Abstract

Objective: Avicenna (Abu Ali al-Hossein ibn Abdullah ibn Sina) who had a special attention toward diseases treatments, gathered results of ages of herbal medicine experiments on humans and animals in his book "Al-Qānūn fī Ṭibb" or "The Canon of Medicine", which is a reliable book in Iranian traditional medicine. The aim of this research was to build a reliable list of plants effective against liver and spleen diseases, based on Avicenna's book (volume 2).

Materials and Methods: By studying the monographs, introduced agents that have been effective in liver and spleen diseases were identified. Upon their origin and effectiveness in diseases of the liver, spleen or both, treatments were organized.

Results: From a huge number of drugs, 163 plants from 73 families were found to be effective in treatment of liver and spleen illnesses. In addition, 30 non-herbal agents effective in treatment of liver diseases were detected. The Lamiaceae family have the most effective herbs for treatment of diseases of the liver, spleen or both. Hemp Agrimony, Irsā, and Fūdhanj achieved the highest scores.

Conclusion: The effects of different plants on liver and spleen diseases were indicated in Avicenna's book. Due to the report on the above book, further studies needed specially on the effect of Irsā (Iris ensata) and family Lamiaceae on liver and spleen diseases.

Ghobadi Pour M, Mirazi N, Seif A. Treatment of liver and spleen illnesses by herbs: Recommendations of Avicenna's heritage "Canon of Medicine". Avicenna J Phytomed, 2019; 9(2): 101-116.

Introduction

The largest organ in the body is the liver, comprising about 2 percent of the total body weight; in an adult with average body mass, the liver is about 1.5 kg. The liver performs many different functions including: 1) filtration and storage of blood; 2) metabolism of carbohydrates, proteins, fats, hormones, and foreign chemicals; 3)

formation of bile; 4) storage of vitamins and iron; and 5) formation of coagulant factors (Hall, 2015). Liver diseases are conditions that affect the liver. The liver is prone to diseases due to multidimensional functions and its location (Kumar et al., 2014). The efficiency of current synthetic agents in treating chronic liver disease is not satisfactory and these chemicals have

undesirable side effects. Thereby, numerous phytochemicals and medicinal herbs, as alternative and complementary treatments, have been investigated for chronic liver diseases (Hong *et al.*, 2015). Iranian traditional medicine (ITM) has been used for prevention, diagnosis, and treatment of diseases and this medicine works based on the humor theory of temperament in which, the liver is one of the most important organs in the body (Akbarzadeh *et al.*, 2015).

Al-Hossein Abu-Ali Ben Abdullah, Ibn Sina, (known as Sheikh al-Rais (or the Prince of the physicians) and in the West as Avicenna, 980-1037 AD) was an extremely talented individual. Avicenna practiced philosophy, astronomy, geometry, mathematics, and medicine as well as poetry and music. Although medicine was not his main area of interest, he became famous as a physician due to the desperate need for thoughtful medical personnel in the Persian kingdom. Among Avicenna's works, his medical book *Al-Qānūn fī Tibb*, known as *Canon* in the Western Hemisphere, has a great scientific and historical value. *Canon* is written in three parts. Part I covers the anatomy and physiology of the human body; Part II includes the description, signs, and symptoms of the disease and Part III describes the treatment of disease and prophylactic measures to prevent disease. For treatment of most diseases, he used food, psychotherapy, and medicinal plants (Qayumi, 1998). Arturo Castiglioni appreciated Avicenna's *Canon*: "The clarity of the clinical histories, the accuracy of the therapeutic indications, constructed logically and without dangerous exaggerations, and the eloquence of his forcible style were sufficient to confer on this book up to the end of the seventeenth century an almost indisputable authority in

the minds of the physicians of all countries" (Galdston, 1955).

Acute liver disease damages the spleen in long term. In Book 2 (the *Materia Medica*) of Canon, Avicenna alphabetically listed about 806 simple medical agents (of floral, mineral, and animal origin) that were used at the time. Each agent may have different possible general actions, followed by specific properties listed according to symptoms of liver and spleen diseases. In floral monographs of Canon, we found that Avicenna has found that some herbs cure some symptoms so we considered such symptoms and searched for herbs with such properties.

