Section S1

Description of the X-ray structure of **8ⁱ**

The structure of $[\text{Ca}_2(\text{bzida})_2(\text{OH}_2)_6]_n$ (**8ⁱ**) consists of dimeric $[\text{Ca}_2(\text{bzida})_2(\text{OH}_2)_6]$ units, in which two $[\text{Ca}(\text{bzida})(\text{OH}_2)_2]$ moieties are bridged by two aqua ligands. These dimeric units form a three-dimensional coordination polymer through binding of one uncoordinated carboxylate O atom of each bzida²⁻ ligand to a neighbouring Ca²⁺ ion. Each Ca²⁺ ion is 8-coordinate, being bonded to the N and two O atoms from a bzida²⁻ ligand, two O atoms from terminal aqua ligands, two O atoms from bridging aqua ligands, and a carboxylate O atom from a bzida²⁻ ligand of a neighboring dimeric $[\text{Ca}_2(\text{bzida})_2(\text{OH}_2)_6]$ unit. The geometry about each Ca²⁺ ion can be approximated as distorted square antiprismatic, similar to that found in **8^h**, O4', O11, O12 and O13 are approximately coplanar, as O1, O3, O12' and N1, and the two planes lie above and below the Ca²⁺ ion, with the donor atoms in a staggered conformation. Ca-O distances lie in the range 2.3702(11) Å to 2.6410(12) Å, with those to the carboxylate O atoms being the shortest, and those to the bridging aqua ligands being the longest. The Ca-N distance (2.6935(13) Å) is the longest metal-ligand bond. Charge considerations and similarity between C2-O1, C2-O2, C4-O3 and C4-O4 distances (mean distance 1.258(5)) require the deprotonation of both ligand carboxylic acid moieties, resulting in dianionic bzida²⁻, and this is supported by the relatively short Ca-O distances involving the carboxylate O atoms. Six really short hydrogen bond interactions (O - O distances range 2.687(2) - 2.887(2)) can be detected, creating a two dimensional network of water molecules.

Section S2

Description of **8ⁱ** theoretical model

The **8ⁱ** polymer was truncated to a $[\text{Ca}_2(\text{bzida})_2(\text{OH}_2)_6]$ repeating unit (monomer). Each calcium center from one monomer is linked to a Ca center from a neighboring monomer via an acetyl (-CH₂COO⁻) "linker" subunit. Each Ca center has two such interactions. Furthermore, the neighboring monomer calcium centers are separated by four bonds Ca-O=C=O-Ca, as such it is expected that Ca centers on neighboring monomers should at most exert only a small electronegative effect on the bonding interactions of their neighbor. Therefore the $[\text{Ca}_2(\text{bzida})_2(\text{OH}_2)_6]$ repeating unit (monomer) was constructed by first isolating the full coordination sphere of the monomer, the acetyl "linkers" and neighboring Ca⁺² atoms from the neighboring repeating unit. In turn this was followed by replacement of the Ca⁺² atoms and capping the "linker" carboxyl groups with protons, which serves to compensate for the excess negative charge resulting from the removal of neighboring monomer Ca⁺² atoms.

