

Visit a data science Meetup near your University, and you will discover a plethora of computational biologists who are now working in the broad field of data science. Join me in my midlife career crisis, and learn about the overlap in vision and tools between computational/mathematical biology and the exploding data science field. I will share tools and perspectives that I have found in this new field that may be useful in computational biology, and I will also suggest how our computational biology students may find themselves prepared for a career as a data scientist.
