## **Workshop Agenda**

- *Introductions & Objectives* 1:30 – 1:45 pm
- *COSYSMO Overview  
& Reuse Research Results* 1:45 – 2:00 pm
- *SE Leading Indicators &  
Requirements Volatility Background* 2:00 – 2:15 pm
- *Causal Model and Feedback* 2:15 – 2:30 pm
- *Survey Results* 2:45 – 3:00 pm
- ***Break*** **3:00 – 3:30 pm**
- *Implications to COSYSMO* 3:30 – 3:45 pm
- *Survey Exercise* 3:45 – 4:30 pm
- *Outbrief and Discussion* 4:45 – 5:00 pm

## ***Objectives of the Workshop***

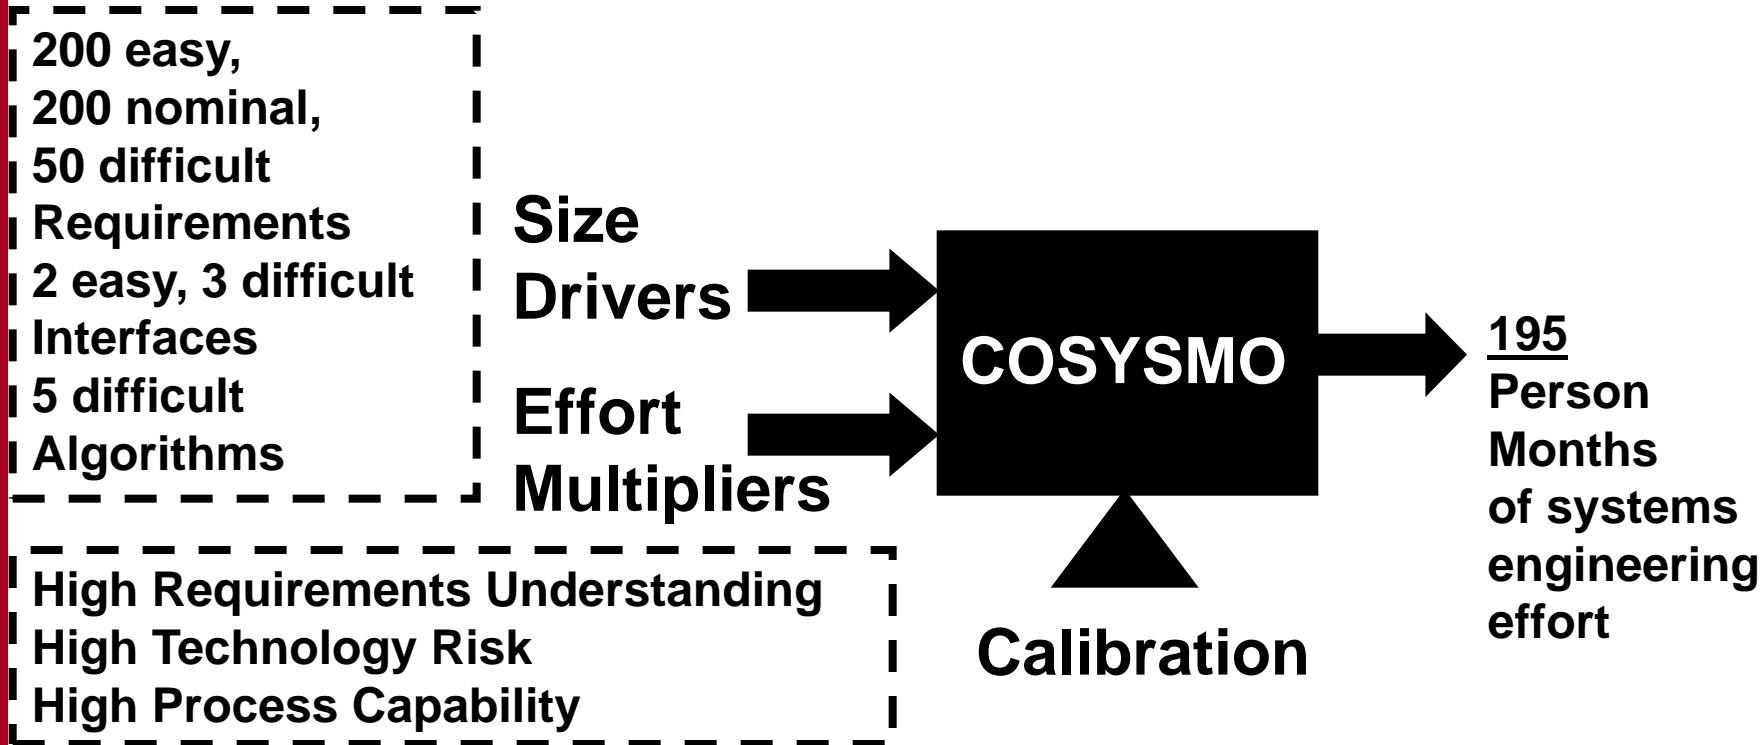

- ***Learn about COSYSMO and the latest research results in systems engineering reuse***
- ***Provide a forum to discuss requirements volatility thresholds and metrics***
- ***Present an overview of the causes of requirements volatility and its impact on systems engineering effort***
- ***Obtain feedback on a proposed extension to COSYSMO to incorporate a requirements volatility cost factor***
- ***Provide an opportunity for participants to exchange lessons learned on requirements volatility and influence the direction of future research***

## ***Intended Outputs***

- ***Feedback on a causal model that relates technical, organizational and contextual project factors to requirements volatility***
- ***Profile of the expected level of requirements volatility as a function of system type and lifecycle phase***
- ***Validation of the “ease of change” curve over the system lifecycle***
- ***Feedback on the COSYSMO requirements volatility extension***

SYSTEMS ENGINEERING PERSON MONTHS

# **COSYSMO 2.0 Operational Concept**

Based on 2009 dissertation by Dr. Jared Fortune

## Model Form

$$PM_{NS} = A \cdot \left[ \sum_k \left( \sum_r w_r (w_{e,k} \Phi_{e,k} + w_{n,k} \Phi_{n,k} + w_{d,k} \Phi_{d,k}) \right) \right]^E \cdot \prod_{j=1}^{14} EM_j$$

$PM_{NS}$  = effort in Person Months (Nominal Schedule)