Materials and Methods

In our evaluation, we used different versions of the Canon book available at: (<https://sites.google.com/site/avicennacanon1a/canon-web-htm>). This library was created by Dr. Hossein Hatami and is also accessible through the Bu Ali Sina Scientific and Cultural Foundation website (<http://www.buali.ir/>). The following versions of the Canon were used in our study: 1) The corrected version of Canon in Persian (Sina, 2010), 2) Arabic manuscript of the Canon (Ibn Sina, 2005), and 3) Translated version of the Canon in English (Sīnā, 1998). As the first step, to indicate which herbs have hepatoprotective and other effects for liver diseases, the 2nd volume of Canon was searched. These items were mutually compared and evaluated. Subsequently, data were collected based on different plant species in the areas of healing, and protection. The flow chart of the study is presented in Figure 1.

Avicenna's herbs for treatment of liver and spleen illnesses

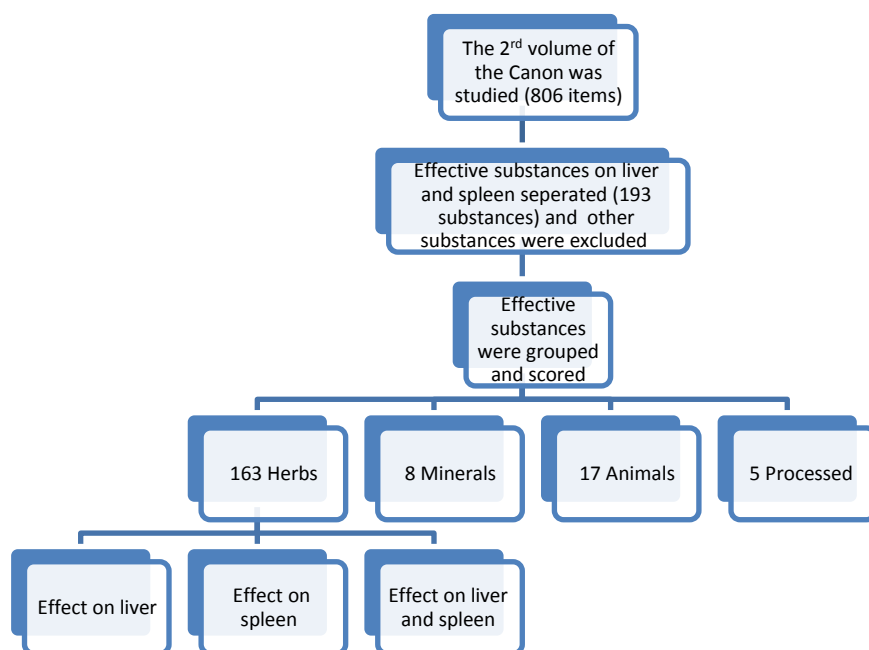

Figure 1. The flow chart of the study.

Statistical analysis

The average values for results are expressed as a mean± standard error of mean (SEM). Statistical analysis was performed using the Statistical Package for the Social Science (IBM SPSS statistics version 23) program for Windows. Statistical significance of differences between groups was evaluated using non-parametric statistics, the relationship between the numbers of herbs in each family to score of herbs was shown by the Kruskal–Wallis test $p < 0.05$ was considered statistically significant. Graphs were created with Excel 2013 software (Microsoft office 2013).

Results

Avicenna introduced 193 agents as they were effective on the liver and spleen. Their characteristics are presented in four categories according to the origin of agent in Tables 1-6 which present basic information such as common name, Persian name, Arabic name, scientific name, family, used parts (i.e. root, fruit, etc.)/ mode of consumption (fried, roasted, etc.) or preparation (enema, smell, etc.), diseases for which the agent was prescribed and finally score.

