Experimental part and NMR spectra

Experimental

General procedures

N,N-Dimethylformamide (DMF) was pre-dried over 4 Å molecular sieves prior to distillation. Triethylamine was distilled from calcium hydride and stored under nitrogen in an amber bottle. ^1H , ^{13}C and ^{31}P NMR spectra were recorded on a Bruker Avance 400 NMR spectrometer at 20 °C in CDCl_3 or $\text{DMSO-}d_6$ using tetramethylsilane (TMS) as an internal standard and 85% aq. phosphoric acid as an external standard for ^{31}P NMR. Chemical shifts are expressed in parts per million (ppm) relative to the reference peak.

***N*9-(2-Hydroxyethyl)adenine (4)[1]**

To a stirred solution of adenine (14.9 g, 110 mmol, 1.00 equiv) in distilled *N,N*-dimethylformamide (80 mL) at room temperature under nitrogen was added ethylene carbonate (10.0 g, 113 mmol, 1.13 equiv) and sodium hydroxide (0.50 g, 12.5 mmol). The reaction mixture heated to reflux and allowed to stir until it was evident that the starting material, adenine, had been consumed by TLC ($R_f = 0.05$ – eluent: 10% MeOH in CH_2Cl_2). On cooling, the solvent was removed in vacuo and the off-white/yellow solid residues, containing a 9:1 mixture of the *N*9 and *N*7 regioisomers by ^1H NMR analysis, were recrystallized from methanol yielding the title compound as an off-white powder (14.20 g, 75 mmol, 68%). Spectroscopic data are consistent with those reported in the literature.

To a stirred suspension of paraformaldehyde (2.22 g, 72 mmol, 1.00 equiv) in diethyl phosphite (**11**) (10.00 g, 72 mmol, 1.00 equiv) was added triethylamine (732 mg, 1.00 mL, 7 mmol, 0.10 equiv). The resulting suspension was heated to 90 °C and the suspension became clear and the mixture began reflux. The reaction was maintained at this temperature for three hours. The product was then purified by flash column chromatography (R_f **10** = 0.60, eluent – 100% EtOAc) and was isolated as a colourless oil (11.62 g, 70 mmol, 96%).

^1H NMR (400 MHz, CDCl_3): 1.35 (6H, t, $J = 7.19$ Hz, OCH_2CH_3), 3.91 (2H, dd appears as a triplet, $J_{\text{H-H}} = J_{\text{H-P}} = 6.30$ Hz, HOCH_2P), 4.13-4.24 (4H, m, OCH_2CH_3), 4.81 – 4.86 (1H, m, HOCH_2P). ^{13}C NMR (100 MHz, CDCl_3): 16.35 (d, $J = 5.68$ Hz, OCH_2CH_3), 56.87 (d, $J = 162.21$ Hz, HOCH_2P), 62.51 (d, $J = 6.76$ Hz, OCH_2CH_3) ^{31}P NMR (175 MHz, CDCl_3): 24.52. Water (20 mL) was added to the reaction mixture and the product was extracted into dichloromethane (20 mL) and washed with 2% sodium thiosulfate (10 mL). Drying of the solvent over magnesium sulfate and removal of the solvent in vacuo furnished the title compound as a pale yellow oil (485 mg, 1.82 mmol, 91%).

To a stirred solution of diethyl (hydroxyethyl)phosphonate (**10**, 5.04 g, 30.0 mmol, 1.00 equiv) in dichloromethane (100 mL) was added triethylamine (3.60 g, 36.0 mmol, 1.20 equiv). General procedure: Determination of conversion of alcohol **4 to phosphonate **6** using electrophiles **5**, **7** and **8**.**

To a stirred suspension of magnesium *tert*-butoxide (510 mg, 3.00 mmol, 3.00 equiv) in anhydrous *N,N*-dimethylformamide (10 mL) was added alcohol **4** (179 mg, 1.00 mmol, 1.00 equiv). The resulting slurry was stirred under a nitrogen atmosphere for 45 minutes. Electrophile **5**, **7** or **8** (1.50 mmol, 1.50 equiv) was then added and the reaction mixture was heated to an internal temperature of ca. 75 °C. The reaction was allowed to proceed for 24 hours after which time it was allowed to cool to room temperature and the magnesium *tert*-butoxide was quenched with acetic acid (1.00 mL). Removal of the

solvent in vacuo followed by co-distillation with toluene (3 × 30 mL) to remove excess DMF afforded the crude reaction mixture as a sticky orange resin which was analysed by ^1H and ^{31}P NMR in order to determine the conversion to **6**. **NOTE:** Care should be taken at this point to minimise yield loss due to losses on transfer. The crude reaction mixture is very sticky and viscous and can be difficult to transfer manually, however it is soluble in methanol.

