ON HOMOMORPHISMS OF COMMUTATIVE INVERSE SEMIGROUPS¹⁾

RONALD O. FULP, Atlanta

(Received January 19, 1965)

If S and T are semigroups, $\text{Hom}(S, T)$ denotes the semigroup of all homomorphisms from S into T with respect to pointwise multiplication. The product of α and β in $\text{Hom}(S, T)$ will always be denoted by $\alpha \cdot \beta$, and function composition will be denoted by juxtaposition. A semigroup S is said to be an inverse semigroup if for each $x \in S$ there is a unique $x^{-1} \in S$ such that $xx^{-1}x = x^{-1}xx^{-1} = x$. For each inverse semigroup S , E_S denotes the maximal idempotent subsemigroup of S . If $e \in E_S$, then S_e denotes the maximal subgroup of S containing e .

The main result of this paper is the determination of $\text{Hom}(S, T)$ in terms of the groups $\text{Hom}(S_e, T_f)$ ($e \in E_S$ and $f \in E_T$) for commutative inverse semigroups S and T . In particular, we determine the character semigroup of a commutative inverse semigroup S in terms of the character groups of the groups S_e ($e \in E_S$). The latter result was obtained for finite S by SCHWARZ [2] and by WARNE and WILLIAMS [3] for inverse S whose idempotents satisfy the minimal condition.

Henceforth, S and T denote commutative inverse semigroups. Let α denote the homomorphism from S onto E_S defined by $x \rightarrow x^{-1}x$. Similarly, define β from T onto E_T . For each λ in $\text{Hom}(E_S, E_T)$, let G_λ denote the set of all φ in $\text{Hom}(S, T)$ such that the diagram

is commutative.

¹⁾ The author is indebted to Professor PAUL D. HILL for his direction and advice in the preparation of this paper.

Lemma 1. For each λ in $\text{Hom}(E_S, E_T)$, G_λ is a subgroup of $\text{Hom}(S, T)$. Furthermore, $\text{Hom}(S, T)$ is the union of the collection of groups G_λ over the semilattice $\text{Hom}(E_S, E_T)$.

Proof. Suppose $\lambda \in \text{Hom}(E_S, E_T)$. If φ_1 and φ_2 are in G_λ , then $\beta(\varphi_1 \cdot \varphi_2) = (\beta\varphi_1) \cdot (\beta\varphi_2) = (\lambda\alpha) \cdot (\lambda\alpha) = \lambda\alpha$ and $\varphi_1 \cdot \varphi_2 \in G_\lambda$. The homomorphism $\lambda\alpha$ is in G_λ and is an identity for G_λ . If $\varphi \in G_\lambda$, then the group inverse of φ is the homomorphism defined by $x \rightarrow \varphi(x)^{-1}$. Thus G_λ is a group for each λ in $\text{Hom}(E_S, E_T)$. Since the collection of groups $\{G_\lambda\}$ partitions $\text{Hom}(S, T)$ regularly, the lemma follows.

If $e \in E_S$ and $f \in E_T$, let τ_e and τ_f be the translations of S and T defined by $x \rightarrow xe$ and $c \rightarrow xf$, respectively. For each λ in $\text{Hom}(E_S, E_T)$, define H_λ to be the subgroup of $\prod_{e \in E_S} \text{Hom}(S_e, T_{\lambda(e)})$ consisting of those members $\varrho = \{\varrho_e\}$ of $\prod_{e \in E_S} \text{Hom}(S_e, T_{\lambda(e)})$ such that the diagram

$$\begin{array}{ccc} S_e & \xrightarrow{\varrho_e} & T_{\lambda(e)} \\ \tau_e \downarrow & & \downarrow \tau_{\lambda(f)} \\ S_f & \xrightarrow{\varrho_f} & T_{\lambda(f)} \end{array}$$

is commutative for all $e, f \in E_S$ such that $f \leq e$ ($f \leq e$ if and only if $ef = f$).

Lemma 2. For each λ in $\text{Hom}(E_S, E_T)$, H_λ is isomorphic to G_λ .

