Abstract

Much of the existing scholarly works portray institutional voids (IVs) in emerging economies as impeding forces against the development of new ventures. However, little attention has been paid to how such voids generate positive outcomes in emerging market new ventures. Drawing on the institutional theory, we propose IVs as crucial enablers of new venture internationalization. In addition, we investigate both how and when IVs enhance the degree to which new ventures internationalize by examining international learning effort (ILE) as a mediator and two domestic market environmental factors (i.e., environmental dynamism and competitive intensity) as important contingencies. We test our moderated mediation model using primary data gathered from 211 new ventures from Ghana. We found that ILE mediates the relationship between IVs and new venture internationalization and that both environmental dynamism and competitive intensity moderate the indirect relationship between home-country IVs and new venture internationalization. We discuss the theoretical and practical implications of this study.

Keywords: Learning effort; institutional voids; home market environment; new venture internationalization; Africa.

1. Introduction

The waves of liberalizations, privatizations and deregulations in the 1970s and early 1980s commencing in the West and spreading to the Global South ushered in a hyper-competitive environment for firms (Osei et al., 2018; Doganis, 2006; Dicken, 2007; Millward, 2005). In the wake of these globalization, transformations and subsequent market reforms, many firms are increasingly exploring foreign growth opportunities (Dai et al., 2014). However, differences in the national supportiveness and quality of the institutional environment remain a major problem facing firms (Tobias, et al., 2013) especially in Africa and unstable institutional environments, such as those often found in emerging economies (Bruton, et al., 2013; Stewart Jr, et al., 2008).

Broadly, one of the hallmarks of developing economies is the existence of institutional voids (IVs) (Garrone et al., 2018; de Lange, 2016; Khanna and Palepu, 2000a, 2010; North, 1990). However, market reforms across the continent since the 1980s under the Structural Adjustment Programs (SAPs) have ushered in new and more competitive environment for businesses. This has

forced some firms to explore internationalization as strategic response (Amankwah-Amoah and Debrah, 2010). For example, Ghana has played a key role in not only championing the independence across the continent in the 1950s and 1960s, but also in advocating for market reforms since. Although many nations in Asia are classified as developing economies with IVs features, some have made greater leap forward in graduating from the so-called “third world” status to become fast growing emerging economies. Compared with African countries, nations in Asia such as China and India have made greater leap forward since the 1980s in terms of reducing vicious cycle of poverty, improving living standards and powering economic development (World Bank, 2011). Africa differs in terms of the values and norms which all influence entrepreneurs’ investment decision. Broadly speaking, IVs such as weak intellectual property rights, red tape and bureaucracy are major characteristics of the business environment in both the African and Asian continents.

Indeed, institutional theory offers a useful theoretical milieu for understanding institutional challenges in developing and emerging economies (Wright et al., 2005; Stewart Jr, et al., 2008). Institutions are defined as “the rules of the game in a society or humanly devised constraints that shape human interaction” (North, 1990, p. 3). These encompass both formal and informal institutions (North, 1990; Scott, 1995). According to Mair and Marti (2009, p. 422), institutional voids (IVs) are said be present in an environment when “institutional arrangements that support markets are absent, weak, or fail to accomplish the role expected of them”. Mair and Marti (2009) examined institutional voids to articulate how the institutional environment influences the entrepreneurial process. Given the evolution of this concept, institutional theory provides insights on how entrepreneurs within a country or region perceive themselves to be enabled or constrained by macro contingencies. IVs such as weak intellectual property rights, lack of transparency, red tape, bureaucracy, administrative delays, inadequate disclosure regime, corruption and political

instability determine firms' ability to exploit and explore market opportunities (Acquaah, 2007; Khanna and Palepu, 2000a, 2000b, 2010). Firms situated in such institutionally stringent environments can be motivated to explore opportunities in foreign markets (Jones, 2012), but many are often confronted with problems such as lack of local market knowledge and expertise (Eriksson, et al., 1997). By acquiring and updating knowledge about foreign markets, firms would be better able to achieve strategic alignment (De Clercq, et al., 2012; Zaheer and Mosakowski, 1997).

While the internal business literature indicates that learning is crucial for firm success and the intensity of learning efforts can equip firms to improve their performance in foreign markets (Cohen and Levinthal, 1990; De Clercq, et al., 2014), there is a lack of knowledge related to how IVs influence firms' learning effort and their subsequent internationalization. In addition, there is the fundamental question: if institutional voids influence new ventures to do business outside the borders of their home country, under what condition does this happen? These issues are particularly important given that the literature on international business related to African businesses points to the strong influence of environmental factors on the internationalization behavior (see Ibeh, Wilson, and Chizema, 2012). As firms that embark on early internationalization tend to face high levels of risk and uncertainty, their effort to learn about the international market can help them understand institutional and competitive conditions in those markets (De Clercq, Sapienza, and Zhou, 2014; Eriksson, Johanson, Majkgard, and Sharma, 1997).

