# Analysis of Patient Monitor Alarms in Adult Intensive Care Units

University of California, San Francisco April 25, 2014 Patricia Harris, RN, PhD

\*\*\*\*

AAMI/HTSI National Alarm Coalition

### **Disclosure Statement**

Our study was sponsored by GE Healthcare in agreement with the Industry Contracts Division, Office of Innovation, Technology & Alliances and with oversight by the Internal Review Board of the University of California, San Francisco (UCSF).

### **UCSF Research Team**

Principal Investigator Barbra Drew, RN, PhD

Co-Principal Investigator, Project Director Patricia Harris, RN, PhD

Co-Investigators: Xiao Hu, PhD Tina Mammone, RN, PhDc Dan Schindler, RN, MSN Jessica Zegre-Hemsey, RN, PhD

GE Healthcare – UCSF Alarm Study

### Drew – Hu Team

## Background Alarm Fatigue in the intensive care unit

### **Study Aims**

Assess alarm prevalence of patients' physiological monitor alarms

Identify audible alarm burden

Analyze select arrhythmia alarms to determine if true or false

Determine patient characteristics that may be associated with frequent alarms

**Ethical Considerations & Preparation** 

Ethical concerns addressed by the UCSF Committee on Human Research

Study approved with waiver of consent

UCSF Medical Center Privacy Office provided approval

UCSF Departments of Bioengineering and IT Security assisted with installation

### Methods

Used specialized research versions of the GE CareScape Gateway and BedMasterEx, developed specifically for this study

Comprehensively gathered monitoring and alarm data 24/7 over one month period

77 beds in five Adult ICUs at UCSF Medical Center

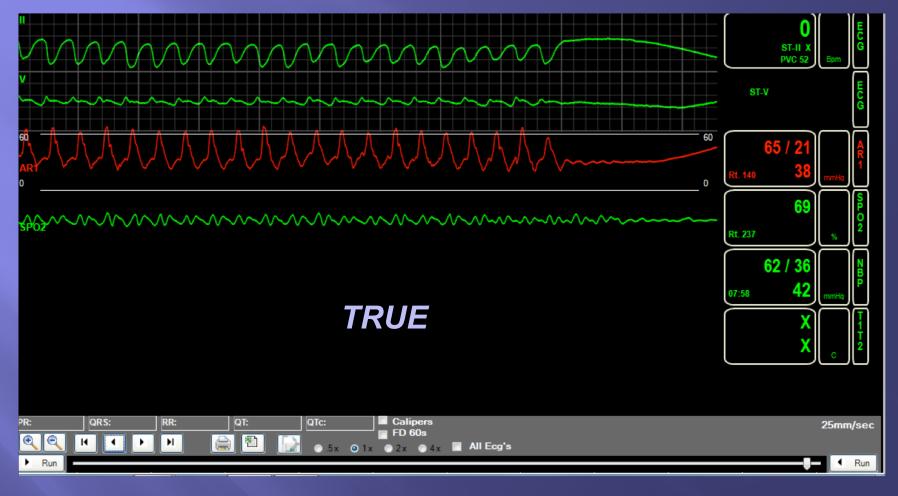

Waveform View

### Ventricular Fibrillation

### Asystole

Alarms to Annotate					
ALARM TYPE	DEFAULT LEVEL				
ASYSTOLE	CRISIS				
VFIB (ventricular fibrillation	CRISIS				
VTACH (ventricular tachycardia)	CRISIS				
ACCVENT (accelerated ventricular)	WARNING				
VBRADY (ventricular bradycardia)	WARNING				
PAUSE	WARNING				

#### **Standardized Annotation:**

- 1. Written protocol with clear definitions
- 2. 3-hour annotation training course by Drew (video-taped)
- 3. Matching Excel Spreadsheet
- 4. 5 experts (Drew, Harris, Mammone, Zegre-Hemsey, Schindler) with clinical experience in acute/critical care & monitoring; also analyzed all clinical data from EMR (Code Blue data, etc.)
- 5. Weekly meetings to discuss annotation cases & to reach consensus