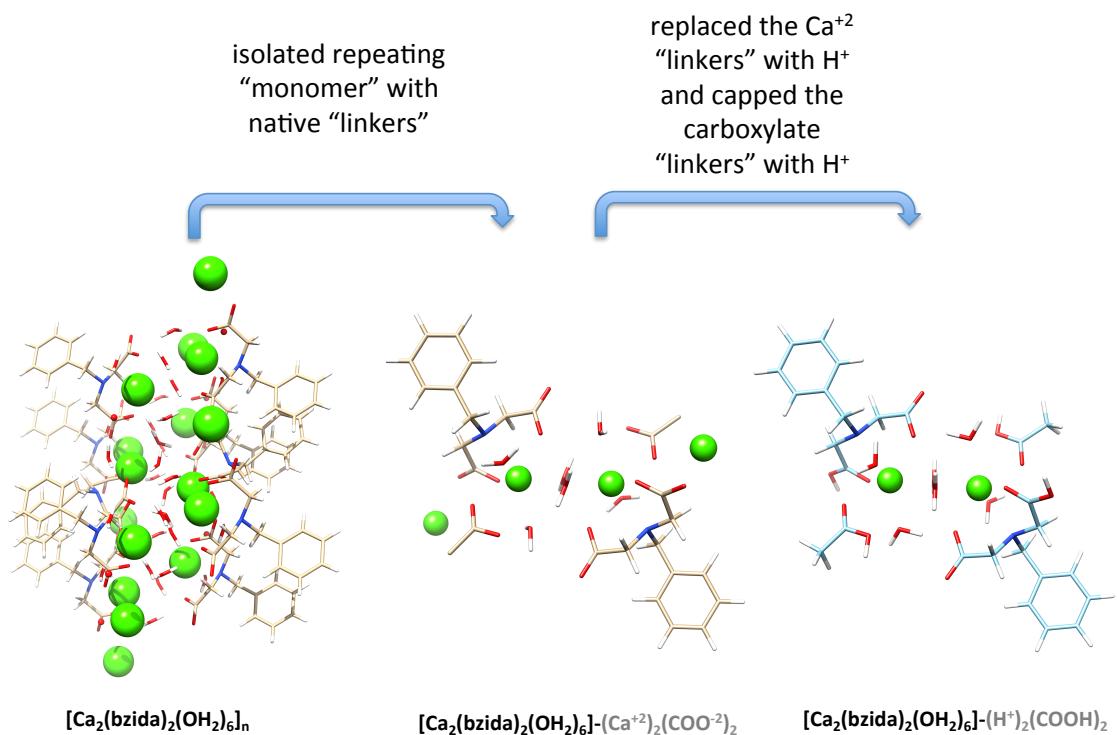

Figure S2.1: Schematic for the construction of the **8ⁱ** model used for properties calculations.

Description of 6^d theoretical model

The 6^d complex was geometry optimized using the TPSS functional, a def2-TZVP basis set and a dense integration grid (Grid 6) on the Ca and Mn centers. The first coordination sphere of calcium was isolated, consisting of the Ca^{+2} center and acetate ligands. The acetate ligands were protonated and oxygen-hydrogen bond distances were optimized.

