“Observations from the Field”

Designing an Enterprise for Value Delivery

Lt Col Luke Cropsey
20 Oct 2010

United States
European Command
“Stronger Together”

Objectives

- Provide a couple of useful, “low-tech” tools or methods to help uncover value
- Provide a model for thinking about value, context and the interface between technical systems and their associated enterprises
- Provide a few insights and helpful hints comparing and contrasting the original research effort with application in practice

Big Ideas

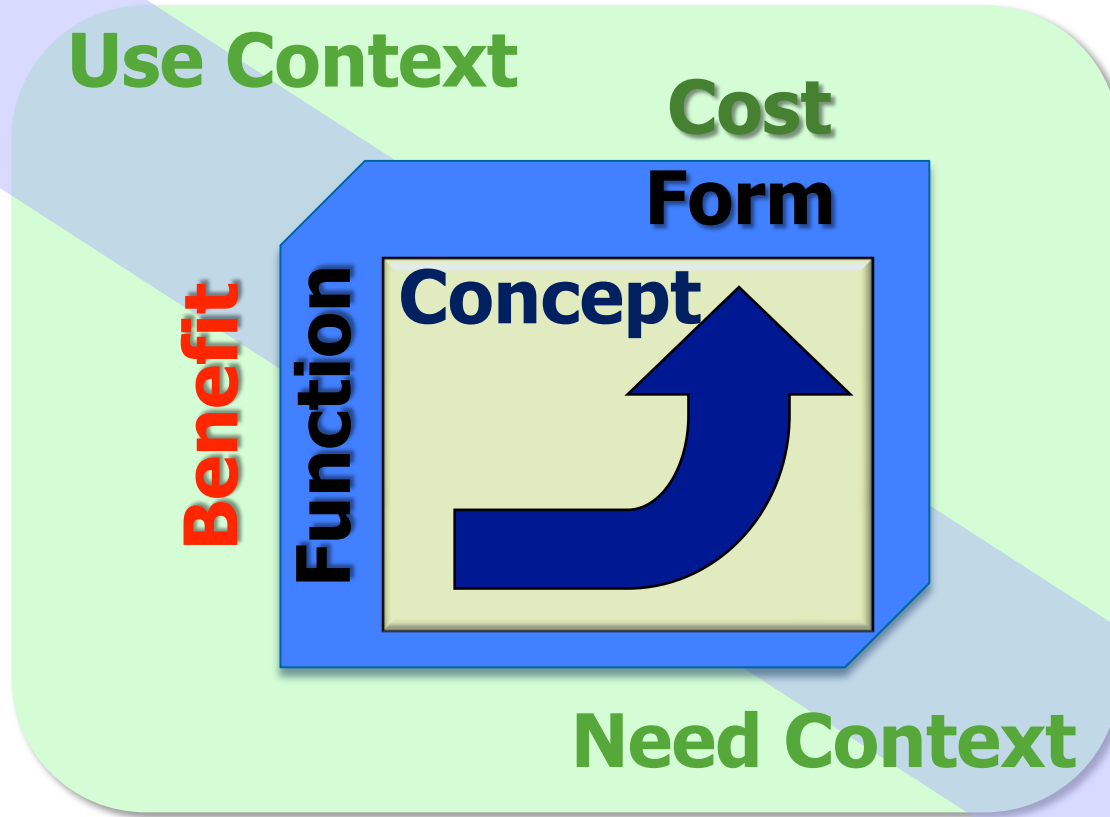

- Value – Focused Thinking
- Context
- Rigor

Enterprise Purpose

*The purpose of the airspace integration enterprise is to restore the principle of maneuver to operations by integrating UAS into civil airspace using a full spectrum approach of policy, procedures and materiel system equipage while **enabling needed UAS training and operational missions** and **meeting the contextual constraints (political, cultural, organizational, resource, etc)** necessary to **successfully deliver incrementally meaningful levels of operational flexibility.***

IO Purpose Statement (JP 3-13)

The purpose of information operations is to achieve and maintain information superiority for the U.S. and its Allies by integrating core, supporting and related capabilities using a full spectrum approach to influence, disrupt, corrupt, or usurp adversarial human and automated decision making while **protecting our own.**

Information Operations

Information operations (IO) are described as the *integrated employment* of electronic warfare (EW), computer network operations (CNO), psychological operations (PSYOP), military deception (MILDEC), and operations security (OPSEC), *in concert with specified supporting and related capabilities*, to **influence, disrupt, corrupt, or usurp** adversarial human and automated decision making while **protecting** our own.

