

Physiologically-based Pharmacokinetics (PBPK) Linked to Pharmacodynamics: *In silico* and *in vitro* Parameterization

Michael B. Bolger, Ph.D.
Chief Scientist
Simulations Plus, Inc.

GPEN, Kansas, 2006

Outline

- PBPK background and principles
 - Pioneers who have influenced our thinking
 - Why PBPK compared to compartmental?
 - Perfusion limited vs. Permeability limited
 - Equations for transport and clearance
- *In silico* generation of organ physiology (PEAR)
- *In silico* calculation of tissue:plasma partition coefficients (and options)
- Examples

GPEN, Kansas, 2006

Pioneers who influenced our thinking

- **Teorell** (1937)
- **Rowland**: Nestorov, Blakey (*iv* barbiturates), Kawai (*iv, po* cyclosporin), Rodgers (*iv, po* β -blockers)
- **Stanski**: Wada (*iv* thiopental)
- **Krishnan**: Poulin (*in silico* Kps), Haddad (*in silico* organ physiology)
- **Price** (*in silico* organ physiology)
- **Brown** (*in vivo* organ physiology)
- **Sugiyama, Holford, Houston**

GPEN, Kansas, 2006

Why PBPK?

- Physically relevant model
- Amenable to inter-species scaling
- Simulate C_p vs. time from *in vitro* data
- Explore PK as function of physiology
 - Disease states
 - Variability

GPEN, Kansas, 2006

Tissue Models

- A fairly complex model:

GPEN, Kansas, 2006

Tissue Models

- **Blood Compartment:**
 - Well Mixed
 - No clearance
 - Linear binding
 - Rapid RBC penetration

$$\frac{dC_{bo}}{dt} = \frac{Q}{V}(C_{bi} - C_{bo})$$

GPEN, Kansas, 2006

Tissue Models

- Perfusion Limited Tissue:
 - Well Mixed
 - Rapid membrane permeation
 - Same unbound concentration in interstitial and intracellular space
 - Preferential partitioning to tissue (K_p)

GPEN, Kansas, 2006

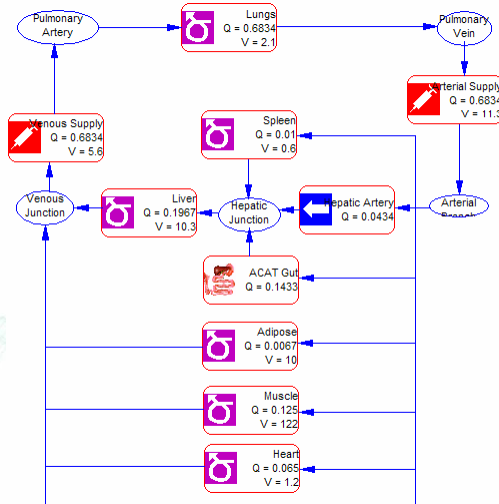

Tissue Models

- Permeability Limited Tissue
 - Slow permeation across cell membranes
 - Unbound concentrations in intracellular and interstitial space are different
 - Only unbound drug permeates or is transported

GPEN, Kansas, 2006

Global Model

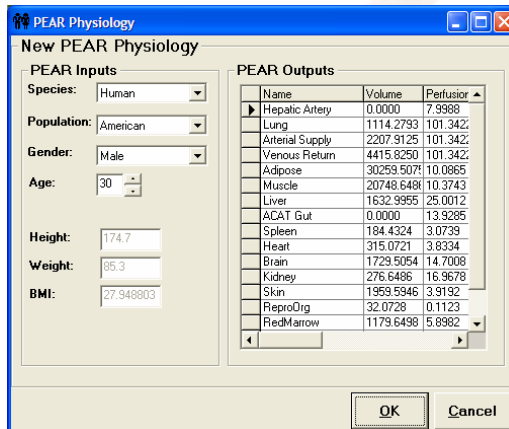

GPEN, Kansas, 2006

GastroPlus Generates PBPK Parameters for You

PEAR Physiology™ Generator
 American/Western
 Japanese/Asian
 Rat (single physiology)

Automatically generates all tissue parameters for selected ethnic group, gender, and age.

Generates random samples for Virtual Trials

GPEN, Kansas, 2006

National Health and Nutrition Examination Survey (NHANES) 2001 – 2002 data

- 11,039 people participated
 - 5331 males, 5708 females
 - 3293 Hispanic
 - 4606 Non-Hispanic White
 - 2681 Non-Hispanic Black
 - 459 other race
- Collected Weight, Height, BMI, and bioelectrical impedance (R = Ohms).

