The purpose of this paper is to introduce new classes of generalized seminormed difference sequence spaces defined by a Musielak-Orlicz function. We also study some topological properties and prove some inclusion relations between resulting sequence spaces.

1. Introduction and Preliminaries

Let ℓ^0 denote the space of all real sequences $x = \{x_k\}$. Let \mathscr{C} denote the space whose elements are the sets of distinct positive integers. Given any element σ of \mathscr{C} , we denote by $c(\sigma)$ the sequence $\{c_n(\sigma)\}$ such that $c_n(\sigma) = 1$ if $n \in \sigma$, and $c_n(\sigma) = 0$ otherwise. Further

$$\mathscr{C}_{s} = \left\{ \sigma \in \mathscr{C} : \sum_{n=1}^{\infty} c_{n}(\sigma) \leq s \right\},$$
(1)

the set of those σ whose support has cardinality at most *s*, and

$$\Phi = \left\{ \phi = \left\{ \phi_k \right\} \in \ell^0 : \phi_1 > 0, \Delta \phi_k \ge 0,$$

$$\Delta \left(\frac{\phi_k}{k} \right) \le 0 \quad (k = 1, 2, \ldots) \right\},$$
(2)

where $\Delta \phi_k = \phi_k - \phi_{k-1}$.

For $\phi \in \Phi$, Sargent [1] defined the following sequence space:

$$m(\phi) = \left\{ x = \{x_k\} \in \ell^0 : \sup_{s \ge 1} \sup_{\sigma \in \mathscr{C}_s} \left(\frac{1}{\phi_s} \sum_{k \in \sigma} |x_k| \right) < \infty \right\},$$
(3)

which was further studied in [2-4].

The space $m(\phi)$ was extended to $m(\phi, p)$ by Tripathy and Sen [5] as follows:

$$m(\phi, p) = \left\{ x = \{x_k\} \in \ell^0 : \sup_{s \ge 1} \sup_{\sigma \in \mathscr{C}_s} \left(\frac{1}{\phi_s} \sum_{k \in \sigma} |x_k|^p \right) < \infty \right\}.$$
(4)

The notion of the difference sequence space was introduced by Kızmaz [6] which was generalized by Mursaleen [7]. It was further generalized by Et and Çolak [8] as follows: $Z(\Delta^{\mu}) = \{x = (x_k) \in \omega : (\Delta^{\mu} x_k) \in z\}$ for $z = \ell_{\infty}$, *c*, and c_0 , where μ is a nonnegative integer and

$$\Delta^{\mu} x_k = \Delta^{\mu-1} x_k - \Delta^{\mu-1} x_{k+1}, \qquad \Delta^0 x_k = x_k \quad \forall k \in \mathbb{N}$$
 (5)

or equivalent to the following binomial representation:

$$\Delta^{\mu} x_{k} = \sum_{\nu=0}^{\mu} (-1)^{\nu} {\binom{\mu}{\nu}} x_{k+\nu}.$$
 (6)

These sequence spaces were generalized by Et and Basarir [9] for $z = \ell_{\infty}(p)$, c(p), and $c_0(p)$.

Dutta [10] introduced the following difference sequence spaces using a new difference operator:

$$Z\left(\Delta_{(\eta)}\right) = \left\{x = (x_k) \in \omega : \Delta_{(\eta)} x \in z\right\} \quad \text{for } z = \ell_{\infty}, c, \text{and } c_0,$$
(7)

where $\Delta_{(\eta)} x = (\Delta_{(\eta)} x_k) = (x_k - x_{k-\eta})$ for all $k, \eta \in \mathbb{N}$. In [11], Dutta introduced the sequence spaces $\overline{c}(\|\cdot,\cdot\|, \Delta^{\mu}_{(\eta)}, p), \ \overline{c}_0(\|\cdot,\cdot\|, \Delta^{\mu}_{(\eta)}, p), \ell_{\infty}(\|\cdot,\cdot\|, \Delta^{\mu}_{(\eta)}, p), \ m(\|\cdot,\cdot\|, \Delta^{\mu}_{(\eta)}, p),$ and $m_0(\|\cdot,\cdot\|,\Delta^{\mu}_{(\eta)},p)$, where $\eta, \mu \in \mathbb{N}$ and $\Delta^{\mu}_{(\eta)}x_k = (\Delta^{\mu}_{(\eta)}x_k)$ $= (\Delta_{(\eta)}^{\mu-1} x_k - \Delta_{(\eta)}^{\mu-1} x_{k-\eta}) \text{ and } \Delta_{(\eta)}^0 x_k = x_k \text{ for all } k, \eta \in \mathbb{N}, \text{ which}$ is equivalent to the following binomial representation:

