Received 21 December 2011; accepted 19 May 2012

Abstract. An important research topic related to the theory and application of the interval-valued intuitionistic fuzzy weighted aggregation operators is how to determine their associated weights. In this paper, we propose a precise weight-determined (PWD) method of the monotonicity and scale-invariance, just based on the new score and accuracy functions of interval-valued intuitionistic fuzzy number (IIFN). Since the monotonicity and scale-invariance, the PWD method may be a precise and objective approach to calculate the weights of IIFN and interval-valued intuitionistic fuzzy aggregation operator, and a more suitable approach to distinguish different decision makers (DMs) and experts in group decision making. Based on the PWD method, we develop two new interval-valued intuitionistic fuzzy aggregation operators, i.e. interval-valued intuitionistic fuzzy ordered precise weighted averaging (IFOPWA) operator and interval-valued intuitionistic fuzzy ordered precise weighted geometric (IFOPWG) operator, and study their desirable properties in detail. Finally, we provide an illustrative example.

Keywords: multi-attribute group decision making, interval-valued intuitionistic fuzzy number, precise weight-determined method, monotonicity, scale-invariance.

JEL Classification: C02, D71, D81.

Introduction

Atanassov (1986) introduced the concept of intuitionistic fuzzy set (IFS), which is an extended and generalized definition of fuzzy set (FS) by Zadeh (1965), and is a powerful tool to deal with vagueness and uncertainty. Since its appearance, IFS has received more and more attention and applied to many fields (Vlachos, Sergiadis 2007; Xu, Yager 2008; Khatibi, Gholam 2009;

Corresponding author Wei Zhou
E-mail: zw453@163.com

Kharal 2009; Ye 2010; Xu 2011; Zavadskas, Turskis 2011). However, decision making often occurs under the situation where there are time pressure and lack of data, and experts may not be able to express their preference between decisions with precise reasons. By combining FS and IFS, Atanassov and Gargov (1989) further proposed the concept of interval-valued intuitionistic fuzzy number (IIFN), which is characterized by a membership function and a non-membership function whose values are intervals rather than real numbers. Thus, the interval-valued intuitionistic fuzzy set has the virtue of complementing FS and IFS, which is more flexible and practical than FS and IFS in coping with fuzziness and uncertainty. After that, the interval-valued intuitionistic fuzzy set (IIFS) has received more and more attention from researchers (Deschrijver, Kerre 2003; Xu 2007a; John *et al.* 2009; Xu, Yager 2009; Li 2010a; Cabreriza *et al.* 2010; Ertugrul 2011), and obtained some research results (Park *et al.* 2009; Liu 2009; Li 2010b; Chen *et al.* 2011; Yue 2011; Zhou, He 2012).

For convenient aggregation and calculation the interval-valued intuitionistic fuzzy set, based on the weighted means and the ordered weighted averaging (OWA) functions (Yager 1988), Xu (2007b) investigated and proposed some interval-valued intuitionistic fuzzy aggregation operators, such as the interval-valued intuitionistic fuzzy weighted arithmetic aggregation (IIFWA) operator, the interval-valued intuitionistic fuzzy ordered weighted aggregation (IIFOWA) operator, and the interval-valued intuitionistic fuzzy hybrid aggregation (IIFHA) operator. Based on the GOWA operator (Yager 2004a) and intuitionistic fuzzy geometric aggregation operator (Xu, Yager 2006), Xu and Chen (2007a) proposed the interval-valued intuitionistic fuzzy ordered weighted geometric (IIFOWG) operator and the interval-valued intuitionistic fuzzy hybrid geometric (IIFHG) operator. Their analytical properties were explored by Wei and Wang (2007), and Xu and Chen (2007b). Moreover, Xu and Cai (2009) studied the incomplete interval-valued intuitionistic fuzzy preference relations and given an approach to decision making based on the incomplete interval-valued intuitionistic fuzzy preference relation. Xu (2010b) investigated the Choquet integrals of weighted intuitionistic fuzzy information. Based on the distance measure for interval-valued intuitionistic fuzzy value, Xu (2010c) further proposed some relations and operations of interval-valued intuitionistic fuzzy values. Xu and Chen (2011) proposed a Bonferroni means based on interval-valued intuitionistic fuzzy value, and so on.

An important issue related to the theory and application of the above interval-valued intuitionistic fuzzy aggregation operators and other weighted aggregation operator is how to determine their weights (Yager 2004b). O'Hagan (1988) suggested a maximum entropy approach, which is called maximum entropy weights. Their properties were investigated by Filev and Yager (1995). Filev and Yager (1998) brought forward an exponential smoothing weighted method, which produces the so-called exponential OWA operator and operator weights. Other approaches include the genetic algorithm weighted method (Nettleton, Torra 2001), the minimum variance weighted method (Fuller, Majlender 2003), the parametric geometric weighted method (Liu, Chen 2004), the mini-max disparity weighted method (Wang, Parkan 2005), the maximal Renyi entropy weighted method (Majlender 2005), the preemptive goal programming weighted method (Wang, Parkan 2007), the deviation entropy weight method (Han, Liu 2011), and the distance measure weighted method (Yue 2011).

However, there are still two puzzles to obtain interval-valued intuitionistic fuzzy aggregation operator weights by the above weight-determined methods. First, the weighted object of these approaches is the intuitionistic fuzzy value or the fuzzy value which is different from the interval-valued intuitionistic fuzzy number. Second, it seems that there is no investigation on the monotonous and scale-invariant properties of the weight-determined method, which is decisive for aggregation and calculation of interval-valued intuitionistic fuzzy values in group decision making. Therefore, how to calculate weights of the monotonicity and scale-invariance under the interval-valued intuitionistic fuzzy information environment is an important research topic that needs to be addressed in the process of multi-attribute group decision making, which is also the focus of this paper. To do this, we propose a precise weight-determined (PWD) method to obtain interval-valued intuitionistic fuzzy aggregation operator weights, based on the new score and accuracy functions of IIFN. Since the monotonicity and scale-invariance, the PWD method may be a precise and objective approach to calculate the weights of IIFN and interval-valued intuitionistic fuzzy aggregation operator, and a more suitable approach to distinguish different DMs and experts in group decision making. Then, based on the precise weight-determined method, we develop the interval-valued intuitionistic fuzzy ordered precise weighted averaging (II-FOPWA) operator and geometric (II-FOPWG) operator, and explore their desired properties in detail. At last, a practical example is provided to demonstrate the application of the new weighted method and two aggregation operators.

The reminder of this paper is organized as follows. We briefly review some basic concepts and operations in Section 1. Section 2 proposes the precise weight-determined method. Section 3 develops the II-FOPWA and II-FOPWG operators, and investigates their desired properties. A practical example is provided in Section 4. The paper ends in final section with concluding remarks.

1. Preliminaries

In the following, we introduce the basic concepts and operations about IIFN (Xu 2007b), which is the basic element of IIFS (Atanassov, Gargov 1989).

Definition 1 (Atanassov, Gargov 1989). Let $X = (x_1, x_2, \dots, x_n)$ be fixed. An interval-valued intuitionistic fuzzy set (IIFS) \bar{A} in X can be defined as:

$$\bar{A} = \left\{ \left(x, \bar{\mu}_{\bar{A}}(x), \bar{\nu}_{\bar{A}}(x) \right) \mid x \in X \right\}, \tag{1}$$

where $\bar{\mu}_{\bar{A}}(x) \in [0,1]$ and $\bar{\nu}_{\bar{A}}(x) \in [0,1]$ satisfy $\sup \bar{\mu}_{\bar{A}}(x) + \sup \bar{\nu}_{\bar{A}}(x) \leq 1$.

Definition 2 (Xu 2007b). Let $\bar{A} = \left\{ \left(x, \bar{\mu}_{\bar{A}}(x), \bar{\nu}_{\bar{A}}(x) \right) \mid x \in X \right\}$ be an IIFS, the pair $(\bar{\mu}_{\bar{A}}(x), \bar{\nu}_{\bar{A}}(x))$ is called an interval-valued intuitionistic fuzzy number (IIFN).

For computational convenience, an IIFN can be denoted by $([a, b], [c, d])$, with the condition that $[a, b] \subset [0,1]$, $[c, d] \subset [0,1]$, and $b + d \leq 1$. Based on the operations of intuitionistic fuzzy values (Atanasov 1986; De *et al.* 2000), Xu (2007b) defined some operations of IIFNs as follows.

Definition 3 (Xu 2007b). Let $\bar{\alpha} = ([a, b], [c, d])$, $\bar{\alpha}_1 = ([a_1, b_1], [c_1, d_1])$ and $\bar{\alpha}_2 = ([a_2, b_2], [c_2, d_2])$ be three IIFNs, then following operational laws are valid:

- 1) $\bar{\alpha}_1 \oplus \bar{\alpha}_2 = ([a_1 + a_2 - a_1 a_2, b_1 + b_2 - b_1 b_2], [c_1 c_2, d_1 d_2])$;
- 2) $\bar{\alpha}_1 \otimes \bar{\alpha}_2 = ([a_1 a_2, b_1 b_2], [c_1 + c_2 - c_1 c_2, d_1 + d_2 - d_1 d_2])$;
- 3) $\lambda \bar{\alpha} = ([1 - (1 - a)^\lambda, 1 - (1 - b)^\lambda], [c^\lambda, d^\lambda])$, $\lambda > 0$;
- 4) $\bar{\alpha}^\lambda = ([a^\lambda, b^\lambda], [1 - (1 - c)^\lambda, 1 - (1 - d)^\lambda])$, $\lambda > 0$.

Then, Xu (2007b) introduced the score function $s(\bar{\alpha}) = (a - c + b - d) / 2$ and the accuracy function $h(\bar{\alpha}) = (a + b + c + d) / 2$ to calculate the score value and accuracy degree of IIFN $\bar{\alpha} = ([a, b], [c, d])$, and gave an order relation between two IIFNs $\bar{\alpha}_1$ and $\bar{\alpha}_2$ as follows.

If $s(\bar{\alpha}_1) < s(\bar{\alpha}_2)$, then $\bar{\alpha}_1 < \bar{\alpha}_2$.

If $s(\bar{\alpha}_1) = s(\bar{\alpha}_2)$, then:

- i) if $h(\bar{\alpha}_1) < h(\bar{\alpha}_2)$, then $\bar{\alpha}_1 < \bar{\alpha}_2$;
- ii) if $h(\bar{\alpha}_1) = h(\bar{\alpha}_2)$, then $\bar{\alpha}_1 \sim \bar{\alpha}_2$;
- iii) if $h(\bar{\alpha}_1) > h(\bar{\alpha}_2)$, then $\bar{\alpha}_1 > \bar{\alpha}_2$.

