### **Abstract**

In the study based on the material of Russian and Tatar derived words you can reveal the nominative derivation specificity, which is a characteristic of most natural languages. We also have established the causes of interlingual asymmetry in the ratio of derivative and non-derivative lexical units: first of all it's the systemicstructural differences between Russian and Tatar languages, due to their belonging to the different morphological types, as well as the specificity of linguistic consciousness, namely the signs and associations that are underlied the name and reflected in its inner form.