A = calibration constant derived from historical project data

k = {Requirements, Interfaces, Algorithms, Scenarios}

$w_x$  = weight for “easy”, “nominal”, or “difficult” size driver

r = {New, Design for Reuse, Modified, Deleted, Adopted, Managed}

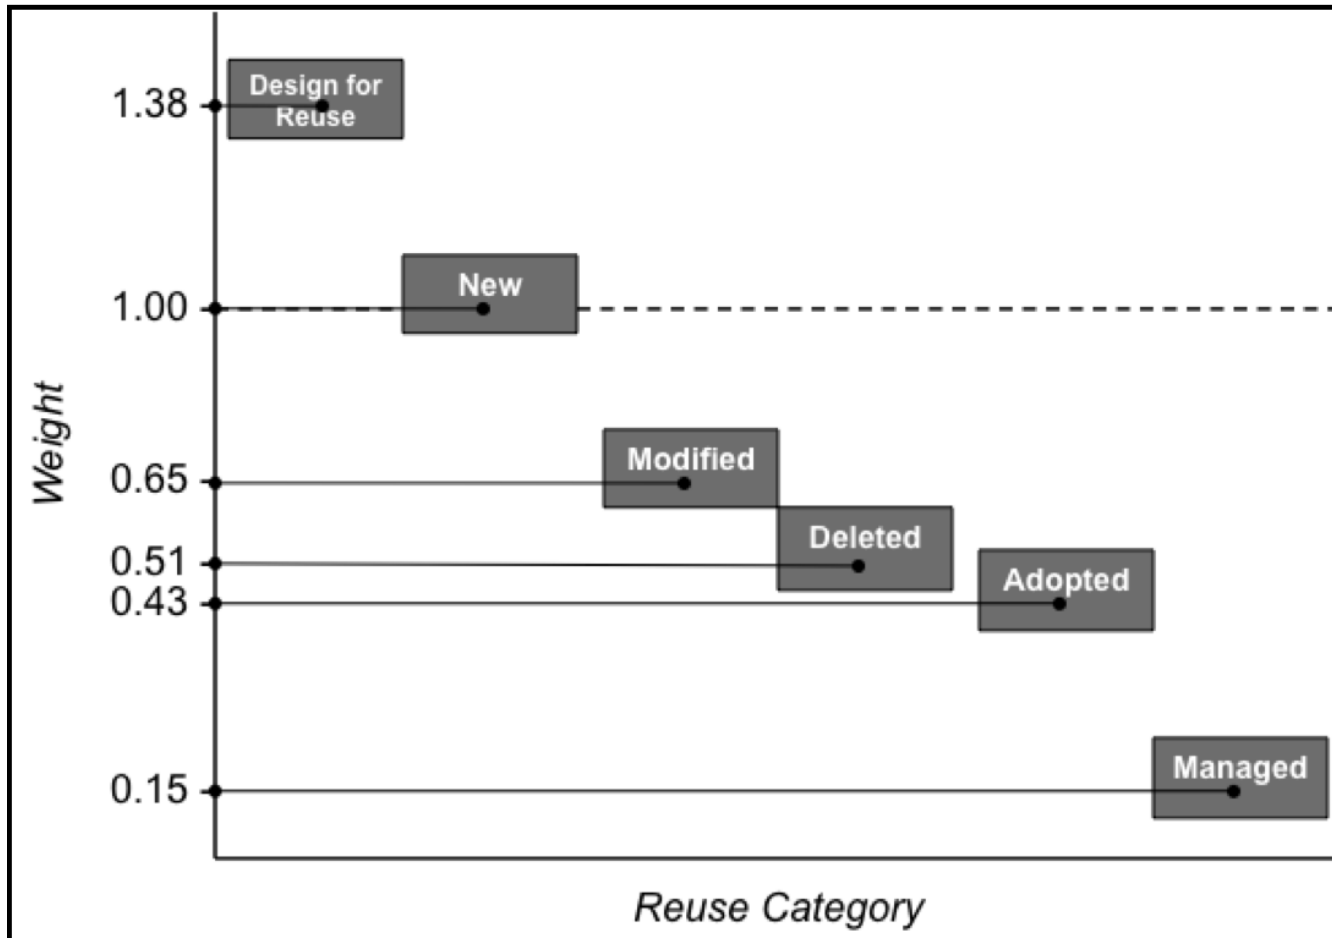

$w_r$  = weight for reuse category

$\Phi_x$  = quantity of “k” size driver

E = represents (dis)economies of scale

EM = effort multiplier for the  $j^{\text{th}}$  cost driver.

## COSYSMO 2.0 Implementation Results

Estimates with COSYSMO (no reuse categories)

