

**Landscape and technology in the
Peak District of Derbyshire:
The fifth and fourth millennia BC.**

Daniel Hind

Volume 2

Figures, tables and appendices.

Dissertation submitted to the University of Sheffield

for the degree of Doctor of Philosophy

June 2000

Key

Slope: F – flat; G – gentle; M – moderate; S – steep.

Geology: L – limestone; H(L) – head; B(SH) – boulder clay over shale; B(M) boulder clay over mudstone; SH – shale; A(SH) – alluvium over shale; G – gritstone; R – river terrace; B – boulder clay; S – sandstone.

State of field: H – harrowed; W – weathered ploughed; R – rolled; P – weathered planted; F – freshly planted.

State of weather: S – sunny; O – overcast; M – misty; R – rainy.

Table 6.2: The number and density of finds for each field.

| TS Field Name | APT No. | Altitude (metres OD) | Adjusted Ha. | Number of finds | Density (Finds/Ha.) |
|------------------------|----------------|---------------------------------|---------------------|------------------------|--------------------------------|

Appendices

Introduction to the recording system

The six appendices relate to the data sets analysed in Chapter 6. The Arteamus Peak Transect (Appendix 1), Roystone Grange test pit material (Appendix 2), two sites from the Harris Collection (Sheffield City Museum), Shacklow and Dimin Dale (Appendix 3) and sites from the Henderson Collection within the bounds of the Peak District National Park (Appendix 4). Two collections from Linch Clough South are included to complement the Henderson Collection (sites 197, 201), the surface collection made by the Peak District National Park Authority Archaeology Section (Appendix 5) and part of a private collection belonging to Dr. Paul Ardron (Appendix 6).

Fields unique to Appendix 1

Field Name

This field refers to the name of the Arteamus sample unit (see Table 6.1 for more information).

APT Field No.

This field refers to the number of the Arteamus sample unit (see Table 6.1 for more information).

Fields unique to Appendix 2

Grid

This field refers to the test pit grid on which the finds were made:

RM Roystone Meadow
PM Parwich Meadow
LKB Lime Kiln Barrow
RR Roystone Rocks
JR Jackdaw Rocks

Test Pit #

This field refers to the unique number given to every test pit by the Roystone Grange directors, the positions of which are available from the Peak District National Park Authority and from Evans 1998.

Fields unique to Appendix 3

Accession

This field records the accession number of the finds as given by Sheffield City Museum.

Description

The context of the finds as written on the finds bags and hand-written cards within.

Max length (cores only)

The Harris collection was recorded early on, before a recording methodology had been established for this dissertation, and different records were kept for cores. This field records the maximum length of the flaking scars on the cores, for comparison

2. *Flake*. A fragment of hard rock intentionally detached from a core, by the application of force. Unlike chunks, a flake will still have an identifiable dorsal and ventral surface even when it is incomplete or fragmentary.
3. *Blade*. A flake with more or less parallel lateral edges which, when complete, would have been at least twice as long as wide.
4. *Core or core fragment*. A block of raw material from which flakes, blades or bladelets are detached. Sometimes preformed by the worker to the desired shape to allow the removal of a definite type of flake or blade, they show negative flake scars, or scar. These should be visible even when only fragments are found.
5. *Core scraper*. A core is usually a by-product, but some were used as scrapers, particularly in the seventh to fourth millennia BC (see Myers 1986). In this context they may show appropriate retouch or use wear.
6. *Core and retouched tool*. A core retouched to for any purpose other than scraping. In the collections analysed in this work, these are frequently awls.
7. *Core rejuvenation flake*. A core (or platform) rejuvenation flake resulted from the process by which an exhausted or ruined core platform was removed as a tabular flake thereby establishing a new platform.
8. *Core rejuvenation flake, retouched*. The removals around part or all of the edge of rejuvenation flakes often causes them to be mistaken for scrapers. The origin of these abrupt negative scars is from the dorsal surface and was executed before the piece was removed from the core. When additional secondary retouch is visible the piece may be deemed to have been reworked for further use.
9. *Core rejuvenation flake retouched as a scraper*. As above [8] with unifacially retouched, steep wide-angled edge.
10. *Polished flake*. A flake, which has retained a portion of the surface of an intentionally polished, tool on part or on its entire dorsal surface. These flakes can be the result of damage to a polished axe or can occur from the reduction of the damaged tool (for example, when it is used as a core to extract the remaining usable raw material).
11. *Bifacially flaked knife*. 'Edge' tool with one edge prepared by flaking (and sometimes grinding) to an angle of less than 45 degrees (Clark *et al.* 1960).
12. *Flake Knife*. 'Edge' tools formed with minimal edge retouch (Saville 1981; Ford 1987).
13. *Bifacially flaked fragment*. A piece of stone that has been bifacially worked but not to the extent that it resembles a recognisable tool form.
14. *Fragment from bifacially flaked implement*. A piece of stone that has been removed from a finished bifacially flaked implement.
15. *Retouched flake (15.1 Retouched blade)*. A piece which shows the removal of a series of small, thin, regular flakes in systematic fashion.
16. *Truncated flake*. A piece distinguished from those accidentally broken, by its morphological association as a by-product either of the burin (Campbell 1977) or microburin (Brézillon 1977, 127-130) techniques. More commonly these techniques are realised on a *Truncated blade* [16.1].
17. *Notched flake (17.1 Notched blade)*. A piece with a short concavity retouched into an edge. This may be achieved by a single blow. On blades, notches are sometimes associated with preparation for the manufacture of microburins (*ibid*).
18. *Notched and retouched flake (18.1 Notched and retouched blade)*. As above with serial retouch outside of, or away from, the notch itself.
19. *Edge-used and edge glossed flake (19.1 Edge-used and edge glossed blade)*. A piece showing the presence of polish that is visible to the naked eye.

