# Borel-Cantelli Lemma ${ }^{1}$ 

Peter Jaeger<br>Ludwig Maximilians University of Munich<br>Germany

#### Abstract

Summary. This article is about the Borel-Cantelli Lemma in probability theory. Necessary definitions and theorems are given in [10] and [7].

MML identifier: BOR_CANT, version: $\underline{7.11 .07} 4.160 .1126$

The notation and terminology used here have been introduced in the following papers: [17], [3], [4], [8], [13], [1], [2], [5], [15], [14], [21], [9], [12], [11], [16], [6], [20], [19], and [18].

For simplicity, we adopt the following rules: $O_{1}$ is a non empty set, $S_{1}$ is a $\sigma$-field of subsets of $O_{1}, P_{1}$ is a probability on $S_{1}, A$ is a sequence of subsets of $S_{1}$, and $n$ is an element of $\mathbb{N}$.

Let $D$ be a set, let $x, y$ be extended real numbers, and let $a, b$ be elements of $D$. Then $(x>y \rightarrow a, b)$ is an element of $D$.

We now state two propositions:
(1) For every element $k$ of $\mathbb{N}$ and for every element $x$ of $\mathbb{R}$ such that $k$ is odd and $x>0$ and $x \leq 1$ holds $\left(-x \operatorname{ExpSeq}_{\mathbb{R}}\right)(k+1)+\left(-x \operatorname{ExpSeq}_{\mathbb{R}}\right)(k+2) \geq 0$.
(2) For every element $x$ of $\mathbb{R}$ holds $1+x \leq$ (the function $\exp )(x)$.

Let $s$ be a sequence of real numbers. The functor ExpFuncWithElementOf $s$ yielding a sequence of real numbers is defined as follows:
(Def. 1) For every natural number $d$ holds (ExpFuncWithElementOf $s)(d)=$ $\sum-s(d) \operatorname{ExpSeq}_{\mathbb{R}}$.
Next we state two propositions:
(3) (The partial product of ExpFuncWithElementOf $\left.\left(P_{1} \cdot A\right)\right)(n)=$ (the function $\exp )\left(-\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}(n)\right)$.

[^0](4) (The partial product of $\left.P_{1} \cdot A^{\mathbf{c}}\right)(n) \leq$ (the partial product of ExpFuncWithElementOf $\left.\left(P_{1} \cdot A\right)\right)(n)$.
Let $n_{1}, n_{2}$ be elements of $\mathbb{N}$. The functor $\operatorname{SeqOfIFGT1}\left(n_{1}, n_{2}\right)$ yielding a sequence of $\mathbb{N}$ is defined by:
(Def. 2) For every element $n$ of $\mathbb{N}$ holds (SeqOfIFGT1 $\left.\left(n_{1}, n_{2}\right)\right)(n)=\left(n>n_{1} \rightarrow\right.$ $\left.n+n_{2}, n\right)$.
Let $k$ be an element of $\mathbb{N}$. The SeqOfIFGT2 $k$ yields a sequence of $\mathbb{N}$ and is defined by:
(Def. 3) For every element $n$ of $\mathbb{N}$ holds (the SeqOfIFGT2 $k)(n)=n+k$.
Let $k$ be an element of $\mathbb{N}$. The SeqOfIFGT3 $k$ yields a sequence of $\mathbb{N}$ and is defined as follows:
(Def. 4) For every element $n$ of $\mathbb{N}$ holds (the SeqOfIFGT3 $k)(n)=(n>k \rightarrow 0,1)$.
Let $n_{1}, n_{2}$ be elements of $\mathbb{N}$. The functor SeqOfIFGT4 $\left(n_{1}, n_{2}\right)$ yielding a sequence of $\mathbb{N}$ is defined as follows:
(Def. 5) For every element $n$ of $\mathbb{N}$ holds (SeqOfIFGT4 $\left.\left(n_{1}, n_{2}\right)\right)(n)=\left(n>n_{1}+\right.$ $\left.1 \rightarrow n+n_{2}, n\right)$.
Let $n_{1}, n_{2}$ be elements of $\mathbb{N}$. One can verify that $\operatorname{Seq} \operatorname{OfIFGT1}\left(n_{1}, n_{2}\right)$ is one-to-one and SeqOfIFGT4 $\left(n_{1}, n_{2}\right)$ is one-to-one.