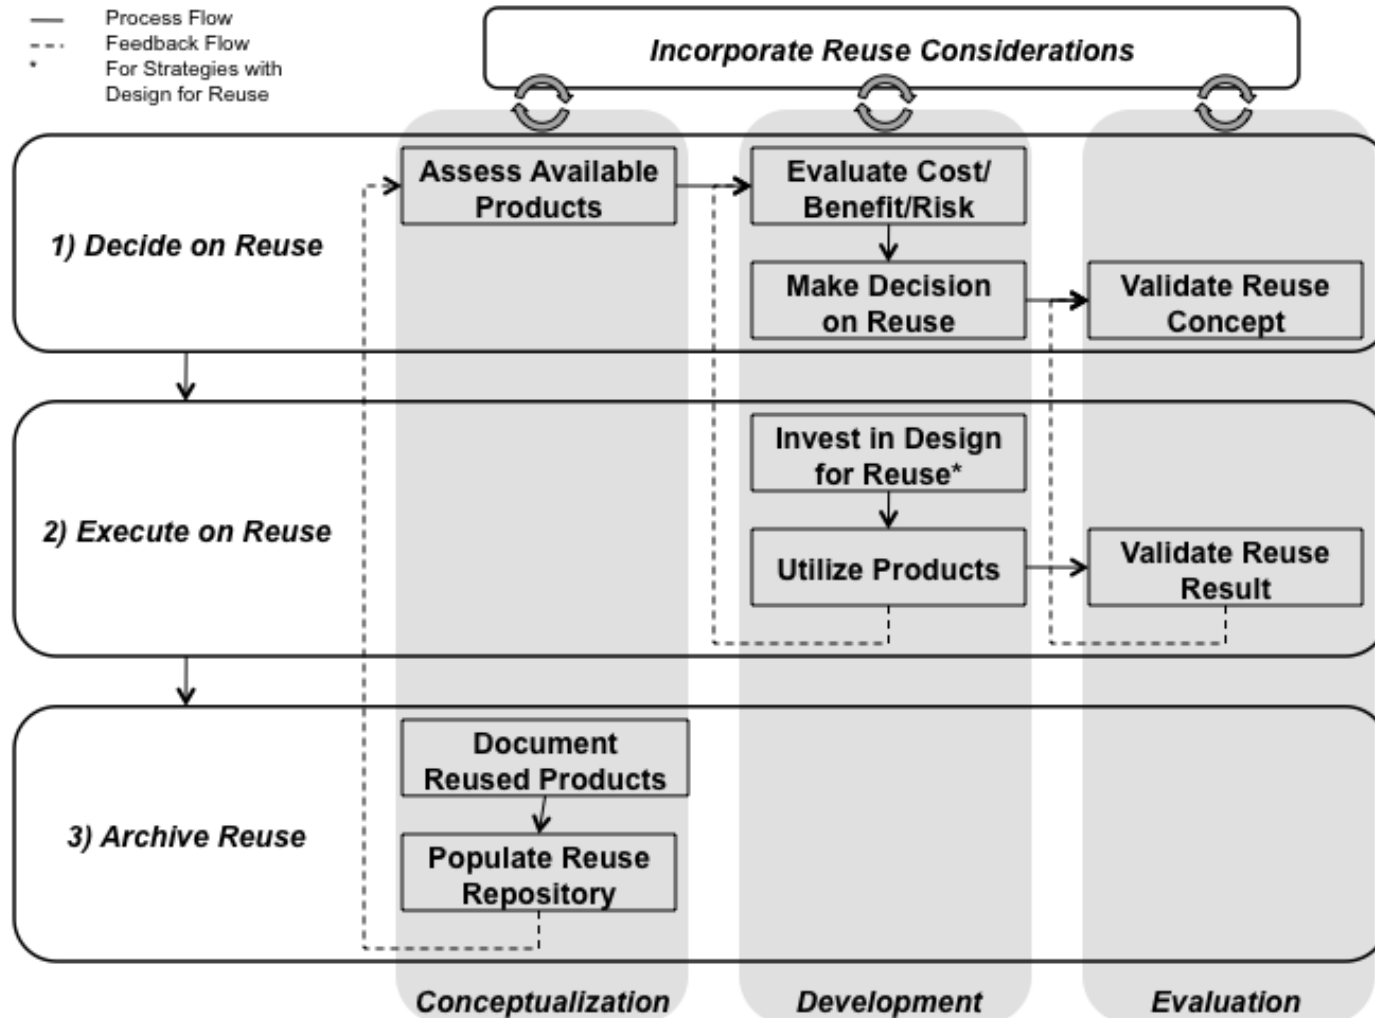

Estimates with COSYSMO 2.0 (with five reuse categories)

- Across 44 projects at 1 diversified organization
- Using COSYSMO:
  - $PRED(.30) = 14\%$
  - $PRED(.40) = 20\%$
  - $PRED(.50) = 20\%$
  - $R^2 = 0.50$
- Using COSYSMO 2.0:
  - $PRED(.30) = 34\%$
  - $PRED(.40) = 50\%$
  - $PRED(.50) = 57\%$
  - $R^2 = 0.72$
- Result: 36 of 44 (82%) estimates improved

## Requirements Trends Leading Indicator

- **Evaluates trends in the growth, change, completeness and correctness of the system requirements.**
- **It helps to determine the stability and completeness of the system requirements which could potentially impact project performance**

# Practical Software and Systems Measurement

## Requirements Volatility as a Leading Indicator

- ***This graph depicts the rate of change of requirements over time as compared to the projected trend and can be used to predict readiness for the Systems Requirements Review (SRR)***

## ***Requirements Volatility Definitions***

***Requirements volatility is the change in requirements (added, deleted, and modified) over a given time interval***

***Also known as:***

***Requirements creep: An increase in scope and/or number of system requirements***

***Requirements churn: Instability in the requirements set – requirements are frequently modified or reworked without necessarily resulting in an increase in the total number of requirements***

# ***Practical Software and Systems Measurement***

## ***Importance of Understanding Requirements Volatility***

- ***Requirements volatility has been identified by numerous research studies as a risk factor and cost-driver of systems engineering projects [Boehm 1991]***
  - ***Requirements changes are costly, particularly in the later stages of the lifecycle process because the change may require rework of the design, verification and deployment plans [Kotonya and Sommerville, 1995]***
  - ***The Government Accountability Office (GAO) concluded in a 2004 report on the DoD's acquisition of software-intensive weapons systems that missing, vague, or changing requirements are a major cause of project failure***
- ***System developers often lack effective methods and tools to account for and manage requirements volatility***

## *Principal Research Question*

*What technical, organizational, and contextual factors drive the amount of systems engineering effort added or reduced due the volatility of system requirements?*

## Literature Background

- *Most of the requirements volatility research to date has been focused on software systems*
- *Various research methods have been utilized to investigate the causes and effects of requirement volatility – a methodological breakdown of the studies reviewed to date is below*

- *However, there still a lack of empirical data to determine the quantitative impact of requirements volatility on systems engineering effort for a broader base of engineering projects*

