Abstract

The gene expression and regulation associated with the initial stage of rind peeling of the satsuma mandarin (*Citrus unshiu* cv. 'Miyagawa-wase') was characterized through the generation of 626 expressed sequence tags (ESTs) derived from a cDNA library prepared from albedo tissues collected 60 days after anthesis. A Total of 451 ESTs was found to have significant similarity to the known sequences. Using our in-house database, a catalogue of 222 ESTs annotated with their putative functions was prepared and compared to the previously prepared catalogue of 442 ESTs derived from mature albedo tissues. In consequence, gene homologues associated with cell wall events were preferably found in this library.

Key words: *Citrus unshiu*; ESTs; cDNA library, gene catalogue

Introduction

The analysis of expressed sequence tags (ESTs) has become a part of the genomic approach to plant science for many plant species (Yamamoto and Sasaki, 1997). The cataloguing of ESTs has emerged as a powerful tool capable of revealing gene expression patterns, gene regulation and sequence diversity (Brandle et al., 2002) as well as assisting in the generation of DNA markers for genome mapping (Kuhara et al., 1994). In most cases it has also given an indispensable aid to cDNA microarray analysis. Furthermore, EST databases have recently contributed to the discovery of the specific gene repertoires associated with the fragrances of roses (Guterman et al., 2002) and terpenoids in *Stevia rebaudiana* (Brandle et al., 2002).

In order to understand gene expression and regulation associated with the development and ripening of citrus

fruits, we have completed the EST analysis of several cDNA libraries derived from sweet orange young seeds (Hisada et al., 1996), juice sac of satsuma mandarin during rapid cell development phase (Hisada et al., 1997), satsuma mandarin fruit at mature phase (Moriguchi et al., 1998), albedo of satsuma mandarin at mature phase (Kita et al., 2000) and ovary at the day of anthesis (Shimada et al., in press). We are particularly interested in the traits that contribute to the quality and commercial value of citrus fruits. It is considered that easy-peeling, which is one of the important traits for commercial value in citrus, is related with the relaxation of cell wall in particular (Brummell and Harpster, 2001). Therefore, we have catalogued EST derived from albedo of satsuma mandarin fruits at the initiation stage of peeling of the rind in which the genes related to cell wall relaxation should be highly expressed. In this report, we list 222 cDNA clones, which were identified by their putative functions by database searches and discuss the characteristic features of the

^{†1} Present address: Department of Plant Cell and Environment, National Institute of Fruit Tree Science, Tsukuba, Ibaraki 305-8605, Japan

The catalogued cDNA clones have been submitted to DDBJ under accession numbers AU300309-AU300928.

catalogue.

Materials and Methods

1. Construction of cDNA library

'Miyagawa-wase' variety of satsuma mandarin (*Citrus unshiu* Marc.), which was cultivated at the National Institute of Fruit Tree Science, Okitsu (Shimizu, Shizuoka, Japan), was used as all fruit sample in this study. Samples were collected 60 days after anthesis (July 16, 1999) when the albedo (inner spongy portion) was capable of being peeled from the segment membrane. The average fruit size was 26.2 mm in diameter with a fresh weight of 9.0 g. Albedo tissue was peeled from the segment membrane using a razor, immediately frozen with liquid nitrogen, and stored at -80°C . The construction of the cDNA library and the subsequent sequencing were conducted following the method of Kita et al. (2000). The cDNA library derived from pre-mature albedo tissue was designated as the ALP cDNA library.

2. Data processing and cataloguing

A total of 626 cDNA clones were randomly selected and sequenced from both the 5' and 3' ends of the inserts. Each sequence was compared with the nucleic acid sequences in the DDBJ (<http://www.ddbj.nig.ac.jp/>; release 51, Sep. 2002) and also with our in-house citrus EST database (Fujii et al., 2003) using the FASTA algorithm (Pearson and Lipman, 1988). A significant match was declared when the optimized similarity score (OPT) was greater than 400. ESTs information including sequence data and annotations were entered into our in-house citrus EST database. Following annotation, a catalogue of 222 ESTs based on function was prepared. Preparation of the cDNA library and catalogue derived from mature albedo tissue designated as ALM was previously reported (Kita et al., 2000). Data analysis, including the comparison of the ALP and ALM catalogues was carried out using the in-house database.