It should be noted that the score function $s(\bar{\alpha})$ is between -1 and 1 , and the accuracy function $h(\bar{\alpha})$ is between 0 and 2 . In order to facilitate the following study about operator weights, we respectively introduce new score function and accuracy function as follows:

$$s_2(\bar{\alpha}) = (2 + (a - c + b - d)) / 4 ; \tag{2}$$

$$h_2(\bar{\alpha}) = (a + c + b + d) / 4 . \tag{3}$$

Since $[a, b] \subset [0, 1]$, $[c, d] \subset [0, 1]$, and $b + d \leq 1$, we can easily get $0 \leq s_2(\bar{\alpha}) \leq 1$ and $0 \leq h_2(\bar{\alpha}) \leq 1$. Compare $s(\bar{\alpha})$ and $s_2(\bar{\alpha})$, we can drive, if $s(\bar{\alpha}_1) > s(\bar{\alpha}_2)$ (or $s(\bar{\alpha}_1) \leq s(\bar{\alpha}_2)$), then $s_2(\bar{\alpha}_1) > s_2(\bar{\alpha}_2)$ (or $s_2(\bar{\alpha}_1) \leq s_2(\bar{\alpha}_2)$); on the other hand, if $s_2(\bar{\alpha}_1) > s_2(\bar{\alpha}_2)$ (or $s_2(\bar{\alpha}_1) \leq s_2(\bar{\alpha}_2)$), then $s(\bar{\alpha}_1) > s(\bar{\alpha}_2)$ (or $s(\bar{\alpha}_1) \leq s(\bar{\alpha}_2)$). Likewise, we can get the same conclusions by comparing $h(\bar{\alpha})$ and $h_2(\bar{\alpha})$. Therefore, if we replace $s(\bar{\alpha})$ and $h(\bar{\alpha})$ by $s_2(\bar{\alpha})$ and $h_2(\bar{\alpha})$, the order relation between two IIFNs $\bar{\alpha}_1$ and $\bar{\alpha}_2$ introduced by Xu (2007b) are also valid.

Based on the above concepts and operations, Xu (2007b) proposed the following interval-valued intuitionistic fuzzy ordered weighted averaging (IIFOWA) operator and interval-valued intuitionistic fuzzy ordered weighted geometric (IIFOWG) operator to aggregate interval-valued intuitionistic fuzzy information.

Definition 4 (Xu 2007b). Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, with the condition that $[a_i, b_i] \subset [0, 1]$, $[c_i, d_i] \subset [0, 1]$ and $b_i + d_i \leq 1$, IIFOWA operator and IIFOWG operator are defined as:

$$\begin{aligned} \text{IIFOWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) &= w_1 \bar{\alpha}_{\sigma(1)} \oplus w_2 \bar{\alpha}_{\sigma(2)} \oplus \dots \oplus w_n \bar{\alpha}_{\sigma(n)} = \\ &\left(\left[1 - \prod_{i=1}^n (1 - a_{\sigma(i)})^{w_i}, 1 - \prod_{i=1}^n (1 - b_{\sigma(i)})^{w_i} \right], \left[\prod_{i=1}^n c_{\sigma(i)}^{w_i}, \prod_{i=1}^n d_{\sigma(i)}^{w_i} \right] \right); \end{aligned} \tag{4}$$

$$\begin{aligned} \text{IIFOWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) &= \bar{\alpha}_{\sigma(1)}^{w_1} \otimes \bar{\alpha}_{\sigma(2)}^{w_2} \otimes \dots \otimes \bar{\alpha}_{\sigma(n)}^{w_n} = \\ &\left(\left[\prod_{i=1}^n a_{\sigma(i)}^{w_i}, \prod_{i=1}^n b_{\sigma(i)}^{w_i} \right], \left[1 - \prod_{i=1}^n (1 - c_{\sigma(i)})^{w_i}, 1 - \prod_{i=1}^n (1 - d_{\sigma(i)})^{w_i} \right] \right), \end{aligned} \tag{5}$$

where $w=(w_1, w_2, \dots, w_n)$ is the weight vector of $\bar{\alpha}_i$, with $w_i \in [0,1]$ and $\sum_{i=1}^n w_i = 1$, and $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$ such that $\bar{\alpha}_{\sigma(i-1)} \geq \bar{\alpha}_{\sigma(i)}$ for $i=2, 3, \dots, n$.

2. The precise weight-determined method under IIFN environment

In this section, we shall propose a precise weight-determined method (PWD) for calculating interval-valued intuitionistic fuzzy aggregation operator weights. A prominent characteristic of PWD method is that put accuracy and precise weights into different IIFNs according to their score value and accuracy degree, and keep weights of the monotonicity and scale-invariance.

Definition 5. Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i=1, 2, \dots, n$) be a collection of IIFNs, and $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$ such that $\bar{\alpha}_{\sigma(i-1)} \geq \bar{\alpha}_{\sigma(i)}$, a precise weight vector $w=(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ of $\bar{\alpha}_i$, is defined as follows:

$$w_{\sigma(i)} = \frac{P_{\sigma(i)}}{\sum_i^n P_{\sigma(i)}}, \tag{6}$$

where

$$P_{\sigma(i)} = S(\bar{\alpha}_{\sigma(i)}) \cdot H(\bar{\alpha}_{\sigma(i)}) \cdot L(\bar{\alpha}_{\sigma(i)}) \cdot R(\bar{\alpha}_{\sigma(i)}), \quad i = 1, 2, \dots, n; \tag{7}$$

$$S(\bar{\alpha}_{\sigma(i)}) = s_2(\bar{\alpha}_{\sigma(i)}); \tag{8}$$

$$L(\bar{\alpha}_{\sigma(i)}) = \prod_{j=1}^{i-1} l(\bar{\alpha}_{\sigma(j)}), \quad i = 2, 3, \dots, n; \tag{9}$$

$$R(\bar{\alpha}_{\sigma(i)}) = \prod_{j=i+1}^n r(\bar{\alpha}_{\sigma(j)}), \quad i = 1, 2, \dots, n-1; \tag{10}$$

$$H(\bar{\alpha}_{\sigma(i)}) = \begin{cases} h_2(\bar{\alpha}_{\sigma(i)}), & \text{if } \prod_{j=1, j \neq i}^n (s_2(\bar{\alpha}_{\sigma(i)}) - s_2(\bar{\alpha}_{\sigma(j)})) = 0; \\ 1, & \text{else} \end{cases} \tag{11}$$

$$l(\bar{\alpha}_{\sigma(j)}) = \begin{cases} h_2(\bar{\alpha}_{\sigma(j)}), & \text{if } s_2(\bar{\alpha}_{\sigma(j-1)}) - s_2(\bar{\alpha}_{\sigma(j)}) = 0 \text{ and } s_2(\bar{\alpha}_{\sigma(j)}) - s_2(\bar{\alpha}_{\sigma(j+1)}) > 0 \\ 1, & \text{else} \end{cases}; \tag{12}$$

$j = 2, 3, \dots, n-1$

$$r(\bar{\alpha}_{\sigma(j)}) = \begin{cases} h_2(\bar{\alpha}_{\sigma(j)}), & \text{if } s_2(\bar{\alpha}_{\sigma(j-1)}) - s_2(\bar{\alpha}_{\sigma(j)}) > 0 \text{ and } s_2(\bar{\alpha}_{\sigma(j)}) - s_2(\bar{\alpha}_{\sigma(j+1)}) = 0 \\ 1, & \text{else} \end{cases}, \tag{13}$$

$j = 2, 3, \dots, n-1$

with $l(\bar{\alpha}_{\sigma(1)}) = l(\bar{\alpha}_{\sigma(n)}) = r(\bar{\alpha}_{\sigma(1)}) = r(\bar{\alpha}_{\sigma(n)}) = 1, L(\bar{\alpha}_{\sigma(1)}) = 1, R(\bar{\alpha}_{\sigma(n)}) = R(\bar{\alpha}_{\sigma(n-1)})$.

By Definition 5, we can obtain $0 \leq w_{\sigma(i)} \leq 1$ and $\sum_{i=1}^n w_{\sigma(i)} = 1$.

The above equations (Eqs (6)–(13)) are named precise weight-determined (PWD) method of obtaining the interval-valued intuitionistic fuzzy aggregation operator weights. In the following, we discuss its two desired properties.

Theorem 1. (Monotonicity) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$ such that $\bar{\alpha}_{\sigma(i-1)} \geq \bar{\alpha}_{\sigma(i)}$, $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_{\sigma(i)}$. Let $\bar{\alpha}_{\sigma(t_1)}$ and $\bar{\alpha}_{\sigma(t_2)}$ ($t_1 < t_2$) be any two IIFNs in $\bar{\alpha}_{\sigma(i)}$, then

(1) if $\bar{\alpha}_{\sigma(t_1)} > \bar{\alpha}_{\sigma(t_2)}$, then $w_{\sigma(t_1)} > w_{\sigma(t_2)}$; (2) if $\bar{\alpha}_{\sigma(t_1)} \sim \bar{\alpha}_{\sigma(t_2)}$, then $w_{\sigma(t_1)} = w_{\sigma(t_2)}$.

Proof. (1) If $\bar{\alpha}_{\sigma(t_1)} > \bar{\alpha}_{\sigma(t_2)}$, we can distinguish eight following cases:

$$s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) = 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) = 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) < 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) = 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) = 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) < 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) < 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) < 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_2)}), h_2(\bar{\alpha}_{\sigma(t_1)}) > h_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) = 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) = 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_2)}), h_2(\bar{\alpha}_{\sigma(t_1)}) > h_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) < 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) = 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_2)}), h_2(\bar{\alpha}_{\sigma(t_1)}) > h_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) = 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) < 1;$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_2)}), h_2(\bar{\alpha}_{\sigma(t_1)}) > h_2(\bar{\alpha}_{\sigma(t_2)}), H(\bar{\alpha}_{\sigma(t_1)}) < 1, \text{ and } H(\bar{\alpha}_{\sigma(t_2)}) < 1.$$

Here we only prove two cases, and the others can be obtained similarly.

Case 1: $s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_2)})$, $H(\bar{\alpha}_{\sigma(t_1)}) = 1$, and $H(\bar{\alpha}_{\sigma(t_2)}) = 1$.

