Ali^{c*}^aFaculty of Science and IT, Al-Balqa'a Applied University, Salt, Jordan, ^bDepartment of Chemistry, The University of Jordan, Amman 11942, Jordan, and ^cDepartment of Chemistry, Al al-Bayt University, Mafraq 25113, JordanCorrespondence e-mail: bfali@aabu.edu.jo

Received 6 November 2012; accepted 13 November 2012

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.014$ Å; R factor = 0.050; wR factor = 0.102; data-to-parameter ratio = 29.5.

The asymmetric unit of the title compound, $(\text{C}_7\text{H}_{10}\text{N})_2[\text{HgBr}_4]$, consists of one cation and one half-anion, bisected by a twofold rotation axis passing through the metal atom. The anion exhibits a distorted tetrahedral arrangement about the Hg^{II} atom. In the crystal, the cations and anions are linked by $\text{N}-\text{H}\cdots\text{Br}$ hydrogen-bonding interactions along $[010]$. Cation-cation $\pi-\pi$ stacking and $\text{Br}\cdots\text{Br}$ intermolecular interactions are absent.

Bis(2,4-dimethylpyridinium) tetrabromidomercurate(II)**Rawhi Al-Far, Salim F. Haddad and Basem F. Ali****S1. Comment**

Noncovalent interactions play an important role in organizing structural units in both natural and artificial systems (Desiraju, 1997). In connection with ongoing studies (Al-Far & Ali 2007; Ali & Al-Far 2007; Ali *et al.*, 2008) of the structural aspects of bromometal anions salts, we herein report the crystal structure of the title compound, (I).

In the title compound, Fig. 1, the asymmetric unit of the title compound, $(C_7H_{10}N)_2[HgBr_4]$, consists of one cation and one half-anion, bisected by a twofold rotation axis passing through the metal center. The anion exhibits a distorted tetrahedral arrangement about the Hg atom (Table 1). The Hg—Br1 and the symmetry related one [2.5767 (11)Å] bonds are almost invariant and significantly shorter than Hg—Br2 and symmetry related one [2.6160 (11)Å]. These lengths fall within the range of Hg—Br distances reported previously for compounds containing $[HgBr_4]^{2-}$ anions (Gowda *et al.*, 2009; Li *et al.* 2009). It is noteworthy that the longer Hg—Br2 and the symmetry related bonds are involved in more and shorter interactions than the shorter bonds (Table 1). In the cation, the bond lengths and angles are in accordance with normal values (Allen *et al.*, 1987). In the crystal structure the cations and anions are linked by N—H \cdots Br hydrogen bonding interactions, Fig.2 along [010] direction. Cation \cdots cation $\pi\cdots\pi$ stacking and Br \cdots Br intermolecular interactions are absent.

S2. Experimental

A warm solution (40°C) of $HgCl_2$ (1.0 mmol) dissolved in ethanol (10 ml; 95%), was added drop wise to a stirred hot solution of 2,4-dimethylpyridine (1 mmol) dissolved in ethanol (10 ml; 95%) and HBr (60%, 1 ml). During reflux for 2 h, liquid Br_2 (1 ml) was added to the mixture. The final mixture was allowed to stand undisturbed at room temperature. Colorless crystals of the title salt formed in two days, filtered off and one crystal suitable for diffraction measurements is used to collect data.

S3. Refinement

All H atoms were positioned geometrically and refined using a riding model, with N—H = 0.86 Å and C—H = 0.93 and 0.96 Å, for aryl and methyl H-atoms, respectively. The $U_{iso}(H)$ were allowed at $1.5U_{eq}(C \text{ methyl})$ or $1.2U_{eq}(N/C \text{ non-methyl})$.

**Figure 1**

Molecular configuration and atom naming scheme for the title compound. Displacement ellipsoids are drawn at the 30% probability level. Symmetry operation (A) stands for $-x + 1, y, -z + 3/2$.

**Figure 2**

Packing diagram of the title compound, down crystallographic *c* axis. Interspecies hydrogen bonds are shown as dashed lines (N—HBr). Symmetry code (i) : $x, -y, z+1/2$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
