

The contribution of interactions to
arthropod community structure depends
on the place and time: Why community
ecologists should think locally and
regionally

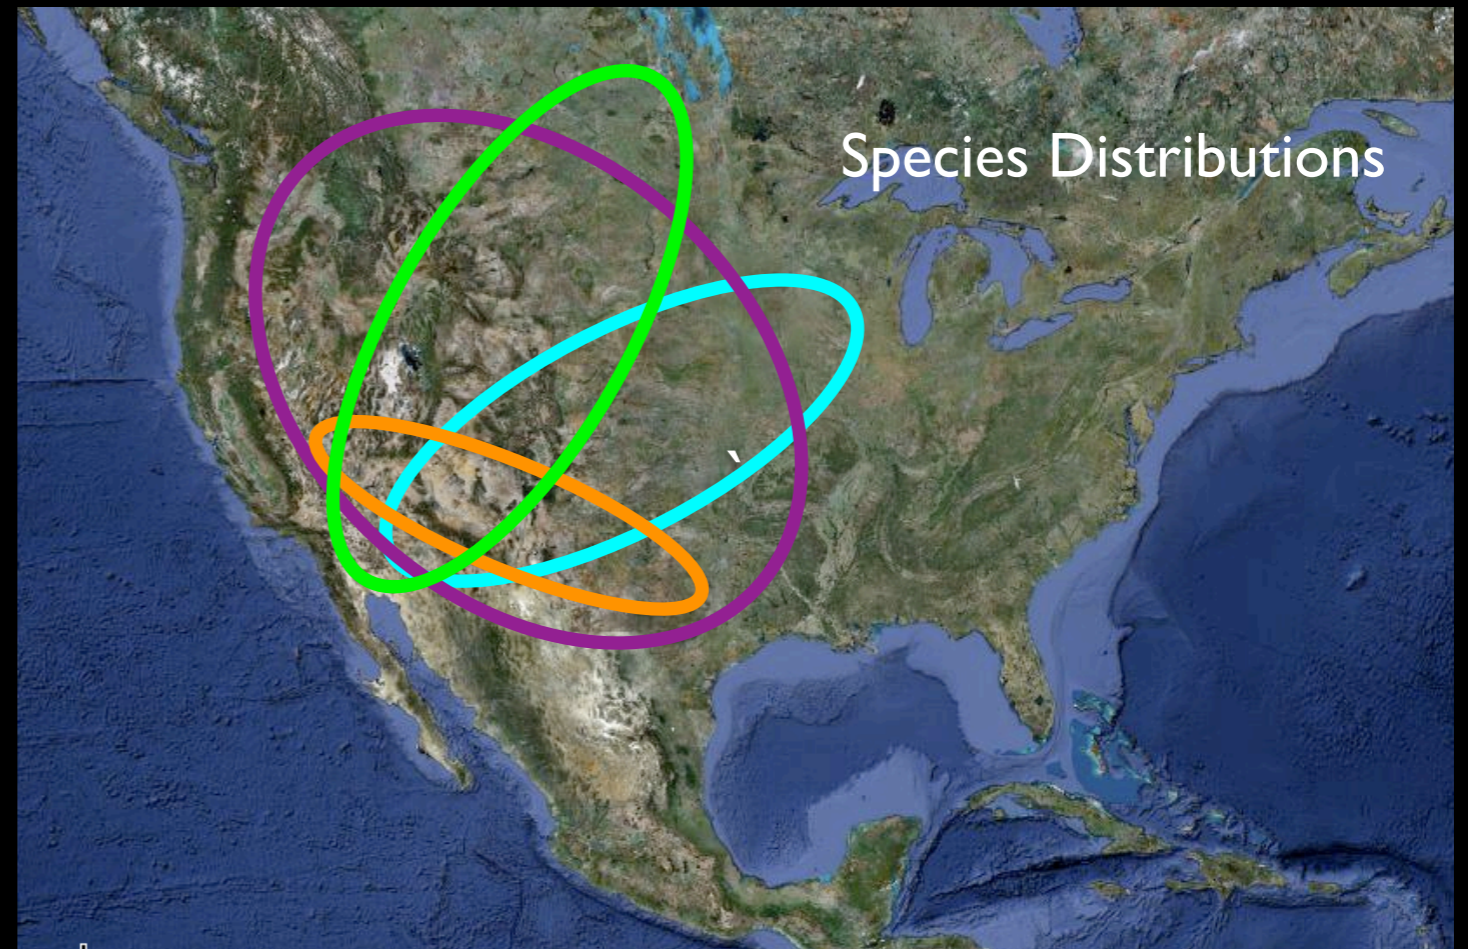

Matthew K. Lau, Laura E. Hagenauer and Thomas G. Whitham

Department of Biological Sciences
Northern Arizona University

Canopy Arthropod Community

The background of the slide features a tree with a detailed illustration of its root system. The roots are shown in a dark, textured style, spreading out from the trunk into the ground. The tree's canopy is visible at the top, with green leaves. The overall image is in grayscale, except for the green leaves and the white text boxes.

Canopy Arthropod Community

**How important are
interactions of canopy
arthropod species?**

Conclusions

Conclusions

- Local interactions can play a role in producing local community structure

Conclusions

- Local interactions can play a role in producing local community structure
- Forces vary by month and by stand

Conclusions

- Local interactions can play a role in producing local community structure
- Forces vary by month and by stand
 - Could result from stand-environmental or compositional differences