In this case, we have:

$$S(\bar{\alpha}_{\sigma(t_1-1)}) > S(\bar{\alpha}_{\sigma(t_1)}) > S(\bar{\alpha}_{\sigma(t_1+1)}); \tag{14}$$

$$S(\bar{\alpha}_{\sigma(t_2-1)}) > S(\bar{\alpha}_{\sigma(t_2)}) > S(\bar{\alpha}_{\sigma(t_2+1)}); \tag{15}$$

$$l(\bar{\alpha}_{\sigma(t_1)}) = l(\bar{\alpha}_{\sigma(t_2)}) = r(\bar{\alpha}_{\sigma(t_1)}) = r(\bar{\alpha}_{\sigma(t_2)}) = 1 \tag{16}$$

and

$$L(\bar{\alpha}_{\sigma(t_1)}) \cdot R(\bar{\alpha}_{\sigma(t_1)}) = \prod_{j=1}^{t_1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_1+1}^n r(\bar{\alpha}_{\sigma(j)}) = \prod_{j=1}^{t_1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_1+1}^{t_2} r(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_2+1}^n r(\bar{\alpha}_{\sigma(j)}); \tag{17}$$

$$L(\bar{\alpha}_{\sigma(t_2)}) \cdot R(\bar{\alpha}_{\sigma(t_2)}) = \prod_{j=1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_2+1}^n r(\bar{\alpha}_{\sigma(j)}) = \prod_{j=1}^{t_1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_2+1}^n r(\bar{\alpha}_{\sigma(j)}); \tag{18}$$

i) if $s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)})$, then

$$\prod_{j=t_1+1}^{t_2} r(\bar{\alpha}_{\sigma(j)}) = \prod_{j=t_1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) = 1; \tag{19}$$

$$R(\bar{\alpha}_{\sigma(t_1)}) \cdot L(\bar{\alpha}_{\sigma(t_1)}) = R(\bar{\alpha}_{\sigma(t_2)}) \cdot L(\bar{\alpha}_{\sigma(t_2)}). \tag{20}$$

Hence, $P_{\sigma(t_1)} > P_{\sigma(t_2)}$ and $w_{\sigma(t_1)} = \frac{P_{\sigma(t_1)}}{\sum_i^n P_{\sigma(i)}} > \frac{P_{\sigma(t_2)}}{\sum_i^n P_{\sigma(i)}} = w_{\sigma(t_2)}$;

ii) if $s_2(\bar{\alpha}_{\sigma(t_1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_1+p)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+q)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)})$, then

$$h_2(\bar{\alpha}_{\sigma(t_1+p)}) \geq h_2(\bar{\alpha}_{\sigma(t_1+p+1)}) \geq \dots \geq h_2(\bar{\alpha}_{\sigma(t_1+q)}) \tag{21}$$

and

$$\prod_{j=t+1}^{t^2} r(\bar{\alpha}_{\sigma(j)}) = 1_{a_{\sigma(t+1)}} \times \dots \times 1_{a_{\sigma(t+p-1)}} \times h_2(\bar{\alpha}_{\sigma(t+p)})_{a_{\sigma(t+p)}} \times 1_{a_{\sigma(t+p+1)}} \times \dots \times 1_{a_{\sigma(t^2)}} = h_2(\bar{\alpha}_{\sigma(t+p)}); \tag{22}$$

$$\prod_{j=t^1}^{t^2-1} l(\bar{\alpha}_{\sigma(j)}) = 1_{a_{\sigma(t^1)}} \times \dots \times 1_{a_{\sigma(t+q-1)}} \times h_2(\bar{\alpha}_{\sigma(t+q)})_{a_{\sigma(t+q)}} \times 1_{a_{\sigma(t+q+1)}} \times \dots \times 1_{a_{\sigma(t^2-1)}} = h_2(\bar{\alpha}_{\sigma(t+q)}). \tag{23}$$

Therefore, $\prod_{j=t+1}^{t^2} r(\bar{\alpha}_{\sigma(j)}) \geq \prod_{j=t^1}^{t^2-1} l(\bar{\alpha}_{\sigma(j)})$, $P_{\sigma(t^1)} > P_{\sigma(t^2)}$ and

$$w_{\sigma(t^1)} = \frac{P_{\sigma(t^1)}}{\sum_i^n P_{\sigma(i)}} > \frac{P_{\sigma(t^2)}}{\sum_i^n P_{\sigma(i)}} = w_{\sigma(t^2)}. \tag{24}$$

Similarly, we could prove the more general case, i.e.

$$s_2(\bar{\alpha}_{\sigma(t^1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t+k_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t+k_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t+p)}) = \dots = s_2(\bar{\alpha}_{\sigma(t+q)}) > \dots > s_2(\bar{\alpha}_{\sigma(t+m_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t+m_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t^2)}). \tag{25}$$

Case 2: $s_2(\bar{\alpha}_{\sigma(t^1)}) > s_2(\bar{\alpha}_{\sigma(t^2)})$, $H(\bar{\alpha}_{\sigma(t^1)}) < 1$, and $H(\bar{\alpha}_{\sigma(t^2)}) = 1$.

In this case, we have:

$$s_2(\bar{\alpha}_{\sigma(t_1-g_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+g_2)}); \tag{26}$$

$$h_2(\bar{\alpha}_{\sigma(t_1-g_1)}) \geq \dots \geq h_2(\bar{\alpha}_{\sigma(t_1)}) \geq \dots \geq h_2(\bar{\alpha}_{\sigma(t_1+g_2)}); \tag{27}$$

$$s_2(\bar{\alpha}_{\sigma(t^2-1)}) > s_2(\bar{\alpha}_{\sigma(t^2)}) > s_2(\bar{\alpha}_{\sigma(t^2+1)}), \tag{28}$$

then

$$H(\bar{\alpha}_{\sigma(t^1)})L(\bar{\alpha}_{\sigma(t^1)})R(\bar{\alpha}_{\sigma(t^1)}) = h_2(\bar{\alpha}_{\sigma(t^1)}) \cdot \prod_{j=1}^{t^1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t+1}^n r(\bar{\alpha}_{\sigma(j)}) = h_2(\bar{\alpha}_{\sigma(t^1)}) \prod_{j=1}^{t^1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t+1}^n r(\bar{\alpha}_{\sigma(j)}); \tag{29}$$

$$H(\bar{\alpha}_{\sigma(t^2)})L(\bar{\alpha}_{\sigma(t^2)})R(\bar{\alpha}_{\sigma(t^2)}) = \prod_{j=1}^{t^2-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t+1}^n r(\bar{\alpha}_{\sigma(j)}) = \prod_{j=1}^{t^1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t+1}^{t^2-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t+1}^n r(\bar{\alpha}_{\sigma(j)}); \tag{30}$$

i) if $s_2(\bar{\alpha}_{\sigma(t_1-g_1)}) = s_2(\bar{\alpha}_{\sigma(t^1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+g_2)}) > s_2(\bar{\alpha}_{\sigma(t_1+g_2+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t^2)})$, we have:

$$\prod_{j=t+1}^{t^2} r(\bar{\alpha}_{\sigma(j)}) = 1; \tag{31}$$

$$\prod_{j=t^1}^{t^2-1} l(\bar{\alpha}_{\sigma(j)}) = h_2(\bar{\alpha}_{\sigma(t_1+g_2)})_{\sigma(t_1+g_2)} = h_2(\bar{\alpha}_{\sigma(t_1+g_2)}). \tag{32}$$

Since $h_2(\bar{\alpha}_{\sigma(t_1)}) \geq h_2(\bar{\alpha}_{\sigma(t_1+g_2)})$, then

$$H(\bar{\alpha}_{\sigma(t_1)}) \cdot L(\bar{\alpha}_{\sigma(t_1)}) \cdot R(\bar{\alpha}_{\sigma(t_1)}) \geq H(\bar{\alpha}_{\sigma(t_2)}) \cdot L(\bar{\alpha}_{\sigma(t_2)}) \cdot R(\bar{\alpha}_{\sigma(t_2)}); \tag{33}$$

$$w_{\sigma(t_1)} = \frac{P_{\sigma(t_1)}}{\sum_i^n P_{\sigma(i)}} > \frac{P_{\sigma(t_2)}}{\sum_i^n P_{\sigma(i)}} = w_{\sigma(t_2)}; \tag{34}$$

ii) if $s_2(\bar{\alpha}_{\sigma(t_1-g_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+g_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_1+p)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+q)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)})$, we have:

$$h_2(\alpha_{\sigma(t_1+p)}) \geq \dots \geq (\alpha_{\sigma(t_1+q)}) \tag{35}$$

and

$$\prod_{j=t_1+1}^{t_2} r(\bar{\alpha}_{\sigma(j)}) = 1_{a_{\sigma(t_1+1)}} \times \dots \times 1_{a_{\sigma(t_1+p-1)}} \times h_2(\bar{\alpha}_{\sigma(t_1+p)})_{a_{\sigma(t_1+p)}} \times 1_{a_{\sigma(t_1+p+1)}} \times \dots \times 1_{a_{\sigma(t_2)}} = h_2(\bar{\alpha}_{\sigma(t_1+p)}); \tag{36}$$

$$\prod_{j=t_1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) = 1_{a_{\sigma(t_1)}} \times \dots \times 1_{a_{\sigma(t_1+g_2-1)}} \times h_2(\bar{\alpha}_{\sigma(t_1+g_2)})_{a_{\sigma(t_1+g_2)}} \times 1_{a_{\sigma(t_1+g_2+1)}} \times \dots \times 1_{a_{\sigma(t_1+q-1)}} \times h_2(\bar{\alpha}_{\sigma(t_1+q)})_{a_{\sigma(t_1+q)}} \times 1_{a_{\sigma(t_1+q+1)}} \times \dots \times 1_{a_{\sigma(t_2-1)}} = h_2(\bar{\alpha}_{\sigma(t_1+g_2)}) \cdot h_2(\bar{\alpha}_{\sigma(t_1+q)}). \tag{37}$$

Hence, $h_2(\alpha_{\sigma(t_1)}) \cdot \prod_{j=t_1+1}^{t_2} r(\alpha_{\sigma(j)}) \geq \prod_{j=t_1}^{t_2-1} l(\alpha_{\sigma(j)})$, $P_{\sigma(t_1)} > P_{\sigma(t_2)}$, and

$$w_{\sigma(t_1)} = \frac{P_{\sigma(t_1)}}{\sum_i^n P_{\sigma(i)}} > \frac{P_{\sigma(t_2)}}{\sum_i^n P_{\sigma(i)}} = w_{\sigma(t_2)}. \tag{38}$$

Similarly, we could prove the more general case, i.e.

