### Abstract

The possibility to determine the relatively small organic compound conformations by the approach on the basis of the analysis of the residual dipolar couplings  $^1\text{H}$ - $^{13}\text{C}$  in the molecules partially aligned in lyotropic liquid crystalline media has been considered. This approach has been used in the nuclear magnetic resonance investigation of the triglycine structure in lyotropic medium (cetylpyridinium bromide/*n*-hexanol). The conformation of triglycine in solution has been established as trans-trans on the basis of the experimental data of observed couplings.