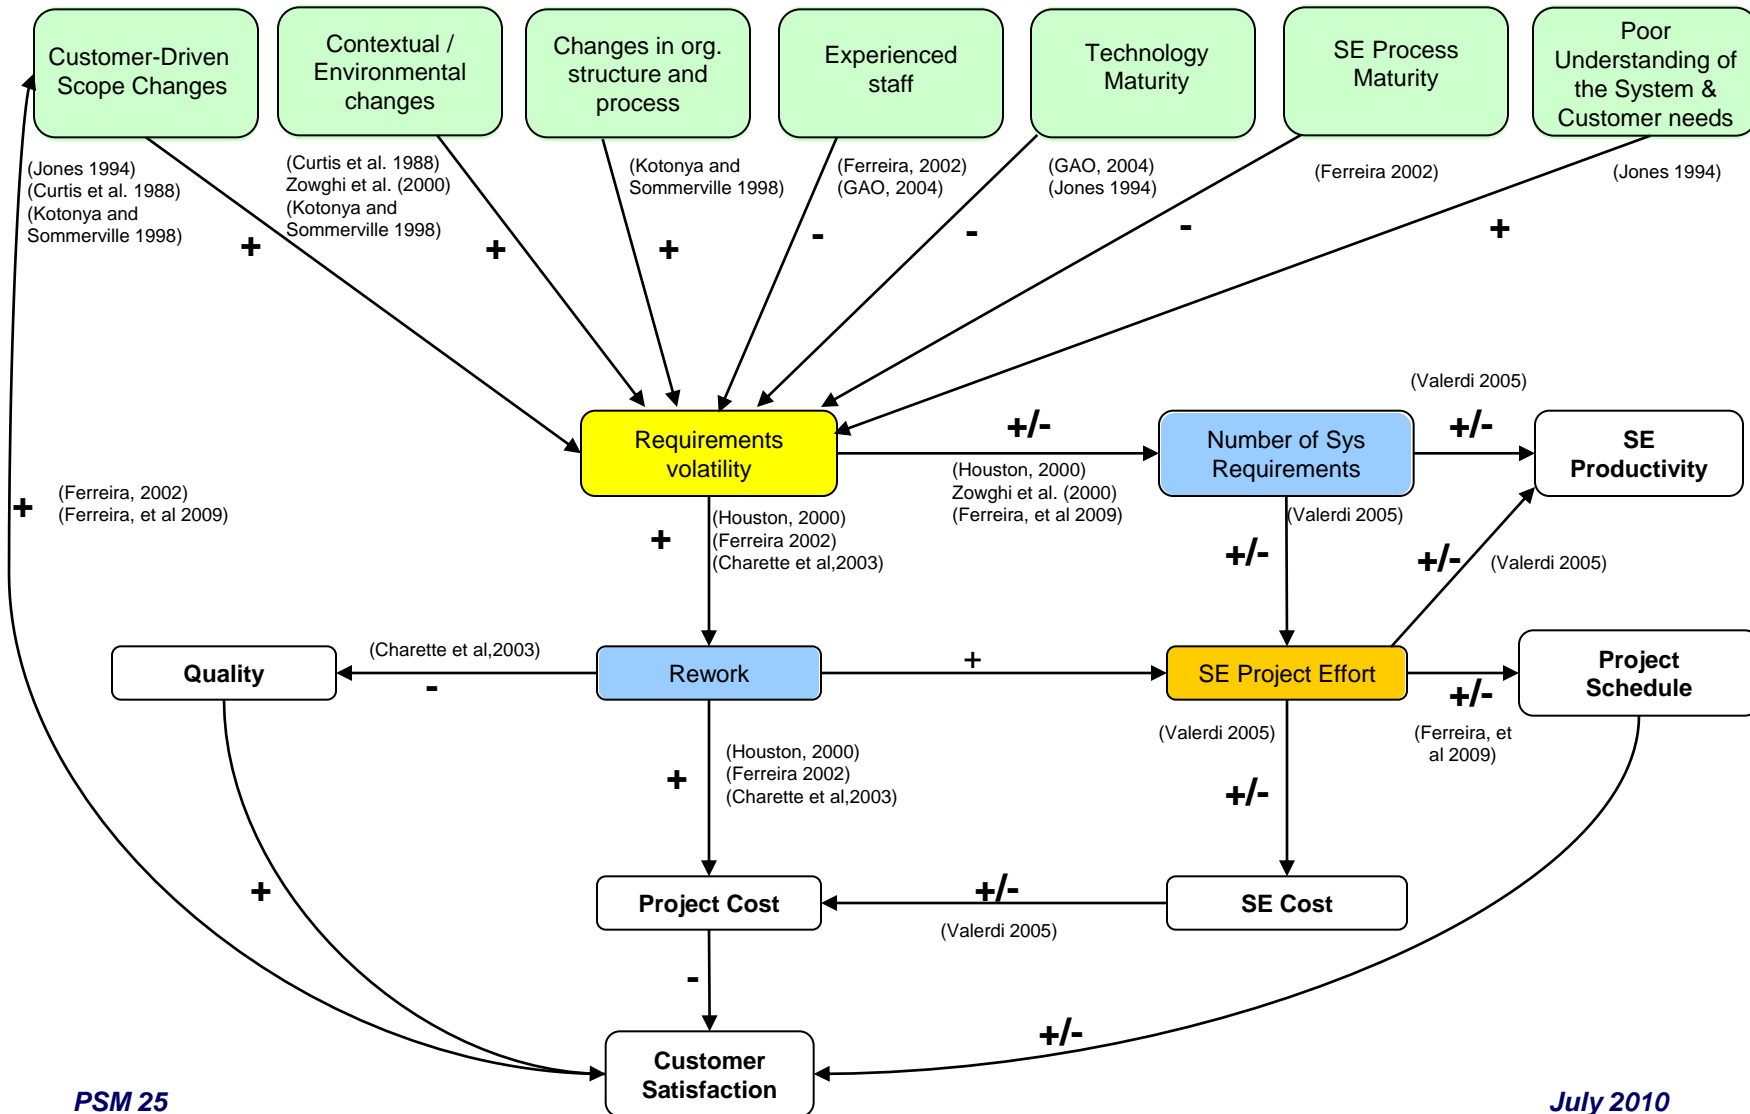

## ***Observations from the literature***

- 1. Requirements volatility is correlated with an increase in project size and systems engineering effort***
- 2. Requirements added after SRR have a greater impact on effort than requirements of comparable complexity captured in the initial baseline***
- 3. The level of volatility in the requirements set is a function of the system life cycle phase***
- 4. The impact of adding, modifying, or deleting a requirement increases the later the change occurs in the system lifecycle***
- 5. Removing a requirement may not necessarily result in a net decrease in systems engineering effort***
- 6. Based on the literature, a causal model was developed that relates technical, organizational and contextual project factors to requirements volatility***

