## Abstract

$\text{In}_2\text{O}_7\text{Si}_2$ , monoclinic,  $C12/m1$  (No. 12),  $a = 6.626(1)$  Å,  $b = 8.604(1)$  Å,  $c = 4.707(1)$  Å,  $\beta = 102.94(2)^\circ$ ,  $V = 261.5$  Å $^3$ ,  $Z = 2$ ,  $R_{\text{g}}(F) = 0.025$ ,  $wR(F^2) = 0.059$ ,  $T = 300$  K.

## Source of material

Single crystals of indium disilicate were grown as a side product by chemical vapour transport of  $\text{Ga}_2\text{O}_3$  and  $\text{In}_2\text{O}_3$  in a closed quartz ampoule. Hydrogen chloride was used as transport agent and a mixture of  $\text{Ga}_2\text{O}_3$  (3.3 mmol) and  $\text{In}_2\text{O}_3$  (5.0 mmol) as source material. After two days of heating in a temperature gradient (1073 K → 1273 K), chemical transport was continued for 6 days using the inverted gradient. Gallium indium oxide was deposited as main product in the crystallization zone. Single crystals of indium disilicate were formed via reaction of  $\text{In}_2\text{O}_3$  with the quartz wall in small amounts.

**Table 2.** Atomic coordinates and displacement parameters (in Å $^2$ ).

Atom	Site	x	y	z	$U_{11}$	$U_{22}$	$U_{33}$	$U_{12}$	$U_{13}$	$U_{23}$

## Discussion

The crystal structure of  $\text{In}_2\text{Si}_2\text{O}_7$  is closely related to the thortveitite type which crystallizes in the monoclinic system (space group  $C2/m$ ,  $Z = 2$ ). Previous structural studies have been performed by Hagenmuller et al. [1] based on Rietveld refinements of X-ray powder diffraction data. The starting parameters for our refinement were taken from [1], which implies an origin shift of 0 0 1/2 compared to the original description of the thortveitite structure [2], but is in agreement with the TYPiX database [3].

The Si—O distances range from 161 pm to 164 pm, the In—O distances from 211 pm to 225 pm. The Si—O1—Si' angle in the  $\text{Si}_2\text{O}_7$  group is 180° forced by the centre of symmetry. It might be possible that we observe the average structure of a disordered  $\text{Si}_2\text{O}_7$  group with a bonding angle unequal to 180°. But from the fact that the anisotropy of the displacement ellipsoid of O1 is rather moderate we conclude that the deviation of this angle from 180° is only small.

**Table 1.** Data collection and handling.

Crystal:	colourless rod, size 0.04 × 0.07 × 0.17 mm
Wavelength:	Mo $K_\alpha$ radiation (0.71073 Å)
$\mu$ :	92.59 cm $^{-1}$
Diffractometer, scan mode:	Stoe IPDS, 200 exposures, $\Delta\phi = 1.5^\circ$
$2\theta_{\text{max}}$ :	56.04°
$N(hkl)_{\text{measured}}$ , $N(hkl)_{\text{unique}}$ :	1296, 298
Criterion for $I_{\text{obs}}$ , $N(hkl)_{\text{gt}}$ :	$I_{\text{obs}} > 2 \sigma(I_{\text{obs}})$ , 287
$N(\text{param})_{\text{refined}}$ :	32
Programs:	SHELXL-93 [4], CIF2SX [5]
