## Abstract

For the Perron roots of square nonnegative matrices  $A, B$ , and  $A + D^{-1}B^T D$ , where  $D$  is a diagonal matrix with positive diagonal entries, the inequality

$$\rho(A + D^{-1}B^T D) \geq \rho(A) + \rho(B)$$

is proved under the assumption that  $A$  and  $B$  have a common unordered pair of nonorthogonal right and left Perron vectors. The case of equality is analyzed. The above inequality generalizes the inequality  $\rho(\alpha A + (1 - \alpha)B^T) \geq \alpha\rho(A) + (1 - \alpha)\rho(B)$ , proved under stronger assumptions by Bapat, and implies a generalization of Levinger's theorem on the monotonicity of the Perron root of a weighted arithmetic mean of a nonnegative matrix and its transpose. Also, for the Perron root

$$\rho\left(A^{(x)} \circ (D^{-1}A^T D)^{(c-x)}\right), \quad c \geq 1, \quad 0 \leq x \leq c,$$

of a weighted (entrywise) geometric mean of  $A$  and  $D^{-1}A^T D$ , where  $A^{(x)} = (a_{ij}^x)$  and “ $\circ$ ” denotes the Hadamard product, the monotonicity property dual to that asserted by generalized Levinger's theorem is established. © 1998 Elsevier Science Inc. All rights reserved.