$$\begin{aligned} s_2(\bar{\alpha}_{\sigma(t_1-g_1)}) &= \dots = s_2(\bar{\alpha}_{\sigma(t_1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+g_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_1+k_1)}) = \\ &\dots = s_2(\bar{\alpha}_{\sigma(t_1+k_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_1+p)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_1+q)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_1+m_1)}) = \\ &\dots = s_2(\bar{\alpha}_{\sigma(t_1+m_2)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)}); \end{aligned} \tag{39}$$

(2) If $\bar{\alpha}_{\sigma(t_1)} \sim \bar{\alpha}_{\sigma(t_2)}$, then

$$\bar{\alpha}_{\sigma(t_1)} \sim \bar{\alpha}_{\sigma(t_1+1)} \sim \dots \sim \bar{\alpha}_{\sigma(t_2)}; \tag{40}$$

$$s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_2)}); \tag{41}$$

$$h_2(\bar{\alpha}_{\sigma(t_1)}) = h_2(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = h_2(\bar{\alpha}_{\sigma(t_2)}) \tag{42}$$

and

$$S(\bar{\alpha}_{\sigma(t_1)}) = S(\bar{\alpha}_{\sigma(t_2)}); \tag{43}$$

$$H(\bar{\alpha}_{\sigma(t_1)}) = h_2(\bar{\alpha}_{\sigma(t_1)}) = H(\bar{\alpha}_{\sigma(t_2)}) = h_2(\bar{\alpha}_{\sigma(t_2)}); \tag{44}$$

Since $\bar{\alpha}_{\sigma(t_1)} = \bar{\alpha}_{\sigma(t_1+1)} = \dots = \bar{\alpha}_{\sigma(t_2)}$ and $s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_2)})$, we have

$$l(\bar{\alpha}_{\sigma(t_1)}) = l(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = l(\bar{\alpha}_{\sigma(t_2-1)}) = 1; \tag{45}$$

$$r(\bar{\alpha}_{\sigma(t_1+1)}) = r(\bar{\alpha}_{\sigma(t_1+2)}) = \dots = r(\bar{\alpha}_{\sigma(t_2)}) = 1, \tag{46}$$

then

$$L(\bar{\alpha}_{\sigma(t_2)}) = \prod_{j=1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) = \prod_{j=1}^{t_1-1} l(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_1}^{t_2-1} l(\bar{\alpha}_{\sigma(j)}) = L(\bar{\alpha}_{\sigma(t_1)}); \tag{47}$$

$$R(\bar{\alpha}_{\sigma(t_1)}) = \prod_{j=t_1+1}^n r(\bar{\alpha}_{\sigma(j)}) = \prod_{j=t_1+1}^{t_2} r(\bar{\alpha}_{\sigma(j)}) \cdot \prod_{j=t_2+1}^n r(\bar{\alpha}_{\sigma(j)}) = R(\bar{\alpha}_{\sigma(t_2)}). \tag{48}$$

Hence, $P_{\sigma(t_1)} = P_{\sigma(t_2)}$ and $w_{\sigma(t_1)} = \frac{P_{\sigma(t_1)}}{\sum_i^n P_{\sigma(i)}} = \frac{P_{\sigma(t_2)}}{\sum_i^n P_{\sigma(i)}} = w_{\sigma(t_2)}$.

Thus the proof is completed.

Theorem 1 indicates that the PWD method could put different weights into different IIFNs, just based on their score value and accuracy degree, which also demonstrates the monotonicity.

Theorem 2. (Scale-invariance) Assume that $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) is a collection of IIFNs, $\bar{\alpha}_{\sigma(i)}$ is a permutation of $\bar{\alpha}_i$ such that $\bar{\alpha}_{\sigma(i-1)} \geq \bar{\alpha}_{\sigma(i)}$, $\bar{\alpha}_{\sigma(t_1)}$ and $\bar{\alpha}_{\sigma(t_2)}$ ($t_1 < t_2$) are any two IIFNs in $\bar{\alpha}_{\sigma(i)}$, $w = (w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of IIFNs $\bar{\alpha}_{\sigma(i)}$, and $t_i, t_j \in \{t_1, t_1 + 1, \dots, t_2\}$, then

$$(1) \text{ if } s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)}), \text{ then } \frac{w_{\sigma(t_i)}}{w_{\sigma(t_j)}} = \frac{s_2(\bar{\alpha}_{\sigma(t_i)})}{s_2(\bar{\alpha}_{\sigma(t_j)})};$$

$$(2) \text{ if } s_2(\bar{\alpha}_{\sigma(t_1)}) = s_2(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t_2)}), \text{ then } \frac{w_{\sigma(t_i)}}{w_{\sigma(t_j)}} = \frac{h_2(\bar{\alpha}_{\sigma(t_i)})}{h_2(\bar{\alpha}_{\sigma(t_j)})}.$$

Proof. For any IIFNs $\bar{\alpha}_{\sigma(t_i)}$ and $\bar{\alpha}_{\sigma(t_j)}$, we proof (1) and (2) as follows:

(1) If $s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)})$, $s_2(\bar{\alpha}_{\sigma(t_1-1)}) > s_2(\bar{\alpha}_{\sigma(t_1)})$, and $s_2(\bar{\alpha}_{\sigma(t_2)}) > s_2(\bar{\alpha}_{\sigma(t_2+1)})$, we have:

$$H(\bar{\alpha}_{\sigma(t_1)}) = H(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = H(\bar{\alpha}_{\sigma(t_2)}) = 1; \tag{49}$$

$$L(\bar{\alpha}_{\sigma(t_1)}) = L(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = L(\bar{\alpha}_{\sigma(t_2)}) = \prod_{j=1}^{t_1-1} l(\bar{\alpha}_{\sigma(j)}); \tag{50}$$

$$R(\bar{\alpha}_{\sigma(t_1)}) = R(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = R(\bar{\alpha}_{\sigma(t_2)}) = \prod_{j=t_2+1}^n r(\bar{\alpha}_{\sigma(j)}), \tag{51}$$

then

$$\frac{w_{\sigma(t_i)}}{w_{\sigma(t_j)}} = \frac{P_{\sigma(t_i)}}{P_{\sigma(t_j)}} = \frac{s_2(\bar{\alpha}_{\sigma(t_i)})}{s_2(\bar{\alpha}_{\sigma(t_j)})}, \quad i, j = t_1, t_1 + 1, \dots, t_2. \tag{52}$$

If $s_2(\bar{\alpha}_{\sigma(t_1)}) > s_2(\bar{\alpha}_{\sigma(t_1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t_2)})$, $s_2(\bar{\alpha}_{\sigma(t_1-1)}) > s_2(\bar{\alpha}_{\sigma(t_1)})$, $s_2(\bar{\alpha}_{\sigma(t_2)}) = s_2(\bar{\alpha}_{\sigma(t_2+1)})$, we have:

$$H(\bar{\alpha}_{\sigma(t_1)}) = H(\bar{\alpha}_{\sigma(t_1+1)}) = \dots = H(\bar{\alpha}_{\sigma(t_2-1)}) = 1; \tag{53}$$

$$H(\bar{\alpha}_{\sigma(t_2)}) = h_2(\bar{\alpha}_{\sigma(t_2)}); \tag{54}$$

$$L(\bar{\alpha}_{\sigma(t1)}) = L(\bar{\alpha}_{\sigma(t1+1)}) = \dots = L(\bar{\alpha}_{\sigma(t2)}) = \prod_{j=1}^{t1-1} l(\bar{\alpha}_{\sigma(j)}); \tag{55}$$

$$R(\bar{\alpha}_{\sigma(t1)}) = R(\bar{\alpha}_{\sigma(t1+1)}) = \dots = R(\bar{\alpha}_{\sigma(t2-1)}) = h_2(\bar{\alpha}_{\sigma(t2)}) \cdot \prod_{j=t2+1}^n r(\bar{\alpha}_{\sigma(j)}); \tag{56}$$

$$R(\bar{\alpha}_{\sigma(t2)}) = \prod_{j=t2+1}^n r(\bar{\alpha}_{\sigma(j)}), \tag{57}$$

then

$$\frac{w_{\sigma(ti)}}{w_{\sigma(tj)}} = \frac{P_{\sigma(ti)}}{P_{\sigma(tj)}} = \frac{s_2(\bar{\alpha}_{\sigma(ti)})}{s_2(\bar{\alpha}_{\sigma(tj)})}, \quad i, j = t1, t1+1, \dots, t2. \tag{58}$$

We could similarly prove other two cases, such as:

i) $s_2(\bar{\alpha}_{\sigma(t1)}) > s_2(\bar{\alpha}_{\sigma(t1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) = s_2(\bar{\alpha}_{\sigma(t1)})$, and $s_2(\bar{\alpha}_{\sigma(t1-1)}) > s_2(\bar{\alpha}_{\sigma(t1)})$;

ii) $s_2(\bar{\alpha}_{\sigma(t1)}) > s_2(\bar{\alpha}_{\sigma(t1+1)}) > \dots > s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) = s_2(\bar{\alpha}_{\sigma(t1)})$, and $s_2(\bar{\alpha}_{\sigma(t1-1)}) = s_2(\bar{\alpha}_{\sigma(t1)})$.

(2) If $s_2(\bar{\alpha}_{\sigma(t1)}) = s_2(\bar{\alpha}_{\sigma(t1+1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) > s_2(\bar{\alpha}_{\sigma(t1)})$, and $s_2(\bar{\alpha}_{\sigma(t2)}) > s_2(\bar{\alpha}_{\sigma(t2+1)})$, we have:

$$H(\bar{\alpha}_{\sigma(i)}) = h_2(\bar{\alpha}_{\sigma(i)}), \quad i = t1, t1+1, \dots, t2; \tag{59}$$

$$L(\bar{\alpha}_{\sigma(t1)}) = L(\bar{\alpha}_{\sigma(t1+1)}) = \dots = L(\bar{\alpha}_{\sigma(t2)}) = h_2(\bar{\alpha}_{\sigma(t1)}) \cdot \prod_{j=1}^{t1-1} l(\bar{\alpha}_{\sigma(j)}); \tag{60}$$

$$R(\bar{\alpha}_{\sigma(t1)}) = R(\bar{\alpha}_{\sigma(t1+1)}) = \dots = R(\bar{\alpha}_{\sigma(t2)}) = h_2(\bar{\alpha}_{\sigma(t2)}) \cdot \prod_{j=t2+1}^n r(\bar{\alpha}_{\sigma(j)}), \tag{61}$$

then

$$\frac{w_{\sigma(ti)}}{w_{\sigma(tj)}} = \frac{P_{\sigma(ti)}}{P_{\sigma(tj)}} = \frac{h_2(\bar{\alpha}_{\sigma(ti)})}{h_2(\bar{\alpha}_{\sigma(tj)})}, \quad i, j = t1, t1+1, \dots, t2.. \tag{62}$$

We could similarly prove other three cases, i.e.

i) $s_2(\bar{\alpha}_{\sigma(t1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) > s_2(\bar{\alpha}_{\sigma(t1)})$, $s_2(\bar{\alpha}_{\sigma(t2)}) = s_2(\bar{\alpha}_{\sigma(t2+1)})$;

ii) $s_2(\bar{\alpha}_{\sigma(t1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) = s_2(\bar{\alpha}_{\sigma(t1)})$, $s_2(\bar{\alpha}_{\sigma(t2)}) = s_2(\bar{\alpha}_{\sigma(t2+1)})$;

iii) $s_2(\bar{\alpha}_{\sigma(t1)}) = \dots = s_2(\bar{\alpha}_{\sigma(t2)})$, $s_2(\bar{\alpha}_{\sigma(t1-1)}) = s_2(\bar{\alpha}_{\sigma(t1)})$, $s_2(\bar{\alpha}_{\sigma(t2)}) > s_2(\bar{\alpha}_{\sigma(t2+1)})$.