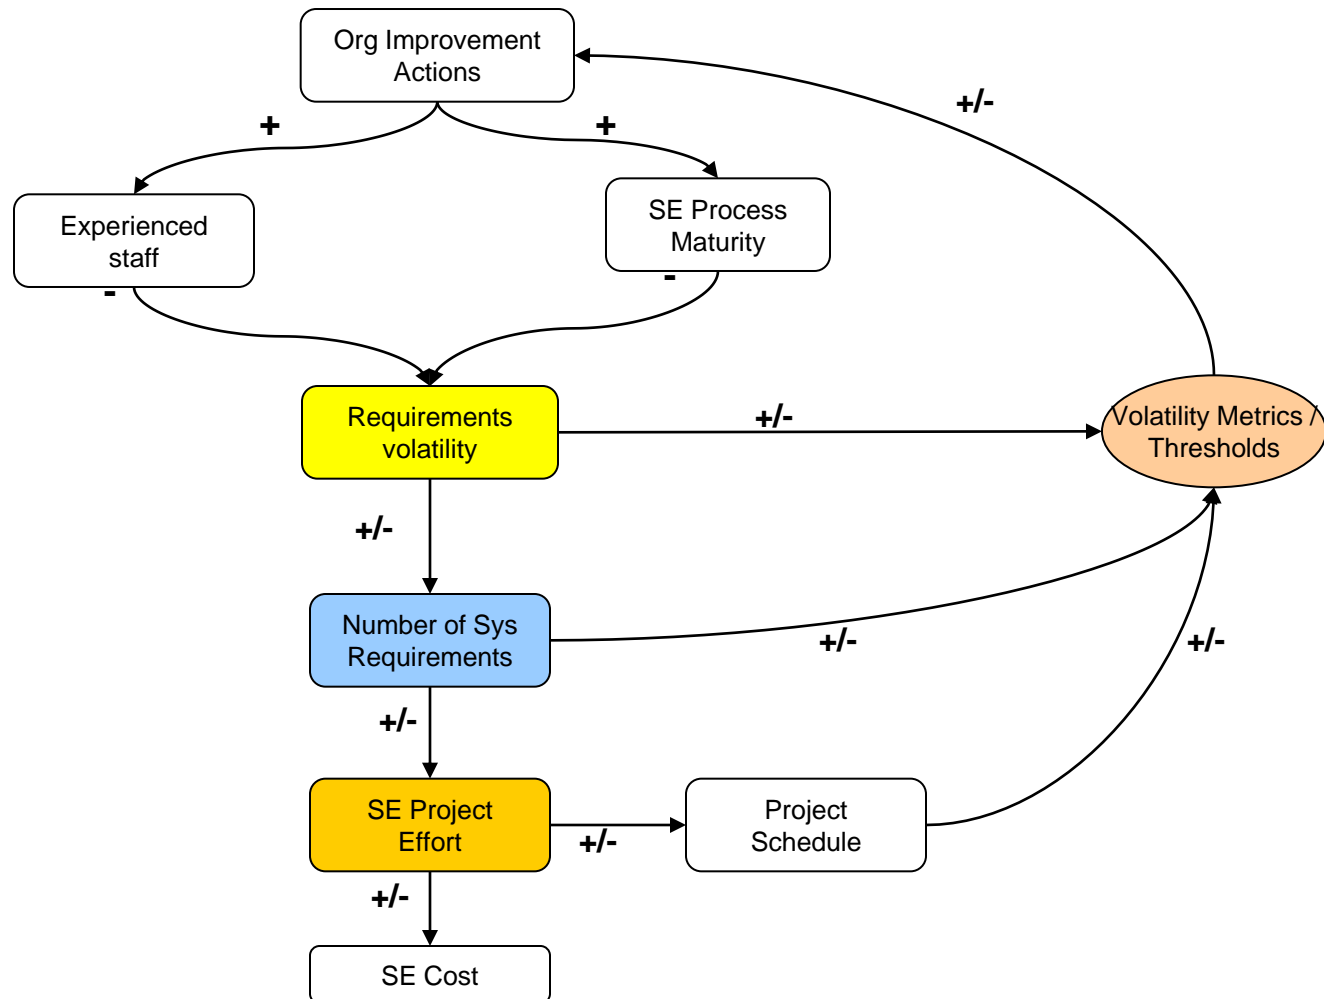

# Practical Software and Systems Measurement

## Causal Model (normative)

# Practical Software and Systems Measurement

## Moderating impact of expected volatility & thresholds

## ***Questions for discussion***

- 1. Are there other important causes of volatility missing in the model?***
- 2. Do you agree with the polarity of the relationships?***
- 3. In what cases is the relationship between volatility and # of systems requirements a positive one, and in what cases is it a negative one?***
- 4. Should the impact of requirements volatility be adjusted based on the criticality/coupling of the requirements?***
- 5. Does volatility have an impact on productivity?***
- 6. Should volatility thresholds vary depending on the size and duration of a project?***

## ***Exploratory Survey***

- ***An exploratory survey was developed to gather the perspectives of subject matter experts on the causes, impacts, and expected level of requirements volatility for a given system of interest***
- ***The survey was piloted during the 2010 USC-CSSE Annual Research Review***
- ***Version 2.0 of the survey was administered at the 2010 LAI Knowledge Exchange Event***
- ***Organizations represented included:***
  - ***The Aerospace Corporation, Northrop Grumman Corporation***
  - ***The Boeing Company, Softstar Systems, Raytheon***
  - ***United Launch Alliance, Massachusetts Institute of Technology, University of Southern California, and***
  - ***Representatives from the United States Army and Navy***

# ***Summary of Survey Results: Use of Requirements Volatility Metrics***

- ***Most participants either agreed or strongly agreed that requirements volatility metrics enable them to monitor and improve the performance of their project (46% USC ARR, 82% LAI)***
- ***However, a sizeable percentage responded that their organizations do not use requirements volatility metrics (36% USC ARR, 63% LAI)***
- ***There seems to be a disconnect between individual contributors' perspectives and organizational adoption of requirements volatility metrics***

## ***Summary of Survey Results: Expected Levels of Volatility***

- ***Most respondents expect >10% volatility during the conceptualize and development phase of the project, and <10% volatility for the rest of the system life cycle***
- ***Participants who work on software-intensive systems expect a higher level of volatility in the later stages of the project than respondents from hardware oriented systems***
- ***Most survey participants stated that the type of project (experimental, development, production, etc.) has a high to very high influence on the expected level of requirements volatility***

# Practical Software and Systems Measurement

## Expected Volatility: USC-CSSE ARR Survey

Please provide your best estimate of the requirements volatility expected during each of following life cycle phases of your organization's typical products/systems.