In addressing these gaps, we make two key contributions to international business and strategy research. First, our study deviates from much of the existing literature that has construed or equated IVs to negative effects for firms operating in the Global South (Mair and Marti, 2009; Meyer, et al., 2009; Ofori-Dankwa and Julian, 2013; Peng, et al., 2008). The existing literature has explored informal institutions in emerging economies and learning in internationalization (De

Clercq et al., 2012; Schwens and Kabst, 2009); their analyses do not examine the underlying mechanisms through which IVs influence the new ventures' internationalization process. The current study, in contrast, sought to obtain evidence relevant to this question by investigating the potential mediating role of international learning efforts which have been found to be crucial in a firm's internationalization process (Sapienza, et al., 2005). Understanding the mechanisms through which firm-level variables such as a firm's efforts to learn from its foreign market(s) influence macro-level dependent variables of new venture internationalization has suggested as a crucial task for the field of international business (e.g., Sapienza, et al., 2005; De Clercq, et al., 2014). Second, although IVs have garnered a plethora of scholarly attention in the last two decades (Khanna and Palepu, 2000a, 2010; Mair, Marti and Ventresca, 2012) in organizational learning (Dau, 2013; Easterby-Smith and Lyles, 2011; Fiol and Lyles, 1985; Hyysalo, 2009; Lee and Yoon, 2015), there is still a theoretical deficit in our understanding of the conditions under which IVs drive learning effort for new ventures to do business beyond their domestic market. Our second contribution is to identify two such conditions.

Following a review of the literature on IVs and new venture formation, we present an analysis of our empirical setting and data sources. This is followed by an explication of our key findings on the effects of ILE. We conclude by setting out both the theoretical and practical implications of the study.

2. Theory and hypotheses development

2.1 Institutional voids, ILE and internationalization

Figure 1 presents our conceptual model and the relationship between IVs, ILE, new venture internationalization and the moderating effects of environmental dynamism and competitive intensity. In an era of increasingly volatile external environments, growth-seeking firms are

increasingly required to explore the copious opportunities in emerging nations (Cavusgil et al., 2012; Hill and Hult, 2018). A substantial body of research has demonstrated the need to move on from the debate of whether institutions matter to the extent that institutions determine success or failure in new markets (Peng, 2004; Peng et al., 2008).

Insert Figure 1 about here

Given that local firms in emerging markets often faced threats stemming from institutional constraints, these constraints are likely to hamper their ability to be competitive (Hitt, Li and Worthington, 2005). A central contention is that weaker institutions or IVs can create unnecessary legal, political and economic challenges that perpetuate underdevelopment and impede business development. However, Mair and Marti (2009) hinted that IVs may represent an opportunity for social change. That is, IVs can trigger firms to internationalize through their learning efforts (Kalvet, et al., 2013). Firms commit scarce resources to learn about the home market (“domestic learning effort”) and foreign markets (“international learning effort”) to improve their competitiveness in international markets (Sapienza, et al., 2005). Accordingly, firms enhance their learning capacity by mobilizing and processing new external knowledge (Cohen and Levinthal, 1990; Easterby-Smith, et al., 2000). By undertaking ILE, market-seeking firms are more likely to insulate the potential effects of relationships between home-country IVs and new-venture internationalization. Some scholars have asserted that such firms may view constraints at home as an opportunity to learn and acquire new knowledge and/or use the home market as a “training ground” for foreign market expansion (see Hitt et al., 2005). That is, firms that perceive higher IVs tend to learn by accumulating superior knowledge to equip them to outcompete rivals (Grant, 1996; Kogut and Zander, 1992). Knowledge accumulations stem from learning from experience and learning from other organizations (Huber, 1991).

By acquiring and assimilating knowledge from challenges of IVs in emerging markets, new ventures can embark on foreign market expansion to remain competitive (Schwens and Kabst, 2009; Zahra, et al., 2000). Through effective learning, firms can improve their resilience and ability to withstand institutional constraints. Based on these lines of thinking, we hypothesize that:

H1: *The relationship between home-country IVs and new venture internationalization is mediated by ILE.*

2.2 The moderating role of environmental dynamism

Environmental dynamism refers to the perceived speed of change in the external environment (Heyden et al., 2013). The dynamic environments are characterized by “rapid, discontinuous change in demand, competitors, technology, and/or regulations such that information is often inaccurate, unavailable, or obsolete” (Eisenhardt and Bourgeois, 1988, p. 816). Research has long established that environmental factors such as state of the economy, political instability and recession can nullify or dissipate a given market and resource advantage (Porter, 1991). Internationalization may be viewed as the viable strategy for emerging market firms confronted with unsurmountable IVs. Thus, the existence of IVs can motivate new ventures to innovate at incredible pace and scope.

To succeed in conditions of constant flux, firms need to learn to innovate to meet evolving customer and competitor demands (Miller and Friesen, 1982). In such conditions, the only option for firms is to learn and develop a knowledge reservoir about not only their domestic markets but also foreign ones (De Clercq et al., 2012). These advantages can equip firms to offset some of the negative effects stemming from liabilities created by IVs. These include limited access to scarce resources, limited prior history and limited customer base, which often constrain new firms’ ability to access scarce resources and networks to improve their competitiveness (Bruderl and Schussler, 1990; Stinchcombe, 1965). By devoting greater levels of resources and expertise to exploring and

exploiting foreign market opportunities, the intensity of a firm's learning effort is also increased (Ocasio, 1997). As such, more intense and repetitive processing creates conditions for firms and individuals to learn from such contexts (Sapienza et al., 2005). Nevertheless, new-venture firms tend to be agile in responding to environmental threats. By capitalizing on this lack of "old baggage" (Amankwah-Amoah, 2016), new-venture firms are better able to acquire and assimilate market knowledge at a faster pace (Autio et al., 2000).