$$\Delta^{\mu}_{(\eta)} x_k = \sum_{\nu=0}^{\mu} (-1)^{\nu} {\mu \choose \nu} x_{k-\eta\nu}.$$
 (8)

The difference sequence spaces have been studied by several authors [12-19] and references therein. Başar and Altay [20] introduced the generalized difference matrix B = $(b_{mk})_{k,m\in\mathbb{N}}$ by

$$b_{mk} = \begin{cases} r, & k = m \\ s, & k = m - 1 \\ 0, & (k > m) \text{ or } (0 \le k < m - 1) . \end{cases}$$
(9)

Başarir and Kayikçi [21] defined the matrix $B^{\mu}(b_{mk}^{\mu})$ which reduces to the difference matrix $\Delta^{\mu}_{(1)}$ if r = 1, s = -1. The generalized B^{μ} -difference operator is equivalent to the following binomial representation:

$$B^{\mu}x = B^{\mu}(x_{k}) = \sum_{\nu=0}^{\mu} {\mu \choose \nu} r^{\mu-\nu} s^{\nu} x_{k-\nu}.$$
 (10)

Let $\wedge = (\wedge_k)$ be a sequence of nonzero scalars. Then, for a sequence space E, the multiplier sequence space E_{Λ} , associated with the multiplier sequence \wedge , is defined as

$$E_{\wedge} = \left\{ x = (x_k) \in \omega : (\wedge_k x_k) \in E \right\}.$$
(11)

Let $\omega(X)$ denote the space of all sequences with elements in (X, q), where (X, q) denotes a seminormed space, seminormed by q. The zero sequence is denoted by θ = $(0, 0, 0, \ldots).$

An Orlicz function M is a function, $M : [0, \infty) \rightarrow$ $[0,\infty)$, which is continuous nondecreasing and convex with M(0) = 0, M(x) > 0 for x > 0 and $M(x) \to \infty$ as $x \to \infty$.

Lindenstrauss and Tzafriri [22] used the idea of Orlicz function to define the following sequence space:

$$\ell_M = \left\{ x \in \omega : \sum_{k=1}^{\infty} M\left(\frac{|x_k|}{\rho}\right) < \infty \right\}, \tag{12}$$

which is called an Orlicz sequence space. The space ℓ_M is a Banach space with the norm

$$\|x\| = \inf\left\{\rho > 0: \sum_{k=1}^{\infty} M\left(\frac{|x_k|}{\rho}\right) \le 1\right\}.$$
 (13)

It is shown in [22] that every Orlicz sequence space ℓ_M contains a subspace isomorphic to ℓ_p ($p \ge 1$). The Δ_2 condition is equivalent to $M(Lx) \leq \hat{K}LM(x)$ for all values of $x \ge 0$ and for L > 1.

A sequence $\mathcal{M} = (M_k)$ of Orlicz functions is called a Musielak-Orlicz function. A sequence $\mathcal{N} = (N_k)$ defined by

$$N_{k}(v) = \sup\{|v| \, u - M_{k}(u) : u \ge 0\}, \quad k = 1, 2, \dots, \quad (14)$$

is called the complimentary function of a Musielak-Orlicz function (see [23, 24]). For a given Musiclak-Orlicz function \mathcal{M} , the Musielak-Orlicz sequence space $t_{\mathcal{M}}$ and its subspace $h_{\mathcal{M}}$ are defined as follows:

$$t_{\mathcal{M}} = \left\{ x \in \omega : I_M(cx) < \infty \text{ for some } c > 0 \right\},$$

$$h_{\mathcal{M}} = \left\{ x \in \omega : I_M(cx) < \infty \forall c > 0 \right\},$$
(15)

where $I_{\mathcal{M}}$ is a convex modular defined by

$$I_{\mathscr{M}}(x) = \sum_{k=1}^{\infty} M_k(x_k), \quad x = (x_k) \in t_M.$$
(16)