Figure 2. Effective herbs against liver and spleen diseases mentioned in Avicenna's book. Scores are according to the number of effects that every herb has been prescribed by Avicenna.

Figure 3. Histogram of families with the highest number of effective herbs.

Figure 4: Relationship between the plant families and a mean of scores of their herbs. Data are presented as mean \pm SEM. $p > 0.05$.

Plants

We reviewed all herbs mentioned in the 2nd volume of Canon and found a total of 163 plants used for liver and spleen illnesses. These plants belong to 73 different families. These herbs included medicinal, poisonous, ornamental and economic plants and weeds that are presented in Tables 1-3. According to their effectiveness, they are categorized as effective on liver Table 1, spleen Table 2

and both liver and spleen Table 3. The second volume of the canon book consists of a series of monographs each one describing different properties of one medicinal herb. The monograph name that described the properties of No. 92 herb is lost during repeated transcription through ages so it has indicated as "???" in Table 1. Herb number 93 is a type of endive with no scientific name.

Table 1. Data from Canon book 2 about herbs with hepatoprotective/hepatotherapeutic effects.

No.	Persian Name	Common name	Arabic name	Scientific Name	Family	Used Parts/ Mode of consumption or preparation	Conditions which the herb has effect on	Score

48	Rivand, rivand.e čini, behman, rāvand	Himalayan rhubarb	Riwand	<i>Rheum officinale</i> L. <i>Rheum emodi</i> Wall. ex Meisn.	Polygonaceae		LD, PL, LW, SHS	4
49	Parsiyo(a)šān	Maiden hair	Barshiāušān	<i>Adiantum capillus veneris</i> L.	Pteridaceae	/ administration with wine	SA, J	2
50	Bādām	Almond	Lauz	<i>Amygdalus communis</i> L.	Rosaceae	Seed /oil, flour	OL, OS, GS, SU, S	5
51	Ru(o)nās	Dyers madder	Fūwah al-šabbāghin	<i>Rubia tinctorum</i>	Rubiaceae	Fruit	S, CLL, CLS, OL, OS	5
52	Fayjan	Common rue	Sozāb , sodāb	<i>Ruta graveolens</i> L.	Rutaceae	/ plastered, decoction	D, GS	2
53	Filzahre		Filzahraj	<i>Lycium afrum</i> L. <i>Rhamnus saxatilis</i> L.	Solanaceae Rhamnaceae	Branch / decocted, orally	S, J	2
54	Haftbarg	Mazerion	Mādhriūm	<i>Daphne mezereum</i> L.	Thymelaeaceae	/ Electuary, suppository,	D, BD, PBB	3

Abbreviations: CH: Cold hepatalgia; STL: strengthens the liver; HS: Hardness of the spleen, splenic hardness; SHS: shrinks the (enlarged) spleen, emaciates the spleen, splenic enlargement, reduces the size of spleen; SD: Splenic disease, splenic disorders; H: Hepatitis; S: Splenitis; LD: Liver disease; LW: Liver weakness; IL: Inflammatory conditions of the liver; GL: Good for liver; GS: Good for spleen, good drugs for the spleen; D: Dropsy (Ascites); TL: tones up the liver; CL: Strengthens 'cold' liver, 'coldness' (atony) of the liver, suitable for the 'coldness' of the liver; LH: Liver hardness; OL: Removes the obstructions of liver, removes hepatic obstructions, de obstruct for the liver; OS: Obstructions of spleen, de obstruct for the spleen; J: Jaundice; GD: General Dropsy (anasarca); PB: Purged out bile, purges out the 'burnt' bile; US: useful for spleen, useful in splenic ailments; PL: Pain of the liver, hepatalgia, painful conditions of liver; BH: Remove bilious humours, expels bilious humours; I: Itch, urticarial, prurigo, scabies; PBB: Purge out black bile; SS: sclerosis of spleen; BJ: Useful in black jaundice, melanotic jaundice; SA: Splenalgia, splenic pain; CLL: Cleanses the liver, cleanses (the foul humours of) the liver; PH: Produces heat in liver, warming drug for liver; VB: vomiting of bile, stops biliary vomiting, bilious vomiting; EL: Expels bile through loose motion; SI: Spleen inflammation; DB: Diluent black bile; UB: useful for bile ailments; EBB: Evacuates the black bile; EVY: Evacuates the yellow bile, evacuates the burnt bile; SSW: splenic swelling; DI: Dissolves inflammation of the spleen; BI: Biliary ileus; CS: Cold spleenalgia; EXB: Expels yellow bile; EB: Expels the black bile; MJ: Melanotic jaundice; BC: Bile clean up; BO: Bile opener; BL: Bile laxative; RBB: Remove black bile; SL: Sclerosis of liver; STS: strengthens the spleen; RB: Removes yellow bile; SU: stirs up yellow bile; CLS: Cleanses the spleen; BD: Useful in bile diarrhea, bilious diarrhea, stop bilious diarrhea.

