### **Abstract**

The spatial structure of calixarenes has been investigated by two-dimensional nuclear Overhauser effect spectroscopy (NOESY). A technique to study spatial structure of small molecules based on the combination of the method of small relaxation delays (Fast NOESY) and the method to measure relative cross-peak intensities has been proposed and approved. The given combination of methods allows one at a fixed time to reach a greater accuracy of measurements in comparison with other methods. © Springer-Verlag 2006.