The crude reaction mixture was then subjected to column chromatography on silica gel (gradient elution: 0–10% MeOH in CH_2Cl_2) in order to determine the yield of **6**. **NOTE:** A wide column should be used here as the crude reaction mixture tends to precipitate, blocking the flow of solvent through the column, which can lead to a build up of pressure within the column.

Spectral data for 6 are given below.

N9-(2-Bromoethyl)adenine (12)

To a stirred suspension of adenine (**3**, 1.35 g, 10 mmol, 1.00 equiv) and potassium carbonate (3.21 g, 23 mmol, 2.30 equiv) in *N,N*-dimethylformamide (30 mL) was added 1,2-dibromoethane (7.40 g, 3.41 mL, 40 mmol, 4.00 equiv) in a single portion. The mixture was stirred under a nitrogen atmosphere for 20 hours after which time the starting material was no longer detectable by TLC and the emergence of a new spot (R_f **12** = 0.40; eluent – 10% MeOH in CH_2Cl_2) was evident. The solvent was removed in vacuo and the residue suspended in water before isolation by vacuum filtration. Washing with cold water (20 mL) and further drying afforded 1.88 g (78%, 7.8 mmol) of the title compound as an orange solid.

Melting point: 297-299 °C. ^1H NMR (400 MHz, $\text{DMSO}-d_6$): 3.95 (2H, t, J = 5.97, CH_2Br), 4.57 (2H, t, J = 5.97, CH_2N), 7.27 (2H, bs, NH_2), 8.15 (1H, s, ArH), 8.19 (1H, s, ArH). ^{13}C NMR $^+$ (100 MHz, $\text{DMSO}-d_6$): 31.54 (CH_2Br), 44.61 (CH_2N), 118.65 (qArC-NH $_2$), 140.87 (ArCH), 149.44 (qArC), 152.48 (ArCH), 155.96 (qArC). IR (KBr, cm^{-1}): 1385, 1357, 1326, 1305, 1246, 1072, 887, 796, 709, 646. HRMS (ESI $^+$): Exact mass calc. for

$C_7H_9N_5^{79}Br$ [M+H] = 242.0041. Found = 242.0023. Exact mass calc. for $C_7H_9N_5^{81}Br$ [M+H] = 244.0290.
Found = 244.0292.

To a stirred suspension of sodium iodide (900 mg, 6 mmol, 2.00 equiv) in acetonitrile (20 mL) was added bromide **12** (750 mg, 3 mmol, 1.00 equiv). The reaction mixture was heated to reflux and stirred for 48 hours after which time the starting material was no longer evident by TLC. The solvent was removed in vacuo and the resulting slurry was suspended in water (15 mL) and filtered. The filter cake was washed with water (2 × 10 mL) and recrystallized from methanol to furnish the title compound (766 mg, 2.44 mmol, 88%) as an off-white solid. Melting point (MeOH): 220-223 °C (Decomposition).

1H NMR (400 MHz, DMSO- d_6): 3.68 (2H, t, J = 6.48 Hz, $CH_2\text{CH}_2I$), 4.51 (2H, t, J = 6.48 Hz, CH_2CH_2I), 7.29 (2H, bs, NH_2), 8.15-8.17 (2 × 1H overlapping singlets, ArH). ^{13}C NMR (100 MHz, DMSO- d_6): 4.30 ($CH_2\text{CH}_2I$), 45.13 (CH_2CH_2I), 118.67 (ArC(NH_2)), 140.60 (ArCH), 149.32 (ArC), 152.45 (ArCH), 155.94 (ArC). To a stirred solution of alcohol **10** (510 mg, 3.00 mmol, 1.00 equiv) in anhydrous DMF (30 mL) was added sodium hydride (76 mg, 3.30 mmol, 1.10 equiv) portionwise under a nitrogen atmosphere at room temperature. The resulting suspension was allowed to stir for an hour before iodide **9** (870 mg, 3.00 mmol, 1.00 equiv) was added in a single portion. The reaction was allowed stir overnight for ca. 16 h before the addition of ice-water (2 mL). To a two-necked 25 mL round bottom flask, equipped with a distillation condenser and a receiving vessel, was added neat triethyl phosphite (7.6 g, 8.00 mL, 48 mmol, 1.00 equiv). The triethyl phosphite was heated to an internal temperature of ca. 125–140 °C with stirring. Ether **18** (6.00 g, 48 mmol, 1.00 equiv) was added dropwise to the flask over approximately 10 minutes. The reaction was allowed to stir at this temperature for a further 4 hours, washing the sides of the flask with hexane to ensure complete consumption of both starting materials, after which time the reaction was found to be complete by ^{31}P NMR analysis. The title compound was used without further purification (11.03 g, 48 mmol, 100%).

