### Abstract

© 2016 Springer Science+Business Media New York The study examined the dose-dependent effects of selective antagonists of  $\alpha$ 2A/D-,  $\alpha$ 2B-, and  $\alpha$ 2C- adrenoceptors applied in concentrations of  $10^{-9}$ – $10^{-5}$  M on atrial and ventricular contractility of rat myocardium in vitro. Selective blockade of each  $\alpha$ 2-adrenoceptor subtype affected the contractile force of the atrial and ventricular strips. Various concentrations of  $\alpha$ 2A/D- and  $\alpha$ 2C-adrenoceptor antagonists produced positive inotropic effect on ventricular strips and negative effect on atrial strips.  $\alpha$ 2B-Adrenoceptor blocker in the majority of the tested concentrations produced a positive inotropic effect in both atria and ventricles.