# Practical Software and Systems Measurement

## Expected Volatility: LAI Knowledge Exchange Survey

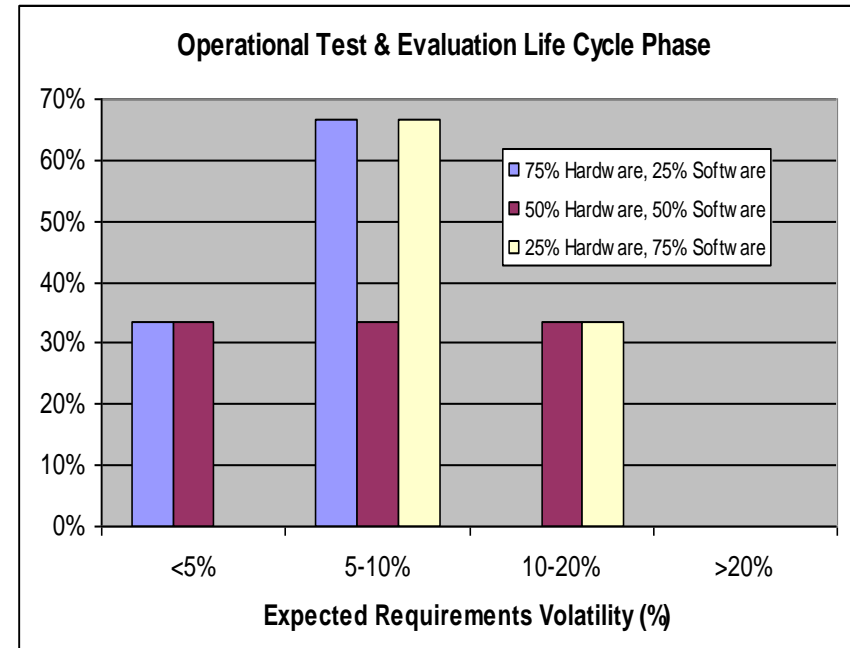

Please provide your best estimate of the requirements volatility expected during each of following life cycle phases (as defined by ISO/IEC 15288 and EIA/ANSI 632) of your organization's typical products/systems (assume stabilized evolutionary development, not agile development).

Requirements volatility is defined as the percentage of the project's total number of requirements that are added, modified or deleted over a specified period of time.

# Practical Software and Systems Measurement

## Impact of Hardware/Software Project Breakdown on Expected Volatility

**Respondents that work on projects with 75% S/W content expect a higher level of requirements volatility in the test through operational life cycle phases than respondents with projects with 75% H/W content**

# ***Summary of Survey Results: Causes and Impacts of Volatility***

- ***In general, preliminary results of the survey support observations from the literature and causal model***
  - ***Most respondents stated that requirements volatility will cause a moderate to large increase in the number of system requirements and the amount of rework***
- ***There were additional findings with respect to the strength of the relationship between variables:***
  - ***All respondents either agreed or strongly agreed that “Poor initial understanding of system requirements or customer needs” is a cause of requirements volatility***
  - ***“Changes in organizational structure and policies” had the lowest level of agreement as a cause of requirements volatility***

## Impacts of Volatility USC-CSSE ARR Survey

Based on your experience, how would you rate the impact of requirements volatility (post requirements baseline) on the following (from large increase to large decrease)?