We consider $t_{\mathcal{M}}$ equipped with the Luxemburg norm,

$$\|x\| = \inf \left\{k > 0 : I_M\left(\frac{x}{k}\right) \le 1\right\},\tag{17}$$

or equipped with the Orlicz norm,

$$\|x\|^{0} = \inf \left\{ \frac{1}{k} \left(1 + I_{M}(kx) \right) : k > 0 \right\}.$$
 (18)

A sequence space *E* is said to be solid if $(\alpha_k x_k) \in E$, whenever $(x_k) \in E$ for all sequences (α_k) of scalars such that $|\alpha_k| \leq 1$ for all $k \in \mathbb{N}$.

A sequence space *E* is said to be monotone if *E* contains the canonical preimages of all its step spaces.

Remark 1. It is well known that a sequence space is solid implies that it is monotone (see Kamthan and Gupta [25]).

The sequence space $m(\phi)$ was introduced by Sargent [1]. He studied some of its properties and obtained its relationship with the space ℓ_p . Later on, it was investigated from sequence space point of view and related with summability theory by Bilgin [26], Esi [27], Tripathy and Mahanta [28], and many others.

The main goal of the present paper is to introduce new classes of generalized seminormed difference sequence spaces defined by Musielak-Orlicz function.

For a given infinite matrix $A = (a_{ik})_{i,k\geq 1}$. The *A*-transform of a sequence $x = (x_k)_{k \ge 1}$ is the sequence $Ax = (A_i)$ $(i \ge 1)$, where

$$A_{i}(x) = \sum_{k=1}^{\infty} a_{ik} x_{k},$$
 (19)

provided that the series on the right converges for each $i \ge 1$.

Let (X, q) be a seminormed space, $\mathcal{M} = (M_i)$ a Musielak-Orlicz function, and $p = (p_i)$ a bounded sequence of positive real numbers. Then we define the following classes of sequences:

$$\ell_{\infty}\left(\mathcal{M}, A, B_{\Lambda}^{\mu}, q, p\right) = \left\{ x = (x_{k}) \in w\left(X\right) : \sup_{i \ge 1} M_{i}\left(q\left(\frac{A_{i}\left(B_{\Lambda}^{\mu}x_{k}\right)}{\rho}\right)\right)^{p_{i}} < \infty,$$
for some $\rho > 0 \right\},$
$$\ell_{1}\left(\mathcal{M}, A, B_{\Lambda}^{\mu}, q, p\right)$$

$$= \left\{ x = (x_k) \in w(X) : \sum_{i=1}^{\infty} M_i \left(q\left(\frac{A_i(B_{\Lambda}^{\mu} x_k)}{\rho}\right) \right)^{p_i} < \infty,$$
for some $\rho > 0 \right\},$

 $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$

$$= \left\{ x = (x_k) \in w(X) : \\ \sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q\left(\frac{A_i(B^{\mu}_{\Lambda} x_k)}{\rho}\right) \right)^{p_i} < \infty, \\ \text{for some } \rho > 0 \right\}.$$

$$(20)$$

The following inequality will be used throughout the paper. If $0 < h = \inf p_k \le p_k \le \sup p_k = H$ and $D = \max(1, 2^{H-1})$ then

$$|a_k + b_k|^{p_k} \le D\left\{ |a_k|^{p_k} + |b_k|^{p_k} \right\},$$
 (21)

for all *k* and $a_k, b_k \in \mathbb{C}$. Also $|a|^{p_k} \le \max(1, |a|^H)$ for all $a \in \mathbb{C}$. We study here some topological properties and establish

inclusion relations between these sequence spaces.

2. Main Results

Theorem 2. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then the spaces $\ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p), \ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$, and $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ are linear spaces over the field of complex number \mathbb{C} .

