South Dakota Sex and Age Structure 1980-1990

by

Peter K. Froelich, Donald E. Arwood, and James L. Satterlee

INTRODUCTION

Age and sex structure of a population plays a critical role in determining the needs and lifestyle of that population. One community, for example, may have a high number of children and youth, a sure indicator of need for teachers and schools; another community may have a high proportion of elderly, indicating a greater need for medical services. People of different ages or gender also may have different consumer preferences.

When business leaders and community leaders know the age and sex structure of their community, they can use that information to help direct resources toward meeting particular needs in education, housing, recreation, and medical and social services.

Although no two communities are likely to have identical age and sex structures, there are general patterns that are helpful for identifying potential population needs. Population pyramids and indices are useful for illustrating these patterns.

POPULATION PYRAMIDS

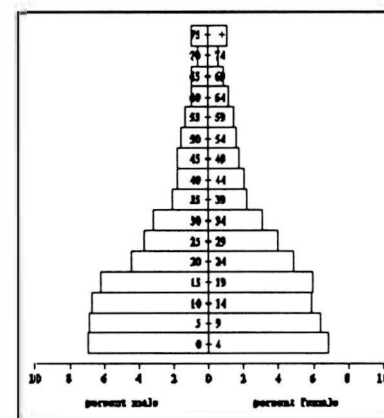

A **population pyramid** is a graphic display of a population's (state, county, town, etc.) age and sex structure. The proportions of males and females for each age cohort are shown as a series of horizontal bars stacked on top of each other.

With the exception of the 75+ age group, each bar represents a five-year age cohort. Bars representing the proportion of males in each age group are on the left hand side of the graph;

bars representing females for each age group are on the right. Each population pyramid is also accompanied by a frequency table that provides additional details.

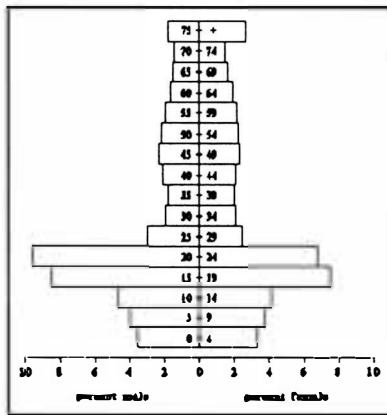

A population pyramid tells a great deal about the population in question. In South Dakota we see five general structural patterns.

An **EXPANSIVE** pyramid (larger bars at the bottom of the pyramid) reveals that a large proportion of the population is young. Shannon, Todd, Buffalo, Dewey, and Ziebach counties are good examples of expansive populations. These populations have needs and preferences associated with a younger population (also see discussion of youth dependency ratio).

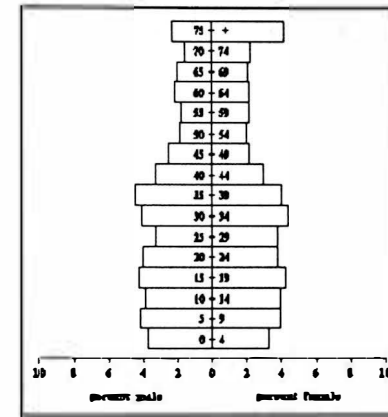

Expansive Pyramid

Brookings and Clay counties are good examples of **CONSTRUCTIVE** pyramids. A constrictive pyramid has a smaller proportion of the population under age 15, particularly when compared to the age groups just over age 15. Brookings and Clay counties have constrictive populations because they have large proportions of college-aged residents.

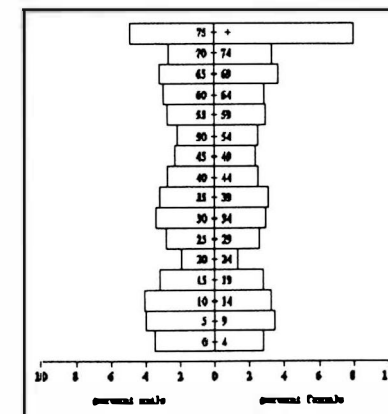

Constrictive Pyramid

A **NEAR STATIONARY** pyramid has roughly equal proportions of people at all age cohorts, with a narrowing of the pyramid at the middle ages. The 1990 pyramids for Brown, Codington, Davison, Lake, and Lawrence counties are good examples of this type of population structure. In South Dakota, this pattern is associated with urban populations that have diverse economies.

