

# Multiscale Materials Modelling on High Performance Computer Architectures

Ivan Kondov

on behalf of the MMM@HPC consortium

## Introduction

- Application area and importance
- Challenges
- Service Oriented Architecture
- Solution strategies

## Implementation

- Implementation strategies
- Methodology – technologies used

## Discussion

- Key results: Proof of principle
- Conclusions and outlook

**Li ion batteries**

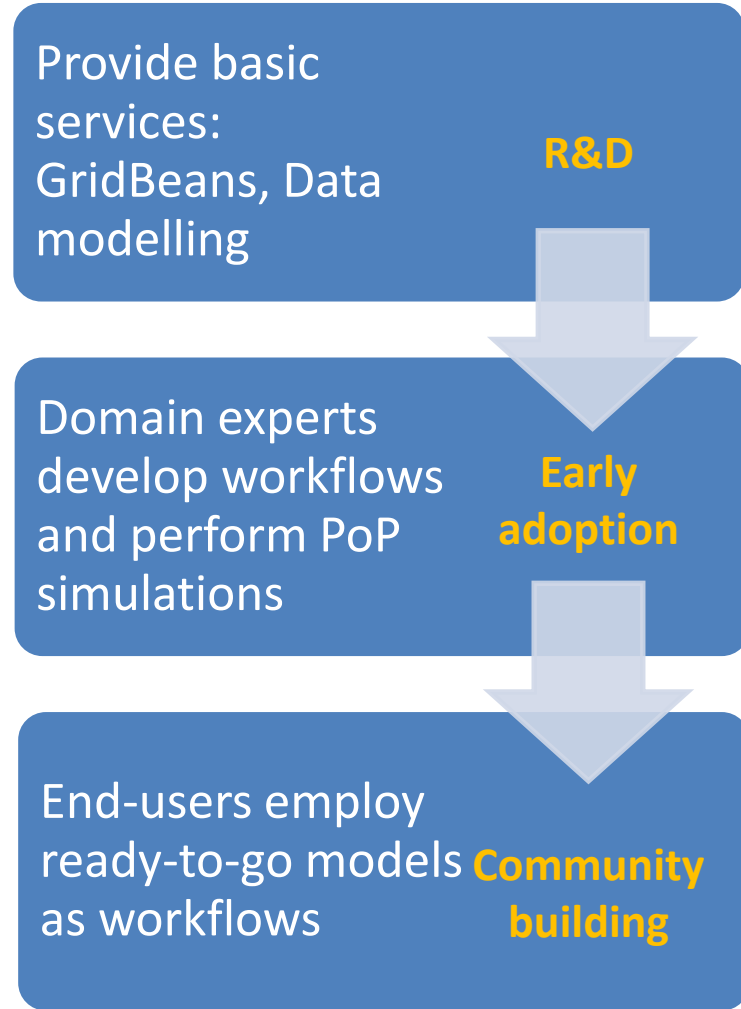

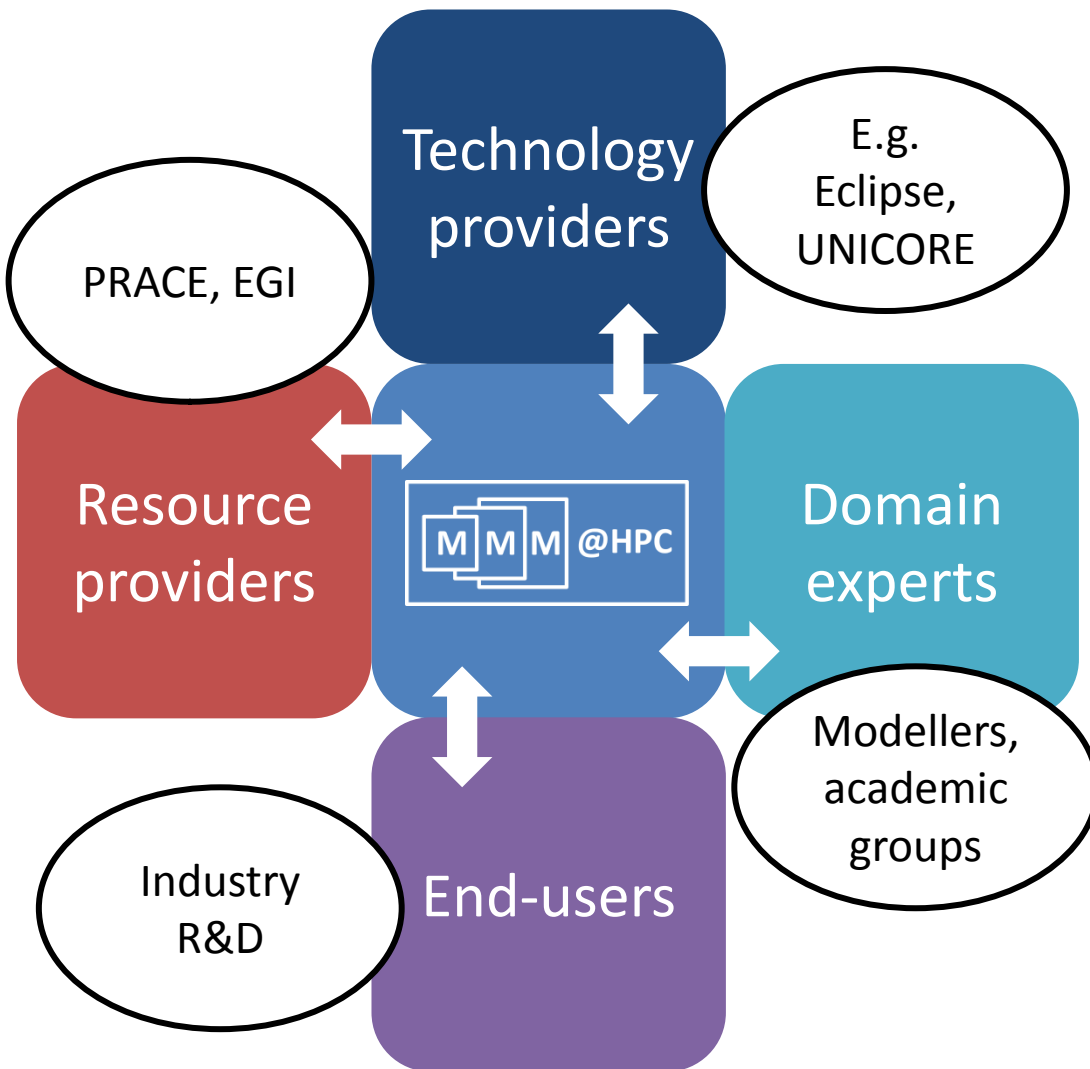

- Modelling and computer simulation essential
  - Reduce time-to-market
  - Reduce product development costs
  - Increase agility of industrial R&D
- Very complex models and environments for simulation
  - Accessible only for few experts
  - Low effectiveness and general applicability