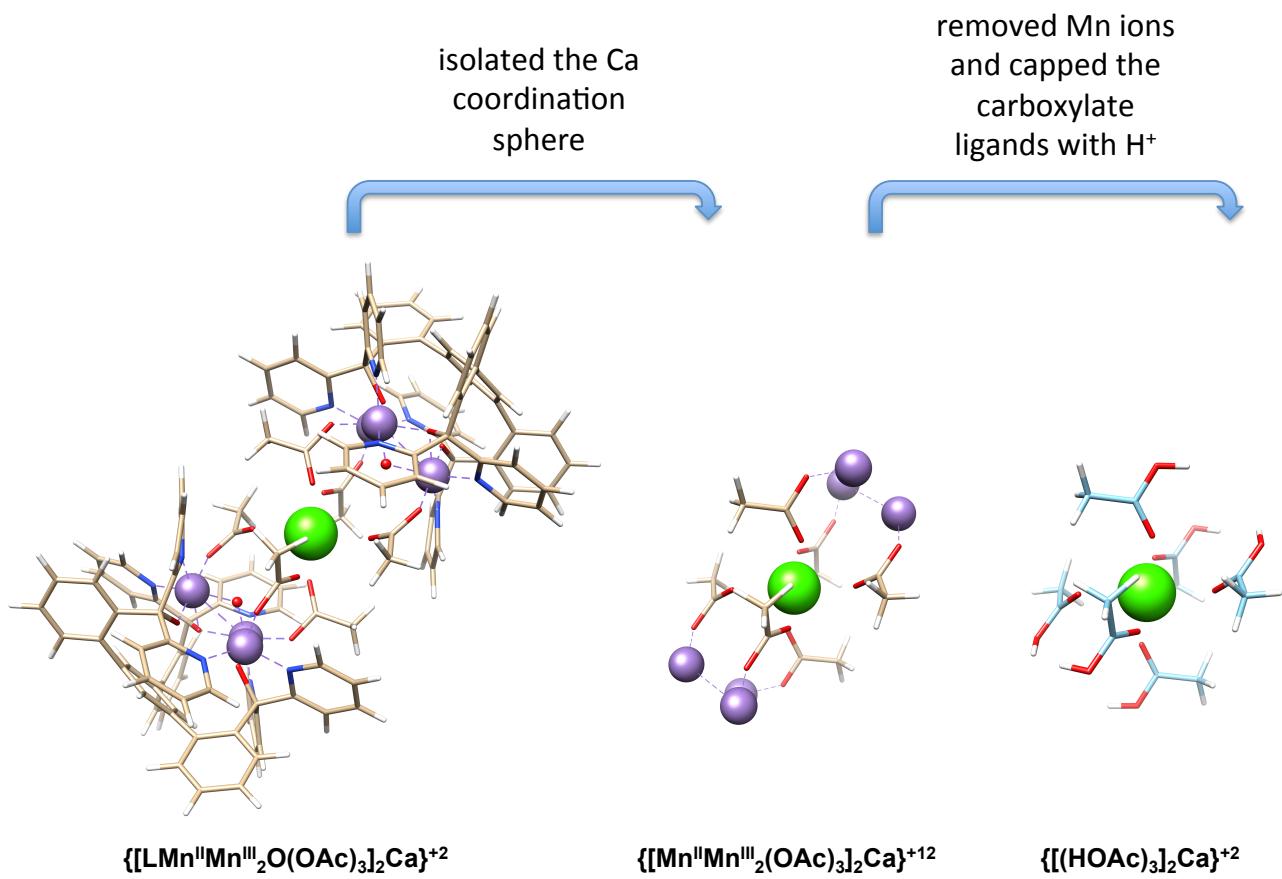

Figure S2.2: Schematic for the construction of the 6^d model used for properties calculations.

Section S3

Functional correlation study

The impact of functional on the calculated Ca K-edge was explored. Similar to previous studies (Inorg Chem 2012, 51, 680; Phys Chem Chem Phys 2013, 15, 2091) a dependence on the amount of Hartree-Fock exchange was found. Five functionals were tested (BP86, PBE, TPSSh, B3LYP and BHLYP) however only the BHLYP functional gave results comparable to experiment. Below the quadrupole intensity is used to help visually track transitions to the d orbitals. The BHLYP functional calculations resolved the Ca K- pre-edge, is the only functional that offers a picture where the pre-edge of the six coordinate complex is lower in intensity than that of the eight coordinate complex, as expected from experiment and predicts a ligand field splitting and relative pre-edge intensities for the six coordinate Ca(OH)_2 (**6**^{D_{2h}}) that match experimentally observed values.

