Analysis of Stream Bed Sediments of Four Mile Creek

INTRODUCTION

Until 1988, solutions containing nitric acid, sodium hydroxide, low levels of radionuclides (mostly tritiated water) and some metals were discharged to unlined seepage basins at the F and H Areas of the Savannah River Site (SRS) as part of normal operations (Killian et al., 1987a,b). The basins are now being closed according to the Resource Conservation and Recovery Act (RCRA). As part of the closure, a Part B Post-Closure Care Permit is being prepared. The Part B permit requires information on contaminant concentrations in stream bed sediments in the adjacent Four Mile Creek, which are reported herein.

The area that includes the basins is bounded to the north and west by Upper Three Runs Creek, and to the south by Four Mile Creek (Figure 1). These tributaries of the Savannah River are drains for the shallow groundwater system in the area. Constituents entering the basins seep to the underlying water table. Once in the water table, most of the constituents flow horizontally to the south in the water table towards Four Mile Creek (FMC). However, a relatively small fraction of the constituents enter a lower water-bearing formation that flows towards Upper Three Runs Creek. Numerical simulations of flow in the hydrologic system underlying the basins indicate that travel times for unretarded constituents from the basins to FMC is on the order of 10 years, and about 70 years from the basins to Upper Three Runs Creek (GeoTrans, 1988). Discharges to the basins started in the 1950's. Therefore, a steady-state profile for unretarded constituents (e.g. tritium) has developed between the basins and FMC, and it is unlikely that constituents emanating from the basins have reached Upper Three Runs Creek.

METHODS

The Four Mile Creek streambed sediments were collected with a mini-dredge thrown from the shore line. Samples were collected from the middle of the stream, and care was taken to minimize turbidity. Once collected, the sediments were gravity-drained in the field and placed in an ice-cooler. Thereafter, all the samples were taken to a controlled laboratory and stored at approximately 3°C. A small sample was collected and then analyzed for alpha, beta, and gamma concentrations to determine the level of shipping required. (The screening indicated that the samples were nonradioactive according to Department of Transportation standards.) The samples were shipped to MetaTrace Inc. for analyses. MetaTrace air dried all of the samples (except those for tritium analysis) before analysis. The analytical methods that were used are given in Appendix A on the raw data reports provided by MetaTrace.

The locations of the six samples that were collected are shown in Figure 1. These samples are coded as FMCSED1 through FMCSED6 (Four Mile Creek SEDiment sample number). FMCSED1 was collected upstream of the Separations Area and FMCSED6 was collected downstream of the Separations Area (and just upstream of C Reactor). FMCSED2 was collected at an impacted point near H Area; FMCSED3 was collected at a point between and F&H Area, and FMCSED4 was collected at an impacted point at F Area. The other samples were collected between these points. A brief description of the sampling points is provided in Table 1.

RESULTS

The results obtained are summarized in Table 2 and are indicative of particulate transport of constituents. The concentration of constituents are greater downstream, than midstream and upstream. The particles transporting the constituents are concentrating downstream, which is especially evident at sampling point FMCSED6. FMCSED6 is at the sampling point where the water is flowing most slowly, and as a result small particles settle out of the stream.

The concentrations of constituents in the FMC streambed are compared to background soils concentrations in the Upland unit at the SRS (Looney et al., 1990). Even though the soils in the Upland Unit may not be representative of streambed sediments. Of the metals analyzed, cadmium and copper concentrations are the only constituents above the maximum background soils values. However, copper was not discharged to the basins (Killian et al., 1987a,b), and during a recent survey along the FMC seepline, copper concentrations were not determined to be elevated (Haselow et al., 1990).

Of the radionuclides analyzed, gross alpha, gross beta, ⁹⁰Sr, and ²³⁸U are above maximum background soil values in at least one sample. Cesium-137, Cobalt-60, Americium-241, Radium-226, and Technetium-99 may also be elevated, but there is not a background value to compare for these constituents. Tritium concentrations in the soils are not reported in Table 2 because tritium moves essentially as water and would not be incorporated in the soil matrix. However, tritium concentrations are reported in Appendix A, but should be interpreted cautiously.

Neither chloride or nitrate are elevated in the streambed sediments as compared to background soils values.

ACKNOWLEDGEMENTS

Ray Cheeseman assisted with the collection and shipment of the samples. Dawn Kaback, Ralph Nichols, Beth Wheat and Brian Looney

WSRC-RP-90-0812

provided helpful editorial comments. In addition, Brian Looney provided technical advise for this project. The author appreciates the efforts of these people.

Table 1. Description of sampling points.

| <u>Sample Code</u> | <u>Description</u> |
|--------------------|--|
| FMCSED1 | Crossing of Four Mile Creek and Road E-1. Stream is slowly flowing and has significant iron-oxide (rust). Coarse sand sediments. |
| FMCSED2 | Crossing of Four Mile Creek and Road 4. Stream is clear relatively fast moving. Coarse sand. |
| FMCSED3 | Directly down-gradient from H-Area Seepage Basins. About 200 yards west of FMC and Road 4. Stream is clear and relatively fast moving. Coarse sand. |
| FMCSED4 | Crossing of FMC and Road C. Stream is clear and relatively fast moving. Coarse sand. |
| FMCSED5 | Crossing of FMC and Road C-4. Stream is clear and relatively fast moving. Sample hard to collect because of rip-rap on bottom of stream. Sample did not contain rocks. Poorly sorted medium to coarse sands with organic material. |
| FMCSED6 | Crossing of FMC and Road A-6. Stream was more turbid and slower flowing. Silty organic rich sediments. |

Table 2. Analytical results for Four Mile Creek streambed sediments.

SAVANNAH RIVER SITE
AIKEN, SOUTH CAROLINA 29808

PROJECT NUMBER: 121-03 R.O. 32

CATEGORY: RADIOCHEMICAL

PARAMETER: Tritium

METHOD: LA9763-R230

MATRIX: SOIL

REPORT DATE: 05/04/90

| metatrace ID | CLIENT ID | DATE SAMPLED | DATE EXTRACTED | DATE ANALYZED | CONC pCi/G | QUAL | DETECTION LIMIT pCi/G | DILUTION |