GPEN, Kansas, 2006

In Silico Tissue Distribution

- Predicting Tissue/Plasma Partition (K_p):
– Poulin & Thiel

$$K_p = \frac{[K \cdot (V_{nlt} + 0.3V_{phl})] + [1 + (V_{wt} + 0.7V_{phl})]}{[K \cdot (V_{nlp} + 0.3V_{php})] + [1 + (V_{wp} + 0.7V_{php})]} \cdot \frac{fu_p}{fu_t}$$

adipose : $K = D_{vo:w}^*$

other : $K = P_{o:w}$

$\log P_{vo:w} = 1.115 \log P_{o:w} - 1.35$ Leo, Hansch

$$fu_t = \left[\left(1 + \left(1 - fu_p \right) / fu_p \right) \cdot RA_{tp} \right]$$

V_{nlt}, V_{phl}, V_{wt} : Volume fraction of neutral lipids, phospholipids, water

RA_{tp} : Albumin ratio tissue : plasma

GPEN, Kansas, 2006

GastroPlus Generates PBPK Parameters for You

Rodgers and Rowland K_p s:

$$K_p = K_{pu} * fu_p$$

Unbound tissue plasma partition coefficient, K_{pu} , is calculated differently for strong bases than for other drugs.

1. **Strong bases and zwitterions with at least one base $pK_a \geq 7$** – takes into consideration the unique interaction of bases with acidic phospholipids ([details](#))

$$K_{pu} = V_{ewt} + \left(\frac{(1/X_{[D],IW})}{(1/X_{[D],P})} \right) V_{iwt} + \left(\frac{Ka[AP]_T((1/X_{[D],IW}) - 1)}{(1/X_{[D],P})} \right) + \left(\frac{K \cdot V_{nlt} + (0.3K + 0.7)V_{phl}}{(1/X_{[D],P})} \right)$$

2. **Acids, Neutrals, and weak bases** – takes into account binding to lipoproteins (neutral drugs) or tissue albumin (acids and weak bases)

$$K_{pu} = \frac{(1/X_{[D],IW})V_{iwt}}{(1/X_{[D],P})} + V_{ewt} + \left(\frac{K \cdot V_{nlt} + (0.3K + 0.7)V_{phl}}{(1/X_{[D],P})} \right) + \left[\left(\frac{1}{fu_p} - 1 - \frac{K \cdot V_{nlp} + (0.3K + 0.7)V_{php}}{(1/X_{[D],P})} \right) \times RA_t \right]$$

$X_{[D]}$ – fraction of neutral drug species in intracellular water (IW, pH=7) and plasma (P, pH=7.4)

K – vegetable oil/water partition coefficient for adipose tissue and 1-octanol/water partition coefficient for remaining tissues

fu_p – fraction unbound of drug in plasma, Ka – association constant of base with acidic phospholipids, $[AP]_T$ – tissue concentration of acidic phospholipids

RA_t – tissue/plasma lipoprotein or albumin ratio

Factors Impacting Bioavailability

- **Physiological**
 - pH
 - Transit Time
 - Gastric Emptying
 - GI Dimensions
 - Liver Blood Flow
 - Species
 - Sex
 - Food Effects
- **Biochemical**
 - Plasma Protein Binding
 - Liver Enzymes
 - Gastrointestinal
 - Metabolic Enzymes
 - Efflux proteins
 - Transporters
 - Pharmacogenomics

Drug and Excipient Interactions with all of the above.

GPEN, Kansas, 2006

Enterocyte Model for Each Compartment

GPEN, Kansas, 2006

Carrier-mediated Transport

$$dM_{ent(i)}/dt =$$

- + Apical Diffusion Rate
- + Apical Carrier-mediated Transport Rate
- Basolateral Transfer Rate
- Gut Metabolism Rate

Apical Carrier-mediated Transport rate =

$$DF_{influx(i)} V_{max,influx} C_{(i)} / (K_{m,influx} + C_{(i)}) - DF_{efflux(i)} V_{max,efflux} C_{u,ent(i)} / (K_{m,efflux} + C_{u,ent(i)})$$

DF = distribution factor for transporter amounts *relative to* V_{max} measurement environment (when V_{max} in a compartment is the same as V_{max} in the measurement environment, then DF = 1.0).