Results and Discussion

1. Sequence Analysis

A total of 626 cDNA clones from the ALP cDNA library derived from albedo tissue of satsuma mandarin ('Miyagawa-

wase') were sequenced. The 626 ESTs generated from the library were clustered into 541 independent groups. The average insert size of the resulting ESTs was on ca. 440bps. Comparison of the sequences with ESTs in the DDBJ and our in-house citrus EST database resulted in the identification of 451 sequences with significant homology to known sequences. Among them, 336 ESTs (53.7%) could be functionally identified, 90 ESTs (14.3%) had homology to EST from other organisms and 25 ESTs (4.0%) shared homology with only putative open reading frame of *Arabidopsis thaliana* genomic sequences. There were only 10 ESTs with homology to genes of other citrus species (Table 1). Significant similarities were not detected for the remaining 175 ESTs (28.0%). As a cause of no similarity, it was considered that either the sequences of 3' untranslated region were obtained, or ESTs were derived from unknown genes which had never registered in the DDBJ. The ALP EST data will be registered in the DDBJ for the public use. Two hundred and twenty two ESTs were catalogued and the resulting ESTs are shown in Table 1 with their putative functions and homology search results. Even in case when isozymes of the same function were found among the above 336 ESTs identified the functions, a single example was entered into the catalogue.

2. Gene repertoires of ALP cDNA library

ESTs in ALP cDNA library were classified according to putative function (Table 2). In this library, 20 gene homologues associated with cell wall events were found. Changes in the cell wall including expansion of the cell wall may possibly be related to the easy-peeling characteristic of the satsuma mandarin. Since morphological changes in albedo would be related to the reduction of pectic substances (Kuraoka and Kikuchi, 1961), homologues of pectate lyase (MAP9U30), pectin acetyltransferase (MAPAE60), pectin methylesterase (MAPAE10), polygalacturonase (MAP9U96), arabinogalactan protein (MAPAE91: Shultz et al., 2000) were found and they might be related to such an event. Homologue of glycine-rich protein (MAPAE88: Uthappa et al., 2001) and proline-rich protein (MAPAE26: Salts et al., 1992) are possibly related to cell structure and cell adhesion in the cell wall. Homologues associated to cellulose, which is a major component of cell wall structure, were also detected (MAPF194, MAPH163:

Favery et al., 2001). The above-mentioned MAPEM60 and MAP9U96 had two redundant ESTs each in total of 626 ESTs and were constructed contig sequences respectively.

When the ALP gene catalogue was compared to a catalogue ALM derived from mature albedo tissue, only 44 kinds (80 clones) of 336 gene homologues in ALP were overlapped. Several examples of them were dynamin-like protein (MAPAE24), ubiquitin SMT3 protein (MAPAE81), cystein proteinase (MAPAT76), actin (MAPDD12) and thioredoxin (MAPFF53). Since the percentage of the overlapped clones is low, the ALP library is suitable for the exploration of important genes associated with the maturation of albedo.

摘 要

ウンシュウミカン果実の剥皮開始期アルベドで発現した遺伝子から作成した cDNA ライブラリーについて、ランダムに cDNA を選択してシーケンスし、626 の cDNA クローンの EST を得た。相同性検索による EST の機能解析の結果、336 クローン (53.7%) で遺伝子機能が推定された。残りのクローンのうち、90 クローン (14.3%)

では他の生物の EST と相同性があり 25 クローン (4.0%) についてはシロイヌナズナのゲノム塩基配列とのみ相同性があった。残りの 175 クローン (28.0%) については他の生物の塩基配列との相同性は見られなかった。機能が推定されたクローンのうち 222 クローンについて、機能推定の結果を一覧表に示した。この cDNA ライブラリーの特徴として、細胞壁にかかわる遺伝子が多くみられた。