Based on the above discussion, we argue that, when the environment is in a state of constant change and unpredictability, the indirect relationship between managerial perception of IVs and new-venture internationalization will be stronger. A major rationale is that in such conditions the basis for success may be predicated on firms' level of international venturing, enabling firms to take opportunities in the international market. Accordingly, we posit that:

H2a: *Environmental dynamism moderates the indirect relationships between home-country IVs and new venture internationalization in such a way that the indirect effect through ILE is stronger at higher levels of environmental dynamism.*

2.3 The moderating role of competitive intensity

Prior studies show that firms' domestic-market competition affects the risk and uncertainty associated with their activities (Auh and Menguc, 2005). Given that entrepreneurs/CEOs control resources in new ventures (Lawrence, 1997), the decision to invest in international markets is affected by the level of competition. Competitive intensity denotes a situation of rivalry among firms operating in the same industry where the behavior of a firm reflects the action of its industry rivals, which brings in unpredictable conditions (Ang, 2008; Auh and Menguc, 2005). This market condition is particularly pronounced in settings where formal institutions are weak (Gao et al., 2015) and firms adopt other means and strategies to overcome the liability of IVs. In this study, we integrate the institutional theory and the contingency philosophy to explain that, under

conditions of higher competitor pressure, the effect of IVs on ILE would be strengthened, which will in turn translate into a higher degree of internationalization. First, the nature and extent of IVs in the home country mean that firms can only maximize their learning outcomes under certain domestic factors such as competitive intensity. During periods of high competitive, firms' behaviors are random, unpredictable and uncertain (Martin and Javal, 2016), which could reduce their growth opportunities. Second, during conditions of intense competition, firms engage in various learning and improvisation activities such as risk-taking, proactiveness and exploring new markets in order to be different and remain above their competitors (Cui et al., 2005; Zahra and Das, 1993). Thus, when competition within the industry is higher, it may then become the case that the basis for sustaining superior competitive advantage may be predicated on learning effort, which could enable new ventures to acquire superior knowledge in the international business arena. Further, most firms view their home country's IVs as an opportunity to learn and acquire new knowledge in order to circumvent the constraints of IVs, hence leading to an increase in their learning efforts. Accordingly, we argue that the combined effects of intense competition within the domestic market and IVs will ultimately amplify international ventures' learning efforts and activities. Accordingly, we contend that:

H2b: *Domestic-market competition moderates the relationships between home-country IVs and new venture internationalization in such a way that the indirect effect through ILE is stronger at higher levels of competitive intensity.*

3. Research method

3.1 Study setting

The hypotheses were tested using a sample of new ventures in Ghana, an emerging sub-Saharan African nation. Ghana was used as the research setting for several reasons. First, Ghana has received substantial attention in the popular business press regarding the success of its economic

transformation and open-market policies (Acquaah, 2007; Leechor, 1994). This offers a unique context to investigate how Western industrialized theories relate to an emerging market setting. Second, Ghana is considered representative of sub-Saharan African economies (Julian and Ofori-Dankwa, 2013). Third, recent literature has shown how most businesses in sub-Saharan Africa and particularly in Ghana have gained significant levels of internationalization due to their presence in neighboring international markets in the ECOWAS sub-region (Boso, et al., 2017). In effect, data from such a context will contribute significantly to the international business literature by exploring how and when firms could leverage the effects of IVs in their new venture internationalization process.

3.2 Sample and data collection

We followed previous studies (e.g., Adomako, et al., 2017; De Clercq et al., 2014) in selecting our sampling frame. First, we selected firms that engaged in international business activities including exporting, importing or activities involving cross-border business. This allowed us to capture firms that were involved in cross-border business activities or transactions.

Second, our sample included firms that internationalized within five years of their incorporation. This was done to exclude the process of incremental internationalization and to capture early internationalizing firms (Madsen and Servais, 1997). Third, we selected firms that were owned independently and non-subsidiary established businesses. This was done because company groups can transfer profits among the firms in the group and close subsidiaries for reasons other than poor performance (Wiklund and Shepherd, 2011). Fourth, our sample included ventures that were founded in 2007 or later. Given that our focus was on new ventures, we selected firms that were 10 years old or younger. Researchers disagree on what constitutes a new venture in entrepreneurship (Cardon and Kirk, 2015; Reynolds and Miller, 1992). We selected new

ventures to capture various stages of the venture's development including those still at the opportunity identification stage.

From a total of 4,580 new ventures held in the Ghana Export Promotion Authority database, 755 ventures met the above sampling criteria. Subsequently, we approached the entrepreneurs of the 755 ventures in person with a hand-delivered questionnaire. Respondents were entrepreneurs (i.e., those who had been engaged in the start-up founding process).

To capture informant competency, each respondent was approached to provide information on a seven-point Likert scale ranging from 1 = strongly disagree to 7 = strongly agree. The informant competency assessed three main issues: (1) their knowledge about the issues under consideration, (2) accuracy of the information provided, and (3) confidence in providing answers to the questions (Morgan, Kaleka, and Katsikeas 2004). The informant competency test was administered as part of the main survey. Overall, we received 238 responses, yielding a 31.52% response rate. However, 19 of the respondents provided incomplete answers to the competency test questions. These responses were discarded. Thus, we obtained 219 complete responses, representing a 29.01% response rate. The results of the informant competency test revealed a mean score of 6.53 (SD = 0.56) for knowledge of issues, 6.44 (SD = 0.53) for accuracy of responses, and 6.69 (SD = 0.54) for confidence in answers.