The most common effective plants prescribed for liver or spleen diseases or both, are shown in Figure 2. Figure 3 shows the plant families (i.e. Lamiaceae, Fabaceae, Apiaceae, Rosaceae, Asteraceae, Solanaceae, and Brassicaceae) with the largest contribution to development of treatments against liver and spleen diseases.

Animals

The majority of the 17 agents of animal's origin including animal, organs or animal physiological fluids used as medication. In certain cases, especially for insects, the whole body was used, and in other cases,

the animal's urine or even the milk was used. The animals and their applications are presented in Table 4.

The used animals can be divided into groups according to their availability, such as domesticated animals, such as jennet, goat, camel, cow, and others such as locust and worms. Wild animals, for example, wolf, sand grouse, red-headed partridge, hedgehog, porcupine, antelope, and stag. Various organs, and products of exotic animals, species such as Spanish fly, coral, oyster have been used in order to cure liver and spleen diseases

Table 4. Animals and their parts used as a source of medication.

No.	Persian name	Common name	Arabic name	Scientific Name	Family	Used Parts/ Mode of consumption or preparation	Diseases Which the agent has Effect on	Score

3	La'l e moa'bberi	A resin	Qaiqahan, qanqahar	<i>Qaiqahan</i>	/ Orally	SHS	1
4	Panir	Cheese	Jubn	<i>Serparium</i>	The water of cheese	PBH, EXB	2
5	Omaali, ormaali, asal' e dāvud, o[w]qan e asal'	Honey wine or mead	Ūmāli	<i>Eleemali muslum</i>	/ Diluted with water	PB	1

Abbreviations: D: Dropsy (Ascites); BD: Useful in bile diarrhea, bilious diarrhea, stop bilious diarrhea; SHS: shrinks the (enlarged) spleen, emaciates the spleen, splenic enlargement, reduces the size of spleen; PBH: Produces bilious humours; EXB: Expels yellow bile; PB: Purged out bile, purges out the 'burnt' bile.

Minerals

We were able to identify 8 materials of mineral origin (Table 5). The use of such agents in medicine has been well-known throughout history.

Agents of other origins

Five medicinal agents that were processed from animal or plant materials or

agents of mixed or unknown origin are presented in Table 6.

Table 7. Effective Medicinal agent for liver and spleen diseases grouped based on their origin.

Origin	Number	Percentage
Plants	163	84.455
Animals	17	8.81
Minerals	8	4.145
Processed	5	2.59
Sum	193	100

Discussion

The overwhelming majority (84.45%) of agents that served as simple drugs were derived only from plants (see Table 7). The proportion of materials derived from animals and animal organs is small (8.80%), and minerals represent an even smaller proportion (4.14%).

Based on our survey of Canon, 163 herbal parts which exert therapeutic effects on the liver and spleen, were found. In this book, some items refer to one herb Ṭarfūlis and Ṭūqriūs both refer to Teukrion or some items are parts of one herb and have different names e.g. Ḥiltit is gum and Maḥrūth is the root of Anjudhān so the last two have same scientific name of *Asafoetida* in the Tables.

