Savannah, Georgia 31406

The Technical Report Series of the Georgia Marine Science Center is issued by the Georgia Sea Grant Program and the Marine Extension Service of the University of Georgia on Skidaway Island (P. O. Box 13687, Savannah, Georgia 31406). It was established to provide dissemination of technical information and progress reports resulting from marine studies and investigations mainly by staff and faculty of the University System of Georgia. In addition, it is intended for the presentation of techniques and methods, reduced data and general information of interest to industry, local, regional, and state governments and the public. Information contained in these reports is in the public domain. If this prepublication copy is cited, it should be cited as an unpublished manuscript.

INTRODUCTION

The intrusion of deep, nutrient-rich Gulf Stream water into the shelf waters off the southeastern United States is probably the major source of nutrients in the shelf waters and consequently intrusions have a major impact on the biota. This particular cruise was one of the first to be designed to find the front that represents the interface between intruding Gulf Stream waters and normal shelf water. Once the front was delineated an anchor station was occupied to observe the time change at a particular location as the front moved back and forth past the station.

The methods used and resultant data from that cruise are presented to aid others in the analyses of intrusions and related phenomena.

AREA AND STATIONS

The area chosen for the study is shown in Figure 1. This location was chosen for the study because it was felt that an intrusion could be observed at this time of year and the weather would be moderate.

Initial observations were made at locations 1-10. Observations 11-37 were then made at the anchor station, followed by hydrographic observations which were made at stations 38-43.