For robustness check, we further approached the finance managers of the 219 firms for foreign sales and total sales figures to serve as an alternative measure of the degree of internationalization (Oesterle and Richta, 2013; Oesterle, et al., 2016). A total of 211 finance managers provided foreign and total sales figures, representing a 27.94% response rate. Hence, we used N = 211 for the analyses.

The firms represented the following industrial sectors: mining and quarrying operators = 28%, processed food and beverages =23%, textiles and garments = 15%; agroprocessing=15%,

crafts and artisans = 9%, engineering services=3%, financial services = 3%, and security services=4: these sectors are representative of most developing economy industries. Therefore, most of the firms are in the manufacturing sector =84%, and a few are service sector firms =16%. On average the firms had been in business for nine years and they employed an average of eight full-time employees. The average annual turnover was US\$ 235,150.

To assess non-response bias, we compared early and late respondents in terms of entrepreneur's age, firm age, firm size and firm age at first internationalization using Pearson's chi-square test for discreet variables (Greenwood and Nikulin, 1996). We found no significant differences between the two groups. Hence, we concluded that non-response bias has no influence on our results (Armstrong and Overton, 1977; Rogelberg and Stanton, 2007).

3.3 Measures

Institutional voids. We used four items from Giachetti's (2016) study to capture the institutional voids ($\alpha = 0.84$). In all, four items were used to capture IVs. Specifically, we adapted only one item from the four measures. The wording of the following item was changed to reflect the Ghanaian business environment: "Underdeveloped education infrastructures and the need for intensive training of Chinese employees". That is, instead of 'Chinese', we used 'Ghanaian' in the preceding statement. The rest of the three items were adopted with no changes to the wording. The scale taps managerial perception of the extent to which IVs are present in the business environment. The respondents were asked to indicate their rating on a seven-point scale with anchors ranging from 1 = not at all to 7 = to an extreme extent.

Environmental dynamism. We measure domestic-market environment dynamism ($\alpha = 0.90$) by adopting a three-item scale developed by Miller and Friesen (1982). This scale tapped

managerial perception of the degree of variation within the domestic-market environment. These items were on a seven-point Likert scale ranging from 1 = not at all to 7 = to an extreme extent.

Competitive intensity. The items measuring competitive intensity ($\alpha = 0.89$) were taken from Jansen et al. (2006). These items assessed managerial perception of degree of competition in the domestic environment. We captured the degree of competition on a seven-point Likert scale ranging from 1 = not at all to 7 = to an extreme extent.

International learning effort. We adopted the seven-item scale with anchors: 1 = not at all and 7 = to an extreme extent to measure ILE. This scale was adapted from De Clercq, et al., (2014) and it assessed the extent to which the venture embarks on activities to acquire new knowledge about foreign markets ($\alpha = 0.88$).

New venture internationalization. We utilized the four-item scale developed by Zahra et al. (2000) to capture new-venture internationalization ($\alpha = 0.91$). This scale tapped a venture's propensity to undertake international expansion activities. Accordingly, respondents were asked to respond on a seven-point scale ranging from 1 = strongly disagree to 7 =strongly agree, to determine the extent of their firms' internationalization intensity within the last two years.

Control variables. We included several control variables to account for their influence on the research model. Firm age was measured using the number of years the business has operated since its incorporation. Firm age was included as a control variable because it has the potential to influence a firm's international operations and performance (Zahra et al., 2000). Firm size has the potential to increase a firm's propensity to internationalize (Zahra et al., 2000). Accordingly, we measured firm size as the logarithm transformation of the number of full-time employees in the business. The entrepreneur's age was included as a control variable as it may show the level of his or her decision-making confidence (Adomako, et al., 2017). Hence, the entrepreneur's age was measured as the number of years since the entrepreneur was born. In addition, as the entrepreneur

obtains more experience on the job, he or she gains significant international experience that may influence his or her decision-making process regarding internationalization (Oesterle, et al., 2016). The entrepreneur's international experience was measured as the number of years the entrepreneur has spent abroad during his or her education or professional career (Laufs, et al., 2016; Musteen, et al., 2010). Prior research has emphasized that industry differences influence a firm's degree of internationalization and its entry mode choice (e.g., Brouthers and Brouthers, 2003; Erramilli and Rao, 1993). In addition, it may be easier in some industries to adapt products than it is in other industries. Hence, industry type was captured with a dummy variable: 0 = manufacturing; 1 = service (Wang, 2008). Using a logarithm transformation to deal with skewness, we controlled for venture's age at first internationalization (De Clercq, et al., 2014). New ventures are constrained by limited financial resources which can hamper the degree to which business is conducted beyond the borders of their domestic market (Ripollés, et al., 2012; Zacharakis, 1997). As such, we controlled for financial resource availability by asking respondents to indicate the degree to which their firms have adequate financial resources to enter a foreign market. We adopted a four-item financial resource scale from Wiklund and Shepherd (2005).

