Abstract

© 2016 Taylor & Francis Group, London. This article touches upon the issues with limits to the economic growth caused by environmental and resource constraints in the Russian science. Hence, we analyze the processes for the coordination of studies of the Soviet and the Russian scientists, together with the leading Western scientific centers in the twentieth century, who have put the liberal-and environmental-minded leaders in the arena of the Russian economic policy. The features of the interpretation for limits to growth were discovered by the Russian scholars-specialists in the scientific area.