# Example: Multiscale modelling of OLEDs

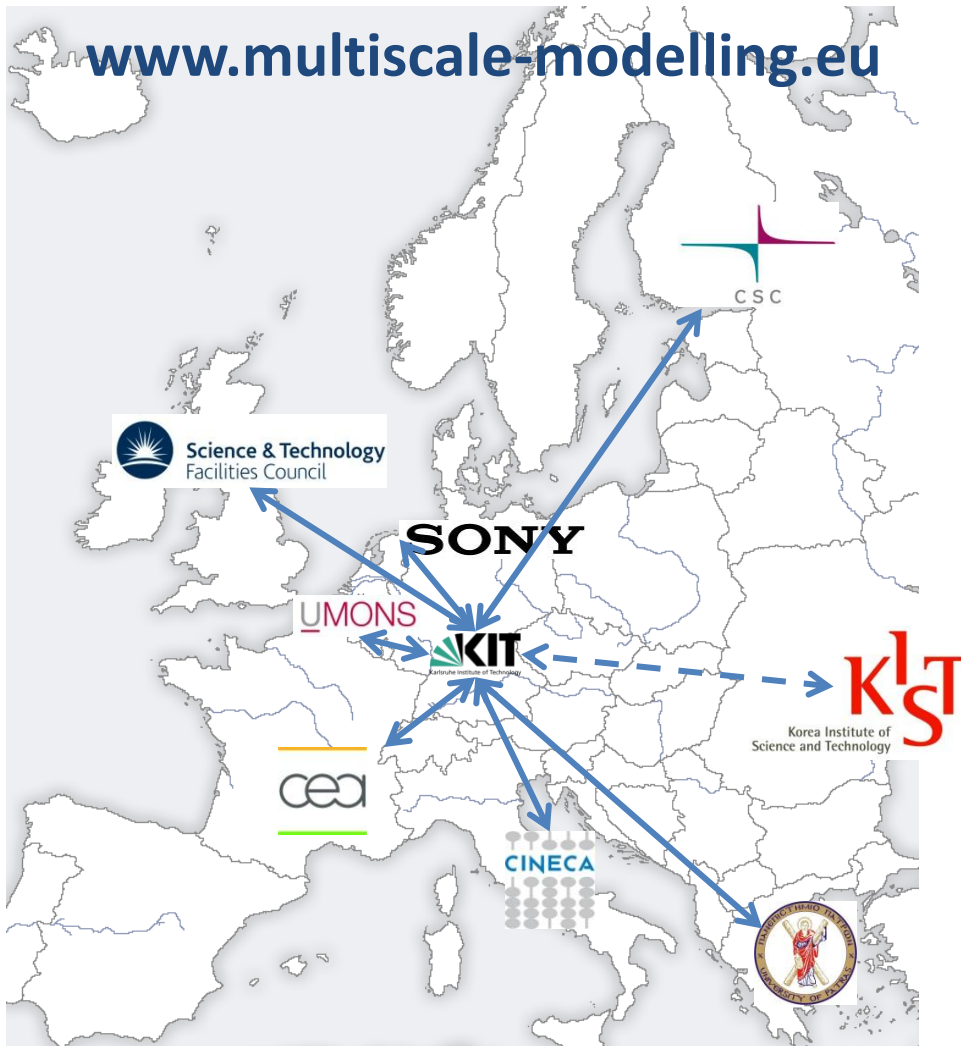

Continuum model (FEA)	Coarse-grained model (CG)	Atomistic model (MM)	Quantum mechanical model (QM)
Elmer	ToFeT (KMC)	DEPOSIT	MOPAC
FEAP	End-bridging MC	DL_POLY	TURBOMOLE
	Transporter	LAMMPS	BigDFT

- HPC centres:  
CINECA, CSC, KIT and KIST (Korea)
- Domain experts:  
Uni Mons, CEA, CSC, STFC, Uni Patras, KIT
- End-users:  
CEA, SONY, KIT
- LoS from PRACE
- Spin-off Nanomatch

## Computing capacity and capability

- High Performance Computing on PRACE resources
- High Throughput Computing on EGI resources

## Security and reliability

- Grid Security Infrastructure
- UNICORE: x.509, SSL, SAML

## License issues

- Open Source Licenses
- UNICORE: UVOS, SAML, VOMS

## In this talk

### Application integration and reusability

- Service Oriented Architecture (SOA)
- Application interfaces: GridBeans
- Application wrappers: OpenMolGRID
- Sequential modelling with UNICORE Workflows

