## I. Thymine monomer

The ground-state geometry of thymine in the singlet, triplet, cation doublet, and anion doublet was optimized with DFT (B3LYP and  $\omega$ B97XD) and CC2. The  $\omega$ B97XD geometries are shown in the first row of Fig. S1. Cartesian coordinates for all levels and states are provided later in this Supporting Information. All three methods produce similar geometries. The singlet and the cation doublet ground states are planar. The triplet and the anion doublet ground states show out-of-plane ring distortions. The singlet ground state, with a closed shell electronic configuration, is the most stable state among the four (Table S1). It is energetically closely followed by the anion species (singly occupied  $\pi^*$ ), then by the triplet ( $\pi\pi^*$ ) and finally by the cation (singly occupied  $\pi$ ).

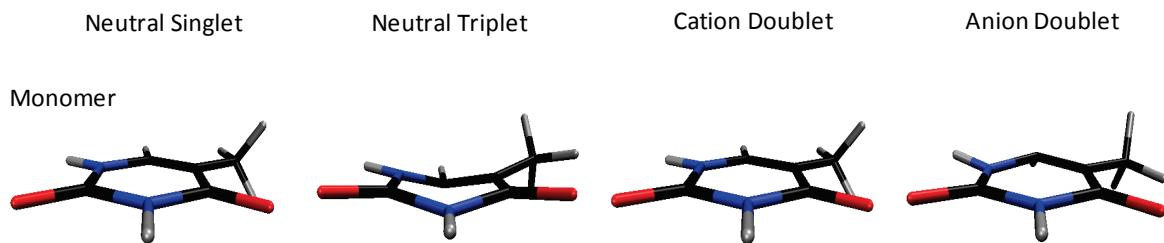

Fig. S1 – Thymine monomer geometries.

Table S1 – Characterization of the ground state of thymine monomer. M – Multiplicity; Q – total charge; S – adiabatic state label; C – diabatic-state character based on the singly-occupied orbitals in the main configuration.  $E_0$  – absolute energy of the state;  $\Delta E_0$  – energy relative to the singlet ground state;  $E_{ZP}$  – zero-point energy based on un-scaled harmonic frequencies;  $\Delta E_{ZP}$  – zero-point corrected relative energy. cs – Closed shell.

M	Q	S	Method	$E_0$ (au)	C	$\Delta E_0$ (eV) [kcal/mol]	$E_{ZP}$ (au)	$\Delta E_{ZP}$ (eV) [kcal/mol]

			CC2	-453.378570	$\pi^*$	0.44 [10.1]	-	-

The lowest vertical excitation energies of thymine are given in Table S2. In the singlet state, the lowest excited state is an excitation from the oxygen lone pairs ( $n_O$ ) into the  $\pi^*$ . The first  $\pi\pi^*$  bright state is the next state with values ranging from 5.04 eV to 5.28 depending of the method. As for comparison with experiments, the first dipole-allowed transition of thymine vapor is peaked at 4.95 eV.<sup>[1]</sup> The excited-state relaxation of thymine after excitation into this state is discussed in Ref.<sup>[2]</sup>. Excitations with the triplet manifold start at about 2 eV above

the  $T_1$  triplet ground state, also with an  $n_O\pi^*$  excitation. The cation manifold is reached right above 1 eV, while the anion states are just below this level. There is a good agreement among the three computational levels provided in Table S2. The first excited state of the singlet, cation and anion are systematically higher in energy with  $\omega$ B97XD than with the other methods. For the singlet, DFT-MRCI excitations are given later in Table S3. The good agreement between methods can be better visualized in Fig. S2, where energy levels for all multiplicities are given in the same scale relative to the minimum of the singlet state.

Table S2 – Characterization of the excited states of thymine monomer. All single-point calculations for the anion with the aug-cc-pVTZ basis set.  $\Delta E$  – excitation energy relative to the ground state of the same multiplicity and charge;  $f$  – oscillator strength for excitation from the ground state. See caption of Table S1 for abbreviations.