Thus the proof is completed.

Example 1. Let $\bar{\alpha}_1 = ([0.1, 0.8], [0.1, 0.2])$, $\bar{\alpha}_2 = ([0.1, 0.7], [0.1, 0.2])$, $\bar{\alpha}_3 = ([0.3, 0.6], [0.2, 0.3])$, $\bar{\alpha}_4 = ([0.2, 0.6], [0.1, 0.3])$ and $\bar{\alpha}_5 = ([0.2, 0.5], [0.1, 0.4])$ be five interval-valued intuitionistic fuzzy numbers (IIFNs) expressed by five DMs (decision makers). To aggregate these attribute values and reflect DMs' preference, we calculate DMs' weights used the prioritized weighted (Xu, Sun 2011) and PWD methods respectively as follows.

According to Eqs (2) and (3), we have:

$$s_2(\bar{\alpha}_1) = 0.65, \quad h_2(\bar{\alpha}_1) = 0.30, \quad s_2(\bar{\alpha}_2) = 0.625, \quad h_2(\bar{\alpha}_2) = 0.275, \quad s_2(\bar{\alpha}_3) = 0.60;$$

$h_2(\bar{\alpha}_3) = 0.35, s_2(\bar{\alpha}_4) = 0.60, h_2(\bar{\alpha}_4) = 0.30, s_2(\bar{\alpha}_5) = 0.55, h_2(\bar{\alpha}_5) = 0.30,$
 then $s_2(\bar{\alpha}_1) > s_2(\bar{\alpha}_2) > s_2(\bar{\alpha}_3) = s_2(\bar{\alpha}_4) > s_2(\bar{\alpha}_5)$ and $\bar{\alpha}_1 \succ \bar{\alpha}_2 \succ \bar{\alpha}_3 \succ \bar{\alpha}_4 \succ \bar{\alpha}_5.$

1. If we use the prioritized weighted method to calculate, then we have:

$$V_0 = 1, V_1 = s_2(\bar{\alpha}_1) = 0.65, V_2 = s_2(\bar{\alpha}_4) = 0.60;$$

$$V_3 = s_2(\bar{\alpha}_3) = 0.60, V_4 = s_2(\bar{\alpha}_4) = 0.60, V_5 = s_2(\bar{\alpha}_5) = 0.55.$$

Therefore,

$$T_1 = V_0 = 1, T_2 = \prod_{k=1}^1 V_{\sigma(k)} = V_{\sigma(1)} = 0.65, T_3 = \prod_{k=1}^2 V_{\sigma(k)} = 0.39;$$

$$T_4 = \prod_{k=1}^3 V_{\sigma(k)} = 0.234, T_5 = \prod_{k=1}^4 V_{\sigma(k)} = 0.1278$$

and

$$w_1(\bar{\alpha}_{\sigma(1)}) = \frac{T_1}{\sum_{i=1}^5 T_i} = 0.4148, w_1(\bar{\alpha}_{\sigma(2)}) = \frac{T_2}{\sum_{i=1}^5 T_i} = 0.2696, w_1(\bar{\alpha}_{\sigma(3)}) = \frac{T_3}{\sum_{i=1}^5 T_i} = 0.1618;$$

$$w_1(\bar{\alpha}_{\sigma(4)}) = \frac{T_4}{\sum_{i=1}^5 T_i} = 0.1008, w_1(\bar{\alpha}_{\sigma(5)}) = \frac{T_5}{\sum_{i=1}^5 T_i} = 0.0530.$$

Thus,

$$(w_1(\bar{\alpha}_{\sigma(1)}), w_1(\bar{\alpha}_{\sigma(2)}), w_1(\bar{\alpha}_{\sigma(3)}), w_1(\bar{\alpha}_{\sigma(4)}), w_1(\bar{\alpha}_{\sigma(5)})) = (0.4148, 0.2696, 0.1618, 0.1008, 0.0530).$$

Furthermore, we have $w_1(\bar{\alpha}_{\sigma(1)}) > w_1(\bar{\alpha}_{\sigma(2)}) > w_1(\bar{\alpha}_{\sigma(3)}) > w_1(\bar{\alpha}_{\sigma(4)}) > w_1(\bar{\alpha}_{\sigma(5)})$ which reflects the monotonicity and DMs' preference, but the scale-invariance.

2. If we use the PWD method to calculate, then we have

$$(S(\bar{\alpha}_{\sigma(1)}), S(\bar{\alpha}_{\sigma(2)}), S(\bar{\alpha}_{\sigma(3)}), S(\bar{\alpha}_{\sigma(4)}), S(\bar{\alpha}_{\sigma(5)})) = (0.65, 0.625, 0.60, 0.60, 0.55);$$

$$(H(\bar{\alpha}_{\sigma(1)}), H(\bar{\alpha}_{\sigma(2)}), H(\bar{\alpha}_{\sigma(3)}), H(\bar{\alpha}_{\sigma(4)}), H(\bar{\alpha}_{\sigma(5)})) = (1.00, 1.00, 0.35, 0.30, 1.00);$$

$$(L(\bar{\alpha}_{\sigma(1)}), L(\bar{\alpha}_{\sigma(2)}), L(\bar{\alpha}_{\sigma(3)}), L(\bar{\alpha}_{\sigma(4)}), L(\bar{\alpha}_{\sigma(5)})) = (1.00, 1.00, 1.00, 1.00, 0.30);$$

$$(R(\bar{\alpha}_{\sigma(1)}), R(\bar{\alpha}_{\sigma(2)}), R(\bar{\alpha}_{\sigma(3)}), R(\bar{\alpha}_{\sigma(4)}), R(\bar{\alpha}_{\sigma(5)})) = (0.35, 0.35, 1.00, 1.00, 1.00).$$

Therefore,

$$(P(\bar{\alpha}_{\sigma(1)}), P(\bar{\alpha}_{\sigma(2)}), P(\bar{\alpha}_{\sigma(3)}), P(\bar{\alpha}_{\sigma(4)}), P(\bar{\alpha}_{\sigma(5)})) = (0.2275, 0.2188, 0.2100, 0.1800, 0.1650);$$

$$(w(\bar{\alpha}_{\sigma(1)}), w(\bar{\alpha}_{\sigma(2)}), w(\bar{\alpha}_{\sigma(3)}), w(\bar{\alpha}_{\sigma(4)}), w(\bar{\alpha}_{\sigma(5)})) = (0.2272, 0.2185, 0.2097, 0.1798, 0.1648).$$

Furthermore, we have $w(\bar{\alpha}_{\sigma(1)}) > w(\bar{\alpha}_{\sigma(2)}) > w(\bar{\alpha}_{\sigma(3)}) > w(\bar{\alpha}_{\sigma(4)}) > w(\bar{\alpha}_{\sigma(5)})$ and

$$\frac{w(\bar{\alpha}_{\sigma(1)})}{w(\bar{\alpha}_{\sigma(2)})} = \frac{s_2(\bar{\alpha}_{\sigma(1)})}{s_2(\bar{\alpha}_{\sigma(2)})} = 1.0400, \frac{w(\bar{\alpha}_{\sigma(3)})}{w(\bar{\alpha}_{\sigma(4)})} = \frac{h_2(\bar{\alpha}_{\sigma(3)})}{h_2(\bar{\alpha}_{\sigma(4)})} = 1.667,$$

which reflects the monotonicity, DMs' preference and scale-invariance. For the third property, the calculation weight of size and proportion by PWD method is similar to that by IIFN this also is the advantage in comparison to prioritized weighted method and other weighted methods.

3. Interval-valued intuitionistic fuzzy ordered precise weighted aggregation operators

Based on Definition 4, we give the definitions of IIFOPWA and IIFOPWG as follows:

Definition 6. Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, interval-valued intuitionistic fuzzy order precise weighted averaging (IIFOPWA) operator and the interval-valued intuitionistic fuzzy order precise weighted geometric (IIFOPWG) operator are defined as follows:

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = w_{\sigma(1)} \bar{\alpha}_{\sigma(1)} \oplus w_{\sigma(2)} \bar{\alpha}_{\sigma(2)} \oplus \dots \oplus w_{\sigma(n)} \bar{\alpha}_{\sigma(n)}; \tag{63}$$

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \bar{\alpha}_{\sigma(1)}^{w_{\sigma(1)}} \otimes \bar{\alpha}_{\sigma(2)}^{w_{\sigma(2)}} \otimes \dots \otimes \bar{\alpha}_{\sigma(n)}^{w_{\sigma(n)}}, \tag{64}$$

where $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$ such that $\bar{\alpha}_{\sigma(i-1)} \geq \bar{\alpha}_{\sigma(i)}$, and $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$.

In the following, we discuss the relationships and properties of two developed interval-valued intuitionistic fuzzy aggregation operators.

