ABSTRACT

The aim of this report is to present a ranking of Nursing journals covered in Google Scholar Metrics (GSM), for the 2008-2012. This is an update of previous ranking, based on the h index for journals included by GSM (Reina Leal, Repiso & Delgado López-Cózar, 2013). GSM doesn't yet allow group and sort journals of a scientific discipline. Therefore, to the nursing discipline, can only be located 41 journals from the ten listings offered by GSM. However, in an attempt to overcome this limitation, we have used the diversity of search procedures allowed by GSM to identify the greatest number of scientific journals of Nursing with h index calculated by this bibliometric tool. Bibliographic searches were conducted between 3rd and 7th February 2014.

The result is a ranking of 366 nursing journals sorted by the same h index, and mean as discriminating value. Journals are also grouped by quartiles.

BACKGROUND

Google Scholar Metrics (GSM) offering a new system of bibliometric evaluation of scientific journals through its H index. This tool was launched in April 2012, and updated in November 2012 and July 2013. The journal rankings are sorted by languages, showing the 100 journals with the greatest impact. For the journals in English, this tool allows to sort by subject areas and disciplines. In this case, it only shows the 20 journals with the highest H Index. This option is not available for journals in the other eight languages present in GSM (Chinese, Portuguese, German, Spanish, French, Italian, Japanese and Dutch). However, in an attempt to overcome this limitation, we have used a diversity of search procedures allowed by GSM to identify the greatest number of scientific journals of Nursing with h index calculated by this bibliometric tool. The aim of this paper is to provide a ranking for all those nursing journals according to GSM.

It means the H Index update made last year for the period 2007-2011. See:

Reina Leal, L.M.; Repiso, R.; Delgado López-Cózar, E. (2013). H Index of scientific Nursing journals according to Google Scholar Metrics (2007-2011). EC3 Reports, 5: 1 July 2013.

METHODOLOGY

Subject area covered: Scientific journals that publish research articles related to nursing and care practice.

Journal search strategy: In order to identify nursing journals, the following sources of information have been consulted:

- *ULRICH'S International Directory*, which is considered the largest and most up-to-date directory of periodic publications in the world. It retrieved all existing scientific journals (academic/scholarly) that had been indexed by topic in the category («subject»): «Nursing».
- *Web of Science*. Journals indexed in the topical category of «Nursing».
- *Scopus*. Journals indexed in the topical category of «Nursing».
- *CINAHL*: Nursing journals considered as «core»: indexed in the database in their entirety (cover to cover).
- *Google Scholar Metrics*. Two strategies were employed here: Firstly, any indexed journals in the Nursing subcategory at the Health & Medical Sciences category, were downloaded. Secondly, a series of searches in journal titles was undertaken using the following keywords: «Nursing», «Care». These searches were carried out in the following languages: English, Spanish, French, Portuguese, Italian, German, Chinese, Japanese, Korean, Arabic, Russian, Turkish and Polish.

Criteria for the inclusion of Google Scholar Metrics journals: It covers only journals that have published at least 100 articles in the period 2008-2012 and those which have received at least one citation (i.e., excluding journals with h-index = 0).

Displaying the results: The journals are sorted by their H Index. In case of equality of it, discriminator value is the mean of the number of citations obtained by the articles that contribute to the H Index.

A date has also been added. It shows its evolution, in contrast to the position held by every journal in Google Scholar Metrics in the period 2007-2011.

Ranking of Nursing journals covered in Google Scholar Metrics (2008-2012)