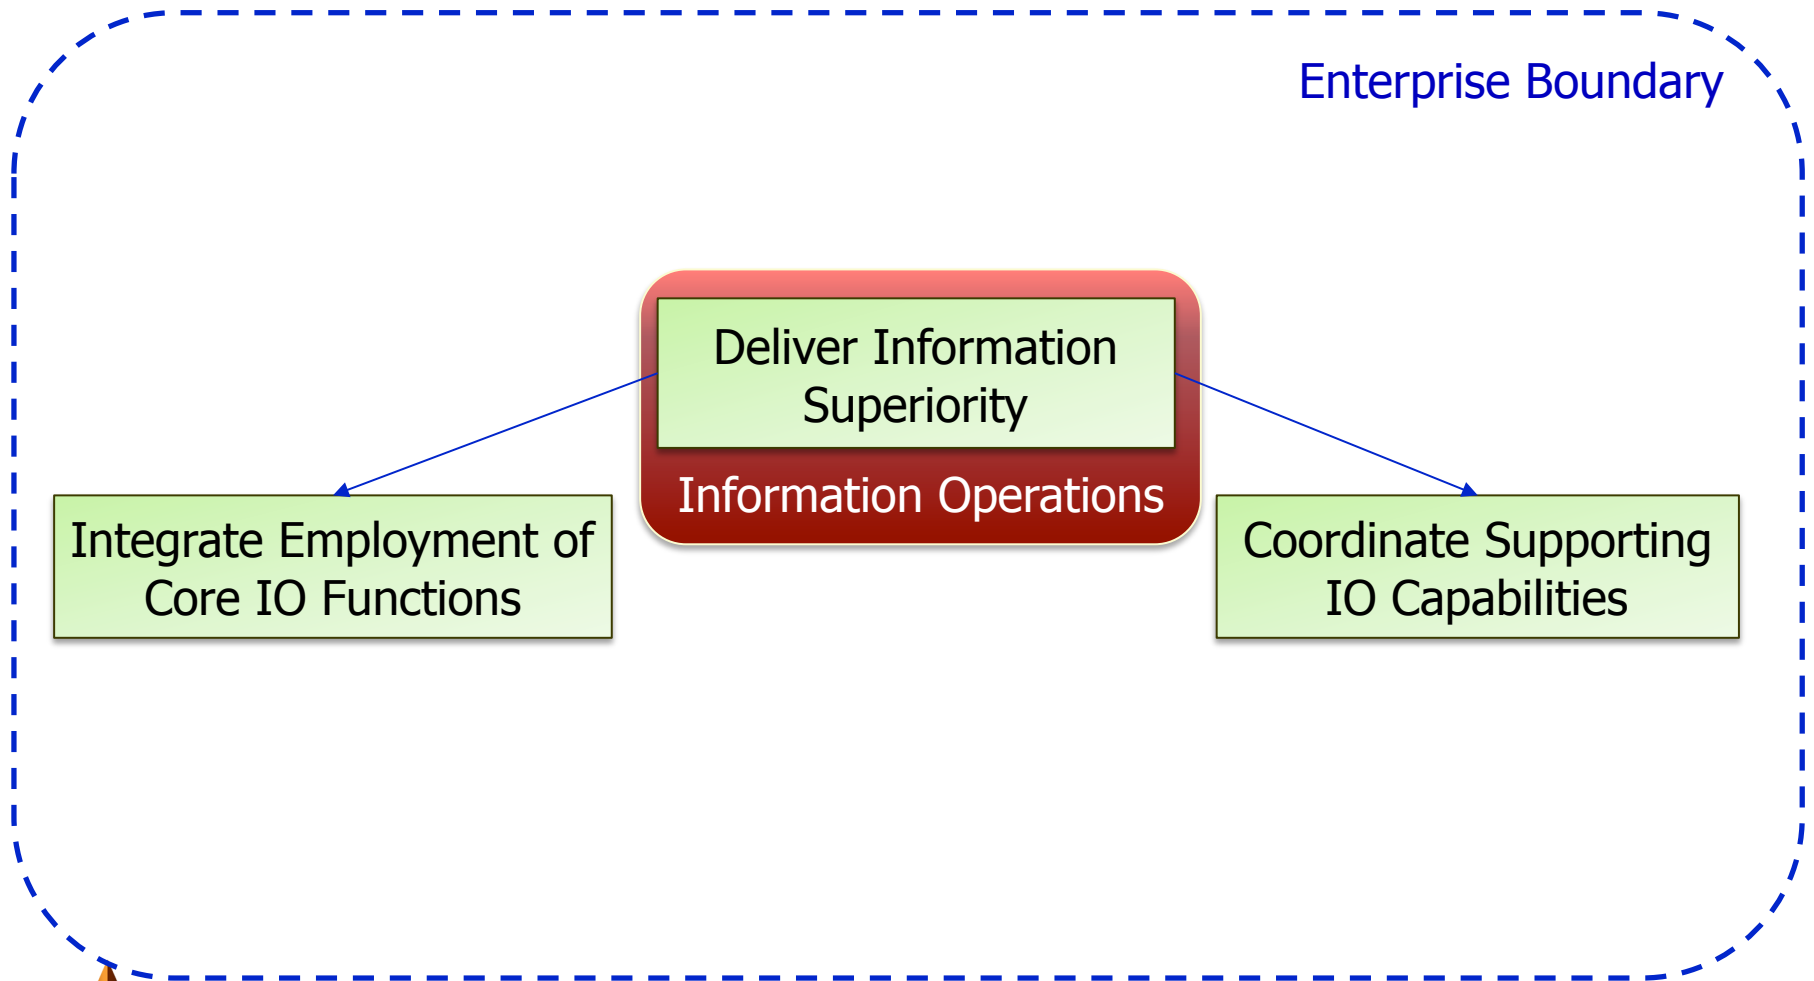

The purpose of this doctrine is to provide **joint force commanders (JFCs)** and their staffs *guidance to help prepare, plan, execute, and assess IO* in support of joint operations. **The principal goal is to achieve and maintain information superiority for the US and its allies.**

IO Purpose Context

IO at a Combatant Command

Commander, United States Strategic Command's (USSTRATCOM's) specific authority and responsibility to coordinate IO across area of responsibility (AOR) and functional boundaries does not diminish **the imperative for other combatant commanders to employ IO**. These efforts may be directed at achieving national or military objectives incorporated in **theater security cooperation plans, shaping** the operational environment for potential employment during periods of heightened tensions, or in **support of specific military operations**. It is entirely possible that in a given theater, the combatant commander will be supported for select IO while concurrently supporting USSTRATCOM IO activities across multiple theater boundaries.

Back Brief Results

- Disconnects between doctrine, leadership, and action officers on what info operations really is/means
- Lack of consensus on attribute definitions
- Lack of consensus on relative attribute weights
- Inability of participants to think in value-space
 - Regressed to “processes” and the need to “order” attributes in a logical sequence
 - Difficulty in thinking in the need space – continued to devolve to solution space
- Result: vote of “no-confidence” in the original value identification

Mid-Course Analysis Observations

- Rigorous decomposition is important for bringing out inconsistencies in people's mental models
 - Different definitions of Info Ops
 - Different perspectives on how activities relate
 - All using the same words to mean different things
- Getting to real value identification takes time, insight, and some intuition for the context of the enterprise
- People have difficulty thinking in the abstract – especially with something as squishy as “enterprise”

Potential Heuristics

- Lack of convergence in stakeholder definitions indicates a failure in proper value identification
- Value-space is not as large as you think it is. Ask “Why” questions to winnow symptoms from root causes.