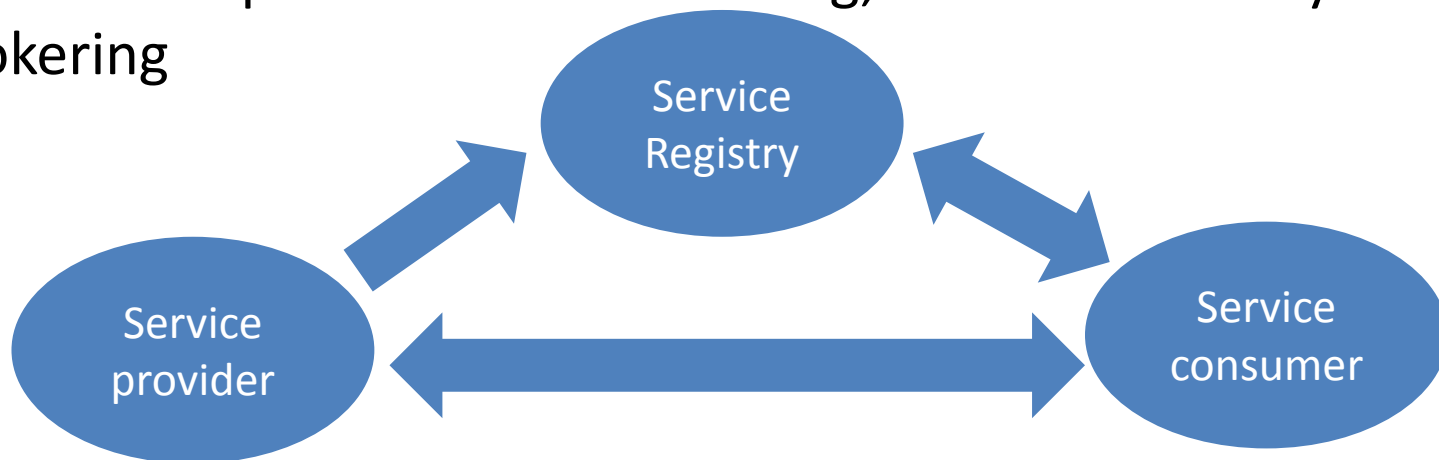

### Data complexity and interoperability

- Pre- post-processing with OpenMolGRID
- Dataflow Management
- Data-model based services

- Evolution of programming paradigms

- Main SOA component: object-based service that allows distributed processing
- Further components: load balancing, service discovery and brokering

# Service Oriented Architecture (SOA)

*“A set of components which can be invoked, and whose interface descriptions can be published and discovered” (W3C)*

- High reuse with no customization!
- Low effort to create new “ad hoc” composite applications from existing services
- Low effort for changing application

- SOA principles: **standardized service contract, loose coupling, abstraction, reusability, autonomy, statelessness, discoverability and composability**
- Standards for SOA implementation: Web Services
  - WSDL or WADL for describing the service
  - SOAP or REST for messaging

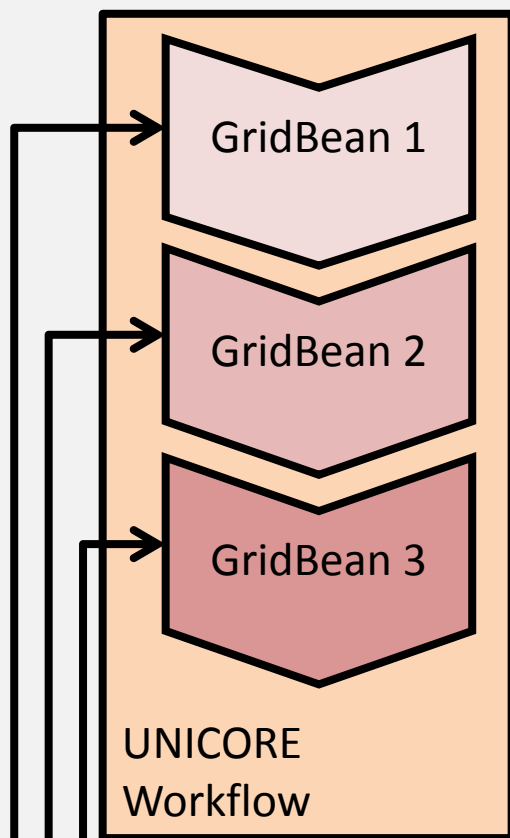

- UNICORE: UNiform Interface to COmputing REsources
- Grid computing technology supported by the European Middleware Initiative (EMI)
- Seamless, secure and intuitive access to distributed grid resources
- Used in daily production at numerous supercomputer centres worldwide - in PRACE (EU), in XSEDE (USA)
- Open source under BSD license
- Implements SOA using standards from the Open Grid Forum (OGF), W3C and OASIS

