Unmanned Vehicle Material Flammability Test

David L. Urban and Gary A Ruff: NASA Glenn Research Center, Cleveland, OH, USA
 A. Carlos Fernandez-Pello: UC Berkeley, Berkeley, CA, USA
 James S. T'ien: Case Western Reserve University, Cleveland, OH, USA
 Jose L. Torero University of Queensland, Brisbane, Australia
 Adam Cowlard: University of Edinburgh, Edinburgh, UK
 Sebastien Rouvreau: Belisama R&D, Toulouse, France

Olivier Minster and Balazs Toth: ESA ESTEC, Noordwijk, Netherlands
 Guillaume Legros: Université Pierre et Marie Curie, Paris, France
 Christian Eigenbrod: University of Bremen (ZARM), Bremen, Germany
 Nickolay Smirnov: Moscow Lomonosov State University, Moscow, Russia
 Osamu Fujita: Hokkaido University, Sapporo, Japan
 Grunde Jomaas: Technical University of Denmark, Kgs. Lyngby, Denmark

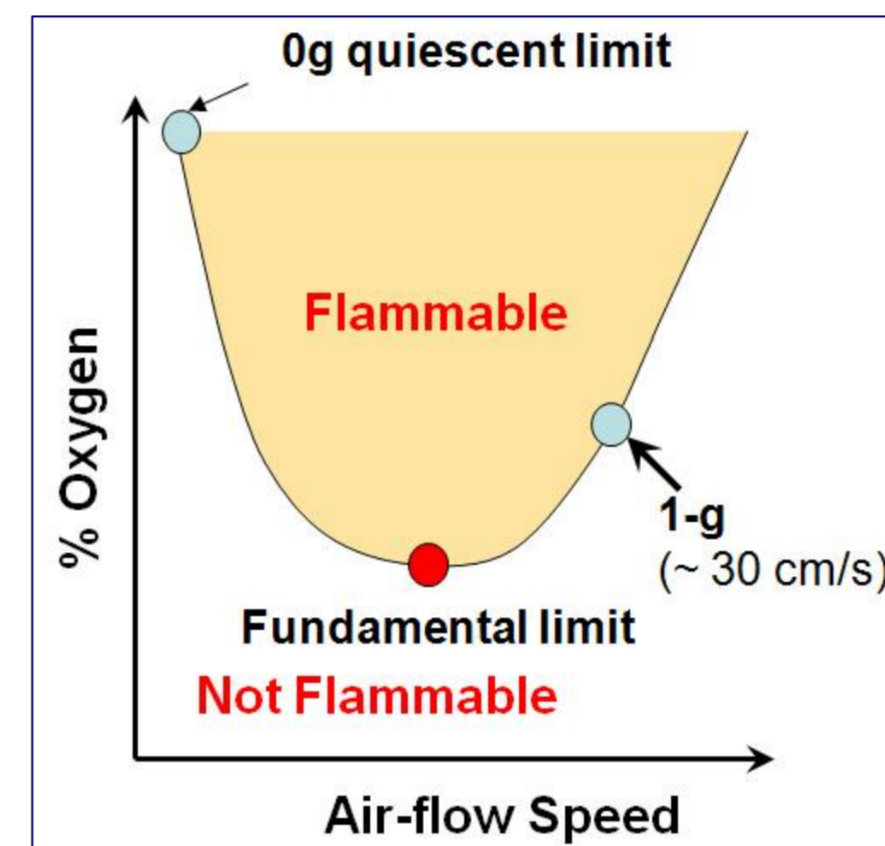

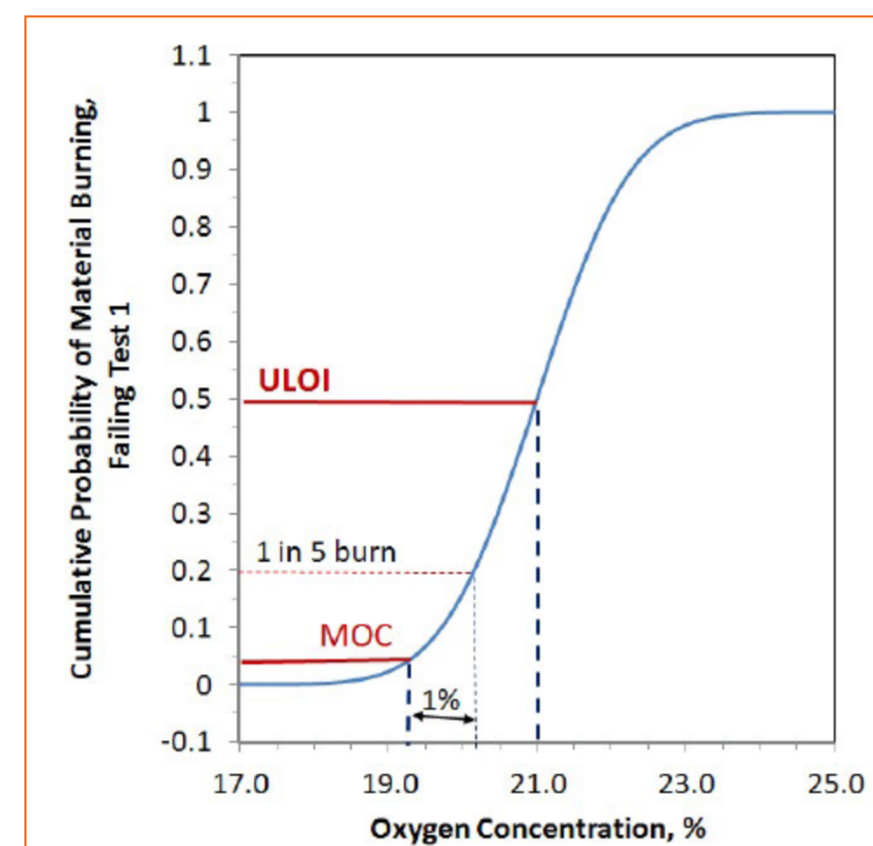

International Topical Team

The experiment is an international collaboration between numerous space agencies. The collaboration is managed by an International Topical Team including participation by NASA and ESA, plus a **group of international scientists (pictures below)**, that aims to revolutionize spacecraft fire safety designs for next-generation space vehicles and habitats. It will feature a validation experiment on an unmanned, but pressurized vehicle, such as the Orbital Sciences Corp. Cygnus vehicle after it has completed its supply mission to the International Space Station.

Problem Identification

Full scale fire testing complemented by computer modeling has substantially improved our understanding of the risk, prevention and suppression of fire in terrestrial systems (cars, ships, planes, buildings, mines, and tunnels). In comparison, no such testing has been carried out for manned spacecraft due to the complexity, cost and risk associated with operating a **material flammability experiment of a relevant size and duration in microgravity**. Therefore, there is currently a gap in knowledge of fire behavior in spacecraft.

