#### DISCLAIMER

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency Thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

## DISCLAIMER

Portions of this document may be illegible in electronic image products. Images are produced from the best available original document.

An experiment was performed to obtain data for the determination of the most desirable location of thermal neutron detectors for control instrumentation in the region immediately below the bottom shield.

Thermal Neutron Flux Beyond the Bottom Shield Mockup

A mockup of the bottom shield as shown in Fig. 1 was placed in the Lid Tank and thermal measurements were made beyond three lead thicknesses. The beryllium slab consisted of pellets (average density of slab 1.23 gm/cc) in a steel container (0.32 cm wall). The remaining components of the mockup were placed in a steel tank (0.32 cm wall) so that they would remain dry. The water in the dry tank was contained in a thin wall (0.32 cm) aluminum tank. Iron slabs (2.22 cm each) and lead slabs (3.81 cm each) were used to mockup the remaining components of the shield. The lead thickness was essentially the only variable in the mockup; however, for configuration 1, a 1-1/2 in. air filled void resulted which was filled with lead for configurations 2 and 3. The amounts of extraneous water between the various components of the mockup are shown in Fig. 1.

Thermal neutron data was taken along the axis of the source, and also along traverses parallel to the shield. This data is presented in Figs. 2 and 3. A tabulation of all the data taken with the various instruments is presented in Tables 1, 2, and 3.
