UTAH SUGAR BEETS.

1897.

BULLETIN No. 53.

JOHN A. WIDTSOE.

INTRODUCTORY.

Although the success of the Utah Sugar Co. has proved that sugar beets can be raised profitably in Utah, the farmers of the State, as well as others who are interested in the erection of sugar factories, desire a more accurate knowledge of the possibilities of the sugar beet in the various parts of the State, than can be obtained from isolated and uncontrolled tests. The Utah Experiment Station carried on, therefore, during the season of 1897, a co-operative sugar beet experiment with the farmers of Utah.

Samples of seed, together with instructions for planting, cultivating and harvesting, were furnished about 500 individuals living in Sevier, Sanpete, Davis, Weber, Box Elder and Cache Counties. At the end of the season 215 samples of beets were received for analysis at the Station laboratory. This bulletin is a record of the quality of the beets grown, as shown by the analyses of the samples received.

The seed used was partly obtained from the U. S. Department of Agriculture (variety, Kleinwanzlebener), and partly from the Utah Sugar Co., at Lehi, Utah.

INSTRUCTIONS SENT THE FARMERS.

Enclosed with every package of seed were the following instructions for planting and cultivating, and for sending samples to the Station laboratory.

CO-OPERATIVE SUGAR BEET EXPERIMENT.

DIRECTIONS FOR CULTURE.

This package of seed is sufficient to plant four square rods, and is furnished with the understanding that the beets will be grown in accordance with the directions, and that samples will be forwarded to the Station for analysis at any time requested. Plant as soon as possible after receiving the seed.

PREPARE THE SOIL by plowing at least 10 inches deep and thoroughly pulverizing it. A leveler, or clod crusher, may be used to advantage. The texture should be as fine as for a garden.

PLANT THE SEED in drills 20 inches apart, either by hand or with a garden seeder, and cover to a depth of one inch. Use all the seed in the package on the four square rods in order to be sure of a perfect stand.

The seed and the instructions to those taking part in the co-operative experiment were sent out under the supervision of Director Luther Foster. The analytical work and the tabulation of results have been under the direction of J. A. Widtsoe. Mr. J. C. Thomas, assistant chemist, analyzed the greater part of the samples.

THIN when the plants have four leaves. Take a sharp five-inch hoe and cut across the row, leaving small bunches six to eight inches apart. These bunches must be thinned by hand, leaving only one strong healthy plant in a place.

CULTIVATE OR HOE the beets soon after thinning. If a cultivator is used it should be a fine-toothed implement, and be run very shallow. The hoe or cultivator should be used often enough to keep the soil mellow and free from weeds.

THE IRRIGATION should not begin until the beets show plainly that they are in need of moisture. If water is applied too early the beets are apt to be short and spriggy, instead of long and tapering, as desired. The number of irrigations will depend on the soil and location, but all watering should cease at least three weeks before the time of harvesting. Prepare for irrigation by running small ditches in alternate rows, and in turning the water on be very careful not to overflow the ditches, for flooding will damage the crop. Cultivate as soon as the ground is dry enough after each irrigation. It will keep the soil loose, and help in retaining the moisture.

Please do not harvest the beets or send samples to the Station until directions have been sent you. With the directions for taking samples a blank will be sent, calling for the following information: Date of planting; the nature of the soil; the number of irrigations, and the time each was given. Keep a careful record of the above data. In the dry farming districts it is desirable to have the beets grown without irrigation. A copy of Farmers' Bulletin No. 52, on The Sugar Beet, which will give additional information, will be mailed to all who are supplied with seed.

LUTHER FOSTER, Director.

Agricultural Experiment Station, Logan, Utah, April 19, 1897.

UTAH EXPERIMENT STATION.

DESCRIPTION OF SAMPLE OF SUGAR BEETS.

Date planted.....	
Date thinned.....	
Date harvested.....	
Character of soil.....	
Character of cultivation (dates, implements, etc.).....	
Length of row harvested (feet).....	
Width between rows (inches).....	
Number of beets harvested.....	
Total weight of beets harvested, less necks and tops (pounds)	
Weather for each month.....	
State	
Postoffice.....	
Date.....	
Name.....	

NOTE—Samples of beets will not be analyzed unless accompanied with this blank filled out.

THE UTAH AGRICULTURAL EXPERIMENT STATION.

LOGAN, September 21, 1897:

DIRECTIONS FOR TAKING SAMPLES OF SUGAR BEETS FOR ANALYSIS.

