

Michael Adams' Biosphere Reserves lecture will serve as something of a "boot camp" for students interested in working in management of land for purposes of **conservation and sustainable local development**.

In the lecture on the Biosphere Reserves will include historical aspects, issues of conservation across a range of ecosystems, sustainable development, and the associated "Logistics" pertaining to requirements of Biosphere Reserves (see below in next line);

The Logistics include such issues as use of reserves for education, training, management, research, networking with agencies, outreach to surrounding communities;

The important connections with local people, indigenous peoples in many instances, and the specific stakeholders relevant to specific reserves;