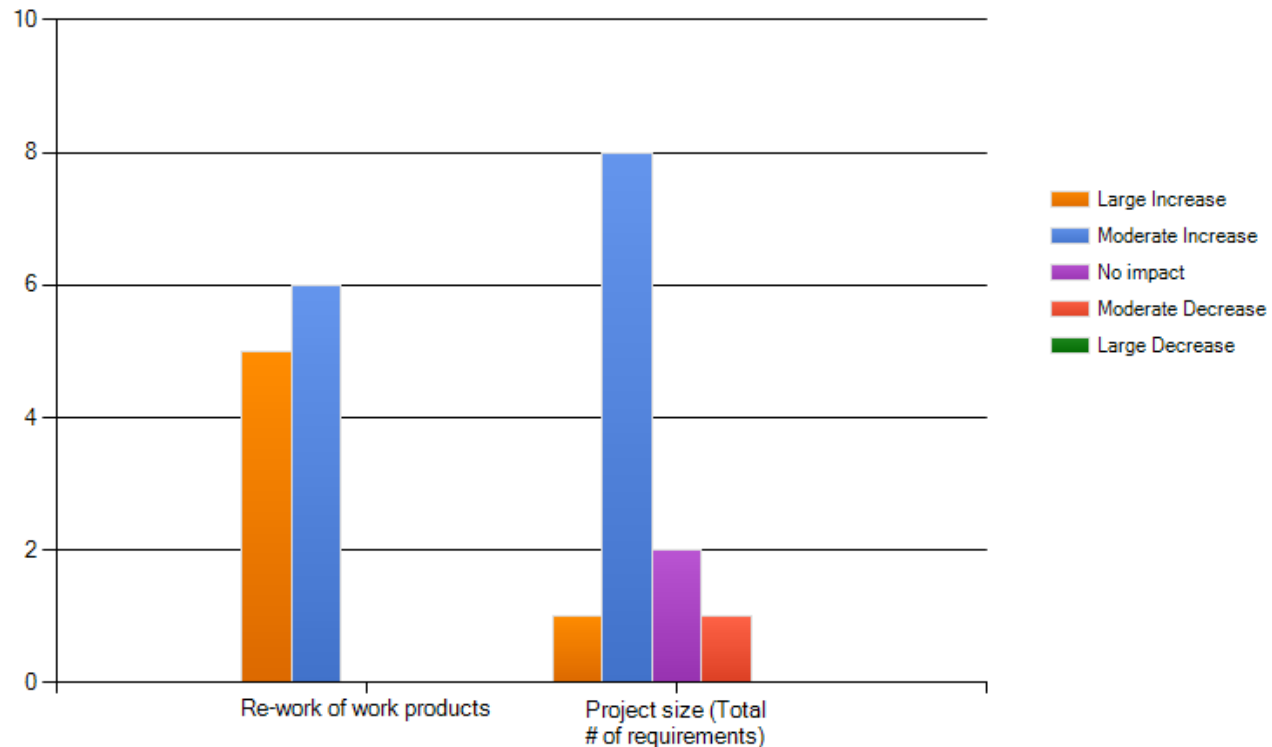

## Impacts of Volatility

### LAI Knowledge Exchange Survey

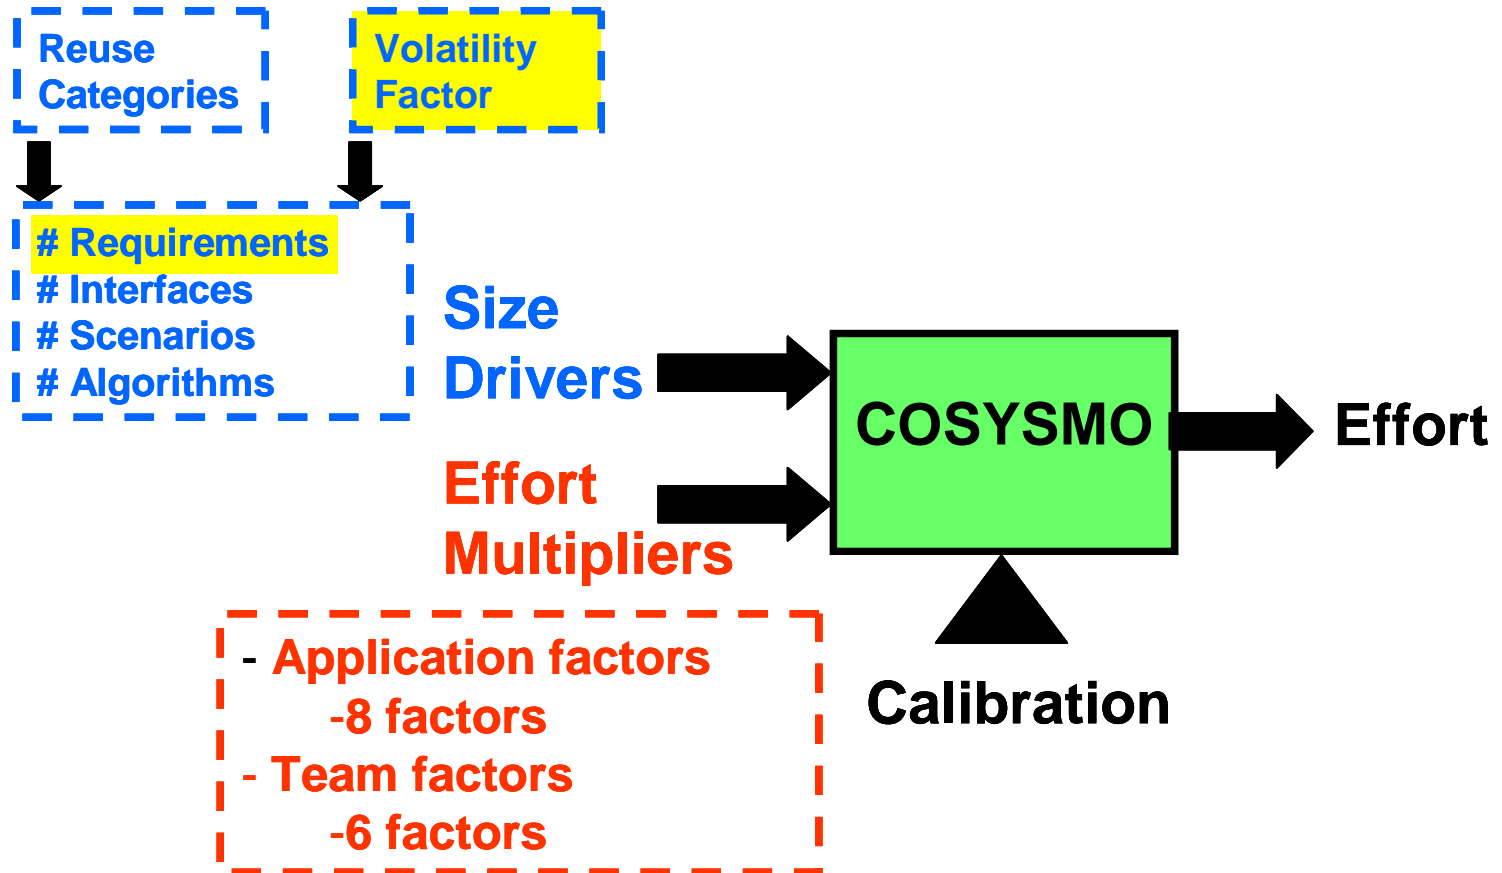

This question deals with the impact of requirements volatility on a project when the volatility occurs after the requirements have been baselined (post systems requirements review).

Based on your experience, how would you rate the impact of requirements volatility (post requirements baseline) on the following (from large increase to large decrease)?

## Implications to COSYSMO

## **Proposed COSYSMO Extension**

- ***During the development of COSYSMO, volatility was identified as a relevant adjustment factor to the model's size drivers***
- ***However, there was insufficient data to incorporate volatility effects into the model***
- ***One of the objectives of the research is to complete the requirements volatility extension to COSYSMO within the existing structure and scope of the model***
- ***The proposed extension builds upon the COCOMO II method of using a size adjustment factor to account for Requirements Evolution and Volatility (REVL)***

*Boehm, B., Abts, C., Brown, A.W., Chulani, S., Clark, B., Horowitz, E., Madachy, R., Reifer, D.J., and Steece, B. (2000). Software Cost Estimation with COCOMO II. Prentice Hall.*

## Volatility Adjustment Factor (1 of 3)

*REVL is defined as the percentage of the baseline set of requirements that is likely to change due to the technical and organizational factors captured in the causal model*

*This relationship is expressed through the following equation:*

$$R_{eff} = \left( 1 + \frac{REVL}{100} \right) \times R_0$$

*Where,*

*$R_0$  = Baseline number of requirements*

*$R_{eff}$  = Effective number of requirements at the end of the project*

*The effective increase in the number of requirements would result in an associated increase in systems engineering effort*

## Volatility Adjustment Factor (2 of 3)

*In COSYSMO, the requirements are categorized by level of complexity as “easy,” “nominal,” and “difficult”*

*Applying the three categories to the equation below results in the following relationship*

$$R_{eff} = \left( 1 + \frac{REVL}{100} \right) \times (R_{e,r} + R_{n,r} + R_{d,r})$$