#### Alarm Annotation and Analysis Plan for GE-Sponsored Study 123.04-2012-GES-0003

PI: Barbara J. Drew, RN, PhD

	CRISIS ECG ALARMS								
Alarm Condition	Potential Cause of False Alarm	Proof of True/False Alarm by Investigator							
1. ASYSTOLE	<ul> <li>Monitor is not detecting sufficient QRS amplitude in analysis leads (I, II, III, &amp; V).</li> <li>Noisy signal</li> </ul>	Asystole True Alarm Proof; (either condition would confirm true alarm)         1. Simultaneous drop in <i>Invasive</i> arterial or PA pressure to near zero (abrupt decrease in pressure waveform amplitude to near isoelectric line); cannot use non-invasive BP         2. Code Blue documentation of asytolic or PEA arrest at same time (<5 sec asystole would not be expected to cause loss of consciousness/Code Blue so asystole must persist)         • Confirm that asystole lasts at least 5 seconds with e-calipers         • If rhythm is determined to be low amplitude VF, count asystole alarm as true         Asystole False Alarm Proof; (either condition would confirm false alarm)         1. There is no simultaneous drop in <i>Invasive</i> arterial or PA pressure (abrupt decrease in pressure waveform amplitude)         2. There is a visible QRS <i>in at least one lead</i> (may be low amplitude and barely visible; must examine all available [7] leads)							
2. VFIB/VTAC	Noisy signal (motion, electrical interference, or other artifact)	<ul> <li><u>VFIB/VTAC True Alarm Proof</u>: (either condition would confirm true alarm)</li> <li>Simultaneous drop in <i>invasive</i> arterial or PA pressure to near zero (abrupt decrease in pressure waveform amplitude to near iscelectric line)</li> <li>Code Blue documentation of VF or VT arrest at same time</li> <li><u>VFIB/VTAC False Alarm Proof</u>: (any of the following conditions would confirm false alarm)</li> <li>There is no simultaneous drop in <i>invasive</i> arterial or PA pressure (abrupt decrease in pressure waveform amplitude)</li> <li>There are QRS complexes at the same rate as the patient's normal rhythm visible throughout a noisy signal <i>in any lead</i> (check RR intervals before, during, after event to see if they "march through")</li> <li>VFIB/VTAC episode lasts &gt;60 seconds but no Code Blue or other documentation that it was recognized clinically (syncope, seizure, LOC)</li> <li>VFIB/VTAC episode lasts &gt;60 seconds but no decrease in SpQ<sub>a</sub>_waxeform amplitude</li> </ul>

### **Standardized Annotation**

- 1. Written protocol with clear definitions
- 2. Three-hour annotation training course by Drew (video-taped)
- 3. In addition to Dr. Drew, our team includes 4 RN experts with acute/critical care & monitoring experience
- 4. We analyzed clinical data from EMR (Code Blue data, etc.) corresponding to what was displayed on the monitor
- 5. Weekly meetings to discuss annotation cases & to reach consensus

#### Alarm Annotation and Analysis Plan for GE-Sponsored Study

#### Barbara J. Drew, RN, PhD

### **CRISIS Alarms**

# Alarm Proof of True/False Alarm by Investigator Condition

#### ASYSTOLE

#### Potential causes of false alarm:

- Monitor is not detecting sufficient QRS amplitude in analysis leads (I, II, III, & V)
- Noisy signal