Alkylation of adenine (**3**) with **14**

To a stirred solution of iodide **14** (10.00 g, 31.0 mmol, 1.05 equiv) in DMF (100 mL) was added adenine (**3**, 3.05 g, 30 mmol, 1.00 equiv) and potassium carbonate (6.00 g, 45 mmol, 1.50 equiv) in a single portion. The reaction was allowed to stir at room temperature for 30 hours until complete consumption of adenine was evident by TLC ($R_f = 0.00$, 10% MeOH in CH_2Cl_2). The reaction mixture was filtered by gravity and the filtrate was concentrated in vacuo to yield a yellow oily residue which was then codistilled with toluene (3×30 mL) to remove the remaining traces of DMF. Purification of the resulting residue by column chromatography (R_f (**6**) = 0.48; Gradient 0–10% MeOH in CH_2Cl_2) furnished (6.90 g, 22.00 mmol, 70%) of the title compound as a colourless foam.

Spectral data consistent with those reported above.

Also present in the crude reaction mixture was the *N7*-regioisomer (**17**). Based on integration of the NCH_2 signals in the ^1H NMR spectrum of the crude reaction mixture at 4.33 ppm (**6**) and 4.50 ppm (**17**), it is formed in a ratio of 4:1 (*N9*:*N7*). General procedure: Determination of the regioselectivity of the alkylation of adenine with **14**

To a stirred solution of iodide **14** (330 mg, 1.05 mmol, 1.05 equiv) in *N,N*-dimethylformamide (10 mL) was added adenine (135 mg, 1.00 mmol, 1.00 equiv) and the base (1.50 mmol, 1.50 equiv). The reaction mixture was stirred at room temperature or heated/cooled to the required temperature for 30 hours. The reaction mixture was filtered by gravity and the filtrate was concentrated in vacuo to yield a yellow oily residue which was then codistilled with toluene (3 × 20 mL) to remove the remaining traces of DMF. The crude reaction mixture was then analysed by ^1H and ^{31}P NMR. Based on integration of the NCH_2 signals in the ^1H NMR spectrum of the crude reaction mixture at 4.33 ppm (**6**) and 4.50 ppm (**20**) the ratio of the two regioisomers was determined.

Salt **21**

To a stirred suspension of adenine (**3**, 1.38 g, 10 mmol, 1.00 equiv) in dichloromethane (30 mL) was added aqueous tetrabutylammonium hydroxide (6.48 g of 1.51 M solution, equivalent to 2.59 g tetrabutylammonium hydroxide in 3.89 g water, 10 mmol, 1.00 equiv). The resulting cloudy mixture was allowed to stir for 20 minutes. Removal of the solvent in vacuo afforded an off-white residue which was azeotropically dried with toluene to afford the title compound as an off-white powder (3.76 g, 10 mmol, 100%).

Melting point (Toluene): 163-167 °C

Preparation of 6 via alkylation of salt 21 with iodide 14

To a stirred solution of **21** (376 mg, 1.00 mmol, 1.00 equiv) in acetonitrile (10 mL) was added iodide **14** (332 mg, 1.00 mmol, 1.00 equiv) in a single portion. The resulting solution was stirred at room temperature for 30 hours after which time the solvent was removed in vacuo. The resulting yellow residue was purified by column chromatography (0–10% MeOH in DCM) affording compound **6** as a colourless solid (211 mg, 0.68 mmol, 68%).

Spectroscopic data for 6 were consistent with those reported above.

To a stirred solution of iodide **14** (177 mg, 0.55 mmol, 1.05 equiv) in DMF (1 mL) was added 6-chloropurine (**22**, 77 mg, 0.50 mmol, 1.00 equiv) and potassium carbonate (100 mg, 0.75 mmol, 1.50 equiv) in a single portion. The reaction was allowed to stir at room temperature for 24 hours until complete consumption of **19** was evident by TLC ($R_f = 0.00$; 10% MeOH in CH_2Cl_2). The reaction mixture was filtered by gravity and the filtrate was concentrated in vacuo to yield a yellow oily residue which was then co-distilled with toluene (3 × 30 mL) to remove the remaining traces of DMF. Purification by column chromatography afforded **23** and **24**.