Theorem 3. Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$, and $w = (w_1, w_2, \dots, w_n)$ is a reduction permutation of $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$, then

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n); \tag{65}$$

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{66}$$

Proof. $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$, based on Theorem 1, we have $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is a permutation of (w_1, w_2, \dots, w_n) such that $w_{\sigma(i-1)} \geq w_{\sigma(i)}$ for $i = 2, 3, \dots, n$. Thus, $(w_{\sigma(1)} \bar{\alpha}_{\sigma(1)}, w_{\sigma(1)} \bar{\alpha}_{\sigma(2)}, \dots, w_{\sigma(1)} \bar{\alpha}_{\sigma(n)})$ is also a permutation of $(w_1 \bar{\alpha}_1, w_2 \bar{\alpha}_2, \dots, w_n \bar{\alpha}_n)$ such that $w_{\sigma(i-1)} \bar{\alpha}_{\sigma(i-1)} \geq w_{\sigma(i)} \bar{\alpha}_{\sigma(i)}$, then

$$w_{\sigma(1)} \bar{\alpha}_{\sigma(1)} \oplus w_{\sigma(2)} \bar{\alpha}_{\sigma(2)} \oplus \dots \oplus w_{\sigma(n)} \bar{\alpha}_{\sigma(n)} = w_1 \bar{\alpha}_1 \oplus w_2 \bar{\alpha}_2 \oplus \dots \oplus w_n \bar{\alpha}_n. \tag{67}$$

Therefore,

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{68}$$

Similarly, we have:

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{69}$$

Thus the proof is completed.

Theorem 4. Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, then IIFOPWA operator aggregated value is also an IIFN, and

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = w_{\sigma(1)} \bar{\alpha}_{\sigma(1)} \oplus w_{\sigma(2)} \bar{\alpha}_{\sigma(2)} \oplus \dots \oplus w_{\sigma(n)} \bar{\alpha}_{\sigma(n)} = \left(\left[1 - \prod_{i=1}^n (1 - a_{\sigma(i)})^{w_{\sigma(i)}}, 1 - \prod_{i=1}^n (1 - b_{\sigma(i)})^{w_{\sigma(i)}} \right], \left[\prod_{i=1}^n c_{\sigma(i)}^{w_{\sigma(i)}}, \prod_{i=1}^n d_{\sigma(i)}^{w_{\sigma(i)}} \right] \right), \tag{70}$$

where $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$.

Proof. Based on Theorem 3, we can get:

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{71}$$

Similar to the proof of IIFWA operator (Xu 2007b), we can get Theorem 4 easily.

Theorem 5. (Boundness) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, and $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$. If

$$\bar{\alpha}^- = \left([\min_i \{a_i\}, \min_i \{b_i\}], [\max_i \{c_i\}, \max_i \{d_i\}] \right); \tag{72}$$

$$\bar{\alpha}^+ = \left([\max_i \{a_i\}, \max_i \{b_i\}], [\min_i \{c_i\}, \min_i \{d_i\}] \right), \tag{73}$$

then

$$\bar{\alpha}^- \leq \text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) \leq \bar{\alpha}^+. \tag{74}$$

Proof. Since $\min \{a_i\} \leq a_i \leq \max \{a_i\}$, $\min \{b_i\} \leq b_i \leq \max \{b_i\}$, $\min \{c_i\} \leq c_i \leq \max \{c_i\}$ and $\min \{d_i\} \leq d_i \leq \max \{d_i\}$, for all i , then

$$\begin{aligned} 1 - \prod_{i=1}^n (1 - a_{\sigma(i)})^{w_{\sigma(i)}} &\geq 1 - \prod_{i=1}^n (1 - \min_i \{a_i\})^{w_{\sigma(i)}} = \\ 1 - \left(1 - \min_i \{a_i\} \right)^{\sum_{i=1}^n w_{\sigma(i)}} &= \min_i \{a_i\}; \end{aligned} \tag{75}$$

$$\prod_{i=1}^n c_{\sigma(i)}^{w_{\sigma(i)}} \geq \prod_{i=1}^n \left(\min_i \{c_i\} \right)^{w_{\sigma(i)}} = \left(\min_i \{c_i\} \right)^{\sum_{i=1}^n w_{\sigma(i)}} = \min_i \{c_i\}. \tag{76}$$

Similarly, we have:

$$1 - \prod_{i=1}^n (1 - a_{\sigma(i)})^{w_{\sigma(i)}} \leq \max_i \{a_i\}; \tag{77}$$

$$\prod_{i=1}^n c_{\sigma(i)}^{w_{\sigma(i)}} \leq \max_i \{c_i\}; \tag{78}$$

$$\min_i \{b_i\} \leq 1 - \prod_{i=1}^n (1 - b_{\sigma(i)})^{w_{\sigma(i)}} \leq \max_i \{b_i\}; \tag{79}$$

$$\min_i \{d_i\} \leq \prod_{i=1}^n d_{\sigma(i)}^{w_{\sigma(i)}} \leq \max_i \{d_i\}. \tag{80}$$

Set $\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \bar{\alpha} = ([a, b], [c, d])$, then we can get:

$$s_2(\bar{\alpha}) \leq \frac{2 + \max_i \{a_i\} - \min_i \{c_i\} + \max_i \{b_i\} - \min_i \{d_i\}}{4} = s_2(\bar{\alpha}^+); \tag{81}$$

$$s_2(\bar{\alpha}) \geq \frac{2 + \min_i \{a_i\} - \max_i \{c_i\} + \min_i \{b_i\} - \max_i \{d_i\}}{4} = s_2(\bar{\alpha}^-); \tag{82}$$

(1) If $s_2(\bar{\alpha}) < s_2(\bar{\alpha}^+)$ and $s_2(\bar{\alpha}) > s_2(\bar{\alpha}^-)$, we have:

$$\bar{\alpha}^- < \text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) < \bar{\alpha}^+; \tag{83}$$

(2) If $s_2(\bar{\alpha}) = s_2(\bar{\alpha}^+)$, we have $a = \max_i \{a_i\}$, $b = \max_i \{b_i\}$, $c = \min_i \{c_i\}$, $d = \min_i \{d_i\}$ and

$$h_2(\bar{\alpha}) = \frac{a + b + c + d}{4} = h_2(\bar{\alpha}^+). \tag{84}$$

Based on the order relation between two IIFNs (Xu, Yager 2006), we have:

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) \sim \bar{\alpha}^+; \tag{85}$$

(3) If $s_2(\bar{\alpha}) = s_2(\bar{\alpha}^-)$, we have $a = \min_i \{a_i\}$, $b = \min_i \{b_i\}$, $c = \max_i \{c_i\}$, $d = \max_i \{d_i\}$ and

$$h_2(\bar{\alpha}) = \frac{a + b + c + d}{4} = h_2(\bar{\alpha}^-); \tag{86}$$

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) \sim \bar{\alpha}^-. \tag{87}$$

From the above three phases, (1) (2) and (3), we have:

$$\bar{\alpha}^- \leq \text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) \leq \bar{\alpha}. \tag{88}$$

This completes the proof of Theorem 5.

Theorem 6. (Commutativity) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IFFNs, and $(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n)$ is any permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$, then

$$\text{IIFOPWA}(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n) = \text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{89}$$

Proof. For $(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n)$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$, we have:

$$(\bar{\alpha}'_{\sigma(1)}, \bar{\alpha}'_{\sigma(2)}, \dots, \bar{\alpha}'_{\sigma(n)}) = (\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)}), \tag{90}$$

where $(\bar{\alpha}'_{\sigma(1)}, \bar{\alpha}'_{\sigma(2)}, \dots, \bar{\alpha}'_{\sigma(n)})$ is a permutation of $(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n)$ with $\bar{\alpha}'_{\sigma(i-1)} \geq \bar{\alpha}'_{\sigma(i)}$, and $(\bar{\alpha}_{\sigma(1)}, \bar{\alpha}_{\sigma(2)}, \dots, \bar{\alpha}_{\sigma(n)})$ is a permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$ such that $\alpha_{\sigma(i-1)} > \alpha_{\sigma(i)}$, for $i = 2, 3, \dots, n$. By Eqs (6)–(13), we have:

$$(\bar{w}_{\sigma(1)}, \bar{w}_{\sigma(2)}, \dots, \bar{w}_{\sigma(n)}) = (w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)}). \tag{91}$$

Therefore,

$$\text{IIFOPWA}(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n) = \text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{92}$$

This completes the proof of Theorem 6.

Theorem 7. (Idempotency) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IFFNs, and $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$. If all $\bar{\alpha}_i$ ($i = 1, 2, \dots, n$) are equal, i.e. $\bar{\alpha}_i = \bar{\alpha} = ([a, b], [c, d])$, then

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \bar{\alpha} = ([a, b], [c, d]). \tag{93}$$

Proof. Since $\bar{\alpha}_i = \bar{\alpha} = ([a, b], [c, d])$ ($i = 1, 2, \dots, n$), then by Theorem 2, we have:

$$w_{\sigma(1)} = w_{\sigma(2)} = \dots = w_{\sigma(n)} = 1/n. \tag{94}$$

Based on Definition 6, we have:

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = w_{\sigma(1)} \bar{\alpha}_{\sigma(1)} \oplus \dots \oplus w_{\sigma(n)} \bar{\alpha}_{\sigma(n)} = \bar{\alpha}, \tag{95}$$

which complete the proof of the theorem.

Corollary 1. If $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) is a collection of the largest IFFNs, i.e. $\bar{\alpha}_i = \bar{\alpha} = ([1, 1], [0, 0])$, for all i , and $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$, then

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = w_{\sigma(1)} \bar{\alpha}_{\sigma(1)} \oplus \dots \oplus w_{\sigma(n)} \bar{\alpha}_{\sigma(n)} = \bar{\alpha} = ([1, 1], [0, 0]), \tag{96}$$

which is also the largest IIFN.

Proof. Similar to the proof of Theorem 7 we can get Corollary easily.

Corollary 2. (Non-compensatory) Assume that $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ is the smallest IIFN, i.e. $\bar{\alpha}_i = ([0, 0], [1, 1])$, then

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFOPWA}(\bar{\alpha}_2, \bar{\alpha}_3, \dots, \bar{\alpha}_n), \quad i = 1; \tag{97}$$

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFOPWA}(\bar{\alpha}_1, \dots, \bar{\alpha}_{i-1}, \bar{\alpha}_{i+1}, \dots, \bar{\alpha}_n), \quad i = 2, \dots, n. \tag{98}$$

Proof. Since $\bar{\alpha}_i = ([0, 0], [1, 1])$, by Definition 5, we have $w(\bar{\alpha}_{\sigma(i)}) \rightarrow 0^+$, then

$$(1 - a_{\sigma(i)})^{w_{\sigma(i)}} = (1 - b_{\sigma(i)})^{w_{\sigma(i)}} = 1; \tag{99}$$

$$c_{\sigma(i)}^{w_{\sigma(i)}} = d_{\sigma(i)}^{w_{\sigma(i)}} = 1; \tag{100}$$

$$w = (w_{\sigma(1)}, \dots, w_{\sigma(i-1)}, w_{\sigma(i)}, w_{\sigma(i+1)}, \dots, w_{\sigma(n)}) = (w'_{\sigma(1)}, \dots, w'_{\sigma(i-1)}, 0, w'_{\sigma(i+1)}, \dots, w'_{\sigma(n)}), \tag{101}$$

where $w = (w_{\sigma(1)}, \dots, w_{\sigma(j-1)}, w_{\sigma(j)}, w_{\sigma(j+1)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$, and $(w'_{\sigma(1)}, \dots, w'_{\sigma(j-1)}, w'_{\sigma(j+1)}, \dots, w'_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$.