Let $n$ be an element of $\mathbb{N}$. Observe that the SeqOfIFGT2 $n$ is one-to-one.
Let $X$ be a set, let $s$ be an element of $\mathbb{N}$, and let $A$ be a sequence of subsets of $X$. The functor $\operatorname{ShiftSeq}(A, s)$ yielding a sequence of subsets of $X$ is defined by:
(Def. 6) $\operatorname{ShiftSeq}(A, s)=A \uparrow s$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, let $s$ be an element of $\mathbb{N}$, and let $A$ be a sequence of subsets of $S_{1}$. The functor $@ \operatorname{ShiftSeq}(A, s)$ yields a sequence of subsets of $S_{1}$ and is defined by:
(Def. 7) @ShiftSeq $(A, s)=\operatorname{ShiftSeq}(A, s)$.
Next we state the proposition
(5)(i) For all sequences $A, B$ of subsets of $S_{1}$ such that $n>n_{1}$ and $B=$ $A \cdot \operatorname{Seq} \operatorname{OfIFGT}\left(n_{1}, n_{2}\right)$ holds (the partial product of $\left.P_{1} \cdot B\right)(n)=($ the partial product of $\left.P_{1} \cdot A\right)\left(n_{1}\right) \cdot\left(\right.$ the partial product of $P_{1} \cdot @ \operatorname{ShiftSeq}\left(A, n_{1}+\right.$ $\left.\left.n_{2}+1\right)\right)\left(n-n_{1}-1\right)$, and
(ii) for all sequences $A, B, C$ of subsets of $S_{1}$ and for every sequence $e$ of $\mathbb{N}$ such that $n>n_{1}$ and $C=A \cdot e$ and $B=C \cdot \operatorname{SeqOfIFGT1}\left(n_{1}, n_{2}\right)$ holds (the partial Intersection of $B)(n)=($ the partial Intersection of $C)\left(n_{1}\right) \cap($ the partial Intersection of @ShiftSeq $\left.\left(C, n_{1}+n_{2}+1\right)\right)\left(n-n_{1}-1\right)$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, let $P_{1}$ be a probability on $S_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. We say that $A$ is all independent w.r.t. $P_{1}$ if and only if the condition (Def. 8) is satisfied.
(Def. 8) Let $B$ be a sequence of subsets of $S_{1}$. Given a sequence $e$ of $\mathbb{N}$ such that $e$ is one-to-one and for every element $n$ of $\mathbb{N}$ holds $A(e(n))=B(n)$. Let $n$ be an element of $\mathbb{N}$. Then (the partial product of $\left.P_{1} \cdot B\right)(n)=P_{1}(($ the partial Intersection of $B)(n)$ ).
The following propositions are true:
(6) Suppose $n>n_{1}$ and $A$ is all independent w.r.t. $P_{1}$. Then $P_{1}(($ the partial Intersection of $\left.A^{\mathbf{c}}\right)\left(n_{1}\right) \cap\left(\right.$ the partial Intersection of @ShiftSeq $\left(A, n_{1}+n_{2}+\right.$ $\left.1))\left(n-n_{1}-1\right)\right)=\left(\right.$ the partial product of $\left.P_{1} \cdot A^{\mathbf{c}}\right)\left(n_{1}\right) \cdot($ the partial product of $\left.P_{1} \cdot @ \operatorname{ShiftSeq}\left(A, n_{1}+n_{2}+1\right)\right)\left(n-n_{1}-1\right)$.
(7) $\quad\left(\right.$ The partial Intersection of $\left.A^{\mathrm{c}}\right)(n)=($ the partial Union of $A)(n)^{\mathrm{c}}$.
(8) $\quad P_{1}\left(\left(\right.\right.$ the partial Intersection of $\left.\left.A^{\mathbf{c}}\right)(n)\right)=1-P_{1}(($ the partial Union of A) (n)).