Immediately after receiving this circular, please select an average row, and gather every plant along a distance which should vary as follows, according to the width between rows:

From rows 16 inches apart, length 19 feet.					
"	"	18	"	"	16½ "
"	"	20	"	"	15 "
"	"	22	"	"	13½ "
"	"	24	"	"	12½ "
"	"	28	"	"	10¾ "

The beets growing in the row, of the length above mentioned, are counted. The tops are removed, leaving about an inch of the stems, the beets carefully washed free of all dirt and wiped dry. Where the row is not long enough to meet the conditions, take enough from the adjacent row or rows to make up the required length. Rows of average excellence must be selected; avoid the best or poorest. Throw the beets promiscuously in a pile, and divide the pile into two parts. This subdivision, of one-half each time, is continued until there are about ten beets in a pile. From these ten select four of medium size. Be careful not to select the largest or smallest.

From all the rest of the beets, save these four, the necks are removed with a sharp knife at a point just below the base of the outer leaves. The beets, including the four saved as a sample, are then weighed.

The number of beets harvested, multiplied by 1742.4, will give the total number per acre. The total weight of beets harvested, multiplied by 1742.4, will give the yield per acre.

Wrap the four sample beets carefully in soft paper, and write your name legibly thereon. The beets must be perfectly dry. Fill out blank describing culture, enclose in the envelop, and sew up in bag with beets. Sew the beets up in a cotton bag, attach the enclosed shipping tag thereto and send by express.

No beets will be analyzed which are not sampled as described above and properly identified.

Blanks are sent to each one for two sets of samples. From three to four weeks should elapse between the times of sending the two sets of samples.

If additional analyses are desired, other blanks will be

sent on application. A model, showing how blanks should be filled out, is enclosed.

THE WEATHER FOR THE SEASON.

The season of 1897 was very dry. In many cases the seed had to be irrigated up. That resulted naturally in diminished yields, and, often, in a poor quality of beets. On the whole, the season was unfavorable for successful beet production.

The following tables give the mean temperature and annual precipitation at Logan, Cache County, for the past seven years. A more complete discussion of the climate of Utah will be found in Bulletin 47 of this Station.

THE VALIDITY OF THE RESULTS.

The farmers taking part in this experiment were, with few exceptions, men who had no previous experience in co-operative work. Neither had the majority any experience in the growing of sugar beets. It could not, therefore, be expected

that the results would be as favorable as they would have been had experienced beet growers, or men who would have followed instructions implicitly, taken part in the work. The results show, in fact, what may be done with the sugar beet in Utah, in spite of poor tillage and an unfavorable season. The effect of proper treatment on the sugar content and purity of the beet is well shown in the results from Cache County. One hundred and seven samples of beets from the county were analyzed: fifty-three from farmers living in various parts of the county; and fifty-four from the College farm. Although the soil of the College farm is poor, the superior care produced beets of better quality than those raised elsewhere in the county. The results are as follows:

	Solids in Juice	Sugar in Juice	Purity
Average of 53 samples from Cache County farmers.....	15.9	12.49	78.25
Average of 54 samples from Station farm	16.5	14.54	87.44
Average of 107 samples from Cache County.....	16.2	13.52	82.89

Moreover, as comparatively few samples were analyzed from each county, the average results do not represent, exactly, the true averages. Yet they show in every case that all the localities that have been tested will produce high grade sugar beets.

EARLIER RESULTS.

Sugar beets from the Station farm and from various parts of Utah were analyzed in 1891, 1892 and 1896. The results agree in showing the beets to be of a very high quality. For the sake of completeness the averages of the earlier results are copied into this bulletin.

*Utah Exp. Station, 8th Annual Report, page 29.

THE AVERAGE RESULTS OF 1897.

Two hundred and eleven samples of sugar beets were received from Sevier, Sanpete, Utah, Salt Lake, Davis, Weber, Box Elder and Cache Counties; four samples from Idaho, and

fifty-four from the Station farm—making a total of 269 samples. The average results of the analyses, for each county, are found in the next table. The individual analyses, with the cultural notes received, are found in the succeeding tables. These tables are practically self-explanatory—no general deductions can be drawn from the cultural notes until data of several seasons have accumulated. The results are in every case of the most encouraging kind, and emphasize the reputation which Utah already possesses, that sugar beets of excellent quality may be grown within her boundaries.