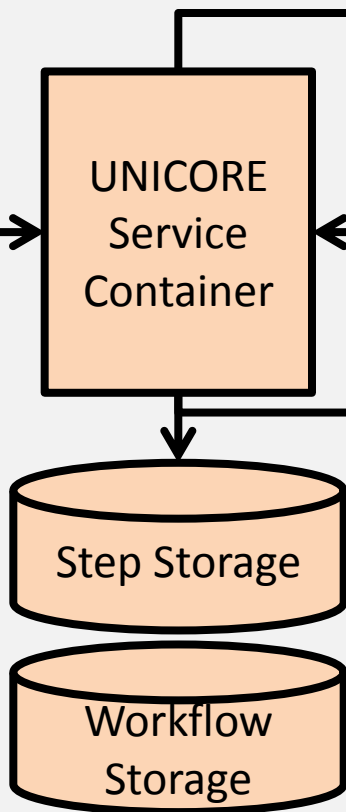

A. Streit et al., Annals of Telecommunications 65, 757 (2010)

The logo for UNICORE, with the 'O' in 'CORE' represented by a globe icon.

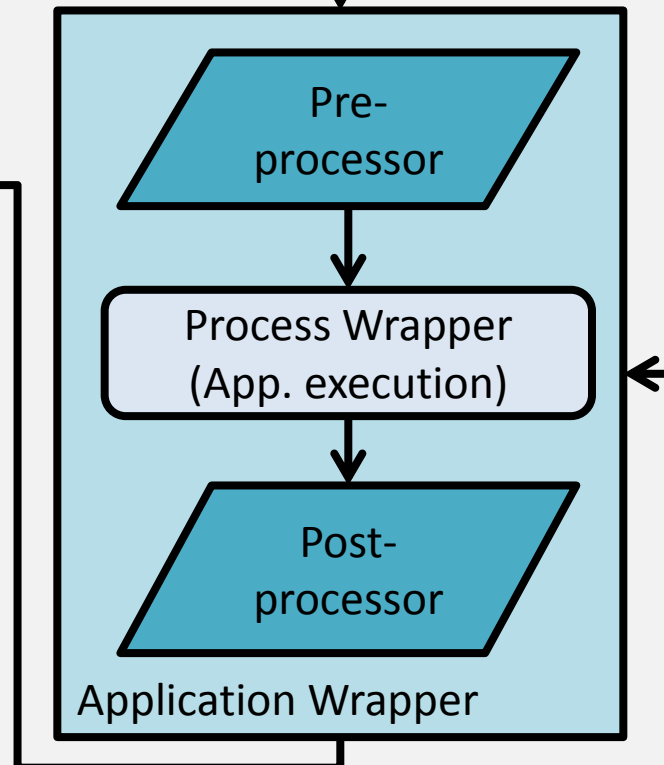