Proof. Let $x = (x_k)$, $y = (y_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$, and $\alpha, \beta \in \mathbb{C}$. Then there exist positive real numbers $\rho_1, \rho_2 > 0$ such that

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_{s}}\frac{1}{\phi_{s}}\sum_{i\in\sigma}M_{i}\left(q\left(\frac{A_{i}\left(B_{\Lambda}^{\mu}x_{k}\right)}{\rho_{1}}\right)\right)^{p_{i}}<\infty,$$

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_{s}}\frac{1}{\phi_{s}}\sum_{i\in\sigma}M_{i}\left(q\left(\frac{A_{i}\left(B_{\Lambda}^{\mu}y_{k}\right)}{\rho_{2}}\right)\right)^{p_{i}}<\infty.$$
(22)

Define $\rho_3 = \max(2|\alpha|\rho_1, 2|\beta|\rho_2)$. Since (M_i) is a nondecreasing, convex function and so by using inequality (21), we have

$$\begin{split} \sum_{i \in \sigma} M_i \bigg(q \bigg(\frac{A_i \left(B^{\mu}_{\Lambda} \left(\alpha x + \beta y \right) \right)}{\rho_3} \bigg) \bigg)^{p_i} \\ &\leq \sum_{i \in \sigma} M_i \bigg(q \bigg(\frac{A_i \left(B^{\mu}_{\Lambda} \alpha x \right)}{\rho_3} \bigg) + q \bigg(\frac{A_i \left(B^{\mu}_{\Lambda} \beta y \right)}{\rho_3} \bigg) \bigg)^{p_i} \\ &\leq D \sum_{i \in \sigma} M_i \bigg(q \bigg(\frac{A_i \left(B^{\mu}_{\Lambda} \alpha x \right)}{\rho_1} \bigg) \bigg)^{p_i} \\ &+ D \sum_{i \in \sigma} M_i \bigg(q \bigg(\frac{A_i \left(B^{\mu}_{\Lambda} \beta y \right)}{\rho_2} \bigg) \bigg)^{p_i}. \end{split}$$
(23)

Thus

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(\alpha x + \beta y \right) \right)}{\rho_{3}} \right) \right)^{p_{i}}$$

$$\leq \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} D \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \alpha x \right)}{\rho_{1}} \right) \right)^{p_{i}}$$

$$+ \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} D \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \beta y \right)}{\rho_{2}} \right) \right)^{p_{i}} < \infty.$$

$$(24)$$

Thus $(\alpha x + \beta y) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Hence $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is a linear space. Similarly, we can prove that the spaces $\ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ and $\ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ are linear spaces. This completes the proof of the theorem.

Theorem 3. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then $\ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p) \subset m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p) \subset \ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$.

Proof. Let $x = (x_k) \in \ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$. Then, for some $\rho > 0$, we have

$$\sum_{i=1}^{\infty} M_i \left(q \left(\frac{A_i \left(B_{\Lambda}^{\mu} x_k \right)}{\rho} \right) \right)^{p_i} < \infty.$$
 (25)

Since (ϕ_n) is a monotonic increasing, we have

$$\frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x_{k} \right)}{\rho} \right) \right)^{p_{i}} \leq \frac{1}{\phi_{1}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x_{k} \right)}{\rho} \right) \right)^{p_{i}} \leq \frac{1}{\phi_{1}} \sum_{i=1}^{\infty} M \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x_{k} \right)}{\rho} \right) \right)^{p_{i}} < \infty.$$
(26)

Hence,

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_s} \frac{1}{\phi_s} \sum_{i\in\sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x_k\right)}{\rho}\right) \right)^{p_i} < \infty.$$
(27)

Thus, $x = (x_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Therefore, $\ell_1(\mathcal{M}, \mathcal{M})$ $A, B^{\mu}_{\Lambda}, q, p) \subset m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, \overline{p}).$

Next, let $x = (x_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Then, for some $\rho > 0$, we have

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} x_k \right)}{\rho} \right) \right)^{p_i} < \infty.$$
(28)

Hence,

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} x_k \right)}{\rho} \right) \right)^{p_i} < \infty$$
(29)

(on taking cardinality of σ to be 1).

Thus, $x = (x_k) \in \ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$. Therefore, $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$. $\phi, q, p) \in \ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$. This completes the proof of the theorem.

