

An Introduction to the Open Archives Initiative Object Reuse and Exchange (OAI-ORE)

Jenn Riley

Metadata Librarian

Digital Library Program

This is all pretty new!

- OAI-ORE v1.0 specs released October 17, 2008
- Content, especially diagrams, in this presentation, adapted from <http://www.openarchives.org/ore/1.0/toc.html>
- Not going to explain all the details, just the ones that look like they'll be useful to production digital libraries

Purposes of OAI-ORE

- Identify “aggregations” of content
- Describe constituents/boundaries of aggregations

That’s it.

- Does *not* prescribe a protocol for transferring content between repositories
- Just about identifying in a machine-readable way what’s there, rather than providing tools for doing anything with that information

Design principles

- Built on web architecture
 - leverage the integrated nature of the web
 - use existing infrastructure to build semantics
- Uses RDF principles
 - think “subject,” “predicate,” object
 - but not only encoded in RDF
 - extends into Linked Data and Cool URIs

The problem

Astrophysics

3 **Parametrization of K-essence and Its Kinetic Term**

4 Hui Li, Zong-Kuan Guo, Yuan-Zhong Zhang

5 (Submitted on 31 Dec 2005 (v1), last revised 18 Jan 2006 (this version, v2))

We construct the non-canonical kinetic term of a k-essence field directly from the effective equation of state function $w_k(z)$, which describes the properties of the dark energy. Adopting the usual parametrizations of equation of state we numerically reproduce the shape of the non-canonical kinetic term and discuss some features of the constructed form of k-essence.

Definitions

- Objects of interest are *resources*
- Resources have *URIs* that identify them
- Aggregations:
 - stand for a set or collection of resources
 - an aggregation is itself a resource
- A *resource map* is a resource that describes the aggregation
- A *representation* is a datastream obtained after dereferencing a URI (e.g., for a resource map)

An example

More detail

<A-1>	<ore:aggregates>	<AR-1>
<A-1>	<ore:aggregates>	<AR-2>
<A-1>	<ore:aggregates>	<AR-3>

A-1	http://www.dlib.org/dlib/february06/smith/aggregation
AR-1	http://www.dlib.org/dlib/february06/smith/02smith.html
AR-2	http://www.dlib.org/dlib/february06/smith/pg1-13.html
AR-3	http://www.dlib.org/dlib/february06/smith/pg1-13.pdf

Requirements for Resource Maps

- **ore:describes**
 - referring to the aggregation resource
- **dcterms:creator**
 - **MUST** be a reference to a Resource of type `http://purl.org/dc/terms/Agent`
 - and be a human (???)
- **dcterms:modified**
 - referring to when the RM was last updated

Some potential features for Aggregations

- **ore:aggregates**
 - referring to resources that make up the aggregation
- **rdf:type**
 - no defined vocabulary
 - expected to use vocabularies other (reputable?) bodies develop (e.g., DCMI Type)

So what's the point of all of this again?

- A fancy way to say things belong together
 - machine-readable
 - machine-understandable?
- Fundamentals that could enable many higher-level services
 - presumably including “re-use” and “exchange”
 - but don't define those services here

Another possible feature of Resource Maps

- MAY include additional properties about the Aggregation and Aggregated Resources, such as:
 - relationships among the Aggregated Resources,
 - relationships from the Aggregated Resources to other Resources,
 - and other properties
- RMs are probably not all that useful to DLs unless this feature is employed

Some potential relationships between Aggregated Resources

- `dcterms:isVersionOf`
- `dcterms:replaces`
- `dcterms:references`

Serializations

- Atom
- RDF/XML
- RDFa
- METS serialization tentatively planned

Accessing Resource Maps over HTTP

- **RECOMMENDED:** 303 redirection and content negotiation
- Simpler use of 303 redirection for a single Resource Map
- Limited but simple strategy using hash URIs
- RFDa (or microformats) either alone or in addition to other formats
- HTTP Proxy URIs and ORE Proxy URI resolver at <http://oreproxy.org/r>