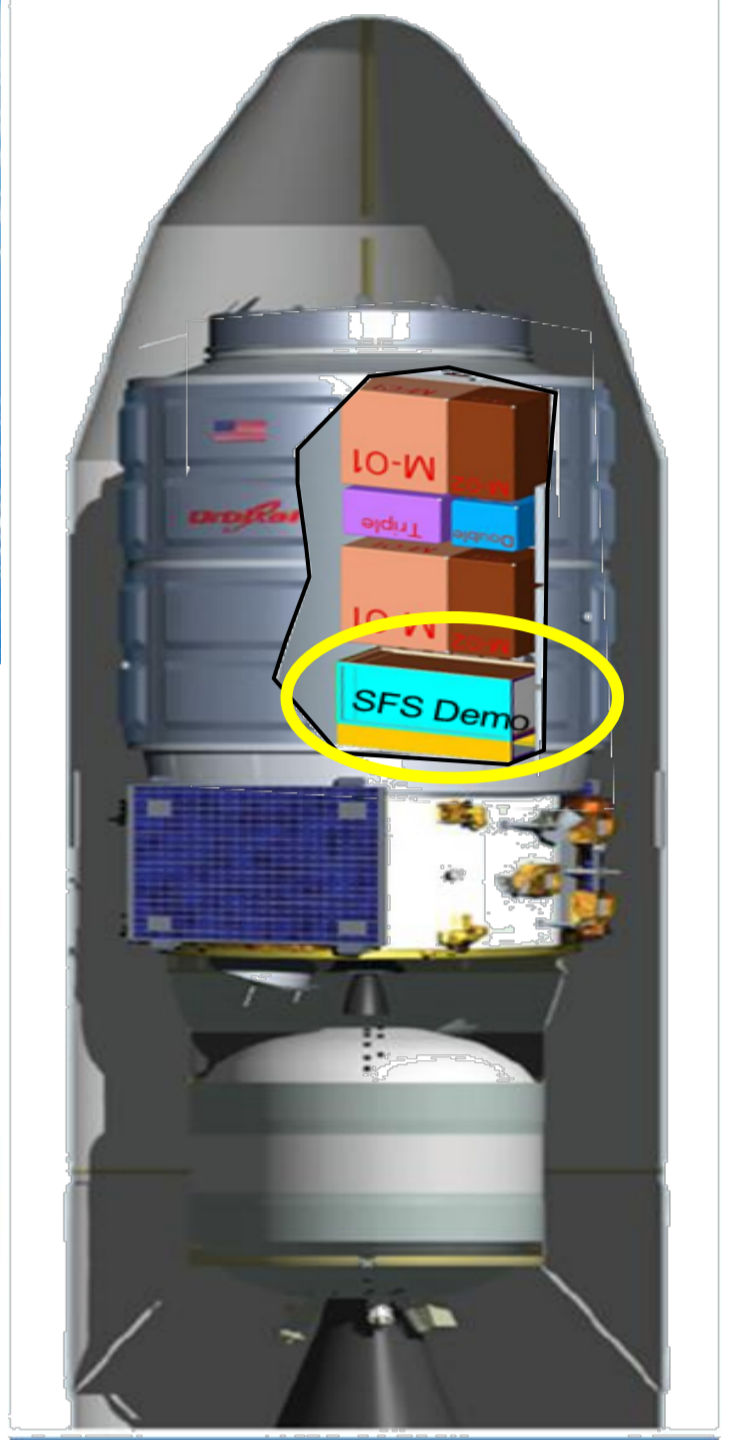

Vehicle Configuration

Cygnus approaching the ISS

Cygnus interior

Cygnus in Shroud

Overpressure Testing and Modeling

The experiment will need to meet rigorous safety requirements to ensure the carrier vehicle does not sustain damage.