Theorem 4. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then the space $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \varphi, q, p)$ is a seminormed space, seminormed by

$$g(x) = \inf \left\{ \rho > 0 : \sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i} \le 1 \right\}.$$
(30)

Proof. Clearly, $g(x) \ge 0$ for all $x = (x_k) \in$ $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ and $g(\theta) = 0$. Let $x = (x_k), y = (y_k) \in$ $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Then there exist $\rho_1 > 0$ and $\rho_2 > 0$ such that

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right)}{\rho_{1}} \right) \right)^{p_{i}} \le 1,$$

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} y \right)}{\rho_{2}} \right) \right)^{p_{i}} \le 1.$$
(31)

Let $\rho = \rho_1 + \rho_2$. Thus, we have

$$\begin{split} \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x + y \right) \right)}{\rho} \right) \right)^{p_{i}} \\ &= \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x + y \right) \right)}{\rho_{1} + \rho_{2}} \right) \right)^{p_{i}} \\ &\leq \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} \left\{ \frac{\rho_{1}}{\rho_{1} + \rho_{2}} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x \right) \right)}{\rho_{1}} \right) \right) \\ &+ \frac{\rho_{2}}{\rho_{1} + \rho_{2}} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(y \right) \right)}{\rho_{2}} \right) \right) \right)^{p_{i}} \\ &\leq \left(\frac{\rho_{1}}{\rho_{1} + \rho_{2}} \right) \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right) \right) \\ &+ \left(\frac{\rho_{2}}{\rho_{1} + \rho_{2}} \right) \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} y \right) }{\rho_{2}} \right) \right)^{p_{i}} \\ &+ \left(\frac{\rho_{2}}{\rho_{1} + \rho_{2}} \right) \sup_{s\geq 1,\sigma\in\mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i\in\sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} y \right) }{\rho_{2}} \right) \right)^{p_{i}} \\ &\leq 1. \end{split}$$

$$(32)$$

Since the ρ 's are nonnegative, so we have

 $q(\nu x)$

$$g(x + y)$$

$$= \inf \left\{ \rho > 0 : \sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} \left(x + y \right) \right)}{\rho} \right) \right)^{p_i} \le 1 \right\}$$

$$\leq \inf \left\{ \rho_1 > 0 : \sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} x \right)}{\rho_1} \right) \right)^{p_i} \le 1 \right\}$$

$$+ \inf \left\{ \rho_2 > 0 : \sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} y \right)}{\rho_2} \right) \right)^{p_i} \le 1 \right\}.$$
(33)

Thus, $g(x + y) \le g(x) + g(y)$. Next, for $\lambda \in \mathbb{C}$, without loss of generality, $\lambda \neq 0$, then

$$= \inf \left\{ \rho > 0 : \sup_{s \ge 1, \sigma \in \mathcal{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} \left(\nu x \right) \right)}{\rho} \right) \right)^{p_i} \le 1 \right\}$$

$$= \inf \left\{ \rho > 0 : \sup_{s \ge 1, \sigma \in \mathcal{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} x \right)}{r} \right) \right)^{p_i} \le 1 \right\},$$

where $r = \frac{\rho}{|\nu|}.$
(34)

This completes the proof of the theorem.

Theorem 5. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then

(i) the space $\ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ is a seminormed space, seminormed by

$$f(x) = \inf\left\{\rho > 0 : \sup_{i \ge 1} M_i\left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right)\right)^{p_i} \le 1\right\},$$
(35)

(ii) the space $\ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ is a seminormed space, seminormed by

$$h(x) = \inf\left\{\rho > 0: \sum_{i=1}^{\infty} M_i\left(q\left(\frac{A_i\left(B_{\Lambda}^{\mu}x\right)}{\rho}\right)\right)^{p_i} \le 1\right\}.$$
 (36)

Proof. It is easy to prove in view of Theorem 4, so we omit the details.

Theorem 6. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$ if and only if $\sup_{s>1}(\varphi_s/\psi_s) < \infty$.