Therefore,

$$\text{IIFOPWA}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFOPWA}(\bar{\alpha}_1, \dots, \bar{\alpha}_{i-1}, \bar{\alpha}_{i+1}, \dots, \bar{\alpha}_n). \tag{102}$$

The other case $i = 1$ can be obtained similarly.

Thus the proof is completed.

Corollary 1 indicates that the alternative or sample could be the best one if every DM thinks so and gives the biggest IIFNs $([1, 1], [0, 0])$, in group decision making. Corollary 2 shows that the attributes given the smallest IIFN $([0, 0], [1, 1])$, by evaluation of DMs, will be overlooked.

Based on IIFOPWA and geometric mean, here we define an interval-valued intuitionistic fuzzy precise weighted geometric (IIFOPWG) operator as follows.

Theorem 8. Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, then the IIFOPWG operator aggregated value is also an IIFN, and

$$\begin{aligned} \text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) &= \bar{\alpha}_{\sigma(1)}^{w_{\sigma(1)}} \otimes \bar{\alpha}_{\sigma(2)}^{w_{\sigma(2)}} \otimes \dots \otimes \bar{\alpha}_{\sigma(n)}^{w_{\sigma(n)}} = \\ &= \left(\left[\prod_{i=1}^n a_{\sigma(i)}^{w_{\sigma(i)}}, \prod_{i=1}^n b_{\sigma(i)}^{w_{\sigma(i)}} \right], \left[1 - \prod_{i=1}^n (1 - c_{\sigma(i)})^{w_{\sigma(i)}}, 1 - \prod_{i=1}^n (1 - d_{\sigma(i)})^{w_{\sigma(i)}} \right] \right), \end{aligned} \tag{103}$$

where $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector.

Proof. The proof of Theorem 8 is similar to Theorem 4.

Theorem 9. (Boundness) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, and $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$. If

$$\bar{\alpha}^- = \left(\left[\min_i \{a_i\}, \min_i \{b_i\} \right], \left[\max_i \{c_i\}, \max_i \{d_i\} \right] \right); \tag{104}$$

$$\bar{\alpha}^+ = \left(\left[\max_i \{a_i\}, \max_i \{b_i\} \right], \left[\min_i \{c_i\}, \min_i \{d_i\} \right] \right), \tag{105}$$

then

$$\bar{\alpha}^- \leq \text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) \leq \bar{\alpha}^+. \tag{106}$$

Proof. The proof of Theorem 9 is similar to Theorem 5.

Theorem 10. (Commutativity) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFS, and $(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n)$ is any permutation of $(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n)$, then

$$\text{IIFOPWG}(\bar{\alpha}'_1, \bar{\alpha}'_2, \dots, \bar{\alpha}'_n) = \text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n). \tag{107}$$

Proof. The proof of Theorem 10 is similar to Theorem 6.

Theorem 11. (Idempotency) Let $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i])$ ($i = 1, 2, \dots, n$) be a collection of IIFNs, where $(w_{\sigma(1)}, w_{\sigma(2)}, \dots, w_{\sigma(n)})$ is precise weight vector of $\bar{\alpha}_i$. If all $\bar{\alpha}_i$ are equal, i.e. $\bar{\alpha}_i = \bar{\alpha} = ([a, b], [c, d])$, for all i , then

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \bar{\alpha} = ([a, b], [c, d]). \tag{108}$$

Proof. The proof of Theorem 11 is similar to Theorem 7.

Corollary 3. (Non-compensatory) If $\bar{\alpha}_i = ([a_i, b_i], [c_i, d_i]) = ([0, 0], [1, 1])$ is a smallest IIFN, then

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFOPWG}(\bar{\alpha}_2, \bar{\alpha}_3, \dots, \bar{\alpha}_n), \quad (i = 1); \tag{109}$$

$$\text{IIFOPWG}(\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_n) = \text{IIFOPWG}(\bar{\alpha}_1, \dots, \bar{\alpha}_{i-1}, \bar{\alpha}_{i+1}, \dots, \bar{\alpha}_n), \quad (i = 2, \dots, n). \tag{110}$$

Proof. The proof of Corollary 3 is similar to Corollary 2.

4. An application of IIFOPWA and IIFOPWG to group decision making

The 2nd Youth Olympic Games will be held in Nanjing, during August 16–28, 2014. To propagandize the Olympic spirit and show our national culture, the organization committee wants to introduce a chief director of the opening and closing ceremonies. There is a panel with four possible alternatives to choose: (1) a_1 is the chief director of the Beijing Olympic Games; (2) a_2 is the chief director of the 16th Asian Olympic Games; (3) a_3 is a international famous director from the United States; and (4) a_4 is a famous director from the domestic. The organization committee must make a decision according to five attributes: (1) c_1 is the morality; (2) c_2 is the comprehension of Chinese and Nanjing culture; (3) c_3 is the international popularity and reputation; (4) c_4 is the work experience; and (5) c_5 is his master work. This introduction has been raised great attention from the international Olympic committee and Nanjing municipal government and local government official d_1 , organization committee chairman d_2 , master of Chinese culture d_3 , and two professional moviemakers d_4 and d_5 sets up the panel of decision makers which will take the whole responsibility for this introduction. The four possible alternatives a_i ($i = 1, 2, 3, 4$) are to be evaluated using the interval-valued intuitionistic fuzzy numbers (IIFNs) by five DMs (decision makers) d_k ($k = 1, 2, 3, 4, 5$). Meanwhile, five attributes c_j ($j = 1, 2, 3, 4, 5$) are equal, and the weight vector of five attributes is $w = (0.2, 0.2, 0.2, 0.2, 0.2)$. However, the weights of five decision makers are completely unknown. Therefore, we could calculate and give a weight vector to five DMs by the precise weight-determined method for the larger score value and accuracy degree means the more information and knowledge about alternatives. Furthermore, we can set or change all the attributes c_j ($j = 1, 2, 3, 4, 5$) to be the benefit type. Then, we construct the following five interval-valued intuitionistic fuzzy decisions matrices $D_{(k)} = (d_{ij}^{(k)})_{4 \times 5}$ ($k = 1, 2, 3, 4, 5$) (Tables 1–5).

Table 1. Interval-valued intuitionistic fuzzy decision matrix $D_{(1)}$

	c_1	c_2	c_3	c_4	c_5
a_1	$([0.85, 0.90], [0.05, 0.1])$	$([0.65, 0.85], [0.0, 0.15])$	$([0.65, 0.80], [0.10, 0.2])$	$([0.75, 0.90], [0.0, 0.05])$	$([0.90, 0.95], [0.0, 0.05])$
a_2	$([0.75, 0.80], [0.1, 0.15])$	$([0.60, 0.80], [0.05, 0.2])$	$([0.55, 0.75], [0.0, 0.25])$	$([0.60, 0.80], [0.05, 0.2])$	$([0.75, 0.85], [0.0, 0.15])$
a_3	$([0.85, 0.90], [0.05, 0.1])$	$([0.25, 0.60], [0.10, 0.4])$	$([0.75, 0.90], [0.00, 0.1])$	$([0.60, 0.85], [0.0, 0.15])$	$([0.70, 0.80], [0.05, 0.2])$
a_4	$([0.78, 0.92], [0.0, 0.05])$	$([0.55, 0.85], [0.05, 0.1])$	$([0.45, 0.65], [0.15, 0.3])$	$([0.55, 0.75], [0.1, 0.25])$	$([0.55, 0.75], [0.1, 0.25])$

Table 2. Interval-valued intuitionistic fuzzy decision matrix $D_{(2)}$

	c_1	c_2	c_3	c_4	c_5
a_1	$([0.68, 0.80], [0.15, 0.2])$	$([0.80, 0.90], [0.05, 0.1])$	$([0.70, 0.85], [0.0, 0.15])$	$([0.65, 0.90], [0.00, 0.1])$	$([0.85, 0.90], [0.05, 0.1])$
a_2	$([0.70, 0.80], [0.10, 0.2])$	$([0.80, 0.90], [0.00, 0.1])$	$([0.50, 0.65], [0.15, 0.3])$	$([0.50, 0.75], [0.1, 0.25])$	$([0.70, 0.85], [0.05, 0.1])$
a_3	$([0.75, 0.85], [0.05, 0.1])$	$([0.50, 0.60], [0.30, 0.4])$	$([0.65, 0.85], [0.1, 0.15])$	$([0.60, 0.90], [0.00, 0.1])$	$([0.75, 0.90], [0.0, 0.05])$
a_4	$([0.80, 0.85], [0.1, 0.15])$	$([0.75, 0.85], [0.05, 0.1])$	$([0.45, 0.60], [0.1, 0.35])$	$([0.45, 0.80], [0.05, 0.2])$	$([0.65, 0.80], [0.05, 0.2])$

Based on PWD method and IIFOPWA operator, the main steps are as follows:

Step 1: Calculate the score values and accuracy degrees of all IIFNs based on $s_2(\bar{\alpha})$ and $h_2(\bar{\alpha})$, and construct the interval-valued intuitionistic fuzzy score and accuracy matrices, $S_{(k)} = (s_k^{ij})_{4 \times 5}$ and $A_{(k)} = (\bar{\alpha}_k^{ij})_{4 \times 5}$ ($k = 1, 2, 3, 4, 5$). Here we only give an interval-valued intuitionistic fuzzy score matrix and accuracy matrix (Tables 6 and 7), and others can be calculated similarly.