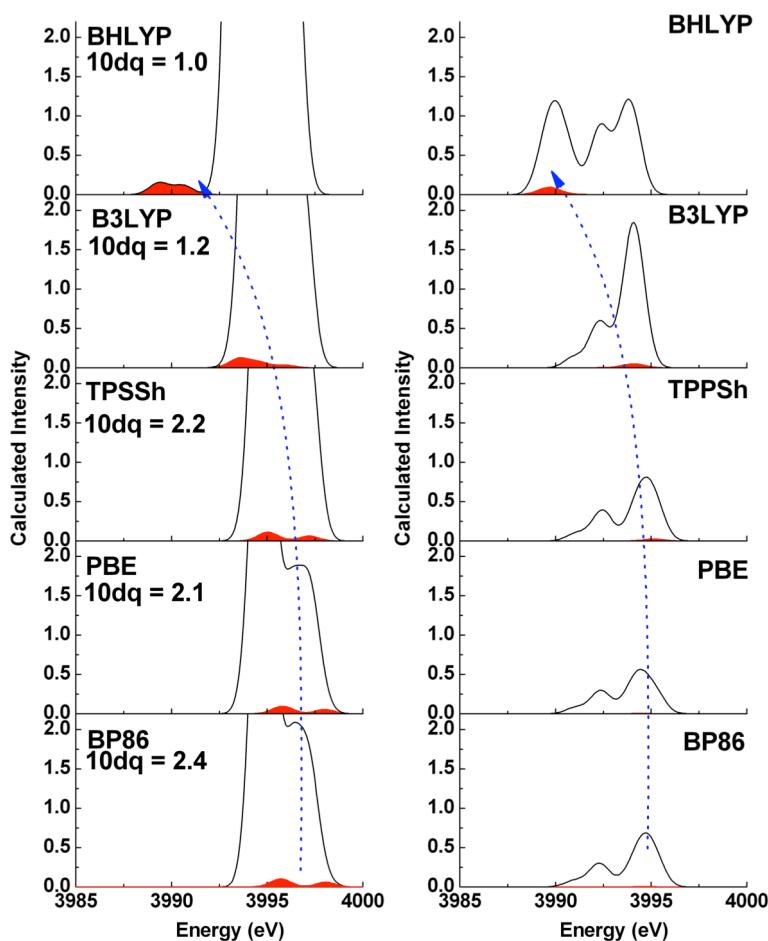

Figure S3.1 Study on the impact of the functional used on calculated Ca K- pre-edges. Study on the Ca(OH)_2 (**6**^{D_{2h}}) (left); study on $[\text{Ca}(\text{Htpaa})(\text{H}_2\text{O})]$ (**8**^f) (right). Total calculated intensity (black), quadrupole intensity (red); Blue arrow shows the dependency of the pre-edge on functional. Calculated spectra were aligned with respect to the Ca 1s core orbital energies using the BHLYP calculation as the standard (energy shift is in eV):

(**6**^{D_{2h}}): BP86 = 67.47; PBE = 69.44; TPSSh = 46.40; B3LYP = 41.23; BHLYP = 0;
 (**8**^f): BP86 = 67.67; PBE = 69.58; TPSSh = 46.56; B3LYP = 41.31; BHLYP = 0;