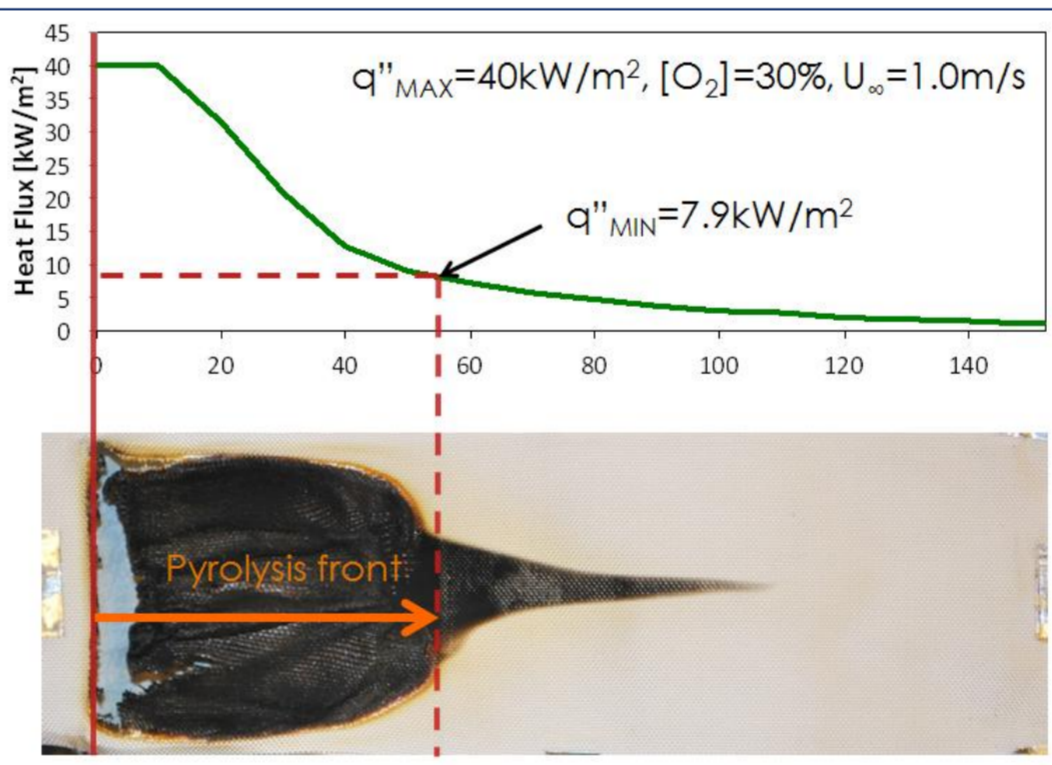

Ground Experiments

SIBAL before and after test

Critical flux for flame spread

Soot measurements in flame (backlighting technique)

Experiment Configuration

Experiment Installed in Cygnus
 Thrust vector aligned with x-axis
 Foam on both sides and bottom of Saffire

Cutaway view of the flow duct and avionics enclosure

Sample card with 5 cm by 30 cm samples

Parabolic Flight Experiments

A new rig for parabolic flight is being built. Team members will conduct short duration validation experiments before every Cygnus flight experiment