20. *Denticulate*. Three types of artefact have been grouped under this category: denticulates, saws and serrated pieces. Saws and serrated pieces are flagged by comments made in the 'notes' column.
- i. Denticulates. A denticulate is a flake core or other blank with a series of interconnecting notches 5mm or more apart along its edge, each formed by a single blow (Wainwright with Longworth 1971, 176 F9). It is commonly. They are thought to be 'Mesolithic' or 'Neolithic' in date (Jacobi and Tebbut 1981, Fig 10; Wainwright and Longworth 1971, 256; Pryor 1978, Table 44, Fig 46: 13).
 - ii. Saws. Flakes or blades with a series if of small contiguous notches or denticulations not more tan 5 mm apart, each formed by the removal of a series of small spalls. They are distinct from denticulates only in scale (Smith 1965, 108; Robertson-Mackay 1980, 157). They are typical of third and early second millennia BC contexts (Clark 1933, 272 Fig 4.57, 61; Smith 1965, 108, Fig 49, 150, 239).
 - iii. Serrated pieces. Flakes or blades with one or more very finely denticulated edges, each tooth being formed by the removal of a single spall (Smith 1965, 91). The serrations are usually along the sides but are occasionally found on the distal end (Robertson-Mackay 1980, 131; c.f. hollow scrapers). The opposite edge and/or the distal end may be backed by abrupt retouch, perhaps to facilitate hafting as a composite tool (Healy and Robertson-Mackay 1983; Bell 1977). The edge of the teeth frequently show a narrow band of gloss , usually on the ventral face for all or part of their length. Serrated edges are consistently found on blades or blade-like pieces than so-called utilised pieces (Smith 1965, fig 38; Bradley 1970, 349; Bell 1977. 26. Fig 8; Robertson-Mackay 1980, 131). Smith (1965) suggests they were used for the cutting of grass or withies. They are found in industries throughout the Holocene (Jacobi 1980) and in the fourth millennium BC can form an important part of the composition of the tool kit (Healey and Robertson-Mackay 1983).
21. *Denticulate and flake-knife*. Retouched piece combining attributes of categories 11 and 20.
22. *Awl or piercer*. Tools that have been retouched to a point. Piercers can be made on a flake, blade or a core. At Dimin Dale (see Volume 1, Chapter 6), the quantity of tools of this type allowed the identification of a number of sub-types known from with parallels in traditional typology (although no examples of 22.1 or 22.2 were noted).
- i. *Meche de foret* or drill bit [22.1].
 - ii. Blades with edges abruptly retouched so that they converge to form a point [22.2].
 - iii. Short, minimally retouched point, often on a suitably shaped support (Saville's standard type, 1981, 9, F284) [22.3].
 - iv. Elaborately retouched elongated point [22.4].
 - v. Spurred implement. A short projection on a scraper-like edge [22.5], may be offset by notches [22.51] (Smith 1965, 105).
 - vi. Points on heavy blanks [22.6].
23. *Awl and flake knife*. A retouched piece combining attributes of categories 11 and 22.
24. *Plano-convex knife*. Edge tool characterised by pressure or scale flaking on a slightly convex upper surface, the under face retaining the flake surface,

with bulb and sometimes striking platform in tact. As a rule the flake from which it was made shows a distinct curve in the longitudinal axis. The classic form appears to be early second millennium BC although it may have antecedents in simpler forms of third millennium date (Pierpoint 1980).

