[^0]

Supplementary Fig. 1 | Top level PSCU block diagram. a, The 2.5 GHz PLL. The output is distributed across the IC to its 16 output PAs. b, The clock multiplier unit (CMU) which synthesizes a phase-shifted 10 GHz signal for the output PAs.

Supplementary Fig. 2 | Circuit model blocks of the X-band power amplifier quad RFIC. a, Power core implementation. b, PA core sensors. c, Process, voltage and temperature (PVT) independent bias generator. d, The 10 GHz phase locked loop (PLL). e, The PLL's quadrature voltage controlled oscillator (QVCO).

Supplementary Fig. 3 | Detail layout of a $4 \times 4$ ultra-lightweight collapsible and deployable phased array system that is integrated with photovoltaics solar cells and concentrators. a, The radiator side. $\mathbf{b}$, The RF IC side.

Supplementary Fig. $4 \mid$ The $4 \times 4$ flexible phased array system prototype simulated scattering parameters. a, Frequency responses due to element 16 being excited (member of the outer 12 radiating elements). b, Frequency responses due to element 14 being excited (member of the inner 4 radiating elements). For the ease of visualization every four S-parameter curves are shown in a separate plot. Element numbering is referenced to supplementary Fig. 3.

Supplementary Fig. $5 \mid$ Measured hologram plots for the $\mathbf{4 x 4}$ flexible phased array tile prototype at $f=9.8 \mathrm{GHz}$ over different $x y$-plane cross-sections along the $z$-direction (propagation direction) for every 10 cm of propagation when all 16-elements turned $\mathbf{O N}$ and their phases are optimized for. a, Scan angle ( $\varphi=0^{\circ}, \theta=0^{\circ}$ ). b, Scan angle ( $\varphi=90^{\circ}, \theta=30^{\circ}$ ).

Supplementary Fig. $6 \mid$ Simulated and measured far-field radiation patterns of the $E_{\theta}$ (left column plots) and $E_{\varphi}$ (right column plots) components of the radiated $E$-fields of the $4 \times 4$ flexible phased array tile prototype at $f$ $=9.8 \mathrm{GHz}$ along the $\boldsymbol{E}$-plane $\left(\varphi=90^{\circ}\right)$ and the $\boldsymbol{H}$-plane $\left(\boldsymbol{\varphi}=\mathbf{0}^{\circ}\right)$ for three scan angels. a, $\left(\varphi=0^{\circ}, \theta=0^{\circ}\right)$. $\mathbf{b},(\varphi=$ $\left.0^{\circ}, \theta=30^{\circ}\right)$. c, $\left(\varphi=90^{\circ}, \theta=30^{\circ}\right)$.

Supplementary Fig. $7 \mid$ Near-filed measurement of the $4 \times 4$ flexible phased array tile prototype when 12 elements are active and 4 corner elements are turned OFF at $\boldsymbol{f}=\mathbf{9 . 8} \mathbf{~ G H z}$. a, Cross-polarization near-field component of $E$-field $\left(E_{x}\right)$. b, Co-polarization near-field component of $E$-field $\left(E_{y}\right)$, for three scan angels $\left(\varphi=0^{\circ}, \theta=0^{\circ}\right),\left(\varphi=0^{\circ}, \theta\right.$ $\left.=30^{\circ}\right)$, and $\left(\varphi=90^{\circ}, \theta=30^{\circ}\right)$ shown from left to right.

c

Supplementary Fig. $8 \mid$ Measured hologram plots for the $4 \times 4$ flexible phased array tile prototype at $f=9.8 \mathrm{GHz}$ over different $x y$-plane cross-sections along the z-direction (propagation direction) for every 10 cm of propagation when 12 elements are active and 4 corner elements are turned OFF. a, Phases are optimized for scan angle $\left(\varphi=0^{\circ}, \theta=0^{\circ}\right)$. $\mathbf{b}$, Phases are optimized for scan angle $\left(\varphi=0^{\circ}, \theta=30^{\circ}\right)$. c, Phases are optimized for scan angle $\left(\varphi=90^{\circ}, \theta=30^{\circ}\right)$.

Supplementary Fig. 9 | Simulated and measured far-field radiation patterns of the total radiated $\boldsymbol{E}$-field (left column plots), $E_{\theta}$ component (middle column plots) and $E_{\varphi}$ component (right column plots) of the $4 \times 4$ flexible phased array tile prototype at $\boldsymbol{f}=\mathbf{9 . 8} \mathbf{~ G H z}$ along the $E$-plane ( $\varphi=90^{\circ}$ ) and the $\boldsymbol{H}$-plane ( $\varphi=\boldsymbol{0}^{\circ}$ ) for three scan angels when 12 elements are active and 4 corner elements are turned OFF. a, Scan angle $\left(\varphi=0^{\circ}, \theta=0^{\circ}\right)$. $\mathbf{b}$, Scan angle $\left(\varphi=0^{\circ}, \theta=30^{\circ}\right)$. c. Scan angle ( $\varphi=90^{\circ}, \theta=30^{\circ}$ ).