4. Analyses

4.1 Common-method variance, reliability and validity assessment

We minimized potential common-method variance by performing two tests. First, we used the approach suggested by Lindell and Whitney (2001) by introducing a marker variable that is not conceptually related to any of the study's constructs. In this study, we identified "foreign employees in the venture's workforce" as our marker variable which is theoretically unrelated to any of the constructs in the model tested. We found that correlation between the market variable

item and the dependent variable is non-significant ($r = -0.02$; $p > 0.10$). In addition, we found non-significant correlations between the marker variable and other constructs in our model, ranging from 0.00 to 0.05. Furthermore, a 95% sensitivity analysis revealed that partial correlations between our hypothesized constructs were significant even after we had taken account of the effect of common-method variance. This indicates that common-method variance does not substantially influence the relationships specified in our study.

Second, we utilized the approach advanced by Williams, Cote and Buckley (1989) and estimated a full-measurement model, in which the same model was re-estimated when an uncorrelated method factor was added. We inspected measurement model quality by examining three fit heuristics, factor loadings and correlations. The fit heuristics inspected were the root mean square error of approximation (RMSEA), the comparative fit index (CFI) and the standardized root mean square residual (SRMR). Confidence in model fit is established when the RMSEA is less than 0.08, the CFI is larger than 0.90 and the SRMR is less than 0.10 (Vandenberg and Lance, 2000). In this study, the inspected fit heuristics (RMSEA = 0.06, SRMR = 0.07, CFI = 0.85) for the full-measurement model show adequate fit. When the uncorrelated method factor was added, we found that the model slightly improved (RMSEA = 0.07, SRMR = 0.08, CFI = 0.89). To establish the extent of the effect of common-method bias, we calculated the variance explained by the method factor by finding the sum of the squared loadings. We observed that the total amount of variance due to the method factor was 8%, which is considered far lower than the threshold of 25% suggested by Williams, Cote and Buckley (1989). Hence, our results suggest that common-method bias is not a major concern in this study.

To assess the reliability and validity of our constructs, we performed confirmatory factor analysis (CFA) using LISREL 9.3 software package. Our CFA model provided adequate fit for the data: χ^2 (degree of freedom [d.f.]) = 825.55 (463); $p < 0.00$; RMSEA = 0.04; NNFI = 0.96; CFI =

0.95 and SRMSR = 0.05. We found that factor loadings for each construct were significant at 1%, supporting convergent validity (Bagozzi and Yi, 1988).

We established reliability by inspecting Cronbach's Alpha values, composite reliability (CR) and average variance extracted (AVE) (Table 1). We found that the Cronbach's Alpha reliability, composite reliability and discriminant validity were acceptable (Bagozzi and Yi, 2012). In addition, factor loadings of each construct exceeded the suggested threshold value of 0.40 and are significant at $p < 0.001$. This indicates convergent validity of the constructs (e.g., Anderson and Gerbing, 1988). We also inspected the AVE of each construct and found that each construct's AVE is larger than 0.50 and higher than the squared correlation between each pair of constructs. This further supports the convergent validity of our construct (Bagozzi and Yi, 2012).

Insert Table 2 about here

4.2 Estimation and results

The proposed mediation model uses the procedure advanced by Baron and Kenny (1986). Before proceeding to the analyses, all the continuous variables were mean centered to account for the potential multicollinearity concerns when testing moderating effects (Aiken and West, 1991). The variance inflation factor (VIF) for each of the mean-centered variables was between 1.22 and 2.59, which is way below the suggested threshold value of 10 (Neter, et al., 1990; Baum, 2006). Hence, we concluded that multicollinearity issues do not influence our research model.

We provide details of means and standard deviations in Table 1. Bivariate correlations are presented in Table 2. We tested our hypotheses using ordinary least square (OLS) regression analysis (Cohen et al., 2003) to establish whether the research model meets the mediation requirements suggested by Baron and Kenny (1986). According to the prescriptions of this procedure, mediation is established when the following conditions are met: (1) the independent

variable significantly predicts both the dependent and the mediator; (2) the mediator significantly affects the dependent variable; and (3) when the mediation is added to the regression equation, the influence of the independent variable on the dependent variable is attenuated. According to the logic of this method, a full mediation is achieved if the influence of the independent variable is non-significant when the mediating variable is included in the regression equation. Partial mediation is established if the influence of the independent variable on the dependent variable is attenuated but remains significant. We present the results of the study following these steps in Table 3. We present the effect of the control variables in Model 1 and Model 2 includes the moderating variables. Model 3 presents the effect of IVs on new-venture internationalization. We found in Model 3 that IVs positively and significantly relate to new-venture internationalization ($\beta = 0.29$, $p < 0.01$). Hence, we satisfy Baron and Kenny's (1986) condition for establishing mediation. In Model 4, we test the effect of IVs on the mediating variable (ILE). The positive and significant influence of IVs on ILE ($\beta = 0.26$, $p < 0.01$) represents the second condition for achieving mediation.

Next, we examine the effect of ILE (mediator) on new-venture internationalization. Results show that ILE positively and significantly relates to new-venture internationalization ($\beta = 0.27$, $p < 0.01$). We also found that, when ILE was included in the regression equation, the effect of IVs on new-venture internationalization is significantly reduced (the β for IVs reduced from 0.29, $p < 0.01$ to 0.02, *ns*). These results confirm the third condition required for mediation. Hence, our results indicate that IVs predict new-venture internationalization and that this relationship is mediated by ILE. This confirms Hypothesis 1.