*Where,*

*$R_{e,r}$  = Initial number of requirements classified as “easy”*

*$R_{n,r}$  = Initial number of requirements classified as “nominal”*

*$R_{d,r}$  = Initial number of requirements classified as “difficult”*

## Volatility Adjustment Factor (3 of 3)

*Observations from the literature indicate that requirements added post-SRR carry an effort penalty due to the potential rework and collateral impact to other engineering products*

*A weighting factor is added to account for this additional effort by increasing the effective functional size of the project*

$$R_{eff} = w_v \left( 1 + \frac{REVL}{100} \right) \times (R_{e,r} + R_{n,r} + R_{d,r})$$

*Where,*

*$w_v$  = Requirements volatility weighting factor*

## **Proposed Revised Algorithm**

$$\Phi_r = \left( \sum_v w_v \cdot \left( 1 + \frac{REVL}{100} \right) \left( \sum_r w_r \left( w_{e,r} \Phi_{e,r} + w_{n,r} \Phi_{n,r} + w_{d,r} \Phi_{d,r} \right) \right) \right)$$

**Where,**

**$\Phi_r$  = total quantity of the requirements size driver**

**REVL = Requirements Volatility and Evolution Factor**

**$w_{xr}$  = weight for “Easy”, “Nominal”, or “Difficult” size driver**

**$r = \{New, Design\ for\ Reuse, Modified, Deleted, Adopted, Managed\}$**

**$w_r$  = weight for reuse category**

**$w_v$  = Requirements volatility weighting factor**

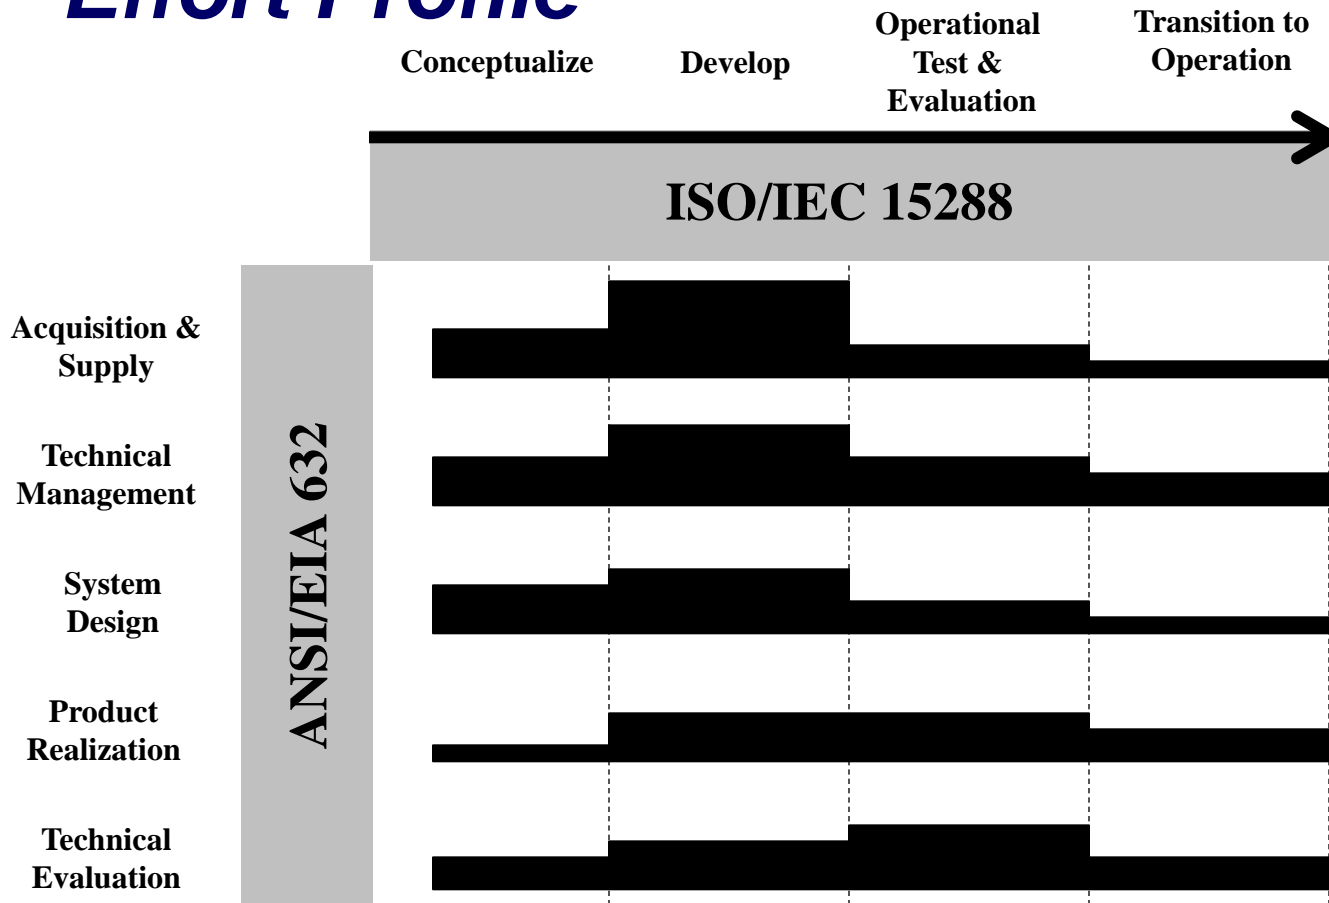

# *Practical Software and Systems Measurement*

## *Use Case: Accounting for Requirements Volatility*

- **Goal:** *Account for the impact of requirements volatility on systems engineering effort for a given system of interest*
- **Summary:** *Changes the requirements set are expected to increase the functional size of the project and cause rework, which has an impact on systems engineering effort*
- **Actors:** *Systems Engineer, project manager*
- **Components:** *Original COSYSMO algorithm, proposed algorithm extension, REVL estimate, requirements volatility weighting factor*
- **Normal Flow:**
  1. *Enter size parameters for the system of interest*
  2. *Enter reuse information if applicable*
  3. *Enter Requirements Evolution and Volatility (REVL) factor*
  4. *Select cost parameters for system of interest*
  5. *COSYSMO Extension Outputs*