- Asystole True Alarm Proof: (either condition would confirm true alarm)
- Simultaneous drop in *invasive* arterial or PA pressure to near zero (abrupt decrease in pressure waveform amplitude to near isoelectric line); cannot use non-invasive BP
- Code Blue documentation of asytolic or PEA arrest at same time (<5 sec asystole would not be expected to cause loss of consciousness/Code Blue so asystole must persist)
- Confirm that asystole lasts at least 5 seconds with e-calipers
- If rhythm is determined to be low amplitude VF, count asystole alarm as true <u>Asystole False Alarm Proof</u>: (either condition would confirm false alarm)
- 1. There is no simultaneous drop in *invasive* arterial or PA pressure (abrupt decrease in pressure waveform amplitude)
- 2. There is a visible QRS *in at least one lead* (may be low amplitude and barely visible; must examine all available [7] leads) Example

1<sub>mv</sub>

UCSF

What is the rate of pressure & SpO<sub>2</sub>

2. Is there a drop in arterial pressure with event?

Preliminary Prevalence Results (using specialized software to capture all alarms) Recordings for 461 unique patients for 31 days **Total Alarms** 2,507,822 1,633,323 (~ 65.1%) Arrhythmia 665,136 (26.<u>5%)</u> Parameter 209,363 (8.3%) Technical <u>381,560</u> Audible alarms

Alarm burden (audible alarms per bed per day)

~ 160 audible alarms/bed/day

## Preliminary Arrhythmia Alarm Analysis Results

Annotation of 12,674 arrhythmia alarms collected during the month of March

Analysis showed ~ 87% of the alarms were technically false, similar to reports of other researchers\*

\* Aboukhalil et al (2008); Graham & Cvach (2010)

## Patient Characteristics N = 461

Characteristic	n			
Smoker	71 (15.4%)			
Obesity (BMI >30)	142 (30.8%)			
Tremor	36 (7.8%)			
Confused	198 (43.0%)			
Ventricular-Pacing	17 permanent 16 temporary (33 = 7.2%)			
Left Ventricular Assist Device (LVAD)	3 (<1%)			
Mechanical ventilation	165 (35.8%)			

# Demographics

Ν	461			
Female	211 (45.8%)			
Age (median = 60 years)	59.6 years			
Latino	52 (11.3%)			
Race Asian African American Pacific Islander White Unknown/decline to state	76 (16.5%) 35 (7.7%) 8 (1.7%) 281 (61.0%) 61 (13,2%)			

## Patients with Annotated Alarms

Total number of unique patients461 (100%)admitted to the ICU duringMarch 2013

Total number of patients with at least one annotatable alarm

252 (54.7%)

Total number of patients with zero annotatable alarms

209 (45.3%)

### ICU Patients' Annotated Alarms N = 461 ICU patients

### Annotated Alarms = 12,674 (representing 252 patients)

Range of number of alarms, Min to Max = 0 - 5725(5725 = 45.2%; N=461)

Total monitoring time > 48,000 hours (N=461)

Mean monitoring time =  $\sim$ 78 hours per patient (N-461)

## Signal Quality = GOOD

Alarm	TOTAL ALARM	TOTAL GOOD (% TOT)	TRUE	TRUE % GOOD	FALS E	FALSE % GOOD	UNABLE TO DETERMINE
ASYS	792	500	260	52	240	48	0
VFIB	158	127	88	69.3	39	30.7	0
VTACH	3,860	2682	473	17.6	2209	82.4	0
ACC VENT	4,366	3826	216	5.7	3608	94.3	2
PAUSE	2,238	1211	314	25.9	897	74.1	0
VB	1,260	1147	39	3.4	1108	96.6	0
TOTAL	12,674	9493 (74.9%)	390	14.6	8101	85.4	2

ASYS = Asystole; VFIB = Ventricular Fibrillation; VTACH = Ventricular Tachycardia; ACC VENT = Accelerated Ventricular; PAUSE = Pause; VB = Ventricular Bradycardia

### Challenge

Reconciliation of inaccurate or missing patient information entered on the monitor with correct data in medical record

### Next Steps

Complete analysis of patient characteristics associated with false alarms

Continue work with engineers to improve ECG detection algorithms and alarm specificity