Step 2: Calculate precise weight vector

$$w(d_{\sigma(q)}^{ij}) = (w(d_{\sigma(1)}^{ij}), w(d_{\sigma(2)}^{ij}), w(d_{\sigma(3)}^{ij}), w(d_{\sigma(4)}^{ij}), w(d_{\sigma(5)}^{ij}))$$

of $d_{\sigma(q)}^{ij} = (d_{\sigma(1)}^{ij}, d_{\sigma(2)}^{ij}, d_{\sigma(3)}^{ij}, d_{\sigma(4)}^{ij}, d_{\sigma(5)}^{ij})$, based on Eqs. (6)–(13), we can get:

$$w(d_{\sigma(q)}^{11}) = (0.2145, 0.2133, 0.1937, 0.1919, 0.1865);$$

$$w(d_{\sigma(q)}^{21}) = (0.2136, 0.2018, 0.1988, 0.1958, 0.1899);$$

$$w(d_{\sigma(q)}^{31}) = (0.2040, 0.2040, 0.2011, 0.1955, 0.1955);$$

$$w(d_{\sigma(q)}^{41}) = (0.2051, 0.2022, 0.2107, 0.1910, 0.1910);$$

$$w(d_{\sigma(q)}^{12}) = (0.2093, 0.2064, 0.2035, 0.1948, 0.1860);$$

$$w(d_{\sigma(q)}^{22}) = (0.2130, 0.2071, 0.2012, 0.1923, 0.1864);$$

$$w(d_{\sigma(q)}^{32}) = (0.2137, 0.2051, 0.2009, 0.1966, 0.1838);$$

$$w(d_{\sigma(q)}^{42}) = (0.2157, 0.2126, 0.2032, 0.2001, 0.1685);$$

$$w(d_{\sigma(q)}^{13}) = (0.2211, 0.2180, 0.2059, 0.1843, 0.1707);$$

$$w(d_{\sigma(q)}^{23}) = (0.2310, 0.2202, 0.1949, 0.1913, 0.1625);$$

$$w(d_{\sigma(q)}^{33}) = (0.2131, 0.2045, 0.2017, 0.1960, 0.1847);$$

$$w(d_{\sigma(q)}^{43}) = (0.2210, 0.2138, 0.1920, 0.1884, 0.1848);$$

$$w(d_{\sigma(q)}^{14}) = (0.2151, 0.2093, 0.2006, 0.1890, 0.1860);$$

$$w(d_{\sigma(q)}^{24}) = (0.2112, 0.2081, 0.2050, 0.1957, 0.1801);$$

$$w(d_{\sigma(q)}^{34}) = (0.2211, 0.2088, 0.2058, 0.1835, 0.1808);$$

$$w(d_{\sigma(q)}^{44}) = (0.2133, 0.2000, 0.1967, 0.1967, 0.1933);$$

$$w(d_{\sigma(q)}^{15}) = (0.2065, 0.2038, 0.1984, 0.1957, 0.1957);$$

$$w(d_{\sigma(q)}^{25}) = (0.2047, 0.2047, 0.2018, 0.1988, 0.1901);$$

$$w(d_{\sigma(q)}^{35}) = (0.2190, 0.2104, 0.2075, 0.1873, 0.1758);$$

$$w(d_{\sigma(q)}^{45}) = (0.2239, 0.2003, 0.2003, 0.1909, 0.1846).$$

a_3	0.9000	0.5875	0.8875	0.8250	0.8125
a_4	0.9125	0.8125	0.6625	0.7375	0.7375

Table 7. Interval-valued intuitionistic fuzzy accuracy matrix of $A_{(1)}$

	c_1	c_2	c_3	c_4	c_5
a_1	0.4750	0.4125	0.4375	0.4250	0.4750
a_2	0.4500	0.4125	0.3875	0.4125	0.4375
a_3	0.4750	0.3375	0.4375	0.4000	0.4375
a_4	0.4375	0.3875	0.3875	0.4125	0.4125

Step 3: Utilize the precise weights $w(d_{\sigma(k)}^{ij})$ and IIFOPWA operator to aggregate all interval-valued individual intuitionistic fuzzy decision matrices $D_{(k)} = (d_k^{ij})_{4 \times 5}$ ($k = 1, 2, 3, 4, 5$) into the collective interval-valued intuitionistic fuzzy decision matrix $D = (d^{ij})_{4 \times 5}$ (Table 8).

Step 4: Utilize the IIFWA operator to aggregate all preference values d^{ij} ($j = 1, 2, 3, 4, 5$) in the i th line of D , and get the overall preference values d^i ($i = 1, 2, 3, 4$), where $w = (0.20, 0.20, 0.20, 0.20, 0.20)$.

$$d^1 = ([0.7863, 0.8837], [0.0000, 0.1127]), d^2 = ([0.7019, 0.8309], [0.0000, 0.1620]),$$

$$d^3 = ([0.7205, 0.8525], [0.0000, 0.1334]), d^4 = ([0.6784, 0.8030], [0.0000, 0.1759]).$$

Step 5: Calculate the score $s_2(d^i)$ of d^i ($i = 1, 2, 3, 4$) respectively, we can get:

$$s_2(\bar{\alpha}_1) = 0.8894, s_2(\bar{\alpha}_2) = 0.8427, s_2(\bar{\alpha}_3) = 0.8599, s_2(\bar{\alpha}_4) = 0.8264.$$

Then, $s_2(\bar{\alpha}_1) > s_2(\bar{\alpha}_3) > s_2(\bar{\alpha}_2) > s_2(\bar{\alpha}_4)$, and $\bar{\alpha}_1 \succ \bar{\alpha}_3 \succ \bar{\alpha}_2 \succ \bar{\alpha}_4$.

Based on PWD method and IIFOPWG operator, the main steps are as follows:

Step 1°: See Step 1.

Step 2°: See Step 2.

Step 3°: Utilize the precise weights $w(d_{\sigma(k)}^{ij})$ and IIFOPWG operator to aggregate all the interval-valued individual intuitionistic fuzzy decision matrices $D_{(k)} = (d_k^{ij})_{4 \times 5}$ ($k = 1, 2, 3, 4, 5$) into the collective interval-valued intuitionistic fuzzy decision matrix $D = (d_{ij})_{4 \times 5}$ (Table 9).

a_1	([0.7650, 0.8373],[0.0839, 0.1671])	([0.7301, 0.8708],[0.0314, 0.1331])
a_2	([0.7703, 0.8406],[0.0907, 0.1518])	([0.7082, 0.8605],[0.0525, 0.1422])
a_3	([0.7996, 0.8801],[0.0500, 0.1000])	([0.3987, 0.5799],[0.2478, 0.4106])
a_4	([0.8224, 0.8886],[0.0527, 0.1028])	([0.6680, 0.8305],[0.0629, 0.1430])
	c_3	c_4
a_1	([0.7505, 0.8713],[0.0535, 0.1339])	([0.7074, 0.8608],[0.0224, 0.1152])
a_2	([0.5294, 0.6776],[0.1678, 0.2958])	([0.6466, 0.8303],[0.0907, 0.1736])
a_3	([0.7479, 0.8999],[0.0314, 0.1010])	([0.6851, 0.8701],[0.0414, 0.1207])
a_4	([0.5158, 0.6698],[0.1440, 0.2924])	([0.5848, 0.7603],[0.1233, 0.2313])
	c_5	
a_1	([0.8710, 0.9211],[0.0314, 0.0814])	
a_2	([0.7301, 0.8604],[0.0517, 0.1211])	
a_3	([0.7567, 0.8581],[0.0314, 0.1259])	
a_4	([0.6489, 0.7805],[0.1028, 0.2108])	

Step 4°: Utilize the IIFWG operator to aggregate all preference values d^j ($j = 1, 2, 3, 4, 5$) in the i -th line of D , and get the overall preference values d^i ($i = 1, 2, 3, 4$), where $w = (0.20, 0.20, 0.20, 0.20, 0.20)$.

$$d^1 = ([0.7628, 0.8718],[0.0448, 0.1266]), d^2 = ([0.6713, 0.8107],[0.0917, 0.1794]),$$

$$d^3 = ([0.6583, 0.8073],[0.0846, 0.1819]), d^4 = ([0.6402, 0.7825],[0.0978, 0.1988]).$$

Step 5°: Calculate the score $s_2(d^i)$ of d^i ($i = 1, 2, 3, 4$) respectively, we can get:

$$s_2(\bar{\alpha}_1) = 0.8658, s_2(\bar{\alpha}_2) = 0.8027, s_2(\bar{\alpha}_3) = 0.7998, s_2(\bar{\alpha}_4) = 0.7815.$$

Then, $s_2(\bar{\alpha}_1) > s_2(\bar{\alpha}_2) > s_2(\bar{\alpha}_3) > s_2(\bar{\alpha}_4)$, and $\bar{\alpha}_1 \succ \bar{\alpha}_2 \succ \bar{\alpha}_3 \succ \bar{\alpha}_4$.

Therefore, the optimal chief director of the opening and closing ceremonies is a_1 , i.e. the chief director of the Beijing Olympic Games.

It is pointed out that the ranking of the alternatives have changed, and the sort result by the IIFOPWG operator is different from that by the IIFOPWA operator. The IIFOPWA operator focuses on the impact of overall observed samples and their data, while the IIFOPWG operator highlights the role of individual sample and its data. For example, when we sort by IIFOPWG operator, several smaller attribute values correlated with the alternative a_3 , such as $d_1^{32} = ([0.25, 0.60],[0.10, 0.4])$ and $d_4^{32} = ([0.35, 0.55],[0.3, 0.45])$ have bigger impact on the variation of its position in the sort.

Concluding remarks

In this paper, for putting larger weights into larger IIFNs while keeping the scale-invariant property, we have proposed a precise weight-determined (PWD) method for obtaining IIFN weights based on new score function and accuracy function of IIFN. Since the monotonicity and scale-invariance, the PWD method may be a precise and objective approach to calculate the weights of IIFN and interval-valued intuitionistic fuzzy aggregation operator, and a more suitable approach to distinguish different DMs and experts in group decision making. Based on the PWD method, we have developed two interval-valued intuitionistic fuzzy ordered weighted aggregation operators, i.e. the interval-valued intuitionistic fuzzy ordered precise weighted averaging (IIFOPWA) operator and the interval-valued intuitionistic fuzzy ordered precise weighted geometric (IIFOPWG) operator. We have investigated various properties of PDW method and two new aggregation operators. Finally, an example is given to illustrate the proposed precise weight-determined method, the IIFOWPA operator and the IIFOPWG operator. The work in this paper develops the theories of the interval-valued intuitionistic fuzzy aggregation operators and weight-determined method. It is worth noting that the results of this paper can be extended to hesitant fuzzy environment.

Wei ZHOU received the PhD degree in management science and engineering from Southeast University, Nanjing, China, in 2012. He is also currently a Vice Professor with the International Business School, Yunnan University of Finance and Economics, Kunming. His research interest covers management engineering and financial engineering.

Jian Min HE received the BSc degree in management science and engineering from Southeast University, Nanjing, China, in 1997. He is also currently a Professor at the School of Economics and Administration, Southeast University. His research interest covers management engineering, systems engineering and financial engineering.