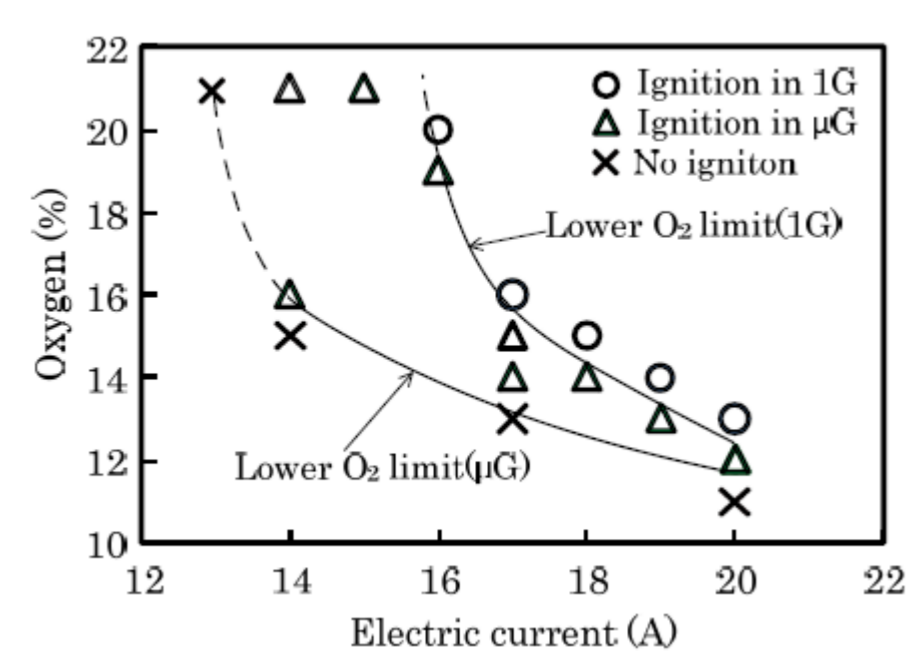

Novespace's plane

New combustion chamber

Drop Tower Experiments

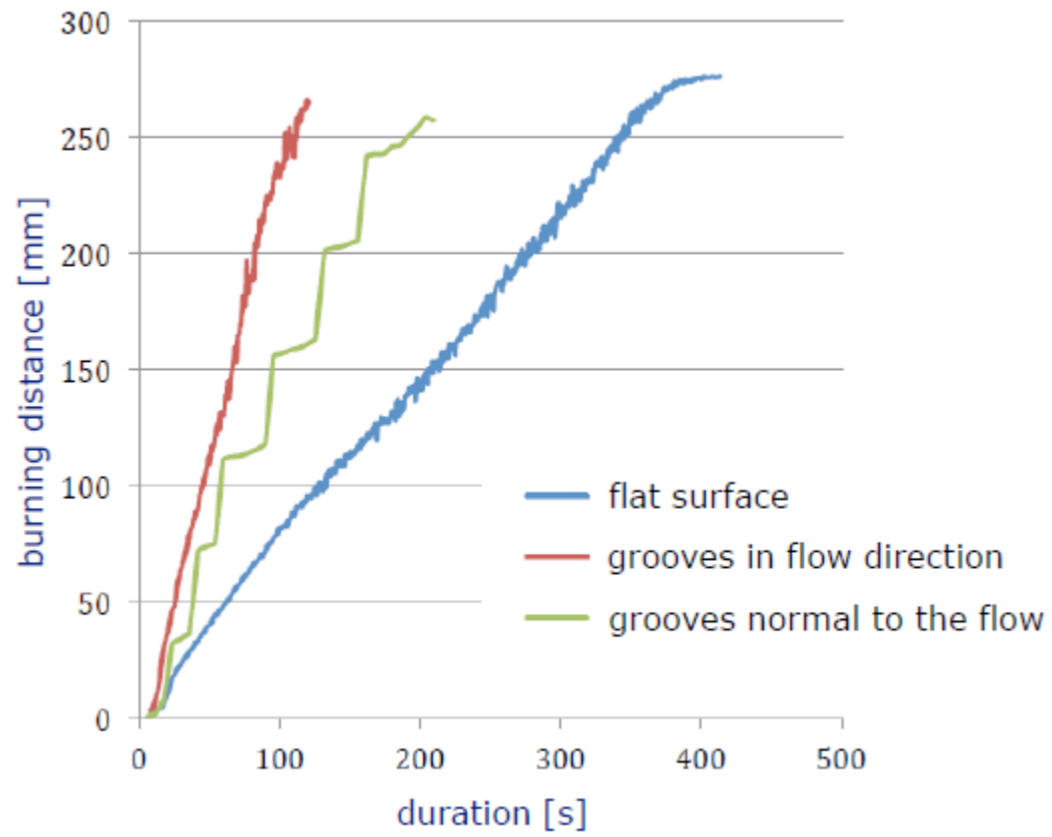

Sample Selection

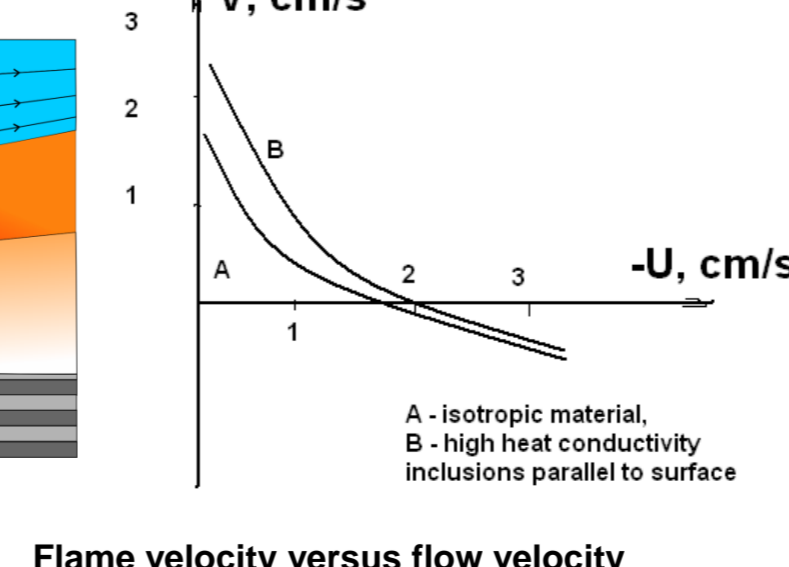

Structured Samples

Comparison of Results

Flame spread over thin combustible layer with high heat conductivity inclusions

The Road Ahead

The large-scale material flammability demonstration will facilitate the understanding of the long-term consequences of a potential spacecraft fire and provide data not only for the verification of detailed numerical models of such an event, but also for the development of predictive models that can assist and optimise fire prevention, response and mitigation.

The first step is to provide a predictive tool that will integrate fire safety into design and management of space vehicles. Such tools will integrate a wide range of design issues including, but not limited to, material selection, emergency response, crew training, post-fire clean-up, fire detection, fire suppression, environmental control and life support (ECLS) system design, and even atmosphere selection to provide a globally optimised solution.