Let $X$ be a set and let $A$ be a sequence of subsets of $X$. The UnionShiftSeq $A$ yielding a sequence of subsets of $X$ is defined as follows:
(Def. 9) For every element $n$ of $\mathbb{N}$ holds (the UnionShiftSeq $A)(n)=$ $\cup \operatorname{ShiftSeq}(A, n)$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. The @UnionShiftSeq $A$ yields a sequence of subsets of $S_{1}$ and is defined as follows:
(Def. 10) The @UnionShiftSeq $A=$ the UnionShiftSeq $A$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. The @lim sup $A$ yielding an event of $S_{1}$ is defined as follows:
(Def. 11) The @lim sup $A=\bigcap$ (the @UnionShiftSeq $A$ ).
Let $X$ be a set and let $A$ be a sequence of subsets of $X$. The IntersectShiftSeq $A$ yields a sequence of subsets of $X$ and is defined as follows:
(Def. 12) For every element $n$ of $\mathbb{N}$ holds (the IntersectShiftSeq $A)(n)=$ Intersection $\operatorname{ShiftSeq}(A, n)$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. The @IntersectShiftSeq $A$ yielding a sequence of subsets of $S_{1}$ is defined as follows:
(Def. 13) The @IntersectShiftSeq $A=$ the IntersectShiftSeq $A$.
Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. The @lim inf $A$ yielding an event of $S_{1}$ is defined by:
(Def. 14) The @lim inf $A=\bigcup($ the @IntersectShiftSeq $A)$.
The following propositions are true:
(9) $\quad\left(\right.$ The @IntersectShiftSeq $\left.A^{\mathbf{c}}\right)(n)=($ the @UnionShiftSeq $A)(n)^{\text {c }}$.
(10) Suppose $A$ is all independent w.r.t. $P_{1}$. Then $P_{1}(($ the partial Intersection of $\left.\left.A^{\mathbf{c}}\right)(n)\right)=\left(\right.$ the partial product of $\left.P_{1} \cdot A^{\mathbf{c}}\right)(n)$.
(11) Let $X$ be a set and $A$ be a sequence of subsets of $X$. Then
(i) the superior setsequence $A=$ the UnionShiftSeq $A$, and
(ii) the inferior setsequence $A=$ the IntersectShiftSeq $A$.
(12)(i) The superior setsequence $A=$ the @UnionShiftSeq $A$, and
(ii) the inferior setsequence $A=$ the @IntersectShiftSeq $A$.