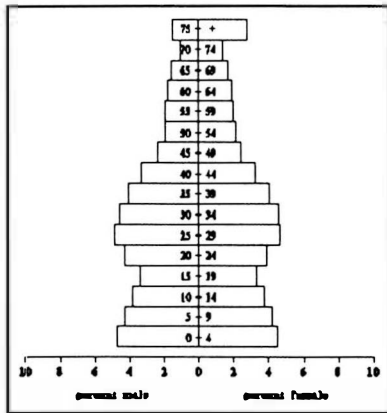

Near Stationary Pyramid

HIGH MIGRATION is another pyramid pattern. Many farm-dependent counties have high out-migration of young adults (ages 18-24). This phenomenon is clearly revealed in their population pyramids. These pyramids often appear to be similar to the near stationary type except that the bars for age categories with high migration rates are shorter than would otherwise be expected. This type usually has relatively larger proportions of people aged sixty-five and over (also see discussion of aged-dependency ratio and index of aging).

High Migration Pyramid

Pennington and Minnehaha county pyramids are examples of the **BABY BOOM** pattern. In 1990, these pyramids have two distinct bulges representing the baby boom (ages 25-44) and the baby boom echo (ages 0-9). Between them are the smaller "baby bust" cohorts (ages 10-24). The needs and preferences of these populations tend to be associated with families and young children.

Baby Boom Pyramid

POPULATION INDICES

Population indices furnish further detail by summarizing the relationships between various segments of the population. We have included eight indices in this publication: median age, sex ratio, general dependency ratio, youth dependency ratio, aged dependency ratio, young adult ratio, index of aging, and fertility ratio. Each of these indices is described below, along with mathematical formulas for calculating these indices.

1. **Median Age.** Median age is a kind of "average" that summarizes the middle age. In 1990, South Dakota's median age was 32.5

years. This means that half the population is younger than 32.5 and half the population is older than 32.5.

In these terms, McPherson County had the oldest population with a median age of 47.0--half were older than 47 and half were younger than 47. Shannon County had the youngest population with a median age of 20.5.

2. **Sex Ratio.** This measure tells us how many males there are per 100 females. In 1990, Buffalo county had the highest sex ratio, with 110.41 males per 100 females. Hyde had the lowest, with a sex ratio of 89.92 per 100 females. The sex ratio is the simplest measure of the population structure.

$$\text{Sex ratio} = \frac{\text{number of males}}{\text{number of females}} \times 100$$

3. **General Dependency Ratio (GDR).** The general dependency ratio (also known as the total dependency ratio) describes the proportion of the population in age groups that tend to be economically dependent, relative to the portions of the population that tend to be economically productive.

Although the upper and lower age boundaries are somewhat arbitrary, the segment of the population which is said to be productive is the group aged 15 through 64. The dependent population are those under age 15 and 65 years old and older.

South Dakota's 1990 GDR was 63.8; this means that there were 63.8 persons in the dependent age group per 100 persons in the economically productive age group. Counties with high general dependency ratios have population structures similar to the

"expansive" pattern (a very young population) or the "high migration" pattern (proportionately fewer people age 15 to 64).

$$GDR = \frac{\text{persons under age 15} + \text{persons age 65 and over}}{\text{number of persons age 15 to 64}} \times 100$$

4. **Youth Dependency Ratio (YDR).** This dependency measure identifies the number of children (age 0 to 14) per 100 productive people in the population (persons age 15 to 64).

In 1990, South Dakota's YDR was 39.7; that means that there were 39.7 dependent youths per 100 persons in the productive age group. Buffalo County, with 71.4, had the highest youth dependency ratio among all counties in the state. Other counties with high youth dependency ratios were Todd (70.0), Shannon (68.1), Ziebach (65.1), Dewey (60.4), Haakon (54.9), Bennett (53.6), Mellette (53.5), and Jackson (52.8). The pyramids for these counties are of the "expansive" variety.

$$YDR = \frac{\text{number of persons under age 15}}{\text{number of persons age 15 to 64}} \times 100$$

5. **Aged Dependency Ratio (ADR).** This dependency measure identifies the number of elderly (age 65 and older) per 100 productive people in the population (persons age 15 to 64).

In 1990, South Dakota's aged dependency ratio was 24.1. McCook County's ADR (51.2) was more than twice that. Besides having a large proportion of elderly, most counties with high aged

dependency ratios also show a high out-migration of young adults and have pyramids of the high migration type.

$$ADR = \frac{\text{number of persons age 65 and over}}{\text{number of persons age 15 to 64}} \times 100$$

6. **Young Adult Ratio (YAR).** The young adult ratio identifies the number of potential parents with young children in the population. This statistic is **not** a dependency measure; instead, it indicates the population's **potential** for fertility. It is calculated by dividing the number of persons age 15 through 34 by the number of persons younger and older than this group.