Next, we examined the moderating role of domestic-market environment (environmental dynamism and competitive intensity). The results in Model 6 show that Hypothesis 2a is confirmed, as the coefficient of the interaction between IVs and environmental dynamism has a

statistically significant effect on ILE ($\beta = 0.49, p < 0.01$). In addition, we confirm Hypothesis 2b as the empirical results in Model 7 show the interaction between IVs and domestic-market competitive intensity positively and significantly influence ILE ($\beta = 0.44, p < 0.01$).

In addition to the above results, we performed Sobel tests to examine the statistical significance of the indirect effect of IVs on new venture internationalization (Sobel, 1982). According to the logic of the Sobel test, the magnitude of the unstandardized indirect effect and its associated standard error must be calculated to find the Sobel statistic (ratio of unstandardized indirect effect over its standard error). To determine the statistical significance of the indirect effect, the Sobel statistic is compared to the z distribution. Our Sobel test shows that the indirect effect of IVs on new-venture internationalization ($z = 2.33, p < 0.01$) was consistent with our prediction and statistically significant. This further confirms Hypothesis 1.

Insert Table 3 about here

4.3 Robustness tests

We undertook two additional tests to establish the robustness of our research model. First, we utilized a path analysis format (Preacher, et al., 2010) using Mplus statistical software package (Muthén and Muthén, 1998–2010) and tested our mediation model through the test of the statistical significance of the indirect effect and its associated confidence interval (MacKinnon, 2008). We found support for the mediating effect of ILE and the moderating role of environment dynamism and competitive intensity. Hypothesis 1 was supported (estimate = 0.16, $p < 0.01$; 95% CI [0.10, 0.26]). The fit heuristics for the model show adequate fit ($\chi^2/df = 1.45, RMSEA = 0.02, NNFI = 0.95, CFI = 0.98, SRMSR = 0.06$). Thus, these results replicate our initial findings.

Second, we used the ratio of foreign sales to total sales as a measure of degree of internationalization to estimate the alternative regression model. This approach to measure degree

of internationalization is widely accepted (Annavarjula and Beldona, 2000). The foreign sales to total sales ratio captures the foreign market penetration of a venture (Thomas and Eden, 2004). Although the foreign sales to total sales ratio represents just one dimension of a firm's international venturing activities, it captures the importance of doing business abroad for single ventures (Oesterle, et al., 2016). Using this measure as an alternative to the subjective measures of degree of internationalization yielded the following results for the mediation hypothesis: (*estimate* = 0.14, $p < 0.05$; 95% CI [0.07, 0.22]). This offers additional support for Hypothesis 1.

Third, we examined our research model by decomposing the firms into very young firms (1-5 years old) and young firms (6-10 years). Subsequently, we estimated two additional and distinct structural models. Results show the same pattern of findings when the independent variables are regressed separately on the very young and young components. Specifically, the indirect effect of IVs on degree of internationalization yielded the following results for very young firms (*estimate* = 0.17, $p < 0.01$; 95% CI [0.11, 0.28]) and for young firms (*estimate* = 0.15, $p < 0.01$; 95% CI [0.09, 0.26]). Thus, findings remain consistent irrespective of the method used.

5. Discussion and conclusion

In this study, we sought to examine IVs as crucial enablers of new venture internationalization. We examined both how and when IVs enhance the degree to which new ventures are internationalized by exploring ILE as a mediator and two domestic-market environmental factors (i.e., environmental dynamism and competitive intensity). We found that a firm's ILE mediates the link between IVs and degree of internationalization. In addition, our results show that both environmental dynamism and competitive intensity moderate the indirect relationship between IVs and the degree of new-venture internationalization.

Our findings contribute to the international business literature in several ways. First, by examining learning and knowledge accumulation in response to IVs, our study addresses an omission in the literature as one of the first empirical works to conceptualize and capture the intricate dynamics and effects of IVs on firms' operations and internationalization. Despite the importance of learning effort for emerging-market firms, there are few scholarly works on learning by such firms (see Hitt et al., 2005). We contribute to the international business literature by examining mechanisms through which IVs can be harnessed, leading to positive outcomes for firms in emerging economies.

Second, our study provides a nuanced understanding of IVs as a predictor of new-venture internationalization by exploring *when* it is more effective. While previous research has examined IVs and the domestic-market environment in isolation, our study offers a contingency perspective and shows that a firm's domestic-market environment offers crucial boundary conditions for the effectiveness of IVs in enabling its internationalization effort. Thus, our study adds to the international business literature by investigating the domestic-market conditions under which the indirect relationship between IVs and new-venture internationalization is effective. In doing so, we show that firms operating in an environment characterized by IVs are likely to make the effort to learn about the international business environment which can trigger international venturing activities, more so when the domestic environment is in a state of flux and highly competitive.

Third, we use unique data from Ghana, a sub-Saharan African emerging economy, to show that IVs, which are frequently prevalent in emerging markets, can serve as enablers for new venture internationalization. By taking a single country perspective, we analyze how emerging country-based firms are likely to internationalize when IVs are present in the firm's operating environment. This is an important addition to the international business literature because very little effort has been devoted to investigating how IVs in an emerging country drive a firm's degree of

internationalization and how market environmental conditions affect this relationship. Moreover, while previous studies show the effect of IVs on firm-level strategy and performance (Hoskisson et al., 2000; Khanna and Palepu, 1997), our study examines how and when IVs serve as enablers for firms' international venturing activities from the perspective of an emerging economy.