Proof. Suppose $\sup_{s\geq 1}(\varphi_s/\psi_s) < \infty$ and $x = (x_k) \in$ $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Then, we have for some $\rho > 0$

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} x \right)}{\rho} \right) \right)^{p_i} < \infty.$$
(37)

Thus,

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\psi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right)}{\rho} \right) \right)^{p_{i}}$$

$$\leq \left(\sup_{s \ge 1} \frac{\phi_{s}}{\psi_{s}} \right) \left(\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right)}{\rho} \right) \right)^{p_{i}} \right) < \infty.$$
(38)

Therefore, $x = (x_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$. Hence, $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p) \subset m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$.

Conversely, let $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p) \subset m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$. Suppose that $\sup_{s\geq 1}(\phi_s/\psi_s) = \infty$. Then there exists a sequence of naturals $\{s_i\}$ such that $\lim_{i\to\infty}(\phi_{s_i}/\psi_{s_i}) = \infty$. Let $x = (x_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Then there exists $\rho > 0$ such that

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_s} \frac{1}{\phi_s} \sum_{i\in\sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i} < \infty.$$
(39)

Now, we have

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\psi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right)}{\rho} \right) \right)^{p_{i}} \\
\ge \left(\sup_{s \ge 1} \frac{\phi_{s}}{\psi_{s}} \right) \left(\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right)}{\rho} \right) \right)^{p_{i}} \right) = \infty. \tag{40}$$

Therefore, $x = (x_k) \notin m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$, which is a contradiction. Hence $\sup_{s \ge 1} (\phi_s/\psi_s) < \infty$.

We get the following corollary as a consequence of Theorem 6.

Corollary 7. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p) = m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$ if and only if $sup_{s\geq 1}(\phi_s/\psi_s) < \infty$ and $sup_{s\geq 1}(\psi_s/\phi_s) < \infty$ for all $s = 1, 2, 3, \ldots$

Theorem 8. Let $\mathcal{M}' = (M_i)', \mathcal{M}'' = (M_i)''$ be Musielak-Orlicz functions which satisfy Δ_2 -conditions and $p = (p_i)$ a bounded sequence of positive real numbers. Then

...

(i)
$$m(\mathcal{M}'^{\mu}_{\Lambda}, \phi, q, p) \subseteq m(\mathcal{M} \circ \mathcal{M}'^{\mu}_{\Lambda}, A, \phi, q, p);$$

(ii) $m(\mathcal{M}'^{\mu}_{\Lambda}, \phi, q, p) \cap m(\mathcal{M}'^{\mu}_{\Lambda}, \phi, q, p) \subseteq m(\mathcal{M}' + \mathcal{M}'^{\mu}_{\Lambda}, \phi, q, p).$

Proof. (i) Let $x = (x_k) \in m(\mathcal{M}_{\Lambda}^{\prime \mu}, \phi, q, p)$. Then there exists $\rho > 0$ such that

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_s} \frac{1}{\phi_s} \sum_{i\in\sigma} M_i' \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i} < \infty.$$
(41)

Let $0 < \varepsilon < 1$ and $0 < \delta < 1$ such that $M_i(t) < \varepsilon$ for $0 \le t < \delta$. Let $y_k = M'_i(q(A_i(B^{\mu}_{\Lambda}x)/\rho))^{p_i}$ and, for any $\sigma \in \mathscr{C}_s$,

let $\sum_{i \in \sigma} M_i(y_k) = \sum_1 M_i(y_k) + \sum_2 M_i(y_k)$, where the first summation is over $y_k \leq \delta$ and the second summation is over $y_k > \delta$. Since (M_i) satisfies Δ_2 -condition, we have

$$\sum_{1} M_{i}(y_{k}) \leq M_{i}(1) \sum_{1} y_{k} \leq M_{i}(2) \sum_{1} y_{k}.$$
 (42)

For $y_k > \delta$

$$y_k < \frac{y_k}{\delta} \le 1 + \frac{y_k}{\delta}.$$
(43)

Since (M_i) is nondecreasing and convex, so

$$M(y_k) < M\left(1 + \frac{y_k}{\delta}\right) < \frac{1}{2}M(2) + \frac{1}{2}M_i\left(\frac{2y_k}{\delta}\right).$$
(44)