Supplementary Fig. 10 | Investigation of square cutout effect on the performance of the flexible fractal inspired modified patch radiator. ,. Schematic of the antenna. b, Reflection coefficient of the antenna for different square cutout widths. c, Antenna resonance frequency as a function of square cutout widths. d, Minimum return loss value (impedance matching condition) at the antenna resonance frequency as a function of square cutout widths. e, Antenna gain at the antenna resonance frequency as a function of square cutout widths. $\mathbf{f}$, Antenna radiation efficiency at the antenna resonance frequency as a function of square cutout widths. $\mathbf{g}$, Antenna radiated power at the antenna resonance frequency as a function of square cutout widths. $\mathbf{h}$, Far-field radiation pattern of the total radiated $E$-field along $\varphi=0^{\circ}$ cut (red curve) and $\varphi=90^{\circ}$ cut (blue curve) for $w=0 \mathrm{~mm}$ at $f=10.4 \mathrm{GHz}$ (antenna resonance frequency). i, Total radiated $E$-field radiation pattern along $\varphi=0^{\circ}$ cut (red curve) and $\varphi=90^{\circ}$ cut (blue curve) for $w=2.3 \mathrm{~mm}$ at $f=10.14$ GHz (antenna resonance frequency). $\mathbf{j}$, Total radiated $E$-field radiation pattern along $\varphi=0^{\circ}$ cut (red curve) and $\varphi=$ $90^{\circ}$ cut (blue curve) for $w=4 \mathrm{~mm}$ at $f=9.13 \mathrm{GHz}$ (antenna resonance frequency).