## II. DFT-MRCI results

Table S3 - DFT-MRCI excited states of neutral singlet states of thymine monomer, dimer and complex. Thymine complex based on  $\omega$ B97XD/cc-pVTZ geometry.  $s$  – Contribution of single excitations for the state.  $\Delta E$  – excitation energy relative to the ground state of the same multiplicity and charge;  $f$  – oscillator strength for excitation from the ground state. C – diabatic-state character based on the singly-occupied orbitals in the main configuration; cs – closed shell. For  $S_0$ , the absolute energy is given in atomic units.

### III. Energy levels

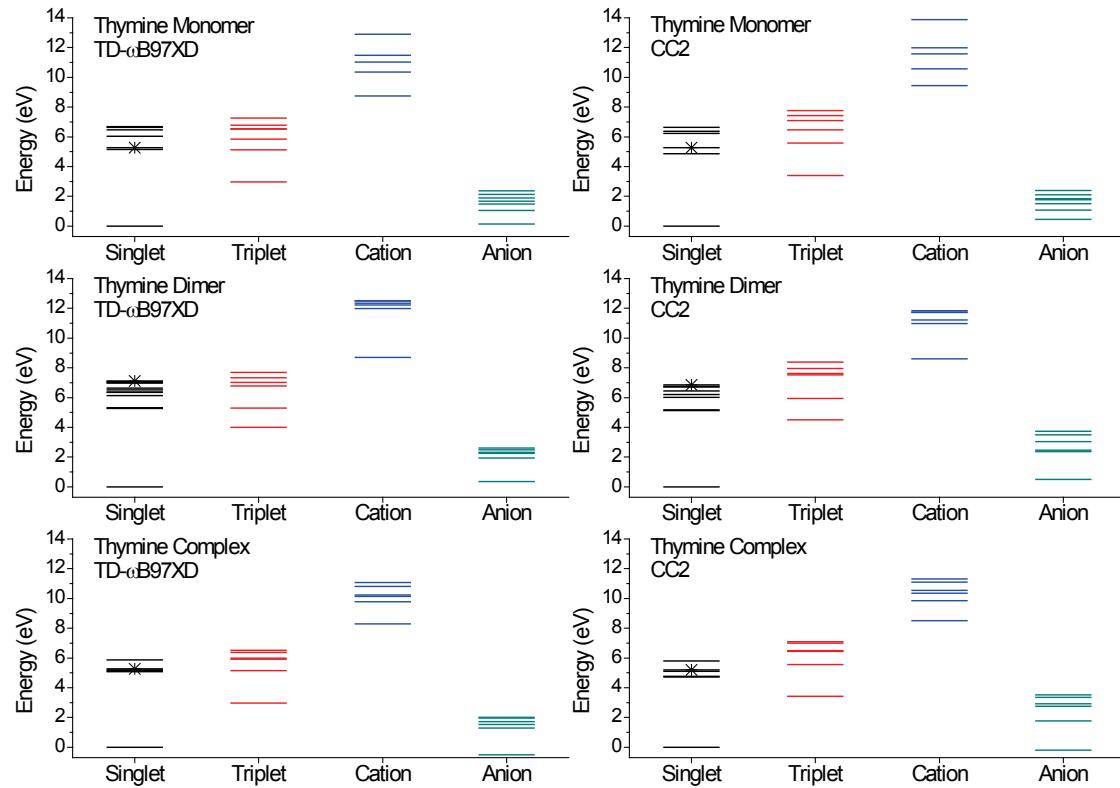

Fig. S2 – Energy levels of thymine monomer, dimer and complex relative to the ground-state singlet of each species. Crosses indicate bright states ( $f > 0.1$ ).

