

1. Their chromosome counts found in the present study together with their chromosome numbers reported previously are also listed in Table 1.

As shown in the Table, *Prunus* subg. *Cerasus* studied displayed four different chromosome counts,  $2n=16$ , 24, 32 and 48. Based on  $x=8$  (Darlington and Wylie 1955), these counts showed euploid series and were interpreted as diploid ( $2n=16$ ), triploid ( $2n=24$ ), tetraploid ( $2n=32$ ) and hexaploid ( $2n=48$ ). In the 193 taxa studied, 161 taxa (83.4%) were diploid, 30 taxa (15.5%) were triploid, one species was tetraploid, and one species was hexaploid. The result shows that the majority of the cultivated *Prunus* subg. *Cerasus* taxa of Japan are diploid.

The chromosome number of *P. lannesiana* 'Nigrescens' was reported as  $2n=25$  (Okabe 1928). Does the report of  $2n=25$  for *P. lannesiana* 'Nigrescens' represent aneuploidy, or is the count an error? Except for the report made by Okabe (1928), aneuploidy has not been found in any Japanese taxa in subg. *Cerasus*. Moreover, all plants of *P. lannesiana* 'Nigrescens' investigated in the study were verified as triploid ( $2n=24$ ). Hence, the  $2n=25$  for this taxon given by Okabe (1928) may be due to miscount caused by the technical difficulties of several decades ago.

Some *Prunus* subg. *Cerasus* taxa are known to comprise two cytological forms: *P. lannesiana* 'Sirayuki', one diploid and the other triploid (Okabe 1927, 1928); *P. pendula* 'Pendula', one diploid and the other triploid (Okabe 1928; Oginuma 1987 a); *P. pseudocerasus*, one triploid and the other tetraploid (Okabe 1928; Oginuma 1987 a,b, 1988); *P. ×subhirtella* 'Subhirtella', one diploid and the other triploid (Okabe 1928; Sax 1931; Oginuma and Tanaka 1976; Oginuma 1987 a). In the present study, *P. ×introrsa* 'Introrsa' and 'Sirayuki' were triploid with  $2n=24$ , but both of them were previously reported as diploid with  $2n=16$  (Okabe 1927; Somego 2000); *P. ×subhirtella* 'Autumnalis' was diploid with  $2n=16$ , while Oginuma and Tanaka (1976) and Oginuma (1987 a) were reported them as triploid with  $2n=24$ . Disagreements of chromosome counts between previous reports by different authors and findings in the present study of these cultivars, await further cytological and taxonomical studies.

The authors are grateful to Tadahiro Hiroi, Yasuo Osumi, Katsuhiro Tabata and Toshitaka Yokoyama (Tama Forest Science Garden), Seiji Saito (Yuki Experimental Station of the Flower Association of Japan), and Hideaki Tanaka (Flower and Green Institute of the Flower Association of Japan) who had provided help and encouragement during this work. We should like to thank the authorities of Tama Forest Science Garden and the Yuki Experimental Station of the Flower Association of Japan for permission to collect plant materials from their reserves.