Proof. Define a function F from G_λ into H_λ by $F(\varphi) = \{\varrho_e\}$ where $\varrho_e = \varphi \mid S_e$. It is easy to verify that F is an isomorphism into H_λ . We show that it is onto. Suppose that $\{\varrho_e\}$ is in H_λ . Let φ denote the function from S into T defined by $\varphi(x) = \varrho_e(x)$ if $x \in S_e$. Now if $x \in S_e$ and $y \in S_f$ for $e, f \in E_S$, then

$$\begin{aligned} \varphi(xy) &= \varrho_{ef}(xy) = \varrho_{ef}(xef) \varrho_{ef}(yef) = \\ &= \lambda(ef) \varrho_e(x) \lambda(ef) \varrho_f(y) = \varrho_e(x) \varrho_f(y) = \varphi(x) \varphi(y). \end{aligned}$$

Thus φ is in $\text{Hom}(S, T)$. Moreover, $(\lambda\alpha)(x) = \lambda(e) = (\beta\varrho_e)(x) = (\beta\varphi)(x)$ if $x \in S_e$, so $\varphi \in G_\lambda$. Hence $F(\varphi) = \{\varphi \mid S_e\} = \{\varrho_e\}$ and F is onto.

Let \mathcal{O} denote the set of all ordered pairs (e, f) of E_S such that $f \leq e$. Define a relation \leq on \mathcal{O} by $(e, f) \leq (e', f')$ if and only if $e' \leq e$ and $f \leq f'$. The relation \leq is a partial order on \mathcal{O} (but, in general, is not a direction). For λ in $\text{Hom}(E_S, E_T)$ and $\alpha \leq \beta$ in \mathcal{O} , define a function $\varphi_\alpha^\beta(\lambda)$ in the following way. If $\alpha = (e, f)$, $\beta = (e', f')$, and ψ is in $\text{Hom}(S_{e'}, T_{\lambda(f)})$, then $\varphi_\alpha^\beta(\lambda)(\psi) = (\tau_{\lambda(f)} \psi \tau_e) \mid S_e$. The function $\varphi_\alpha^\beta(\lambda)$ is a homomorphism from $\text{Hom}(S_{e'}, T_{\lambda(f)})$ into $\text{Hom}(S_e, T_{\lambda(f)})$. We abbreviate $\varphi_\alpha^\beta(\lambda)$ to φ_α^β since it is always clear from the context which λ is associated with a given φ_α^β . Note that if $\alpha \leq \beta \leq \gamma$ in \mathcal{O} then $\varphi_\alpha^\beta \varphi_\beta^\gamma = \varphi_\alpha^\gamma$ and φ_α^α is the identity on its domain.

Theorem 1. *If λ is in $\text{Hom}(E_S, E_T)$, then*

$$(1) \quad G_\lambda \cong \text{invlim} [\{\text{Hom}(S_e, T_{\lambda(f)})\}_{(e,f) \in \mathcal{O}}; \{\varphi_\alpha^\beta\}]$$

and

$$(2) \quad \text{Hom}(S, T) \cong \bigcup_{\lambda \in \text{Hom}(E_S, E_T)} \text{invlim} [\{\text{Hom}(S_e, T_{\lambda(f)})\}_{(e,f) \in \mathcal{O}}; \{\varphi_\alpha^\beta\}]$$

Proof. Let the group on the right hand side of 1) be denoted by L_λ . By Lemma 1 and Lemma 2, it suffices to show that $H_\lambda \cong L_\lambda$ for each λ in $\text{Hom}(E_S, E_T)$. Let F denote the function from H_λ into $\prod_{(e,f) \in \mathcal{O}} \text{Hom}(S_e, T_{\lambda(f)})$ defined by the condition: if $\varrho = \{\varrho_e\} \in H_\lambda$, then $F(\varrho) = \theta = \{\theta_\alpha\}_{\alpha \in \mathcal{O}}$ where $\theta_\alpha = \tau_{\lambda(f)} \varrho_e \tau_e$ for each $\alpha = (e, f)$ in \mathcal{O} . Note that $\theta_{(e,e)} = \varrho_e$ if $e \in E_S$, and, therefore, F is one-one. It is immediate that F is a homomorphism. Now we show that F maps into L_λ . Suppose $\varrho \in H_\lambda$, $\theta = F(\varrho)$, and $\alpha \preceq \beta$ where $\alpha = (e, f) \in \mathcal{O}$ and $\beta = (e', f') \in \mathcal{O}$. Then

$$\begin{aligned} \varphi_\alpha^\beta(\theta_\beta) &= (\tau_{\lambda(f)} \tau_{\lambda(f')} \varrho_e \tau_e) \mid S_e = \\ &= (\tau_{\lambda(f)} \varrho_{f'} \tau_{f'} \tau_{e'}) \mid S_e = \tau_{\lambda(f)} \tau_{\lambda(f')} \varrho_e = \theta_\alpha, \end{aligned}$$