Let $O_{1}$ be a non empty set, let $S_{1}$ be a $\sigma$-field of subsets of $O_{1}$, let $P_{1}$ be a probability on $S_{1}$, and let $A$ be a sequence of subsets of $S_{1}$. The functor $\operatorname{SumShiftSeq}\left(P_{1}, A\right)$ yields a sequence of real numbers and is defined by:
(Def. 15) For every element $n$ of $\mathbb{N}$ holds ( $\left.\operatorname{SumShiftSeq}\left(P_{1}, A\right)\right)(n)=\sum\left(P_{1}\right.$. $@ \operatorname{ShiftSeq}(A, n))$.
We now state several propositions:
(13) If $\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}$ is convergent, then $P_{1}($ the $@ \lim \sup A)=0$ and $\lim \operatorname{SumShiftSeq}\left(P_{1}, A\right)=0$ and $\operatorname{SumShiftSeq}\left(P_{1}, A\right)$ is convergent.
(14)(i) For every set $X$ and for every sequence $A$ of subsets of $X$ and for every element $n$ of $\mathbb{N}$ and for every set $x$ holds there exists an element $k$ of $\mathbb{N}$ such that $x \in(\operatorname{ShiftSeq}(A, n))(k)$ iff there exists an element $k$ of $\mathbb{N}$ such that $k \geq n$ and $x \in A(k)$,
(ii) for every set $X$ and for every sequence $A$ of subsets of $X$ and for every set $x$ holds $x \in \operatorname{Intersection}$ (the UnionShiftSeq $A$ ) iff for every element $m$ of $\mathbb{N}$ there exists an element $n$ of $\mathbb{N}$ such that $n \geq m$ and $x \in A(n)$,
(iii) for every sequence $A$ of subsets of $S_{1}$ and for every set $x$ holds $x \in \bigcap$ (the @UnionShiftSeq $A$ ) iff for every element $m$ of $\mathbb{N}$ there exists an element $n$ of $\mathbb{N}$ such that $n \geq m$ and $x \in A(n)$,
(iv) for every set $X$ and for every sequence $A$ of subsets of $X$ and for every set $x$ holds $x \in \bigcup$ (the IntersectShiftSeq $A$ ) iff there exists an element $n$ of $\mathbb{N}$ such that for every element $k$ of $\mathbb{N}$ such that $k \geq n$ holds $x \in A(k)$,
(v) for every sequence $A$ of subsets of $S_{1}$ and for every set $x$ holds $x \in \bigcup$ (the @IntersectShiftSeq $A$ ) iff there exists an element $n$ of $\mathbb{N}$ such that for every element $k$ of $\mathbb{N}$ such that $k \geq n$ holds $x \in A(k)$, and
(vi) for every sequence $A$ of subsets of $S_{1}$ and for every element $x$ of $O_{1}$ holds $x \in \bigcup$ (the @IntersectShiftSeq $A^{\mathbf{c}}$ ) iff there exists an element $n$ of $\mathbb{N}$ such that for every element $k$ of $\mathbb{N}$ such that $k \geq n$ holds $x \notin A(k)$.
(15)(i) $\lim \sup A=$ the $@ \lim \sup A$,
(ii) $\liminf A=$ the $@ \lim \inf A$,
(iii) the @lim inf $A^{\mathbf{c}}=(\text { the } @ \lim \sup A)^{\mathrm{c}}$,
(iv) $\quad P_{1}\left(\right.$ the @ $\left.\lim \inf A^{\mathbf{c}}\right)+P_{1}($ the $@ \lim \sup A)=1$, and
(v) $\quad P_{1}\left(\liminf \left(A^{\mathbf{c}}\right)\right)+P_{1}(\lim \sup A)=1$.
(16)(i) If $\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}$ is convergent, then $P_{1}(\lim \sup A)=0$ and $P_{1}\left(\liminf \left(A^{\mathrm{c}}\right)\right)=1$, and
(ii) if $A$ is all independent w.r.t. $P_{1}$ and $\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}$ is divergent to $+\infty$, then $P_{1}\left(\liminf \left(A^{\mathbf{c}}\right)\right)=0$ and $P_{1}(\lim \sup A)=1$.
(17) If $\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}$ is not convergent and $A$ is all independent w.r.t. $P_{1}$, then $P_{1}\left(\liminf \left(A^{\mathbf{c}}\right)\right)=0$ and $P_{1}(\lim \sup A)=1$.
(18) If $A$ is all independent w.r.t. $P_{1}$, then $P_{1}\left(\liminf \left(A^{\mathbf{c}}\right)\right)=0$ or $P_{1}\left(\liminf \left(A^{\mathbf{c}}\right)\right)=1$ but $P_{1}(\lim \sup A)=0$ or $P_{1}(\lim \sup A)=1$.
(19) $\quad\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot @ \operatorname{ShiftSeq}\left(A, n_{1}+1\right)\right)(\alpha)\right)_{\kappa \in \mathbb{N}}(n) \leq\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}\left(n_{1}+\right.$ $1+n)-\left(\sum_{\alpha=0}^{\kappa}\left(P_{1} \cdot A\right)(\alpha)\right)_{\kappa \in \mathbb{N}}\left(n_{1}\right)$.
(20) $\quad P_{1}\left(\left(\right.\right.$ the @IntersectShiftSeq $\left.\left.A^{\mathbf{c}}\right)(n)\right)=1-P_{1}(($ the $@ U n i o n S h i f t S e q$ A) $(n)$ ).
(21)(i) If $A^{\mathbf{c}}$ is all independent w.r.t. $P_{1}$, then $P_{1}(($ the partial Intersection of $A)(n))=\left(\right.$ the partial product of $\left.P_{1} \cdot A\right)(n)$, and
(ii) if $A$ is all independent w.r.t. $P_{1}$, then $1-P_{1}(($ the partial Union of $A)(n))=\left(\right.$ the partial product of $\left.P_{1} \cdot A^{\mathbf{c}}\right)(n)$.