Section S4

Fitted Experimental and Calculated Ca K- pre-edge XAS spectra

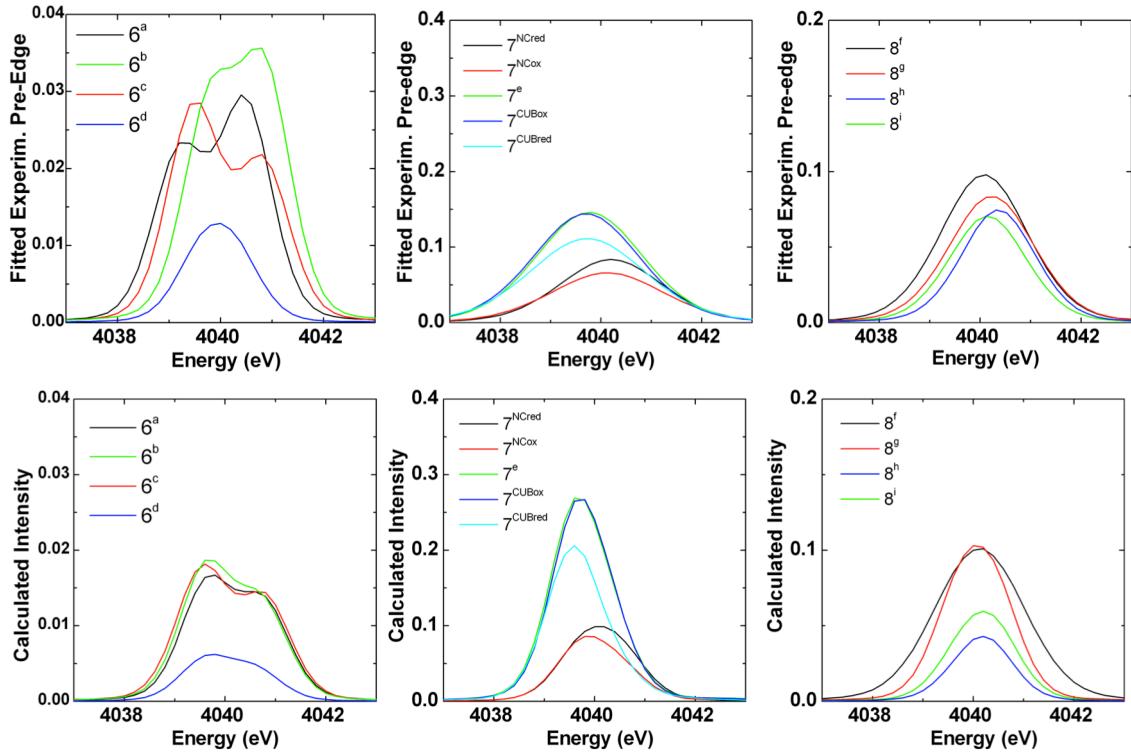

FIGURE S4.1: Fitted experimental Ca *K*- pre-edges of six, seven and eight coordinate species. The rising edge background has been subtracted for clarity. (top). Calculated Ca *K*- pre-edges for six, seven and eight coordinate species. The transitions were approximated as Gaussian-Lorentzian sum peaks with 75% Gaussian character. The transition energies were shifted by 50.17 eV and the intensities multiplied by a factor of 3500 units.