In old manuscripts, there are different descriptions for identical herb so different scientific names have been proposed for the same herb. Prof. Ghahraman and Prof. Okhovvat have introduced appropriate scientific names for old names; in the present study, we used scientific names according to their suggestions (Ghahreman and Okhovvat, 2004).

From antiquity until now herbalist and medicinal experts had a quest to find the most effective herb that has the richest source of medicinal material, in order to use it in liver tonics and other formulas. Our research revealed that the effective herbs are not limited to one family but the most frequently used herbs belong to several families that are given in Figure 3. Some families like Laminacea have higher numbers of herbs that are frequently used as effective therapeutics for spleen and liver diseases. We propose to study the herbs of this family and other families noted in Figure 2 in order to find the most effective herb for treatment of liver and spleen diseases.

According to the number of effects that every herb has, as prescribed by Avicenna as effective on liver or spleen diseases or both, the herbs were scored (Figure 2). Ghāfith (*Eupatorium cannabinum*) was named "The eupatorion of Avicenna"

(Tobyn *et al.*, 2016) in old times, is one of the highly scored herbs. The present studies demonstrated choleric and hepatoprotective effects of hemp agrimony (Lexa *et al.*, 1989) although it contains pyrrolizidine alkaloids (Edgar *et al.*, 1992; Hendriks *et al.*, 1987) which have hepatotoxic and potentially carcinogenic and genotoxic effects and essential oils of *E. cannabinum* is notably toxic (Judzentiene *et al.*, 2016). On the other hand, the effects of a plant such as Irsā (*Iris ensata*) which has the highest score (Figure 1), on the liver or spleen, have not yet been reported and its medicinal use had been uncertain or unknown according to lack of articles is considered a good candidate for future investigations. Fūdhanj (*Mentha piperita*) which also gained a high score was used successfully by Avicenna as a drug, for treatment of liver and spleen diseases. It was shown that *M. piperita* causes lipid peroxidation and hepatic damage in a dose-dependent manner (Akdogan *et al.*, 2004). It has hepatotoxic potential (Douros *et al.*, 2016) and moderately severe adverse effects (Posadzki *et al.*, 2013), further studies in this field are needed. Meanwhile, *M. piperita* has radioprotective properties against gamma irradiation which is probably mediated via its antioxidant and free radical scavenging activities of leaf extract (Samarth *et al.*, 2006); also, this plant may be useful for reducing the side effects of arsenic-induced hepatopathy (Sharma *et al.*, 2007). Afsantin (*Artemisia absinthium*) is another high-score herb which exhibits hepatoprotective action partly through microsomal drug metabolizing enzymes (MDME) inhibitory action (Gilani and Janbaz, 1995), has significant antioxidant activity and protects the liver and kidney (Kharoubi *et al.*, 2008) probably through its immunomodulatory activity (Amat *et al.*, 2010). Also, this plant was considered for reducing hepatic damage and it may serve as an alternative medicine in hepatic conditions (Saxena and Shukla, 2012).

These results show a need for a close scrutiny in methods of planting, harvesting, processing, extraction and preparing a single or combination formula that affects remedies and practice of ancient medicine. In order to prepare a suitable herbal drug for the treatment of complicated diseases such as liver cirrhosis and hepatocellular carcinoma, according to Avicenna book, further studies are needed to make an effective drug for liver or spleen diseases is promising.

Through analysis of 806 therapeutic items of Avicenna 2nd volume of Canon, we prepared a list of agents that are effective in three main areas namely, liver, spleen, and liver & spleen diseases. The current study indicates the necessity of deep analysis, study and further assessment of listed items.

Acknowledgment

We appreciate Dr. Hossein Hatami for his efforts in establishing such useful database of Avicenna and other Iranian traditional medicine (ITM) scientist's books in Bu-Ali Sina scientific & cultural foundation site.

Conflicts of interest

The authors declare that there is no conflict of interest associated with this work.
