Received 22 July 2012; accepted 31 July 2012

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.007$  Å;  
 $R$  factor = 0.052;  $wR$  factor = 0.106; data-to-parameter ratio = 17.7.

The asymmetric unit of the title compound,  $C_{28}H_{22}Br_2N_2O_2S_2$ , comprises half of a Schiff base ligand, the whole molecule being generated by a crystallographic inversion center located at the mid-point of the C–C bond of the central methylene segment. Intramolecular O–H···N and O–H···S hydrogen bonds make  $S(6)$  and  $S(5)$  ring motifs, respectively. In the crystal, there are no significant intermolecular interactions.

#### **Comment**

In continuation of our work on the crystal structures of Schiff base ligands (Kargar *et al.*, 2011; Kia *et al.*, 2010), we synthesized and determined the X-ray crystal structure of the title compound.

The asymmetric unit of the title compound, Fig. 1, comprises half of a Schiff base ligand. The whole molecule is generated by a crystallographic inversion center located in the middle of the C14—C14<sup>i</sup> bond of the methylene segment [Symmetry code: (i) -*x*, -*y*+1, -*z*+1]. The bond lengths (Allen *et al.*, 1987) and angles are within the normal ranges. Intramolecular O—H···N and O—H···S hydrogen bonds make S(6) and S(5) ring motifs, respectively (Table 1; Bernstein *et al.*, 1995).

There are no significant intermolecular interactions in the crystal structure.

#### **Experimental**

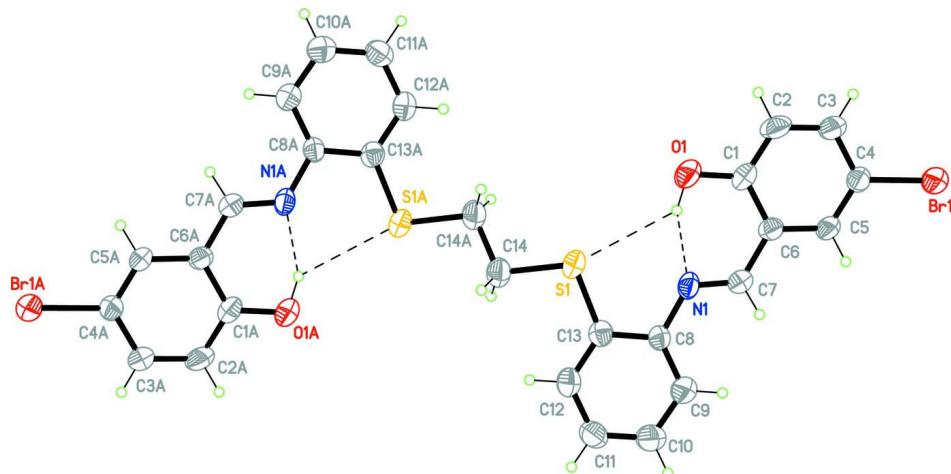

The title compound was synthesized by adding 5-bromosalicylaldehyde (2 mmol) to a solution of 2-(2-(2-aminophenyl-thio)ethylthio)benzenamine (1 mmol) in ethanol (30 ml). The mixture was refluxed with stirring for half an hour. The resultant solution was filtered. Light-yellow needle-like crystals of the title compound, suitable for *X*-ray structure analysis, were obtained by slow evaporation of a solution in ethanol at room temperature over several days.

#### **Refinement**

The O-bound H atom was located in a difference Fourier map and constrained to refine on the parent atom with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ . The C-bound H atoms were included in calculated positions and treated as riding atoms: C-H = 0.93 and 0.97 Å for CH and CH<sub>2</sub> H atoms, respectively, with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ .

#### **Computing details**

Data collection: *APEX2* (Bruker, 2005); cell refinement: *SAINT* (Bruker, 2005); data reduction: *SAINT* (Bruker, 2005); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXTL* (Sheldrick, 2008) and *PLATON* (Spek, 2009).

**Figure 1**

The molecular structure of the title compound, showing 40% probability displacement ellipsoids and the atomic numbering [symmetry code for A: -x, -y + 1, -z + 1]. Dashed lines show the intramolecular interactions

#### **4-Bromo-2-[(*E*)-(2-{[2-[(*E*-5-bromo-2-hydroxybenzylidene]amino)phenyl]sulfanyl}ethylsulfanyl}phenyl)iminomethyl]phenol**

##### *Crystal data*

Bruker SMART APEXII CCD area-detector diffractometer

Radiation source: fine-focus sealed tube

Graphite monochromator

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan (*SADABS*; Bruker, 2005)

$T_{\min} = 0.393$ ,  $T_{\max} = 0.694$

10754 measured reflections

2879 independent reflections

1277 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.093$

$\theta_{\max} = 27.1^\circ$ ,  $\theta_{\min} = 1.5^\circ$

$h = -17 \rightarrow 17$

$k = -6 \rightarrow 4$

$l = -22 \rightarrow 22$

##### *Refinement*

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.052$

$wR(F^2) = 0.106$

$S = 0.93$

2879 reflections

163 parameters

0 restraints

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H-atom parameters constrained

$$w = 1/[\sigma^2(F_o^2) + (0.0347P)^2]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.38 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.55 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional R-factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and R-factors based on ALL data will be even larger.