Overall, we advance international business literature by enhancing scholarly understanding of how and when firms can pursue international business activities. Specifically, we proposed and tested a moderated mediation model that considers how and when IVs boost a firm's degree of internationalization. Hence, we show the importance of concurrently examining mediating and moderating influences to advance scholarly effort in understanding how IVs may trigger the degree to which firms embark on international venturing activities.

Our study has implications for practice too. First, the results indicate that, for emerging-market new ventures, IVs through ILE can help them to do business outside the borders of their home country. While previous studies indicate that the presence of IVs create institutional vacuums for firms (Khanna and Palepu, 1997, 2000a, 2000b), we show that this vacuum helps new ventures to expand their activities beyond the home country. This insight is particularly relevant for emerging-market new ventures that operate in institutionally challenged environments, which are mostly characterized by low levels of institutional development due to the absence of institutional rules, or the presence of ambiguous or poorly enforced rules.

Second, by demonstrating IVs as a trigger for learning efforts among new ventures, there is a need for aspiring and existing entrepreneurs to shift their mindsets from viewing local institutions as "barriers" to viewing them as "opportunities" to increase or engage in innovation activities and learn. By being able to navigate around the voids, the new ventures would be better equipped to expand into neighboring African countries and other emerging economies, which tend to have similar institutional constraints. Thus, the learning capabilities become difficult for rival

firms to mimic. From a public policy standpoint, there is a need for the national government to promote exporting and international expansion not only as a national necessity but also as a means for local firms to spread their risks and improve their survival chances. Results from our study show that IVs promote internationalization of new ventures through learning. An implication is that emerging-economy governments could develop and promote educational programs to help entrepreneurs learn. This can be done by promoting knowledge exchange among new firms and aspiring entrepreneurs. In addition, entrepreneurs can learn from networking derived from social and business ties. Such learning can equip local firms for new markets.

6. Limitations and direction for future research

Despite the study's contributions to practice, it has some limitations with the potential of opening future research avenues. First, our study finds a significant mediating effect of ILE on the relationship between IVs and new-venture internationalization. However, arguments can be made that certain firm- or individual-level dispositions can complement the mediating effect of learning on the link between IVs and new-venture internationalization. For example, Boso et al. (2018) found that the effect of learning on new venture performance is dependent on entrepreneurial alertness to market opportunities. Thus, the international business literature will be advanced if future studies extend the current model by investigating boundary conditions that are relevant to the international learning–new-venture internationalization relationship.

Second, the study collected data at one point in time. In this case, there is a limitation of the extent to which causal inferences can be made (Rindfleisch et al., 2008). Although our new-venture internationalization data were lagged relative to the independent variables, this does not entirely take away the issues of causality. In addition, we used the ratio of foreign sales to total sales as a measure of degree of internationalization to estimate an alternative regression model in our robustness test. We suggest that the literature will benefit from a more nuanced finding if future

research adopts a longitudinal approach in data collection for similar studies. Third, we used firms that are operating in a developing economy within the African continent. This limits the generalization of our findings to such a specific context. Future studies across other developing and developed countries will further deepen the discourse and, most importantly, contribute to the strategy and international business literature. Finally, the geographical location of a firm has the potential to influence that firm's degree of internationalization (Fernhaber, et al., 2008). A major reason is that some ventures located in urban centers can acquire the resources required to embark on internationalization. Future studies should control for firm location (urban and rural).