Synthesis of iodomethyl pivalate (32)

To a stirred solution of chloromethyl pivalate (2.50 g, 17 mmol, 1.00 equiv) in acetonitrile (5 mL) was added sodium iodide (4.50 g, 30 mmol, 1.90 equiv) in a single portion. The reaction mixture was allowed to stir under a nitrogen atmosphere overnight at 30 °C, during which time a strong brown colour had formed. Reaction progress was followed by ¹H NMR by taking aliquots from the reaction and removing the solvent in vacuo. Dichloromethane (25 mL) and water (25 mL) were subsequently added to the reaction mixture. The dichloromethane layer was separated from the aqueous layer and then washed

with 2% sodium thiosulfate solution (20 mL) before drying over anhydrous magnesium sulfate. Removal of the solvent in vacuo afforded the title compound as a yellow-pink oil (3.46 g, 14.5 mmol, 85%).

Spectroscopic data were consistent with those reported previously in the literature [8]

^1H NMR (300 MHz, CDCl_3): 1.19 (9H, s, $\text{C}(\underline{\text{CH}}_3)_3$), 5.93 (2H, s, OCH_2I). ^{13}C NMR (75 MHz, CDCl_3): 26.74 ($\text{C}(\underline{\text{CH}}_3)_3$), 31.37 (OCH_2I), 38.9 ($\underline{\text{C}}(\text{CH}_3)_3$), 176.27 ($\underline{\text{C}}=\text{O}$).

Synthesis of *O,O*-di(pivaloxymethyl) 2-chloroethoxymethylphosphonate (33)

To a stirred solution of phosphonic acid **31** (860 mg, 5.00 mmol, 1.00 equiv) in acetonitrile (50 mL) was added DBU (1.90 g, 12.50 mmol, 2.50 equiv) in a single portion. The resulting solution was stirred at room temperature for 30 minutes. Pivalate **32** (3.02 g, 12.50 mmol, 2.50 equiv) was then added and the resulting solution was stirred for 48 h at room temperature. Removal of the solvent in vacuo afforded a yellow residue which was purified by column chromatography (eluent: 100% diethyl ether) giving the title compound as a yellow oil (1.08 g, 2.7 mmol, 54%).

^1H NMR (400 MHz, CDCl_3): 1.24 (18H, s, 2 x $\text{C}(\underline{\text{CH}}_3)_3$), 3.63 (2H, t, $J = 6.98$ Hz, $\text{ClCH}_2\text{CH}_2\text{O}$), 3.86 (2H, t, $J = 6.98$ Hz, $\text{ClCH}_2\text{CH}_2\text{O}$), 3.95 (2H, d, $J = 8.99$ Hz, OCH_2P), 5.69-5.75 (4H, m, OCH_2O). ^{13}C NMR (100 MHz, CDCl_3): 26.81 ($\text{C}(\underline{\text{CH}}_3)_3$), 38.71 ($\text{ClCH}_2\text{CH}_2\text{O}$), 42.27 ($\underline{\text{C}}(\text{CH}_3)_3$), 65.53 (d, $J = 165.61$ Hz, OCH_2P), 73.11 (d, $J = 9.63$ Hz, $\text{ClCH}_2\text{CH}_2\text{O}$), 81.69 (d, $J = 6.31$ Hz, OCH_2O), 176.80 ($\underline{\text{C}}=\text{O}$). ^{31}P NMR (175 MHz, CDCl_3): 20.70. IR (ATR, cm^{-1}): 2974, 2936, 2912, 2875, 1750, 1481, 1462, 1429, 1275, 1130, 1055, 998, 958, 890, 767, 564. ((2-Oxido-1,4,2-dioxaphosphan-2-yl)oxy)methyl pivalate (35)

To a stirred solution of phosphonate **33** (201 mg, 0.50 mmol, 1.00 equiv) in MeCN (5 mL) in a microwave vial was added DBU (153 mg, 1.00 mmol, 2.00 equiv) and a magnetic stirrer bar. The vial was sealed with a Teflon cap and heated with stirring to 120 °C in a CEM Discovery SP Microwave Synthesizer. The

reaction mixture was held at this temperature for 20 minutes and then allowed to cool gradually. The contents were then diluted with DCM (20 mL) and washed with 2 M HCl (2 × 10 mL) and brine (1 × 10 mL) before being dried over magnesium sulfate and concentrated in vacuo affording the title compound as a pale yellow oil (110 mg, 0.44 mmol, 88%).