## UNICORE Rich Client

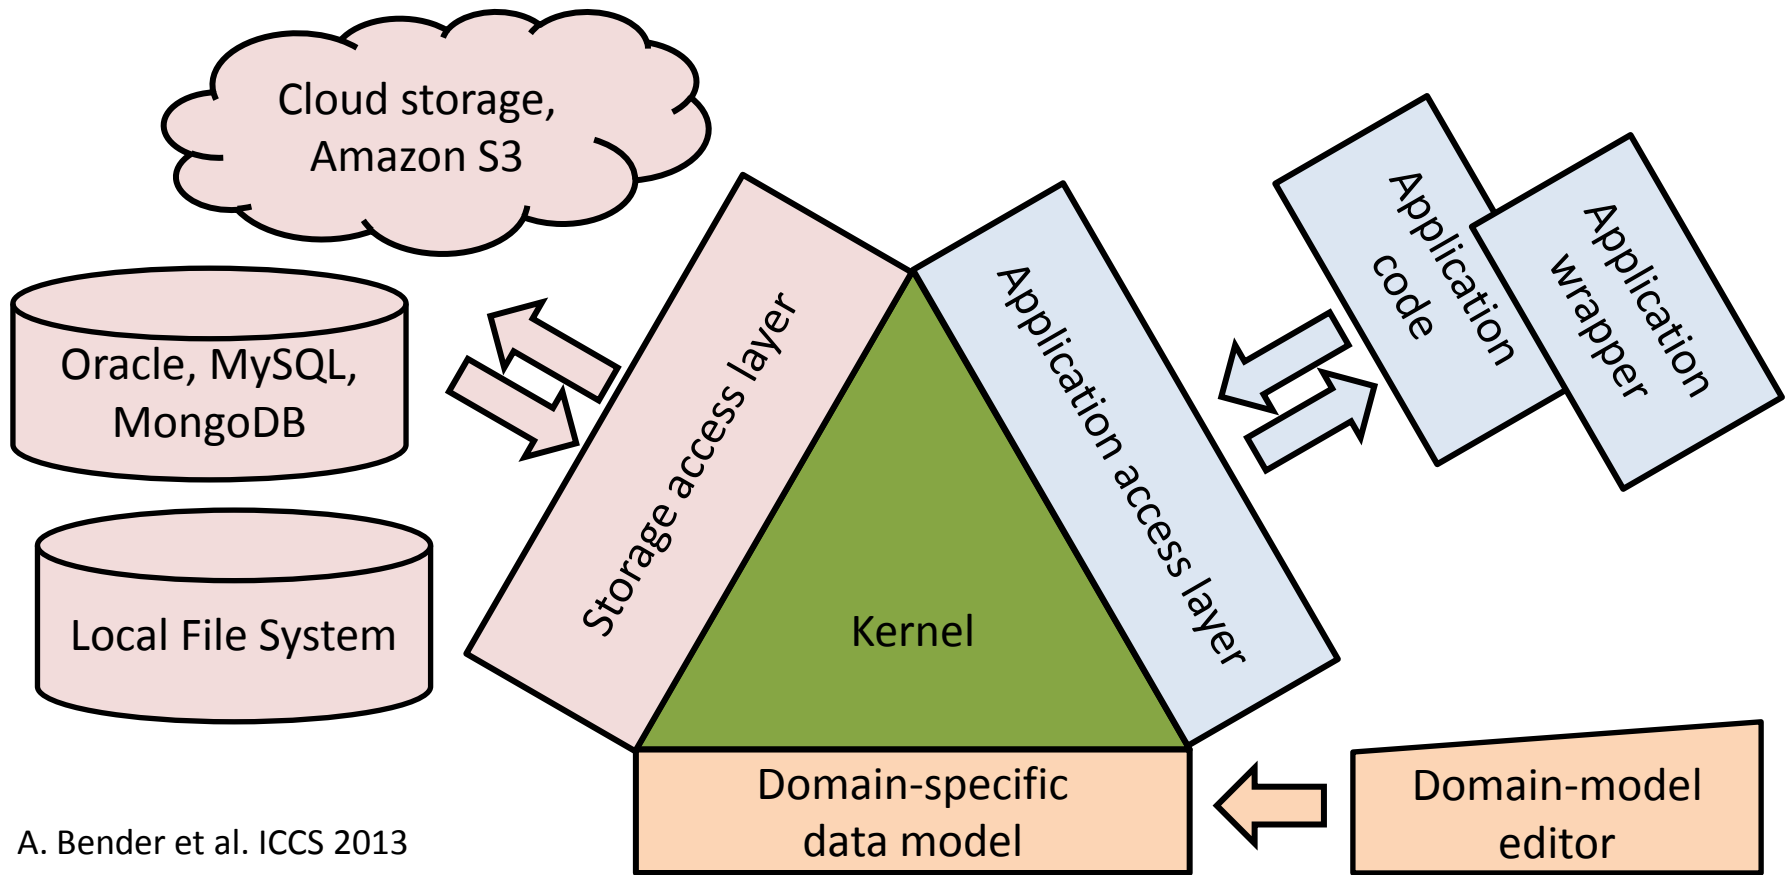

## UNICORE Site

S. Bozic et al. eChallenges 2012

# Data model driven approach

A. Bender et al. ICCS 2013

- Better than “yet another standard format”
- Separates storage, access and definition of data

