Mild template synthesis of copper(II)-containing macrocyclic compounds in the Cull-1,-diaminoethanedithione-1,2-ethanedione-1,2 and Cu II-1,2-diamino-ethanedithione-1,2-butanedione-2,3 triple systems into Cu₂[Fe(CN)₆]-gelatin-immobilized matrix implants

Abstract

The complexing processes in the Cull-1,2-diaminoethanedithione- 1,2-ethanedione-1,2 and Cull-1,2-diaminoethanedithione-1,2- butanedione-2,3 triple systems occuring in the copper(II)hexacyanoferrate(II) gelatin-immobilized matrix in contact with aqueous alkaline solutions (pH~12) containing 1,2-diaminoethanedithione-1,2 and ethanedione-1,2 or butanedione-1,2 under room temperature, and between MCl₂, 1,2-diaminoethanedithione- 1,2 and ethanedione-1,2 or butanedione-1,2 in the ethanol solutions, upon heating up to ~80 °C, have been studied. In both systems indicated, template synthesis occurs in the gelatin-immobililized matrix but does not occur in the ethanol solution. As a result of template synthesis, macrocyclic Cull chelates with 2,7-dithio-3,6-diazaoctadien-3,5-dithioamide-1,8 and its 4,5-dimethylsubstituted derivative are formed in the gelatin-immobilized matrix. 1,2-diaminoethanedithione-1,2 and ethanedione-1,2 or butanedione-2,3 are the ligand synthons in the processes indicated. © 2007 Springer.