Value Identification – Round #2

- Reduce Ambiguity in objectives and effects
 - “Rinse and Repeat” as needed
 - “Planning should be done top down, Refinement bottom up” – An artillery man’s perspective
- Open the trade space for Course of Action development
 - Sum of the Parts \neq The Whole
 - Ops vs. BPC perspectives
- Enhance collaboration and team work across the staff and with external organizations

Architecture Leverage Points

The Cognitive Domain

WISDOM = Understanding + Experience

UNDERSTANDING = Knowledge + Insight

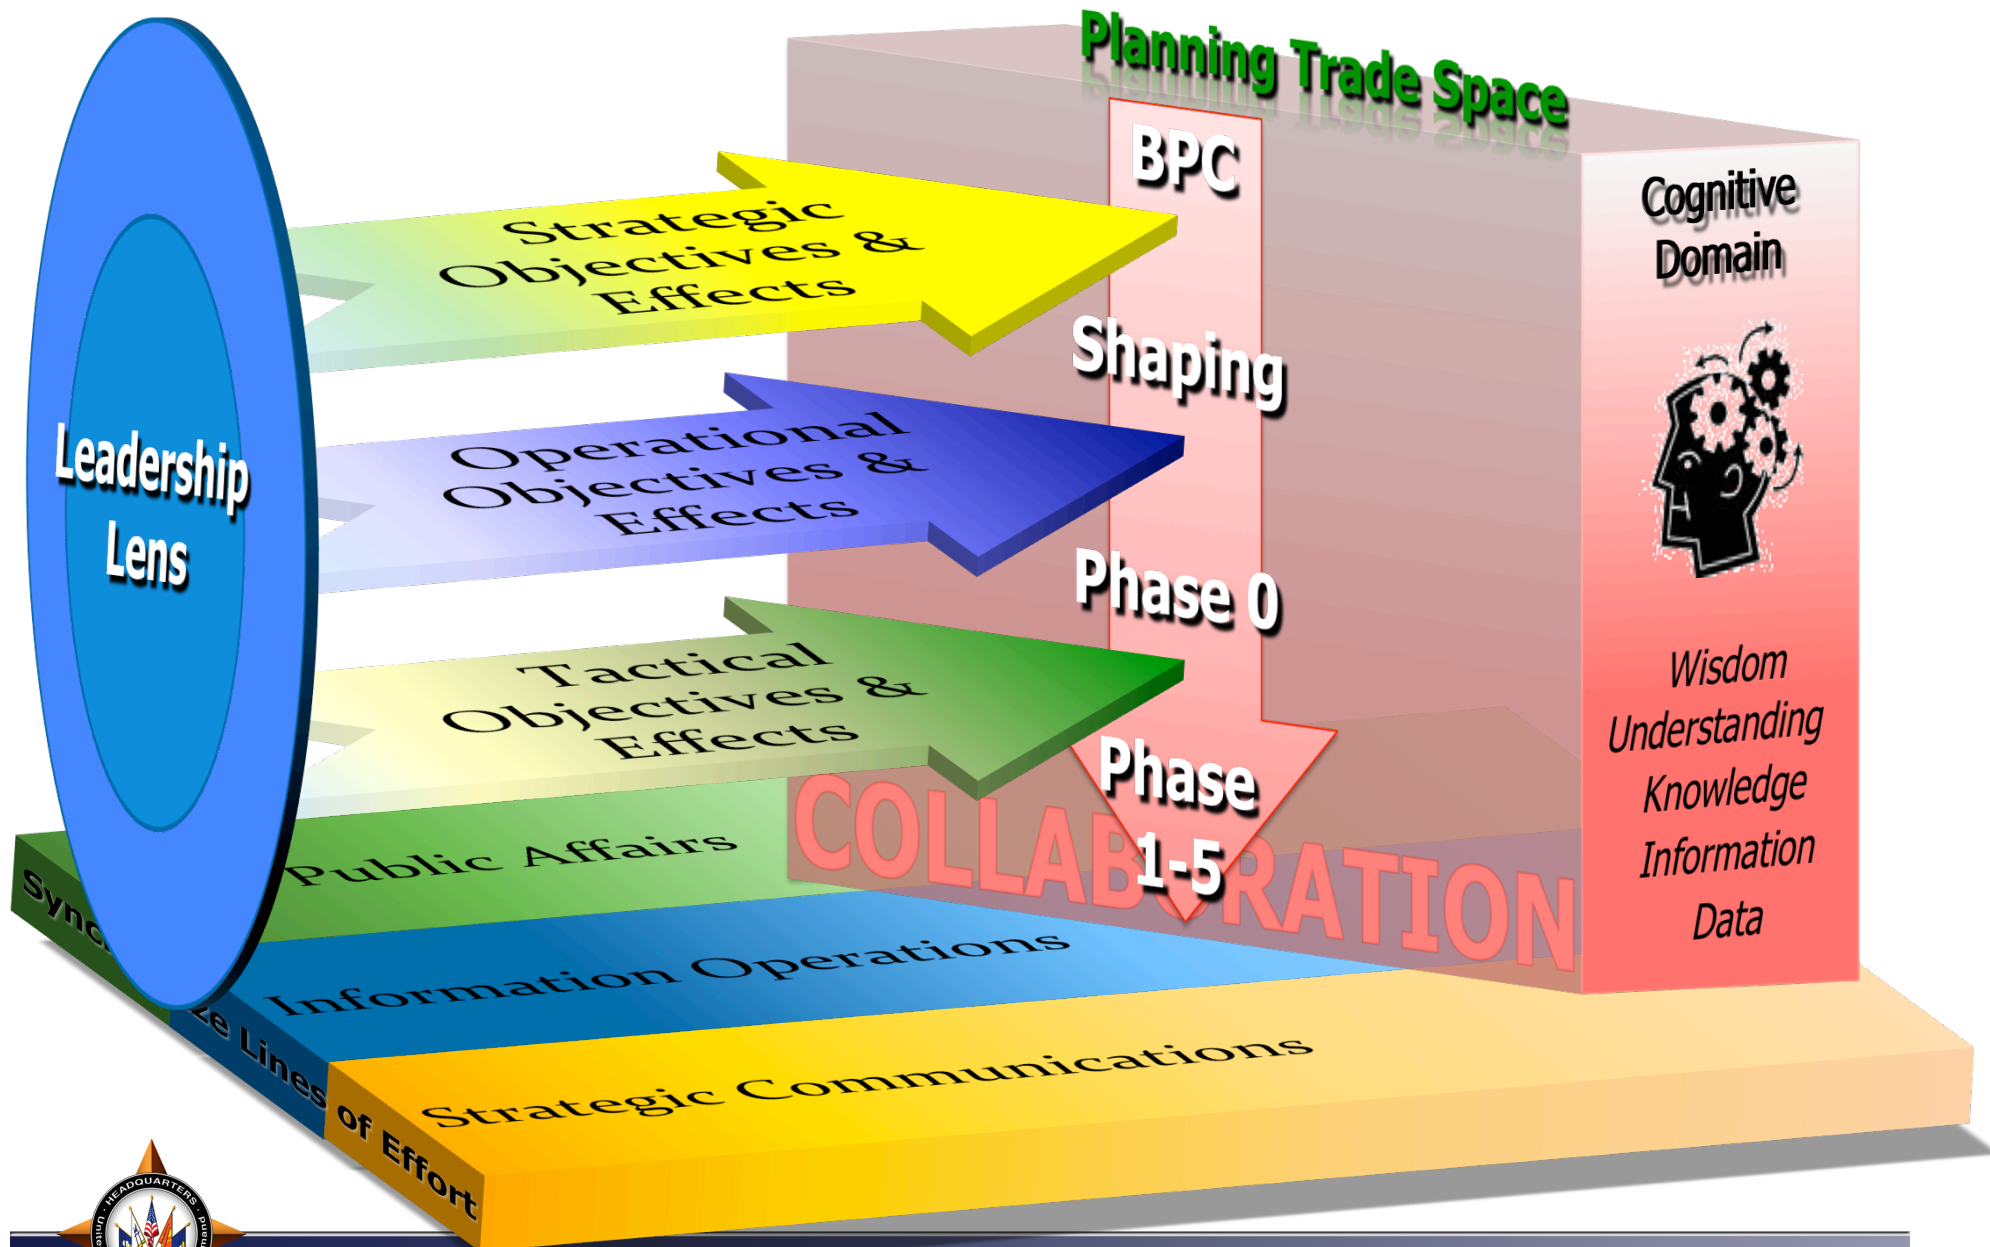

KNOWLEDGE = Information + Synthesis across Multiple Contexts

INFORMATION = Data + Context

DATA = Facts and Figures

United States
European Command
"Stronger Together"

United States
European Command
"Stronger Together"