GPEN, Kansas, 2006

Transporter Distribution Factors

Lower V_{max}

Higher V_{max}

GPEN, Kansas, 2006

First Pass Metabolism

- Gut wall metabolism can be significant, especially for CYP3A4 and CYP2D6 substrates
- Hepatic first pass is a function of the unbound concentration presented to the liver and hepatic blood flow rate
- Changing absorption location and rate can change *both* gut wall metabolism and hepatic first pass metabolism

GPEN, Kansas, 2006

Calculation of hepatic clearance

Houston et al. (1997)

Step 1. *In vitro* incubation of drug with microsomes/hepatocytes/liver slices to obtain enzyme kinetic constants V_{max} and K_m and the *in vitro* intrinsic clearance

Step 2. Scale *in vitro* enzyme kinetic constants to *in vivo* conditions based on species-specific physiological scale factors.

Step 3. Based on a hepatic blood flow model (e.g. Venous equilibrium model⁽¹⁾), determine *in vivo* hepatic clearance. Rate of drug elimination = $CL_h \times$ Concentration

GPEN, Kansas, 2006

Significance of Gut Metabolism and Controlled Release

GPEN, Kansas, 2006

Gut Metabolism Scale Factors

Paine MF and Thummel KE, JPET, 1997; 283(3): p. 1552-62.

Liver CYP3A = 5489 nmol
Liver Wt. = 1800 g
MicProt = 52.5 mg / g liver
CYP3A4 = 69.7 pmol / mgP

3A4 (nmol) = 9.7 38.4 22.4

GPEN, Kansas, 2006

Image J Analysis of Jejunum vs. Colon Metabolism Scale Factors

Liver CYP3A = 5489 nmol
 Jejunum CYP3A4 = 38.4 nmol
 Colon CYP3A4 = 0.6 - 6.7 nmol

Figure 4. RNA blot analysis of human gastrointestinal mRNA samples. The abundant transcript CYP3A4 (P450) mRNA, sizes in approximately 1.9 kb. Lane 1 to 1 contains 5 micrograms of human liver mRNA, lane 4 contains 5 micrograms jejunal mRNA, lanes 5-15 (hybridization at 50 degrees C; wash at 65 degrees C in 0.1 X SSC).

Jejun.....Colon.....

(Agoram & Bolger, 2001)

GPEN, Kansas, 2006

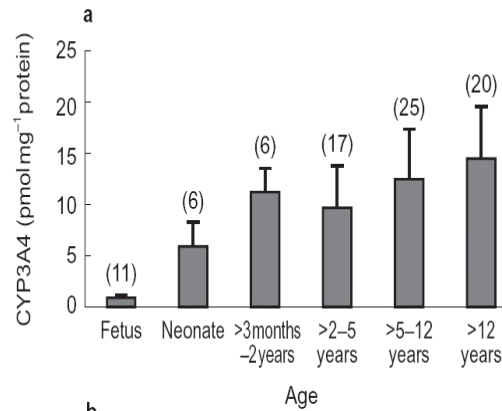

Midazolam (New dose design)

- Aim: To design a new formulation of MDZ to minimize first pass
- Method: Avoid gut metabolism by releasing drug in colon
- 0% released at 3h; 100% released at 5h
- F_b increases from 25% to 45%
- E_g reduces from 49% to 6%

Figure 1. RT-PCR analysis of human PepT1, PTR3, PHT1, and HPT-1 mRNAs in the human esophagus (A), stomach (B), duodenum (C), jejunum (D), ileum (E), ileocecum (F), cecum (G), ascending colon (H), transverse colon (I), descending colon (J), rectum (K), and in Caco-2 cells (L). RT-PCR was performed with specific primers for each mRNA and amplified products of PepT1, PTR3, PHT1, and HPT-1 were 588, 470, 443, and 1004 bp, respectively. Reaction products were electrophoretically separated in 1.4% agarose gels, stained with ethidium bromide (top panels), and identity confirmed by Southern Blot analysis (lower panels). Commercially available human β -actin primers were used to generate a mRNA expression positive control, amplifying a product of 303 bp.

Conclusions

- *In silico* estimates of biopharmaceutical properties are useful in early discovery.
- The combination of *in silico*, *in vitro*, and PBPK provide useful simulations prior to *in vivo* testing.
- Significance / Relevance of transporters can be studied with simulation.
- Data Integration is essential.