#### IV. Grid definition

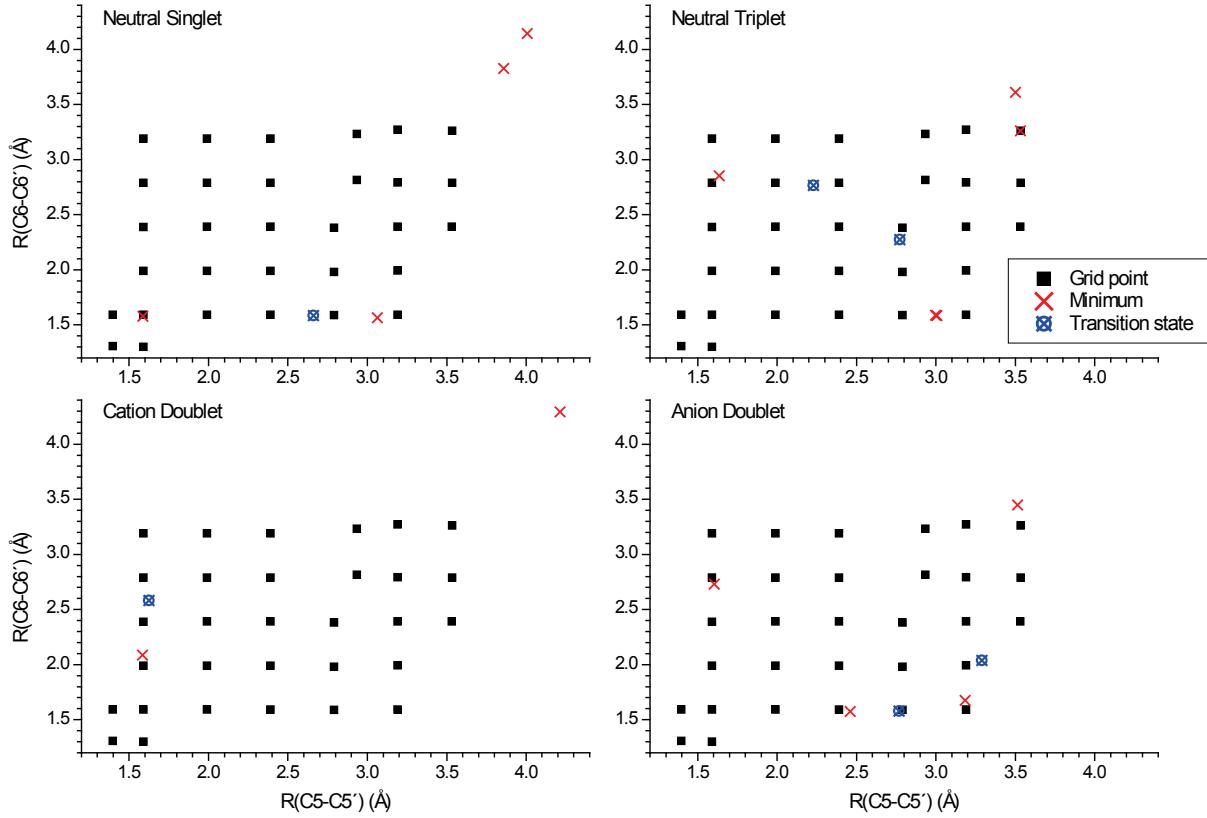

Fig. S3 – Definition of the grid used to compute the potential energy surface. In addition to the points with fixed values of  $R(C5-C5')$  and  $R(C6-C6')$ , fully optimized geometries and transition states (still keeping the sugar restrictions) were included as well.