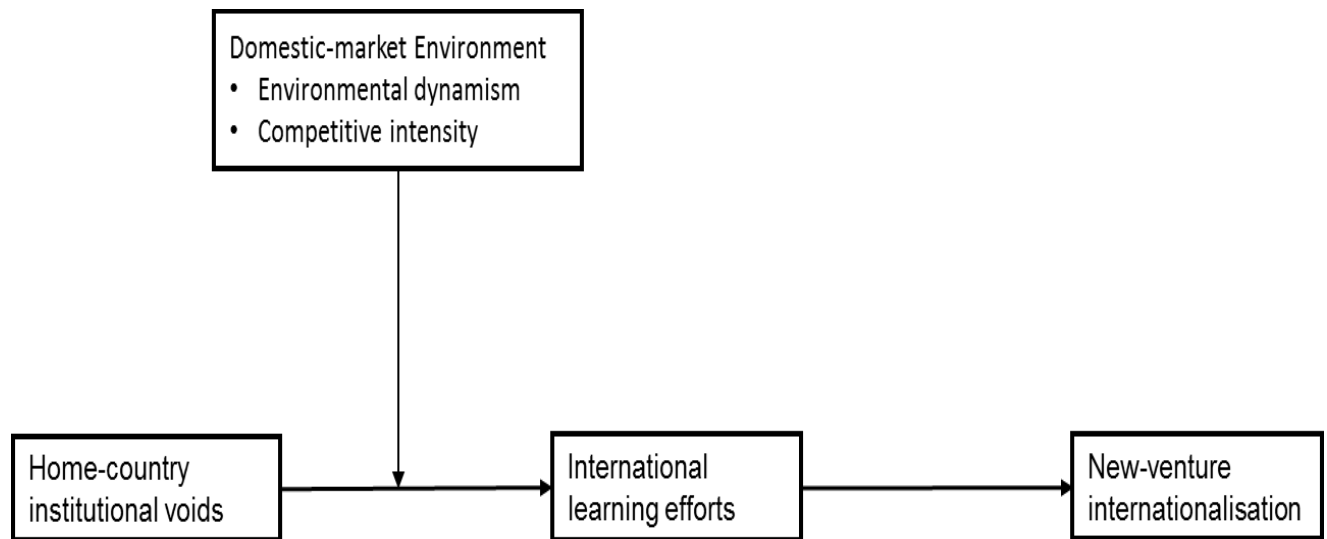

Figure 1: Conceptual model of the study

Table 1: Descriptive statistics, validity and reliability tests

Model variable	Item descriptions	Mean (SD)	Factor loadings (t-values) ^a	Cronbach's α	CR	AVE
To what extent do you agree with the following statements describing your business environment? Please circle the number that best represents your opinion. 1 = not at all ; 7 = to an extreme extent.						
Institutional voids (Giachetti, 2016)	Lack of infrastructure to facilitate the relationship between the firm and its clients, or between the firm and its suppliers	4.62 (1.60)	0.89 (1.00)	0.84	0.86	0.59
	We were able to find adequate and reliable information about the tastes and preferences of consumers, and the reliability of suppliers with ease (r)	4.75 (1.55)	0.88 (28.11)			
	Underdeveloped education infrastructures and the need for intensive training of Ghanaian employees	4.12 (1.63)	0.86 (26.70)			
	Ambiguous bureaucratic and legal system					
Financial resource (Wiklund and Shepherd, 2005).	- Our company has difficulty in accessing financial capital to support its business operations (r)	4.51 (1.15)	0.80 (1.00)	0.94	0.96	0.65
	- If we need more financial assistance for our business operations, we could easily get it	4.80 (1.16)	0.77 (18.47)			
	- We have substantial financial resources at the discretion of managers for funding business initiatives	4.75 (1.55)	0.83 (17.30)			
	- We are able to obtain financial resources at short notice to support business operations	4.82 (1.22)	0.82 (17.28)			
To what extent do you agree with the following statements describing your business environment? Please circle the number that best represents your opinion. 1 = not at all; 7 = to an extreme extent.						
Environment dynamism	Competitors are constantly trying out new competitive strategies	4.74 (1.11)	0.92 (1.00)	0.90	.091	.64
	Customer needs and demands are changing rapidly in our industry	3.82 (1.60)	0.84 (15.48)			
	New markets are emerging for products and services in our industry	4.81 (1.20)	0.87 (26.30)			
Competitive intensity (Jansen et al., 2006).	Competition in our local market is intense	4.69 (1.05)	0.88 (1.00)	0.89	0.90	0.68
	Our organizational unit has relatively strong competitors	5.75 (0.88)	0.86 (15.97)			
	Competition in our local market is extremely high	5.58 (0.89)	0.83 (15.46)			
	Price competition is a hallmark of our local market		0.72 (14.89)			
To what extent do you agree with following statements relating to activities to develop new knowledge in foreign markets. 1 = not at all; 7 = to an extreme extent						
International learning effort (De Clercq, Sapienza and Zhou, 2014)	We put great effort into developing new knowledge regarding competitors who operate in foreign markets	5.55 (1.11)	0.85 (1.00)	0.88	0.90	0.56
	We put great effort into developing new knowledge regarding foreign cooperative agreements in our industry	5.04 (1.43)	0.77 (16.46)			
	We put great effort into developing new knowledge regarding foreign laws that affect our business	5.45 (1.32)	0.87 (18.77)			
	We put great effort into developing new knowledge regarding foreign business norms affecting our industry	3.63 (1.78)	0.64 (14.73)			
	We put great effort into developing new internal procedures for our foreign activities	4.50 (1.16)	0.93 (29.88)			
	We put great effort into developing new reward systems for our foreign activities	5.02 (1.41)	0.90 (28.24)			
	We put great effort into developing new knowledge in foreign markets.	4.83 (1.12)	0.87 (26.27)			
To what extent do you agree with the following items describing your firm's activities? Please circle the number that best represents your opinion 1 = strongly disagree; 7 =strongly agree.						
New venture internationalization (Zahra et al., 2000)	Entering new foreign markets	4.69 (1.57)	0.84 (16.44)	0.91	0.93	0.62
	Expanding the firm's international operations	4.50 (1.16)	0.82 (16.04)			
	Supporting start-up business activities dedicated to international operations	4.68 (1.04)	0.94 (29.75)			
	Financing start-up business activities dedicated to international operations	3.82 (1.61)	0.75 (15.52)			
Please answer the following questions by writing down your responses						
Observed variables	- Firm age (log)	8.56 (6.63)				
	- Firm size (log)	8.13 (12.47)				

	- Entrepreneur age	48.11 (9.45)				
	- Entrepreneur international experience	4.33 (5.9)				
	- Industry dummy	0.55 (0.47)				

^aPrincipal component extraction. r = reverse coded. CR = composite reliability; AVE = average variance extracted; SD = standard deviation

Table 2. Bivariate correlations

	Variables	1	2	3	4	5	6	7	8	9	10	11