Possible ReM for digitized book

Possible ReM for data and published paper based on it

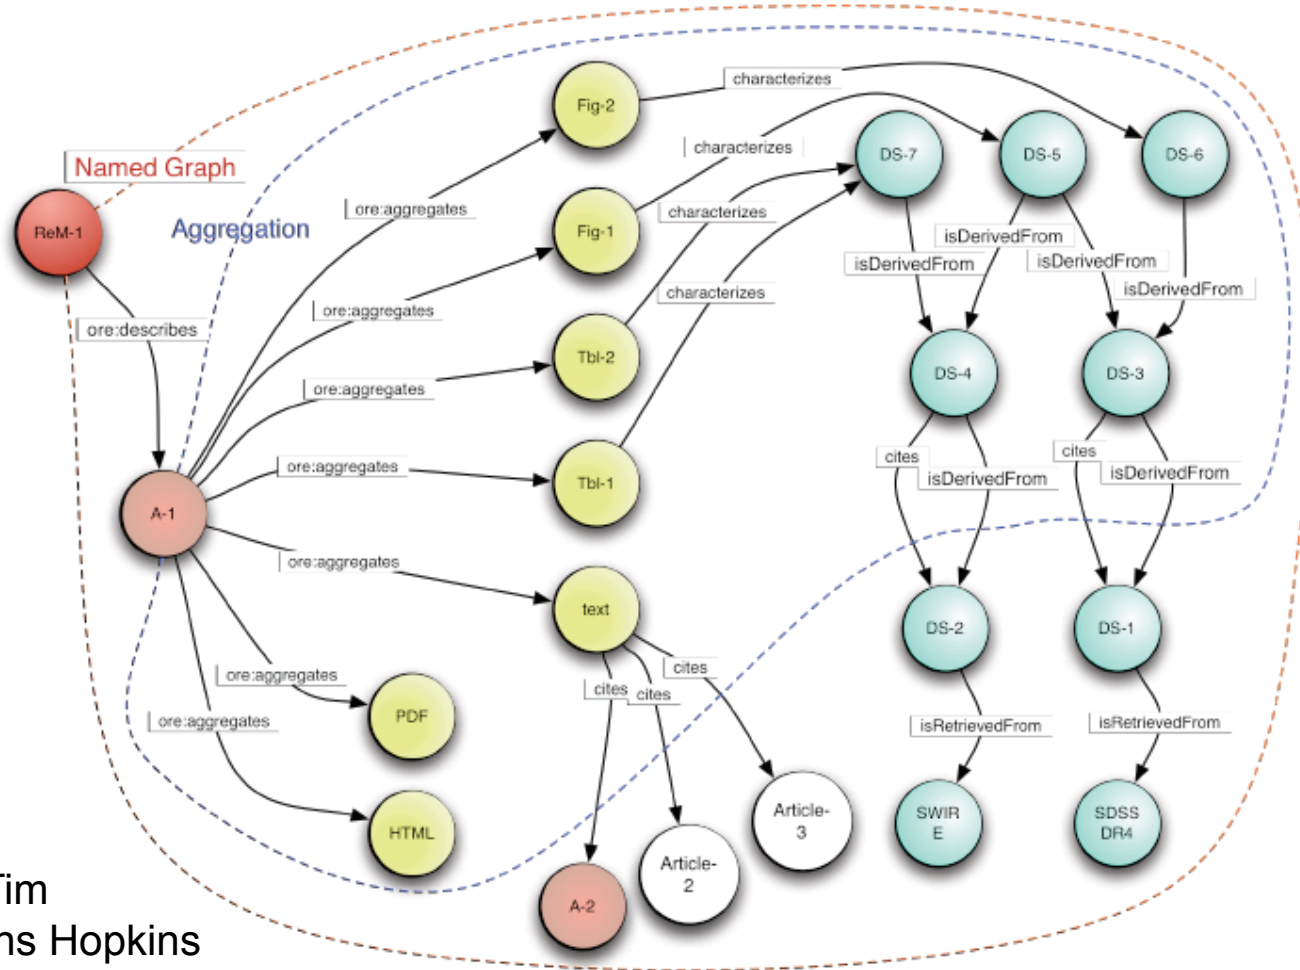

Diagram by Tim DiLauro, Johns Hopkins

How the DLP could use OAI-ORE

- As shared data representation for scenarios like those we just saw
- ReMs in RDFa behind individual item HTML displays to describe multiple versions
- Treat “collections” as aggregations and expose ReMs from DLP home page
- Connect online secondary sources to primary sources we deliver
- ???

The bottom line

- OAI-ORE *adds* a tool to our ever-growing cabinet
- Won't solve all of our problems
- But looks promising as one strategy for putting our collections *in the flow*.

Thank you!