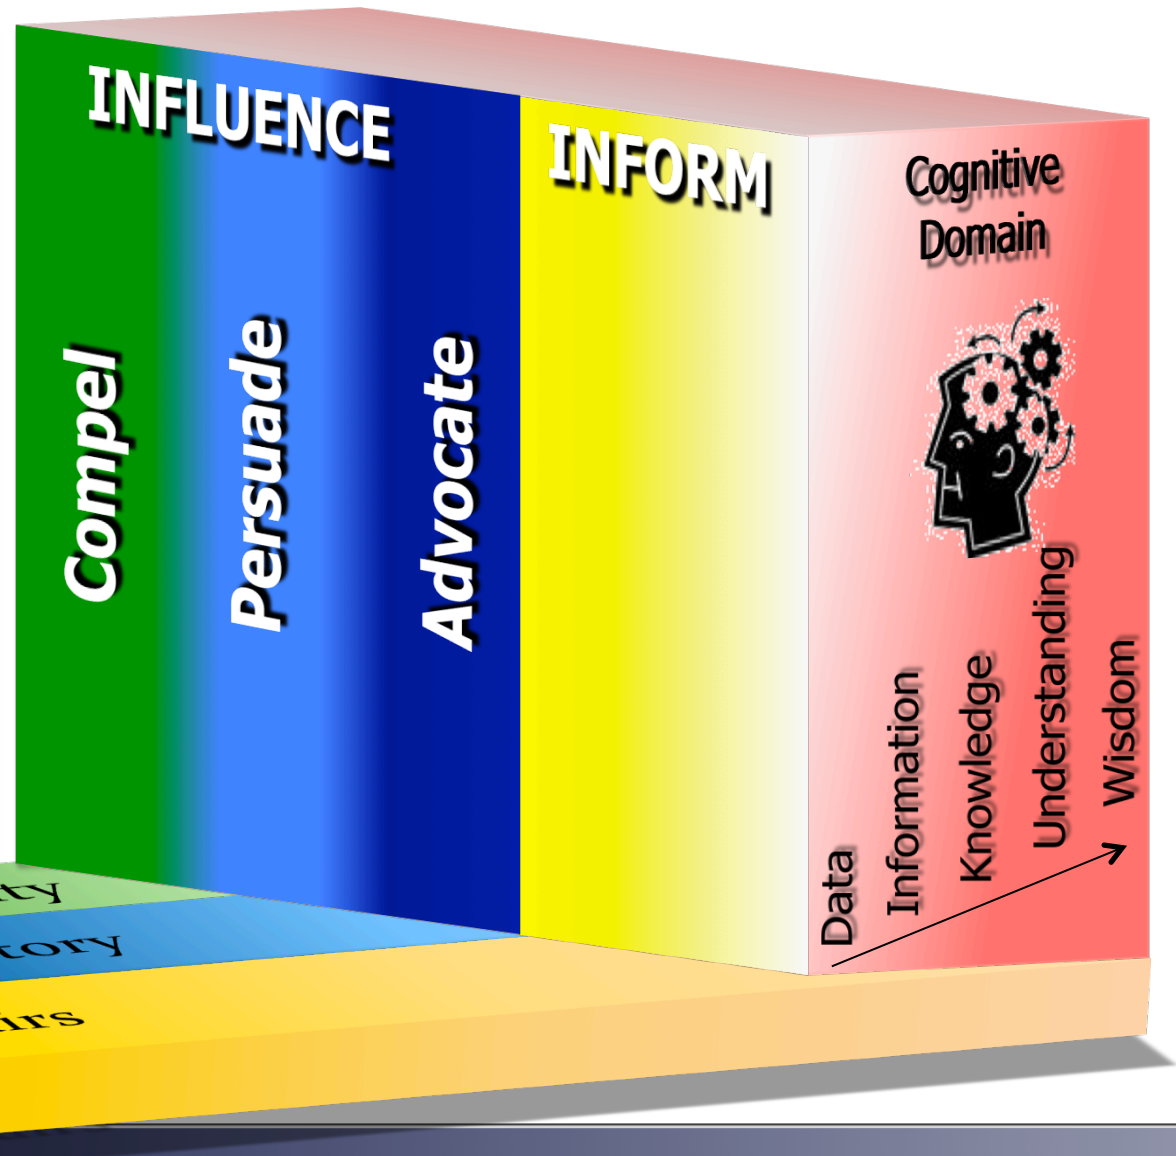

Cognitive Lines of Effort

Inform – provide facts

Advocate – tell our story

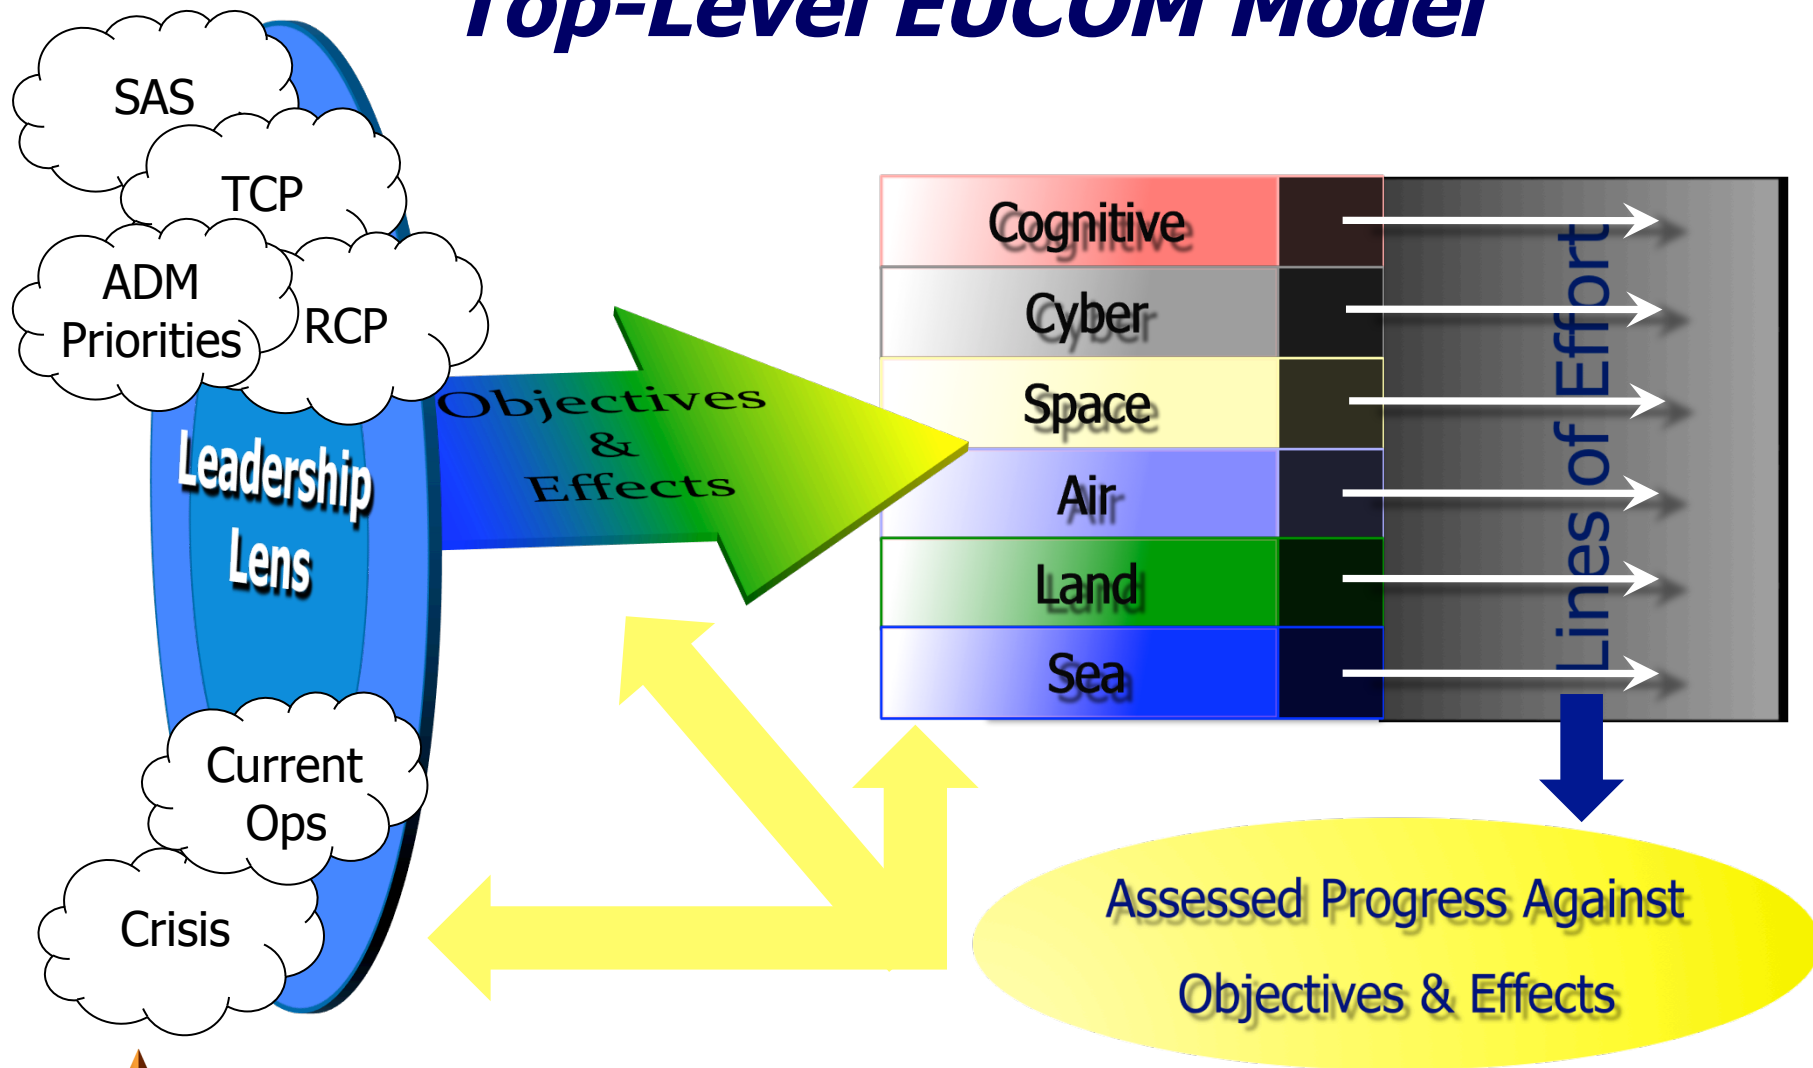

Persuade – change minds

Compel – change actions

Top-Level EUCOM Model

Key Activities & Products

Outline

- Case Study #1 – Integrating Unmanned Aircraft Systems in the National Airspace
- Case Study #2 – Architecting EUCOM Information Operations for Value Delivery
- Observations between Theory (Case Study #1) and Practice (Case Study #2)
- Conclusions

Convergence between Theory & Practice

- Value-focused thinking works
 - Keep the discussion in “need” vice “solution” space
 - Generating the dialogue produces the insight – ask “why” at least three more times
- Drive the discussion to a common model
 - Unarticulated assumptions will kill you – get them out in the open
 - Words are too ambiguous – use pictures at a minimum
- Context, Context, Context!
 - You cannot have too much domain experience
 - Get perspectives from everyone in the enterprise

Divergence between Theory and Practice

- Most people don't think in the abstract very well