Since (M_i) also satisfies Δ_2 -condition, so

$$M_i\left(y_k\right) < \frac{1}{2}K\frac{y_k}{\delta}M_i\left(2\right) + \frac{1}{2}K\frac{y_k}{\delta}M_i\left(2\right) = K\frac{y_k}{\delta}M_i\left(2\right).$$
(45)

Hence,

$$\sum_{2} M_{i}(y_{k}) \leq \max(1, K\delta^{-1}M_{i}(2)) \sum_{2} y_{k}.$$
 (46)

By (42) and (46), we have $x = (x_k) \in m(\mathcal{M} \circ \mathcal{M}_{\Lambda}^{\prime \mu}, \phi, q, p)$. Hence

$$m\left(\mathscr{M}^{\prime\mu}_{\Lambda},\phi,q,p\right)\subseteq m\left(\mathscr{M}\circ\mathscr{M}^{\prime}_{\Lambda},\phi,q,p\right).$$
(47)

(ii) Let $x = (x_k) \in m(\mathcal{M}'^{\mu}_{\Lambda}, \phi, q, p) \cap m(\mathcal{M}''^{\mu}_{\Lambda}, \phi, q, p)$. Then there exists $\rho > 0$ such that

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i}^{\prime} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right) }{\rho} \right) \right)^{p_{i}} < \infty,$$

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i}^{\prime \prime} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} x \right) }{\rho} \right) \right)^{p_{i}} < \infty.$$
(48)

The rest of the proof follows from the equality

$$\sum_{i\in\sigma} \left(\mathcal{M}'_{i} + \mathcal{M}''_{i}\right) \left(q\left(\frac{A_{i}\left(x\right)}{\rho}\right)\right)^{p_{i}}$$
$$= \sum_{i\in\sigma} M'_{i} \left(q\left(\frac{A_{i}\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right)\right)^{p_{i}} + \sum_{i\in\sigma} M''_{i} \left(q\left(\frac{A_{i}\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right)\right)^{p_{i}}.$$
(49)

This completes the proof of the theorem.

Corollary 9. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then, we have $m(A, B^{\mu}_{\Lambda}, \varphi, q, p) \subseteq m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \varphi, q, p)$.

Proof. It follows from Theorem 8(i) on considering $\mathcal{M}'(x) = x$, for all $x \in [0, \infty)$.

The following result is a consequence of Theorem 8 and Corollary 9.

Corollary 10. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then $m(A, B^{\mu}_{\Lambda}, \varphi, q, p) \subseteq m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \psi, q, p)$ if and only if $sup_{s\geq 1}(\varphi_s/\psi_s) < \infty$.

Theorem 11. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then the space $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is solid.

Proof. Let $x = (x_k) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Then

$$\sup_{s\geq 1,\sigma\in\mathscr{C}_s} \frac{1}{\phi_s} \sum_{i\in\sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i} < \infty.$$
 (50)

Let (α_k) be a sequence of scalars with $|\alpha_k| \le 1$ for all $k \in \mathbb{N}$. Then the result follows from (50) and the following inequality

$$\sum_{i\in\sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}\alpha x\right)}{\rho}\right) \right)^{p_i} \le \sum_{i\in\sigma} |\alpha| M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i} \le \sum_{i\in\sigma} M_i \left(q\left(\frac{A_i\left(B^{\mu}_{\Lambda}x\right)}{\rho}\right) \right)^{p_i}.$$
(51)

This completes the proof of the theorem.

In view of the above result, we get the following corollaries.

Corollary 12. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then the space $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is monotone.

We formulate the following result which can be established following the technique of Theorem 11 and Corollary 12.

Corollary 13. Let $\mathcal{M} = (M_i)$ be a Musielak-Orlicz function and $p = (p_i)$ a bounded sequence of positive real numbers. Then the spaces $\ell_{\infty}(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ and $\ell_1(\mathcal{M}, A, B^{\mu}_{\Lambda}, q, p)$ are solid and monotone.

Theorem 14. If (X, q) is complete, then $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is also complete.