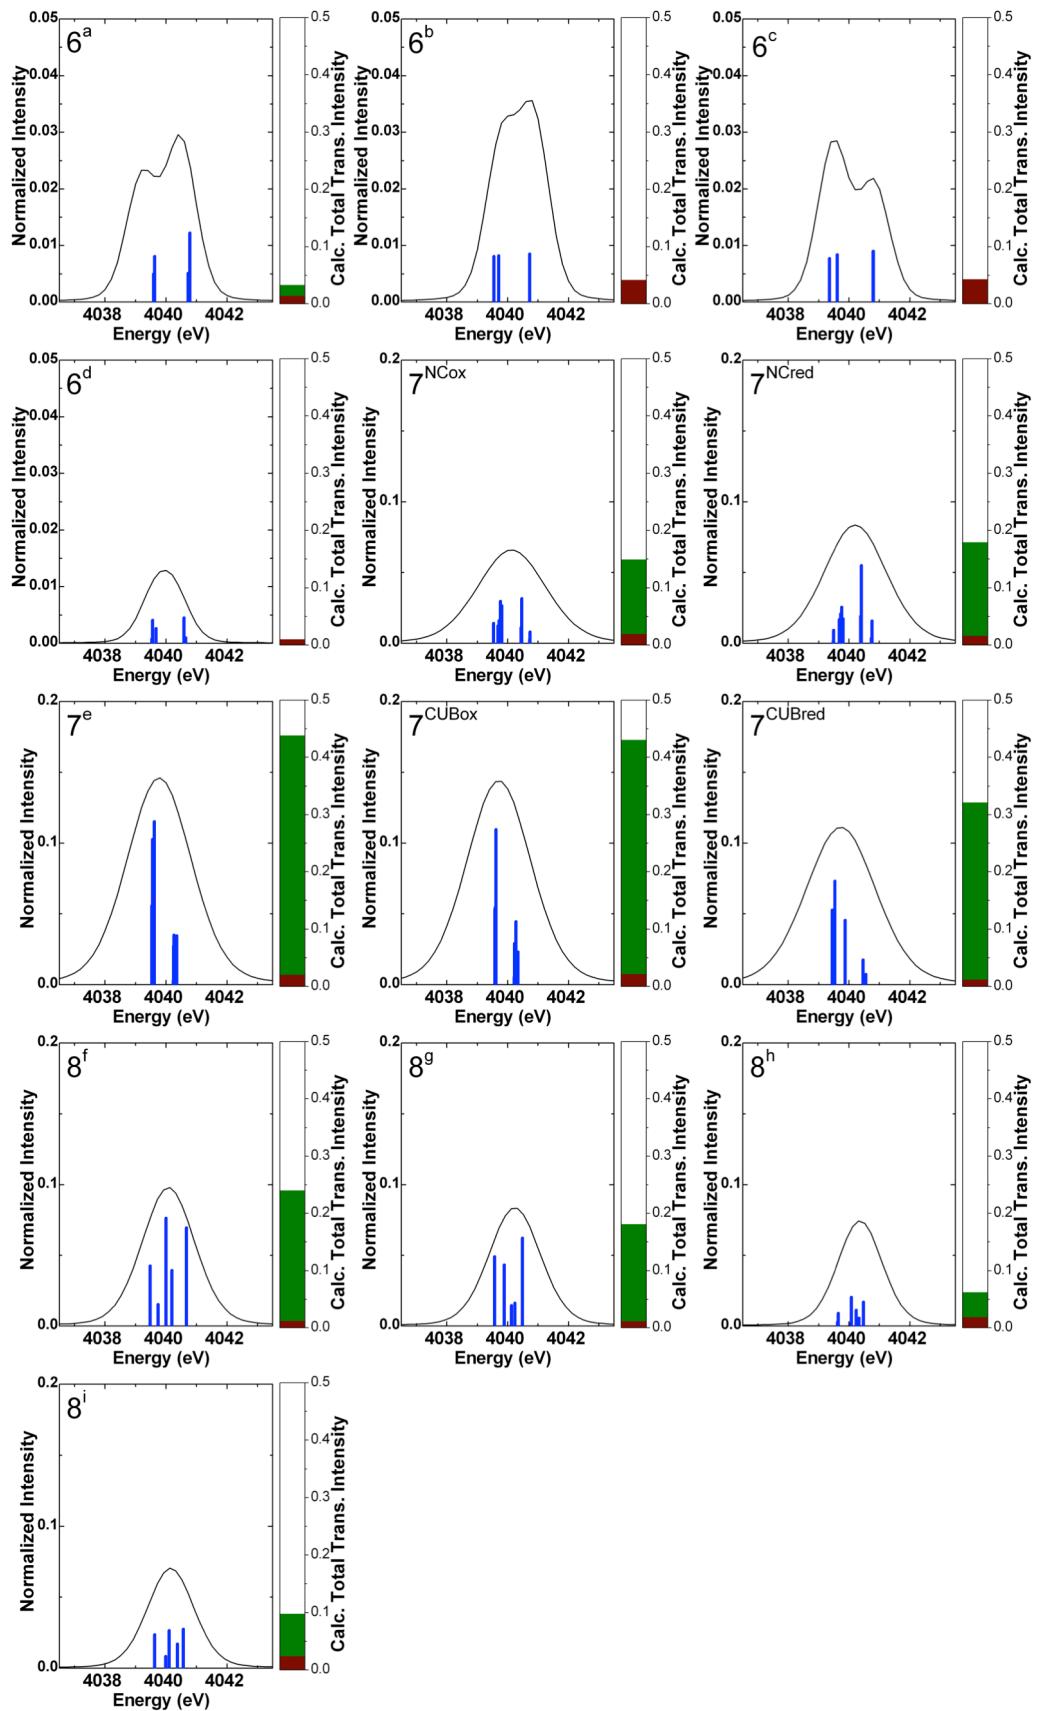

FIGURE S4.2: Fitted experimental Ca K- pre-edges (black line) overlaid with calculated transition intensities (blue bars). Contribution to the total calculated Ca K- pre-edge intensities from dipole (green) and quadrupole (red) is shown as a bar-graph for each complex. The calculated transitions were shifted by 50.17 eV and the intensity multiplied by a factor of 3500.

TABLE S4.3: Break down of calculated transitions contributing to the Ca K- pre-edge for the compounds under study. The energy for the calculated transitions were shifted by 50.17 eV and the total, dipole and quadrupole intensities were multiplied by a factor of 3500.