 - EA hurts most people's head – get concrete fast
 - Avoid the “process and organization” trap
- “Politics” has to be added to the model
 - Implementation in a bureaucracy may be the hardest thing you attempt in the entire process
 - Architect for stable intermediate forms based on what is politically achievable
- Getting time to “think” is next to impossible
 - Looks a lot like “doing” nothing
 - The “urgent” displaces the “important”

Outline

- Case Study #1 – Integrating Unmanned Aircraft Systems in the National Airspace
- Case Study #2 – Architecting EUCOM Information Operations for Value Delivery
- Observations between Theory (Case Study #1) and Reality (Case Study #2)
- Conclusions

Conclusions

- **Rigor** counts – don't take shortcuts
- Never accept the first answer you get – keep digging
- A **common model** is essential – words are necessary but not sufficient – drive out ambiguity 24/7
- Context, Context, Context – must have domain savvy
- Generating stakeholder **dialogue** may be the most important thing you do through the entire effort
- Implementation is as hard as value identification
- **Politics** drives the design for stable intermediate forms of an enterprise architecture – account for it early

Helpful Hints

- Use someone else to take notes so you can just listen
- Use analogies to drag important concepts out of the stakeholder's framework and into a broader context
- Value identification takes time – don't attempt to get it all in one pass or a single interview
- There is no substitute for domain experience. Go get it before attempting an EA effort of any size.
- Expect conflict to result through the process and know how to deal with it so it doesn't derail the effort
- Get your boss's perspective early and often or you won't get the implementation right

Enterprise Purpose Framework

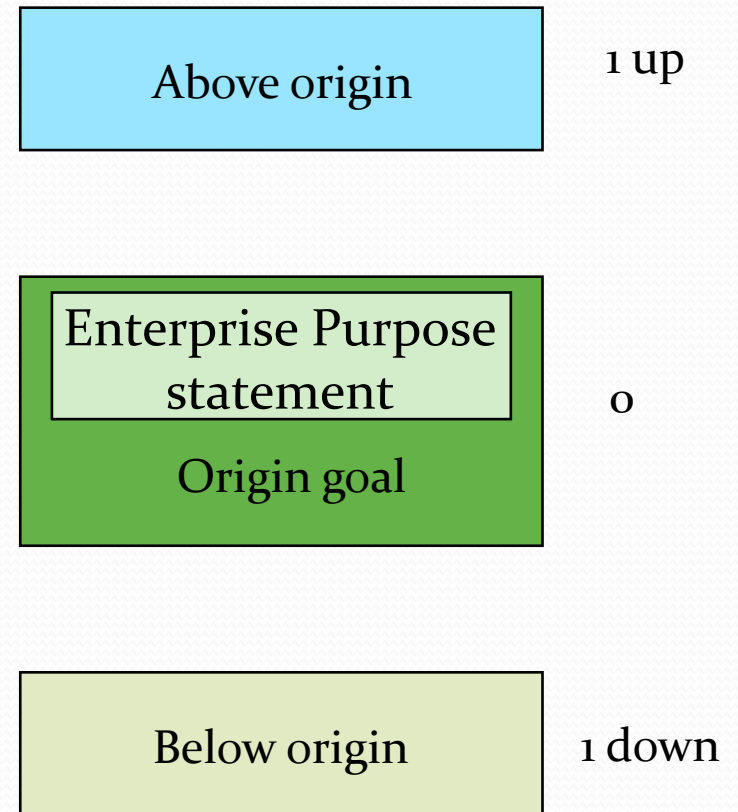

Layers above the “origin”

- The product/system success goal (the “origin”) is just one part of the goal structure of the enterprise.
- Understanding (by the architect) how the origin goal combines with other enterprise goals is vital. You may have to reconstruct these to have them make sense.
- Layers above origin goal merge into enterprise strategy and other functional strategies.