# Proof of principle: OLED workflow

S. Bozic et al. UNICORE Summit 2012

The screenshot displays the UNICORE Rich Client interface. On the left, the Grid Browser shows a hierarchy of grids including CINECA: PRACE, CINECA-PLX, SARA-HUYGENS, CSC: MMM@HPC, and FZJ D-Grid. The main workspace shows a workflow diagram for 'OledPairwiseQmMopacWorkflow.flow'. The workflow starts with a 'Start' node, followed by 'MOPAC', 'Deposit', 'Openbabel', 'Pairfinder', and 'Counter'. A 'ForEachActivity2' loop contains a 'ForEach' loop. The Tools and Applications panel lists various applications like Pairfinder v1.0, PairwiseQmMopac v1.0, POVRay v3.6, Script v2.2, and Turbomole v1.0. The Structures panel shows control flow elements like If-Statement, While-Loop, Repeat-Loop, Group, and ForEach-Loop.

## Developers of application interfaces

Develop GridBeans, Application Wrappers

Combine technology and single-domain expertise

Setup and maintenance of tools and services

## Workflow designers

Construct workflow models for different applications

Expertise with modelling in several application domains

Assistance with integrating GridBeans

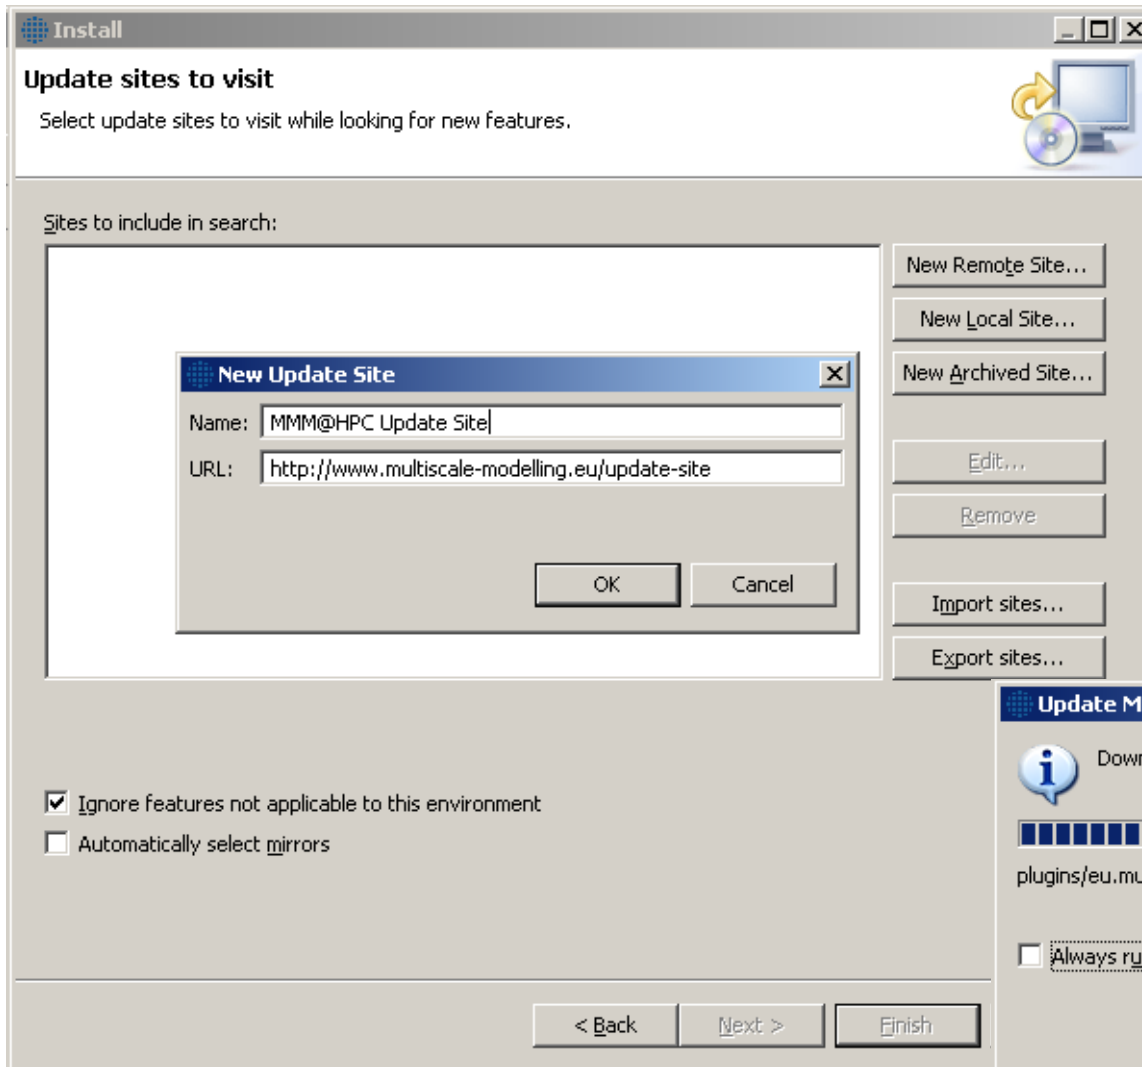