## V. Basis set effects

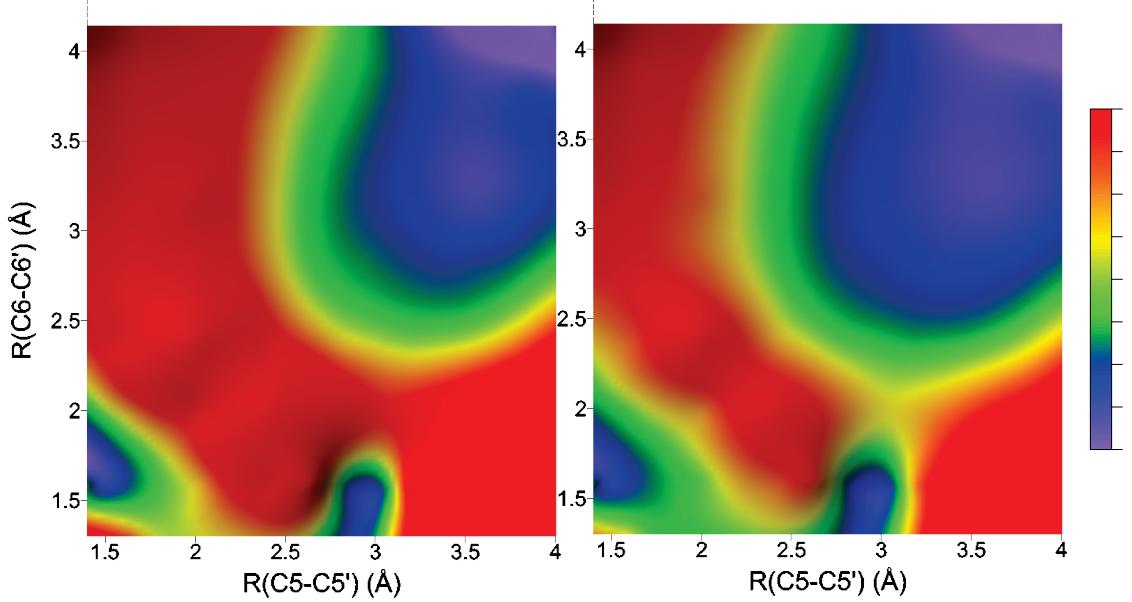

Fig. S4 – 2D cuts of the potential energy and charge difference surfaces of thymidine dimer (ground state neutral singlet). Comparison of calculations with aug-cc-pVDZ and cc-pVTZ for thymines. Sugars were computed with the cc-pVDZ basis set in both cases. Both maps are based on the same geometries, optimized with cc-pVTZ (thymines) and cc-pVDZ (sugars).

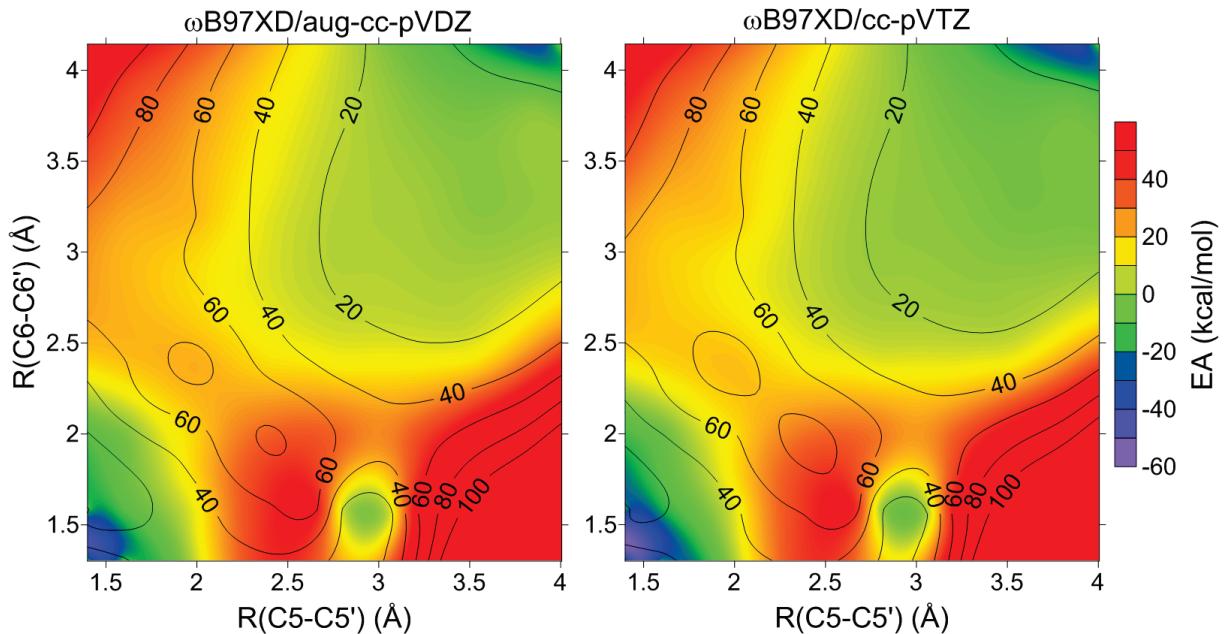

Fig. S5 - Energy difference between the singlet ground state and the anion ground state (EA) computed on singlet geometries. The contours indicate the singlet energies. Comparison of calculations with aug-cc-pVDZ and cc-pVTZ for thymines. Sugars were computed with the cc-pVDZ basis set in both cases. Both maps are based on the same geometries, optimized with cc-pVTZ (thymines) and cc-pVDZ (sugars).