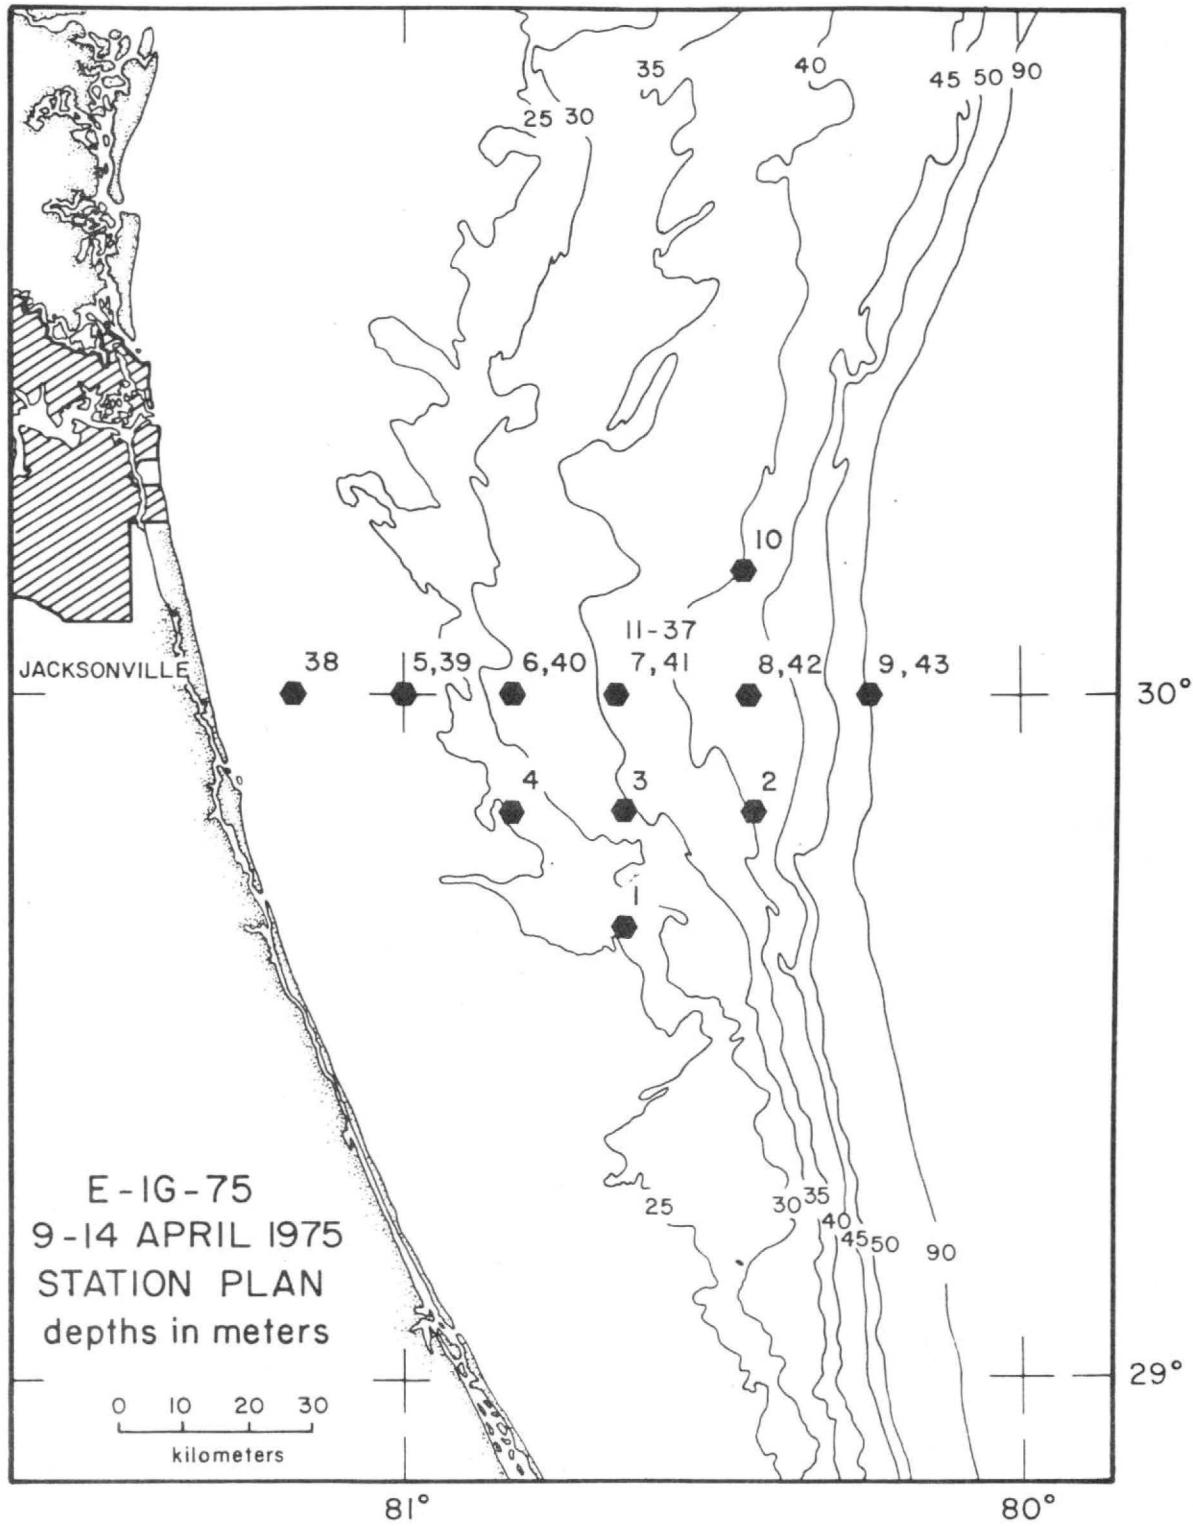

FIGURE 1. THE STUDY AREA.

METHODS

Meteorological

Weather and sea-state observations were made hourly by the bridge officer. These data were used in determining the weather situation during a station. The data appear in the hydrographic observations printout. An explanation of this code is found in National Oceanographic Data Center Manual Series titled, "Processing Physical and Chemical Data from Oceanographic Station, Part 1, Coding and Keypunching". A brief explanation is given at the beginning of Appendix B.

Conductivity/Salinity/Temperature/Depth

An Interocean C/S/T/D with onboard analog and digital recorders was used for the C/S/T/D profiles. Since the probe was not equipped with a Rosette sampler the C/S/T/D cast was followed by a Niskin bottle cast with bottle placing determined by the structure observed during the C/S/T/D cast.

The calibration for salinity and temperature was accomplished by tripping a Niskin bottle with reversing thermometers at a near-bottom depth. The bottom layer during the anchor station was well mixed and changed little with time.

A total of 21 temperature calibrations were made with the C/S/T/D averaging 0.108°C higher with a standard deviation of 0.034. Fifteen salinity comparisons were made with C/S/T/D averaging higher by $0.572^{\circ}/\text{oo}$ with a standard deviation of 0.011. These corrections were applied to the C/S/T/D observations.

Nutrients

Water samples were taken in 125 ml polyethylene bottles and quick frozen in a cryogenic freezer, then stored in a deep freezer until analysis.

Phosphate and silicate were determined by the method of Strickland and Parsons (1972). Modifications were made to reduce the volumes required.

Nitrate was determined by the cadmium reduction technique as modified by Gardner (1975).