## End-users

Employ ready-to-go models as workflow simulations

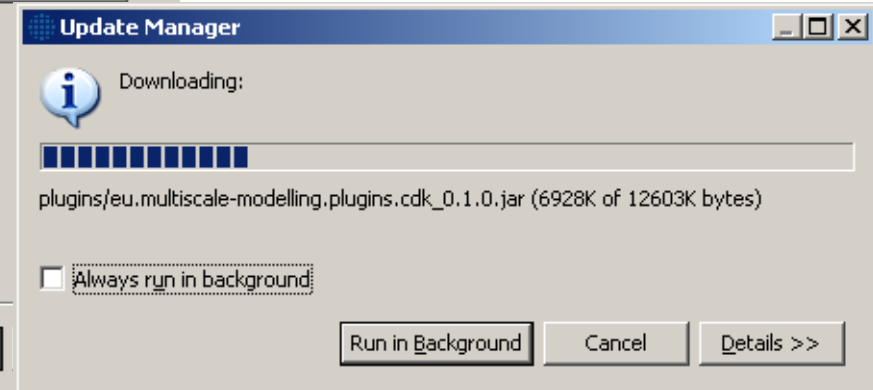

No technology or modelling expertise

Help with using the models

# GridBean Deployment Service

- MMM@HPC Update Site
- Install GridBeans in the URC

## Public Software Downloads

### OLED Workflow

UNICORE workflow for simulation of charge transport in an amorphous molecule (pre-release) License: FreeBSD License

Filename: OLED\_Workflow.zip

**Step 1**

Import

### Import Projects

Select a directory to search for existing Eclipse projects.

Select root directory:  Browse...

Select archive file:  Browse...

Projects:

- OLED Workflow Alq3 (OLED Workflow Alq3)

Select All  
Deselect All  
Refresh

Copy projects into workspace

Working sets

Add project to working sets

Working sets:  Select...

< Back Next > Finish Cancel

**Step 2**

Powered by  
**UNICORE**  
**OPEN SOURCE**

- All consortium partners in MMM@HPC
- Funding from the EC

The project MMM@HPC is funded by the 7th Framework Programme of the European Commission within the Research Infrastructures with grant agreement number RI-261594.

- Partner projects, infrastructures, companies, and technology providers