25. *Plano-convex knife and end scraper*. Artefact combining the attributes of categories 24 and 33.
26. *Worn-edge flake*. Edge wear is the removal of material from edges by flaking and/or rounding by use. In practice it is impossible to distinguish from edge damage - the removal of material from edges by natural processes, spontaneous retouch, and soil movement, trampling - without use-wear analysis.
27. *End scraper and flake knife*. Artefact combining the characteristics of categories 11 and 33.
28. *Side scraper and flake knife*. Artefact combining the characteristics of categories 11 and 32.
29. *End scraper and notch*. Artefact combining the characteristics of categories 17 and 33.
30. *Disc scraper*.
31. *Miscellaneous or irregular scraper*. Scrapers (Clark *et al.* 1960; Bradley 1970) are unifacially retouched tools with a steep, wide-angled edge that is suitable for a number of tasks, including scraping hides, planing wood or bone, and occasionally cutting like a knife. At Dimin Dale certain instruments, morphologically similar to flake knives, but with steep retouch angles have been characterised as scrapers with piercing points [31.1].
32. *Side scraper*. Scrapers that are made on the side of a flake or blade. The retouched side may either edge, or on both (a double side scraper).
33. *End scraper*. Scraper that is made on the end of a flake or blade. The retouched end may be the proximal end or the distal end, but the vast majority of end scrapers are made on the distal end, as this does not require the removal of the bulb of percussion.
34. *Hollow scraper*. Any scraper with a concave scraping edge.
35. *Horseshoe scraper*. Any scraper made on a large flake with a semi-circular edge, wider than the butt.
36. *Thumbnail scraper*.
37. *End and side scraper*. Artefact combining the characteristics of categories 32 and 33.
38. *Side and hollow scraper*. Any artefact combining the characteristics of categories 32 and 34.
39. *Wedge*. Axe-like implement with a cutting edge of steeply tapering profile and a thick butt, which would withstand hammering.
40. *Burin*. A burin is a chisel-like implement derived from a flake or blade by the removal of edges parallel to their long axis and/or transversely or obliquely. The 'burin break' generally forms a right angle edge on one or both margins. The 'sides' of a burin consist of one or more burin facets, that is, flake scars each of which is produced by striking a piece off a flake, blade or bladelet, which may or may not have been prepared to receive this blow. The piece that is struck off is usually long and narrow, and is called the 'burin spall'.

41. *Microlith*. Small blade, bladelet or portion thereof, normally with bulbar end removed and modified by abrupt retouch, often on an anvil to a standardised series of shapes (Jacobi 1978b, 16).
42. *Microburin*. The resulting waste product from the manufacture of microliths, particularly scalene triangles, by notching and snapping a blade (the microburin technique).
43. *Backed bladelet*. Small blade with abrupt marginal retouch along one or more side. Jacobi (1979: 73) suggests that northern straight-backed bladelet type assemblages or March Hill industries dominate all of eastern northern England (except for an area in the south-east of the region), during the seventh to fifth millennia.
44. *Fabricator*. Rod-like tool, characterised by abrasion on one or both ends, sometimes extending along the sides. (Bradley 1970, 356; Robertson-Mackay 1980; Healey and Robertson-Mackay 1983).
45. *Leaf-shaped arrowhead*. Small, thin, bifacial projectile point that is retouched on both surfaces and shaped like a leaf or diamond. In date they range from the later fourth to the early second millennium BC (Green 1980).
46. *Transverse arrowhead*. Term used to embrace the petit tranchet derivative, chisel ended and oblique forms, although in the current work, oblique forms are categorised separately under category 48. Petit tranchet derivatives are made on a section of a flake or blade with a quadrangular cross-section. The side of the support, parallel to the main axis of the flake forms the cutting edge and is always unworked, the edges being shaped or blunted by abrupt, non-invasive retouch. Chisel ended forms are commonly sub-rectangular in shape and have no secondary retouch on the transverse edge (Green 1980).
47. *Barbed-and-tanged arrowhead*. Bifacially flaked projectile point recognisable by the presence of a tang and usually, but not always, barbs (Green 1980).
48. *Oblique Arrowhead*. Bifacially flaked sub-triangular projectile point, often with hollowed asymmetrical base, which in some instances develops into a deliberately shaped single barb, The transverse edge is secondarily flaked to produce a point.
49. *Flint axe*. Large bifacially flaked piece typified by a broad cutting edge, a symmetrical profile and even distribution of weight across the blade. They are sometimes partially or completely ground and polished.
50. *Stone axe or fragments*. Fragments of the above [49], generally recognisable by one surface showing evidence of grinding and polishing.
51. *Hammerstone/anvil*. Nodular form with one or more percussed or heavily abraded areas around their perimeters.
52. *Gunflint*. Sub-rectangular flints with trapezoidal cross-section, made in different sizes to suit different guns.

Reduction (all appendices)

Stage analysis or reduction sequence, as per Barnatt *et al.* (in prep: 9). Based on the proportion of the dorsal flaked retaining an unflaked portion.

1. Primary (>50% unflaked)
2. Secondary (>0 but <50% unflaked)
3. Tertiary (all flaked)

Length and Breadth (not Appendix 4)

These fields record length (from proximal to distal end of the piece at right angles to the platform) and breadth (across the maximum extent of the piece at right angles to the length) measurements of complete, unretouched/utilised flakes and blades only, in line with Barnatt *et al.* (in prep.).

Flake or Blade (all appendices, cores only)

This field records whether flaking scars on a core show evidence of flake-working, blade-working or both.

1. Flake core
2. Blade core
3. Flake and blade core

No. Platforms (all appendices, cores only)

This field refers to the number of platforms present on a core.

No. Scars (not appendix 3)

This field records the number of flaking scars visible on a core.

Broken (all appendices)

This field records whether or not the piece has been broken. Broken pieces are signified by the entry of a "1".

Burnt (all appendices)

This field records whether or not a piece has been subject to thermal treatment, signified by an entry of a "1".