South Dakota's 1990 young adult ratio was 42.4. The YAR's of Clay County (95.1) and Brookings County (75.6) were quite a bit larger than the state average. Minnehaha (50.4) and Pennington (50.6) also had high young adult ratios.

$$YAR = \frac{\text{number of persons age 15 to 34}}{\text{number of persons under age 15} + \text{number of persons age 35 and over}} \times 100$$

7. **Index of Aging.** This index is a very sensitive measure of the age structure of a population. It compares the old to the young of a population by dividing the number of elderly (age 65+) by the number of children (under 15 years old) in the population. A score of 100 means that there are 100 elderly for every 100 persons under age fifteen. Scores of 100 or more are very high.

In 1990, South Dakota had eleven counties with index of aging scores that exceeded 100: McCook (147.7), Hutchinson (122.5), Jerauld (113.7), Bon Homme (108.3), Kingsbury (107.6), Miner (105.1), Edmunds (104.2), Fall River (103.7), Hyde (103.1), Day (102.1), and Turner (100.2).

$$\text{Index of aging} = \frac{\text{number of person age 65+}}{\text{number of persons under age 15}} \times 100$$

8. **Fertility Ratio (FR).** The fertility ratio is often called the child-woman ratio because it compares the number of children in the population under age five to the number of women in their child-bearing years. Although it is not a measure of the actual number of births in a population, the fertility ratio is a good indicator of fertility behavior in the population. It is usually used when vital statistics data are not available.

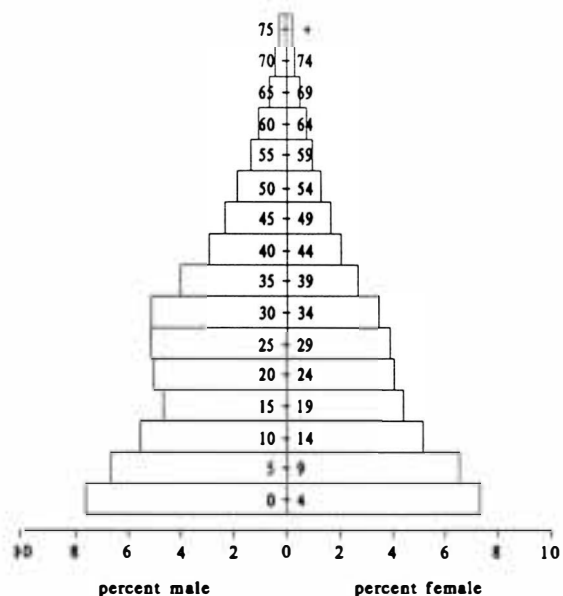

For example, at the height of the baby boom in 1960, the fertility ratio for South Dakota was 670.44. This means that there were 670.44 children under age 5 for every 1,000 women age 15 through 44. By 1970, the baby boom had ended and the fertility ratio had dropped to 424.47.

$$\text{FR} = \frac{\text{number of persons under age 5}}{\text{number of women age 15 to 44}} \times 1000$$

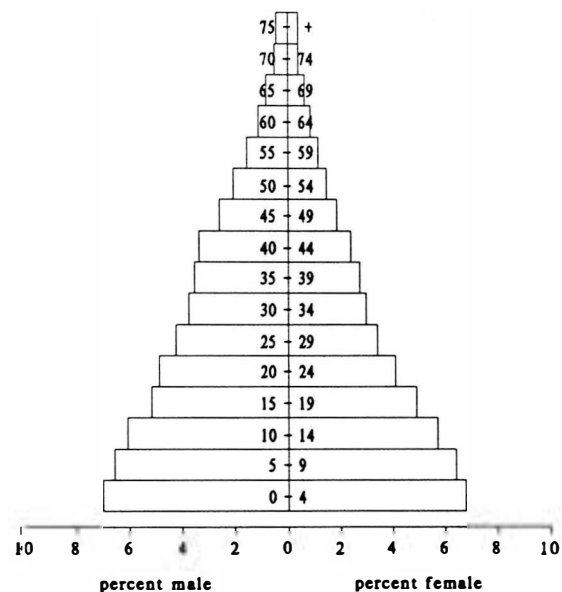

SUMMARY

This report is an update of one of our most popular publications. It provides population pyramids, frequency tables, and descriptive indices for each county in South Dakota. The statistics contained in this publication are based on the decennial censuses. The source for 1990 data is the "1990 Census of Population and Housing, Summary Tape File 1A, Vol. 1 (CD-ROM)," U.S. Department of Commerce. The data for 1980 are from "United States Population, 1980, South Dakota: General Population Characteristics. PC80-1-B43," U.S. Department of Commerce. Data for pyramids prior to 1980 are from "South Dakota Population, Age and Sex Structure, 1970-1980," Update Series C229, No. 9, Department of Sociology, South Dakota State University, Brookings, South Dakota.