System problem statement (SPS) within the “origin” goal

Layers below the origin

- These decompose the origin goal (usually the live or die goals [0.1] and other necessary goals [0.2])
- Usually meaningful decomposition of goals is not possible until high level concept (form and function) are defined

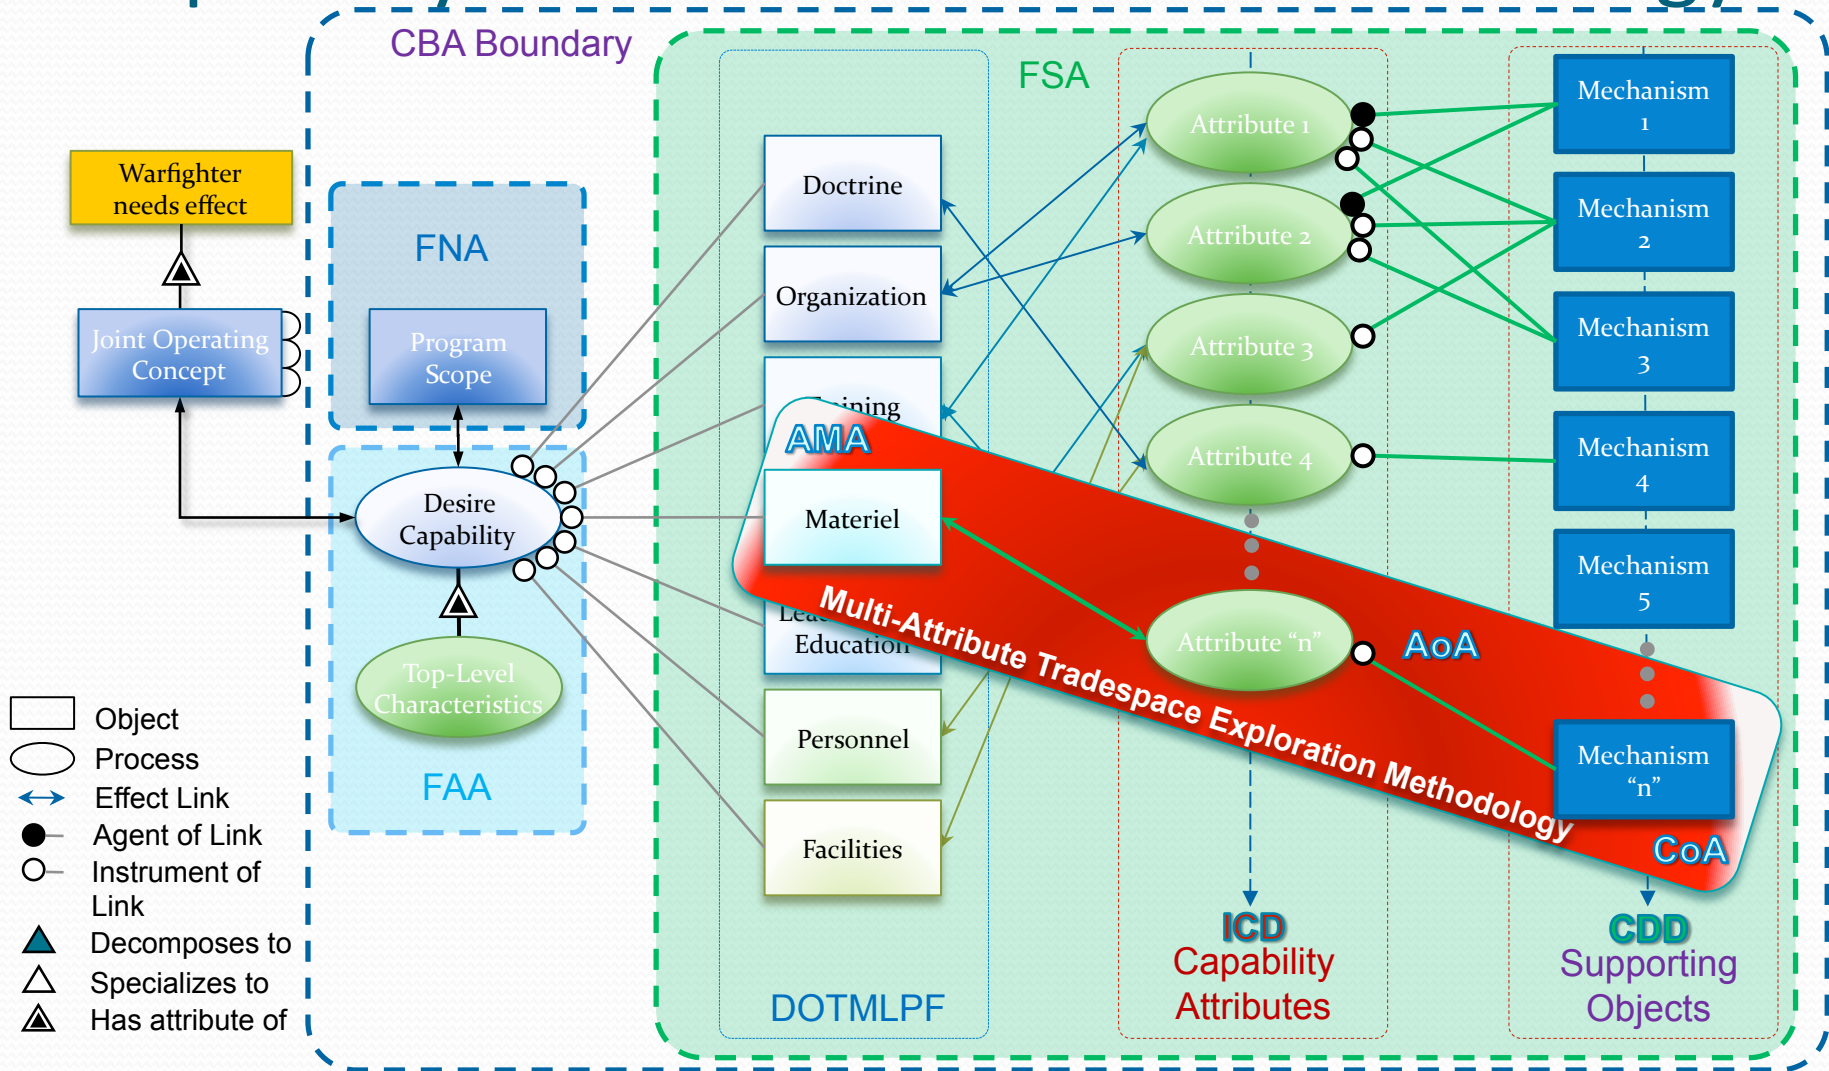

Source: Crawley

Concept Fragment Generation

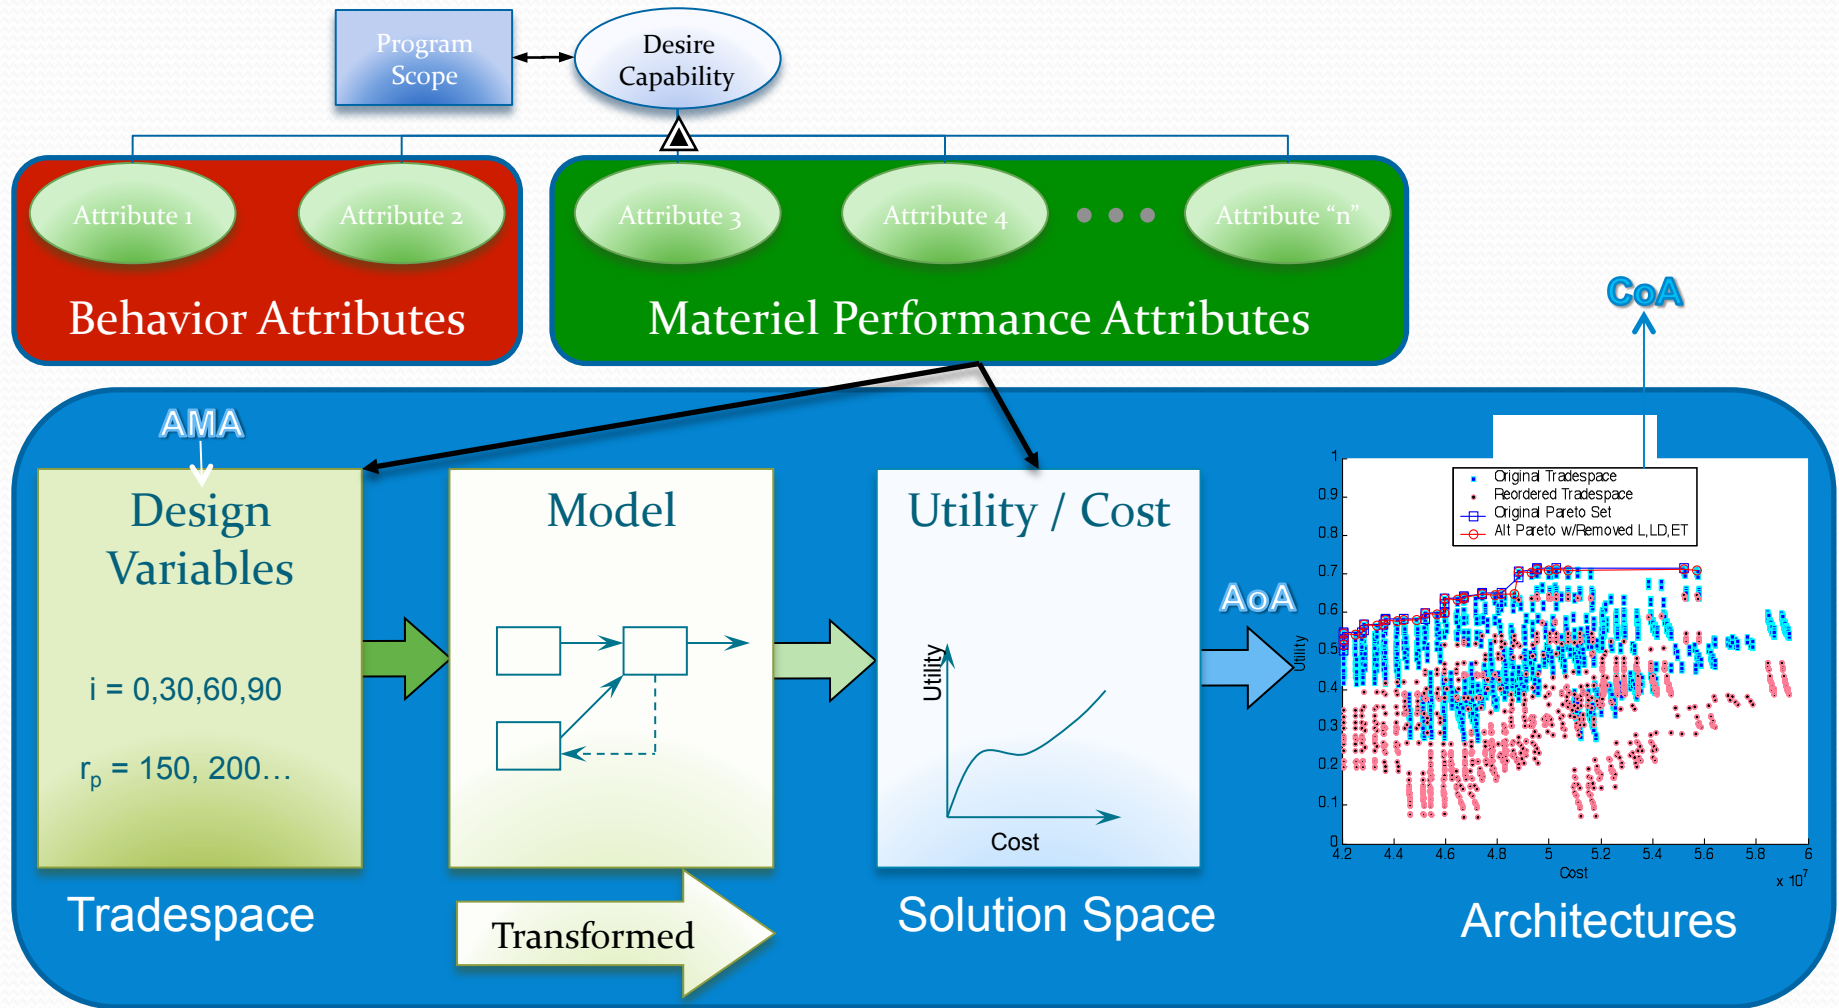

- Assess each of the desired attributes through the lens of a particular framework perspective
- Brainstorm potential mechanisms for creating the desired attribute from that particular perspective
- Assess compatibility of individual concept fragments with leadership direction and compatibility with other concept fragments
- Cull out those fragments that are inconsistent with leadership direction
- Develop architectures off compatible concept fragments to populate the full tradespace