Proof. Let (x^j) be a Cauchy sequence in $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$, where $x^j = (x^j_k) = (x^j_1, x^j_2, x^j_3, ...) \in m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ for each $j \in \mathbb{N}$. Let r > 0 and $x_0 > 0$ be fixed. Then for each $\varepsilon/rx_0 > 0$, there exists a positive integer n_0 such that

$$g\left(x^{j}-x^{l}\right) < \frac{\varepsilon}{rx_{0}}, \quad \forall j,l \ge n_{0}.$$
 (52)

This implies

$$\inf \left\{ \rho : \sup_{s \ge 1, \sigma \in \mathcal{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} \left(x^j - x^l \right) \right)}{\rho} \right) \right)^{p_i} \le 1 \right\}$$
$$< \frac{\varepsilon}{rx_0}, \quad \forall j, l \ge n_0.$$
(53)

We have for all j, $l \ge n_0$ and by (53)

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x^{j} - x^{l} \right) \right)}{h \left(x^{j} - x^{l} \right)} \right) \right)^{p_{i}} \le 1$$

$$\Longrightarrow \frac{1}{\phi_{1}} M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x^{j} - x^{l} \right) \right)}{h \left(x^{j} - x^{l} \right)} \right) \right)^{p_{i}} \le 1$$

$$\Longrightarrow M_{i} \left(q \left(\frac{A_{i} \left(B_{\Lambda}^{\mu} \left(x^{j} - x^{l} \right) \right)}{h \left(x^{j} - x^{l} \right)} \right) \right)^{p_{i}} \le \phi_{1}, \quad \forall j, l \ge n_{0}.$$
(54)

We can find r > 0 such that $(rx_0/2)\eta(x_0/2) > \phi_1$, where η is the kernel associated with Musielak-Orlicz function \mathcal{M} , such that

$$M_{i}\left(q\left(\frac{A_{i}\left(B_{\Lambda}^{\mu}\left(x^{j}-x^{l}\right)\right)}{h\left(x^{j}-x^{l}\right)}\right)\right)^{p_{i}} \leq \frac{rx_{0}}{2}\eta\left(\frac{x_{0}}{2}\right)$$

$$\implies q\left(A_{i}\left(B_{\Lambda}^{\mu}\left(x^{j}-x^{l}\right)\right)\right)^{p_{i}} < \frac{rx_{0}}{2} \cdot \frac{\varepsilon}{rx_{0}} = \frac{\varepsilon}{2}.$$
(55)

Hence $A_i(B^{\mu}_{\Lambda}x^j)_{j\geq 1}$ is a Cauchy sequence in (X, q), which is complete. Therefore, for each $k \in \mathbb{N}$, there exist $x_k \in X$ and $x = (x_k)$ such that $q(A_i(B^{\mu}_{\Lambda}(x^j - x)))^{p_i} \to 0$ as $j \to \infty$. Using the continuity of \mathcal{M} , so for some $\rho > 0$, we have

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{\lim_{i \to \infty} A_{i} \left(B^{\mu}_{\Lambda} \left(x^{j} - x^{l} \right) \right)}{\rho} \right) \right)^{p_{i}} \le 1$$
$$\implies \sup_{s \ge 1, \sigma \in \mathscr{C}_{s}} \frac{1}{\phi_{s}} \sum_{i \in \sigma} M_{i} \left(q \left(\frac{A_{i} \left(B^{\mu}_{\Lambda} \left(x^{j} - x^{l} \right) \right)}{\rho} \right) \right)^{p_{i}} \le 1.$$
(56)

Now, taking the infimum of such ρ 's by (53), we get

$$\inf \left\{ \rho > 0 : \right\}$$

$$\sup_{s \ge 1, \sigma \in \mathscr{C}_s} \frac{1}{\phi_s} \sum_{i \in \sigma} M_i \left(q \left(\frac{A_i \left(B^{\mu}_{\Lambda} \left(x^j - x^l \right) \right)}{\rho} \right) \right)^{p_i} \le 1 \right\} < \varepsilon,$$

$$\forall j \ge n_0.$$
(57)

Since $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is a linear space and $(x - x^j)$ are in $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$, so it follows that $x = x^j + (x - x^j) \in$ $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$. Hence $m(\mathcal{M}, A, B^{\mu}_{\Lambda}, \phi, q, p)$ is complete. This completes the proof of the theorem.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
