## Pesticides Registered for Mosquito Control in South Dakota

*by Michael A. Catangui, Extension entomologist, and  
James A. Wilson, Extension pesticide coordinator,  
SDSU Plant Science Department*

Pesticides alone will not eliminate all mosquitoes. The use of pesticides to control mosquitoes around the home and yard must be part of a multifaceted approach that includes the following non-chemical tactics:

- Eliminate standing water.
- Fix broken window screens.
- Use outdoor bug lights.
- Installing carbon dioxide-baited traps.

Some mosquitoes will always “get through.” If you will be outdoors, it is recommended that you wear a mosquito repellent of your choice, avoid being outdoors around sunset and sunrise, and cover as much skin as possible with appropriate clothing. For more information on selection and use of insect repellents, refer to FS 920 Personal Mosquito Repellents available at your local Extension office or online at <http://sdces.sdstate.edu/westnile/publications.htm>.

This publication lists the most common insecticides that are registered in South Dakota for use around the house and yard. The products are arranged by the active ingredient. The active ingredient is usually listed prominently in the first section of the label. This section will list the chemical name and/or the common name of the pesticide and also the concentration.

This list was current as of June 2004, but label uses and registrations change. Before using any pesticide, be sure to read the entire label to ensure that the product can

be used for mosquitoes, can be applied around the home and yard, and to be sure all safety restrictions are followed. For more information, refer to FS 923 Controlling Mosquitoes Around the Home and Yard.

The product label contains information about how to properly, safely, and legally use the pesticide. Every label has information regarding what protective clothing should be worn when using the product. Chemical resistant rubber gloves, long-sleeved shirt and long pants are almost always recommended. Also consider using protective eyewear and waterproof foot wear. If chemical soaks into leather shoes, it will stay there and will re-expose your feet to the chemical every time they get wet or sweaty. Always change clothing and shower after making pesticide applications to remove any residue with which you may have come in contact.

Pay particular attention to the label restrictions. Many pesticides registered for mosquito control will say “do not re-enter treated areas until sprays have dried.” Common sense would say to avoid contact with treated areas as long as feasible to reduce exposure to the chemical. Most of the mosquito pesticides are not registered for use on food crops, so be sure to avoid the garden when treating with those products. Use no more chemical than is required, and store it in a safe location away from children. Although most pesticides for mosquito control are not very toxic, to be applied safely, they still must be used with strict accordance to the label directions.

## Mosquito Larvicides

The immature forms of mosquitoes live in water. Pesticides applied on bodies of water to kill mosquito “wigglers” or larvae are called larvicides. The different active ingredients of mosquito larvicides available for use in South Dakota are listed in Table 1. Monomolecular films and aliphatic petroleum hydrocarbons leave a film on the water surface to suffocate the wigglers. Crystal

proteins derived from *Bacillus thuringiensis* subspecies *israelensis* (Bti) or *Bacillus sphaericus* (Bs) bacteria kill mosquito wigglers by paralyzing their gut upon ingestion of the active substance. Methoprene and pyriproxyfen disrupt the metamorphosis or molting of the wigglers. Pyrethrins, temephos, and malathion kill wigglers on contact with the treated water.

## Mosquito Adulticides

Pesticides designed to kill adult mosquitoes are called adulticides. Adulticides that last for several days are also called residual or barrier adulticides. Residual adulticides usually are applied on surfaces or vegetations where mosquitoes may rest during the day. Adult mosquitoes are killed upon contact with the treated surfaces.

Examples of residual adulticides are those containing synthetic pyrethroids (bifenthrin, cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, lambda-cyhalothrin, permethrin, phenothrin, and resmethrin), carbaryl, malathion, and naled (Tables 2–10).

Residual insecticides usually are applied as coarse sprays using ordinary sprayers. Mist blowers, like the ones used in cattle feedlots for fly control, can also be used.

Also available to homeowners are adulticides designed mainly to quickly kill or knockdown adult mosquitoes without leaving a lot of residues in the sprayed areas.

Examples of quick knockdown, non-residual insecticides are those containing natural pyrethrins. Pyrethrins are purified extracts from flowers of a certain species of chrysanthemum.

Some residual insecticides mentioned above like resmethrin, permethrin, and malathion, if applied as a “hot” fog using thermal foggers or as a “cold” fog using ultra low volume (ULV) machines, also will mainly be quick knock-down, non-residual treatments. Such applications will remain suspended in air and slowly dissipate within hours of application.