and $\theta \in L_\lambda$. In order to show that F is onto L_λ , suppose that $\theta \in L_\lambda$. Define $\varrho = \{\varrho_e\}_{e \in E_S}$ where $\varrho_e = \theta_{(e,e)}$ for all $e \in E_S$. We show that $\varrho \in H_\lambda$ and that $F(\varrho) = \theta$. Suppose $f \preceq e$ in E_S , $\alpha = (e, e)$, $\beta = (f, f)$, and $\gamma = (e, f)$. Then $\gamma \preceq \alpha$, $\gamma \preceq \beta$, and

$$\tau_{\lambda(f)} \varrho_e = \tau_{\lambda(f)} \theta_\alpha = \varphi_\gamma^\alpha(\theta_\alpha) = \theta_\gamma = \varphi_\gamma^\beta(\theta_\beta) = \theta_\beta \tau_f \mid S_e = \varrho_f \tau_f \mid S_e.$$

From the above equations, one has that $\varrho \in H_\lambda$. It follows from similar calculations that $F(\varrho) = \theta$, which completes the proof of the theorem.

A character of S is a homomorphism χ from S into the multiplicative semigroup C of complex numbers such that $\chi(1) \neq 0$ if 1 is an identity of S . We let S^* denote the semigroup of characters of S with respect to pointwise multiplication. If S is a group, then S^* is the usual character group of S .

If $\lambda \in E_S^*$, the set of $e \in E_S$ such that $\lambda(e) \neq 0$ forms a directed set with respect to the order \preceq on E_S . For each pair (e, f) of elements from this directed set such that $f \preceq e$, define π_e^f to be the adjoint of the translation from S_e into S_f , that is, $\pi_e^f(\varphi) = (\varphi \tau_f) \mid S_e$ for each φ in S_f^* . It follows that $[\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}]$ is an inverse system of groups.

Theorem 2. $S^* \cong \bigcup_{\lambda \in E_S^*} \text{invlim} [\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}]$ provided that the inverse limit

of a void collection of groups is defined to be the zero group.

Proof. If in Theorem 1 we let $T = C$, we have only to show that

$$L_\lambda = \text{invlim} [\{\text{Hom}(S_e, T_{\lambda(f)})\}_{(e,f) \in \mathcal{O}}; \{\varphi_\alpha^\beta\}]$$

is isomorphic to $\text{invlim} [\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}]$ for each λ in E_S^* such that λ is not identically zero. The function F from L_λ onto $\text{invlim} [\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}]$ defined by $F(\{\theta_a\}) = \{\varrho_e\}$ where $\varrho_e = \theta_{(e,e)}$ for each $e \in E_S$ with $\lambda(e) \neq 0$ is an isomorphism. The details of the proof that F is an isomorphism are similar to those in the proof of Theorem 1.

The following corollary of Theorem 2 is essentially Theorem 5.63 in [1].

Corollary. *If E_S satisfies the minimal condition, then $S^* \cong \bigcup_{\lambda \in E_S} S_{e(\lambda)}^*$ where $e(\lambda)$ is the minimal e such that $\lambda(e) \neq 0$.*

Proof. Since the set $\{e \in E_S \mid \lambda(e) \neq 0\}$ has a minimal element $e(\lambda)$,

$$\text{invlim} [\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}] = S_{e(\lambda)}^*.$$

More precisely, the map $\{\varrho_e\} \rightarrow \varrho_{e(\lambda)}$ is an isomorphism from $\text{invlim} [\{S_e^*\}_{\lambda(e) \neq 0}; \{\pi_e^f\}]$ onto $S_{e(\lambda)}^*$.

ГОМОМОРФИЗМЫ КОММУТАТИВНЫХ ИНВЕРСНЫХ ПОЛУГРУПП

РОНАЛЬД О. ФУЛП Ronald O. Fulp), Атланта

Пусть S, T — коммутативные инверсные полугруппы, E_S, E_T — подполугруппы идемпотентов. Если $e \in E_S, f \in E_T$, то пусть S_e, S_f — максимальные группы, принадлежащие идемпотентам e, f .

Целью статьи является изучение строения $\text{Hom}(S, T)$ с помощью групп $\text{Hom}(S_e, S_f)$.

Как следствие получают некоторые результаты, касающиеся характеров инверсных полугрупп.