Surface Current

A Bendix Q-15 ducted impeller current meter was suspended at 5 m depth from the port bow of the ship. The current direction and speed were continuously recorded on a two-channel Rustrak recorder. The record was good except for occasional times when ship yaw was quite noticeable. The meter record was hand digitized with averages taken when required.

Zooplankton

All zooplankton samples were collected with a cylinder-cone net of 50 cm mouth diameter and 253 μm mesh. The open mesh to mouth area ratio was 8:1. The front part of the net was held in a wide frame to prevent the use of bridles hanging in front of the net mouth. TSK-Flowmeters were placed both inside and outside the net mouth to determine the amount of water filtered and to indicate clogging. The inside flowmeter readings were above 85% of the outside readings thus showing no sign of clogging.

All zooplankton tows were taken while at anchor station from April 10 to 13, 1974, at $30^{\circ} 0.0\text{N}$ latitude and $80^{\circ} 38.0\text{W}$ longitude. Every tow was oblique (Surface - 10 to 12 m in depth - surface). The speed of the current along the boat ranged from 0.4 to 1.2 knots. The volume of seawater filtered ranged from 3.49 to 20.19 m^3 .

All samples were immediately preserved in 2% buffered Formaldehyde. Within four weeks all samples were transformed into Glycol-Phenoxytol for preservation. If necessary, samples were split with a Folsom plankton splitter. The amounts counted ranged from 1/8 to an entire sample. The preserved animals showed little sign of damage. This is mainly attributed to the slow towing speed and the fixation/preservation technique.

Chlorophyll a and Phytoplankton

Chlorophyll a concentrations were determined fluorometrically using an extraction method adapted from Yentsch and Menzel (1963). Samples for phytoplankton cell analysis were preserved in Lugol's solution modified by Utermöhl (1958).

DATA STORAGE

All data presented here and some additional items are on file at the Skidaway Institute of Oceanography. The hydrographic data are on file at the National Oceanographic Data Center.

CRUISE PARTICIPANTS

The following people participated in this cruise:

Larry P. Atkinson, Skidaway Institute

Roger B. Hanson, Marine Institute (Sapelo)

John Wheeler, Marine Institute (Sapelo)

Louise Jaffe, Skidaway Institute

Diane Wynne, Skidaway Institute

Gustav-A. Paffenhofer, Skidaway Institute

ACKNOWLEDGEMENTS

This research was supported by a research grant from the Skidaway Institute of Oceanography to Larry P. Atkinson. Funding subsequently was provided by the U. S. Energy Research and Development Administration (E[38-1]-889).

The ship support was provided by the Duke University Cooperative Oceanography Program which is supported by the National Science Foundation (GD-32560).

Publication as part of the Technical Report Series of the Georgia Marine Science Center was funded by the National Sea Grant Program, U. S. Department of Commerce, Grant No. 04-6-158-44115.

The usual outstanding cooperation of the EASTWARD crew is appreciated.

We would like to thank the following people who took part in the data reduction and report preparation: Dan Perlmutter, drafting; Paula Vopelak, typing; Louise Jaffe, Robert Bernatsky, Lisa Morehouse, data reduction.

APPENDIX B

HYDROGRAPHIC DATA

The following printout is taken from the NODC listing and processed with a Skidaway Institute code. An explanation of the listing follows:

Header Data: Times are GMT

Weather Data: These data are taken from the ship's log.

Wind Force: In Beaufort Wind Scale. The conversion to m/sec is as follows:

<u>Force</u>	<u>m/sec</u>
0	0-0.2
1	0.3-1.5
2	1.5-3.3
3	3.4-5.4
4	5.5-7.9
5	8.0-10.7
6	10.8-13.8
7	13.9-17.1

Wind direction: direction in degrees

Air temp: in degrees Celcius

Weather code: WMO Code 4501

Atmospheric Pressure: in millibars

Sea state: not recorded

Wave direction: in degrees

Cloud type: WMO Code 0500

Cloud amount: WMO Code 2700

Visibility code: not given

The hydrographic notations are as follows:

z = observation in meters

T = temperature in $^{\circ}\text{C}$

S = salinity in $^{\circ}/\text{oo}$

D = density in sigma-t units

SVA = specific volume anomaly $\times 10^5$

O_2 = not given

O_2^1 = not given

AOU = not given

$O_2\text{A}$ = not given

P04 = phosphate concentrations in μm

NO_3 = nitrate concentrations in μm

Si = silicate

N/P = nitrate phosphate ratio