Supplementary Fig. $11 \mid$ Radiator layer pitch sensitivity analysis on the performance of the fractal inspired modified patch radiation for various pitch angle $\alpha$ measured from the $\boldsymbol{y}$-axis. a, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response for different pitch angles. c, Antenna resonance frequency as a function of pitch angle at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of pitch angle at the corresponding resonance frequency. e, Return loss value as a function of pitch angle at $f=9.8$ $\mathrm{GHz} . \mathbf{f}$, Antenna gain as a function of pitch angle at the corresponding resonance frequency. $\mathbf{g}$, Antenna radiation efficiency as a function of pitch angle at the corresponding resonance frequency. $\mathbf{h}$, Radiated power as a function of pitch angle at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of pitch angle at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Antenna radiation efficiency as a function of pitch angle at $f=9.8 \mathrm{GHz}$. $\mathbf{k}$, Radiated power as a function of pitch angle at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 12 | Radiator layer single-side bend sensitivity analysis on the performance of the fractal inspired modified patch radiation for various single-side bend angle $\alpha$ measured from the $\boldsymbol{x}$-axis. a, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response for different single-side bend angles. $\mathbf{c}$, Antenna resonance frequency as a function of single-side bend angle at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of single-side bend angle at the corresponding resonance frequency. $\mathbf{e}$, Return loss value as a function of single-side bend angle at $f=9.8 \mathrm{GHz}$. f, Antenna gain as a function of single-side bend angle at the corresponding resonance frequency. $\mathbf{g}$, Antenna radiation efficiency as a function of single-side bend angle at the corresponding resonance frequency. $\mathbf{h}$, Radiated power as a function of single-side bend angle at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of single-side bend angle at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Antenna radiation efficiency as a function of single-side bend angle at $f=9.8 \mathrm{GHz}$. $\mathbf{k}$, Radiated power as a function of singleside bend angle at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 13 | Radiator layer double-side bend sensitivity analysis on the performance of the fractal inspired modified patch radiation for various double-side bend angle $\alpha$ measured from the $\boldsymbol{x}$-axis. a, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response for different double-side bend angles. $\mathbf{c}$, Antenna resonance frequency as a function of double-side bend angle at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of double-side bend angle at the corresponding resonance frequency. e, Return loss value as a function of double-side bend angle at $f=9.8 \mathrm{GHz}$, $\mathbf{f}$. antenna gain as a function of double-side bend angle at the corresponding resonance frequency. $\mathbf{g}$, Antenna radiation efficiency as a function of double-side bend angle at the corresponding resonance frequency. $\mathbf{h}$, Radiated power as a function of double-side bend angle at the corresponding resonance frequency. i, Antenna gain as a function of double-side bend angle at $f=$ 9.8 GHz . $\mathbf{j}$, Antenna radiation efficiency as a function of double-side bend angle at $f=9.8 \mathrm{GHz}$. $\mathbf{k}$, Radiated power as a function of double-side bend angle at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 14 | Radiator layer tilt sensitivity analysis on the performance of the fractal inspired modified patch radiation for various tilt angle $\alpha$ measured from the $\boldsymbol{x}$-axis. a, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response for different tilt angles. c, Antenna resonance frequency as a function of tilt angle at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of tilt angle at the corresponding resonance frequency. e, Return loss value as a function of tilt angle at $f=9.8 \mathrm{GHz} . \mathbf{f}$, Antenna gain as a function of tilt angle at the corresponding resonance frequency. $\mathbf{g}$, Antenna radiation efficiency as a function of tilt angle at the corresponding resonance frequency. $\mathbf{h}$, Radiated power as a function of tilt angle at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of tilt angle at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Antenna radiation efficiency as a function of tilt angle at $f=9.8 \mathrm{GHz} . \mathbf{k}$, Radiated power as a function of tilt angle at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 15 | Misalignment sensitivity analysis on the performance of the fractal inspired modified patch radiation for when the radiator layer and the 4-layer RF flexible board are misaligned in the $\boldsymbol{x}$-direction. $\mathbf{a}$, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response as a function of $\Delta x$. $\mathbf{c}$, Antenna resonance frequency as a function of $\Delta x$ at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of $\Delta x$ at the corresponding resonance frequency. e, Return loss value as a function of $\Delta x$ at $f$ $=9.8 \mathrm{GHz} . \mathbf{f}$, Antenna gain as a function of $\Delta x$ at the corresponding resonance frequency. $\mathbf{g}$, Radiated power as a function of $\Delta x$ at the corresponding resonance frequency. $\mathbf{h}$, Antenna radiation efficiency as a function of $\Delta x$ at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of $\Delta x$ at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Radiated power as a function of $\Delta x$ at $f=9.8 \mathrm{GHz}, \mathbf{k}$, Antenna radiation efficiency as a function of $\Delta x$ at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 16 | Misalignment sensitivity analysis on the performance of the fractal inspired modified patch radiation for when the radiator layer and the 4-layer RF flexible board are misaligned in the $\boldsymbol{y}$-direction. $\mathbf{a}$, Schematic of the antenna. $\mathbf{b}$, Return loss frequency response as a function of $\Delta y$. $\mathbf{c}$, Antenna resonance frequency as a function of $\Delta y$ at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of $\Delta y$ at the corresponding resonance frequency. e, Return loss value as a function of $\Delta y$ at $f$ $=9.8 \mathrm{GHz} . \mathbf{f}$, Antenna gain as a function of $\Delta y$ at the corresponding resonance frequency. $\mathbf{g}$, Radiated power as a function of $\Delta y$ at the corresponding resonance frequency. $\mathbf{h}$, Antenna radiation efficiency as a function of $\Delta y$ at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of $\Delta y$ at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Radiated power as a function of $\Delta x$ at $f=9.8 \mathrm{GHz}$. $\mathbf{k}$, Antenna radiation efficiency as a function of $\Delta y$ at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 17|Misalignment sensitivity analysis on the performance of the fractal inspired modified patch radiation for when the radiator layer and the 4 -layer RF flexible board are misaligned in the $\boldsymbol{z}$-direction (e.g. solder thickness). a, Schematic of the antenna. b, Return loss frequency response as a function of $\Delta z$. c, Antenna resonance frequency as a function of $\Delta z$ at the corresponding resonance frequency. d, Minimum return loss value (impedance matching condition) as a function of $\Delta z$ at the corresponding resonance frequency. $\mathbf{e}$, Return loss value as a function of $\Delta z$ at $f=9.8 \mathrm{GHz}$. f. Antenna gain as a function of $\Delta z$ at the corresponding resonance frequency. $\mathbf{g}$, Radiated power as a function of $\Delta z$ at the corresponding resonance frequency. $\mathbf{h}$, Antenna radiation efficiency as a function of $\Delta z$ at the corresponding resonance frequency. $\mathbf{i}$, Antenna gain as a function of $\Delta z$ at $f=9.8 \mathrm{GHz}$. $\mathbf{j}$, Radiated power as a function of $\Delta z$ at $f=9.8 \mathrm{GHz} . \mathbf{k}$, antenna radiation efficiency as a function of $\Delta z$ at $f=9.8 \mathrm{GHz}$.

Supplementary Fig. 18 | FIMP antenna's interdigital capacitor section used for impedance matching and loading the antenna. a, Design layout. b, Extracted normalized impedance on the Smith chart.

Supplementary Table 1 | Resonance frequency and return loss values associated with each of the 16 elements of the flexible $4 \times 4$ phased array tile proof-of-concept prototype.

Supplementary Table $5 \mid$ The simulated and measured radiation characteristics summary of the $4 \times 4$ flexible phased array tile proof-of-concept when 12 elements are ON (corners elements turned OFF) for the three chosen scan angle phase settings: $\left(\varphi=0^{\circ}, \theta=0^{\circ}\right),\left(\varphi=0^{\circ}, \theta=50^{\circ}\right)$ and $\left(\varphi=90^{\circ}, \theta=30^{\circ}\right)$. (The measured values are shown by blue color text and the simulated values are represented with black color text.)

|  |  |  | Normalized intensity (dB) | Largest sidelobe (dB) | Half-power beamwidth (deg) |
| :---: | :---: | :---: | :---: | :---: | :---: |
