## Research question

**How do different forest conversion practices (clear cut, selective cutting) affect N cycling in an N-loaded spruce forest ecosystem?**

# Experimental site: Höglwald

# Location of the different experimental sites in the Höglwald

# Höglwald characteristics

<b>Forest:</b>	<b>Approx. 100-yr-old spruce</b>
<b>Elevation:</b>	<b>540 m.a.s.l.</b>
<b>Mean annual temperature:</b>	<b>7.7 °C</b>
<b>Mean annual precipitation:</b>	<b>933 mm</b>
<b>Humus type:</b>	<b>Moder (~7 cm)</b>
<b>Soil type:</b>	<b>Typic Hapludalf (USGS)</b>
<b>pH in CaCl<sub>2</sub>:</b>	<b>&lt; 3 (organic layer)</b> <b>&lt; 4 (A horizon)</b>
<b>Wet N deposition:</b>	<b>~30 kg (NH<sub>4</sub><sup>+</sup>:NO<sub>3</sub><sup>-</sup> = 2:1)</b>

## Experimental areas

Spruce control

**Control site without treatment (last thinning 1975)**

Selective cutting

**Area of 1 ha with selective cutting in 2000 and 2006 (removal of c. 20 % of the trees each time)**

Clearcut

**Area of 1 ha, clear-cut in 2000 and planted with beech**

**Start of the experiment:  
Cutting:**

**July 1999 (pre-treatment phase)  
End of February 2000, 2006**

# N input via throughfall

<u>Treatment</u>	<u>2000</u>	<u>2001</u>	<u>2002</u>	<u>Average</u>
Control	30.1	20.9	25.9	25.6
Selected cutting	24.2	17.4	24.5	22.0
Clear-cut	14.8	11.5	10.4	12.2

Huber et al. (2004), *Plant and Soil* **267**, 23-40.

# Nitrate in seepage water

$\text{NO}_3^-$  [ $\mu\text{molc l}^{-1}$ ]

Nitrate concentrations in seepage water (40 cm depth)

- **enhanced** under the clear-cut area in the first and second year after the treatment

- **lower** in the third year as compared to the control and selective cutting area.

# Calculated total greenhouse gas budget of forest conversion over a period of 80 years

Papen & Brüggemann, 2006

## Conclusions

In contrast to selective cutting, clearcut led to

- a strong increase of nitrate leaching for 2 years,
- an enormous increase of soil N<sub>2</sub>O emissions for 4 years,
- a strong decrease in CH<sub>4</sub> uptake for at least 8 years,
- an offset of the total greenhouse gas budget of the forest of 9% more than selective cutting over the course of 80 yrs,

in an N-saturated spruce forest ecosystem in Central Europe.
