# Applied Physiology Laboratory

Pittsburg State University

## Introduction

- Aerobic capacity ( $VO_{2MAX}$ ) predicts both athletic performance and health status. Many tools are available to assess  $VO_2$  MAX ranging in both cost and accuracy.
- Understanding limitations of less expensive tools, likely found in settings such as health clinics or sports performance facilities, will help practitioners in developing accurate exercise prescriptions for their respective populations.

## Purpose

To evaluate agreement lower cost  $VO_{2MAX}$  assessment tool (Vacu-Med Vista MINI-CPX) to the industry “gold standard” (ParvoMedics TrueOne 2400).

## Methods

- Thirty-one participants ( $22.5 \pm 3.5$  years; BMI  $24.9 \pm 2.3$ ; 51% female) completed two sessions of maximal  $VO_{2MAX}$  assessment using the Bruce Protocol graded treadmill exercise test.
- The first session of assessment utilized the “gold-standard” unit (TrueOne 2400, ParvoMedics, Inc., Murray, UT).
- ). 24-48 hours later the second unit (Vista Mini-CPX, Vacu-Med, Inc., Ventura, CA) was used to assess  $VO_{2MAX}$  again.

## Statistical Analysis

- A Bland-Altman analyses was used to evaluate both potential bias and agreement for between the two assessment tools.

## Results

- The CPX unit significantly overestimated  $VO_{2MAX}$  compared to the TrueOne (Bias =  $10.67 \pm 5.87$  ml/kg/min, LoA = -0.83, 22.18;  $t = 1.96$ ,  $p < .001$ ).
- However, the CPX unit demonstrates good reliability as 93.5% (29/31 participants) of values fell within the 95% LoA.
- Further, values above 46.5 ml/kg/min tend to be greater than the mean bias while those below tend to be lower than the mean bias ( $r = .605$ ,  $F = 16.80$ ,  $p < .001$ ).

TABLE 1. Participant Characteristics

	Age (year)	Sex	BMI	Fat Mass (kg)	Fat Free Mass (kg)
Participants (n=31)	22.939 ± 4.24	M=51.5% F=48.5%	24.96 ± 4.11	22.77 ± 11.08	53.65 ± 13.31

TABLE 2. Regression Statistics

Standard Error	4.752696697
Observations	31

TABLE 3. ANOVA

ANOVA	df	SS	MS	F	Significance F
Regression	1	379.5423732	379.5424	16.80274	0.000305471
Residual	29	655.055651	22.58813		
Total	30	1034.598024			

## Results

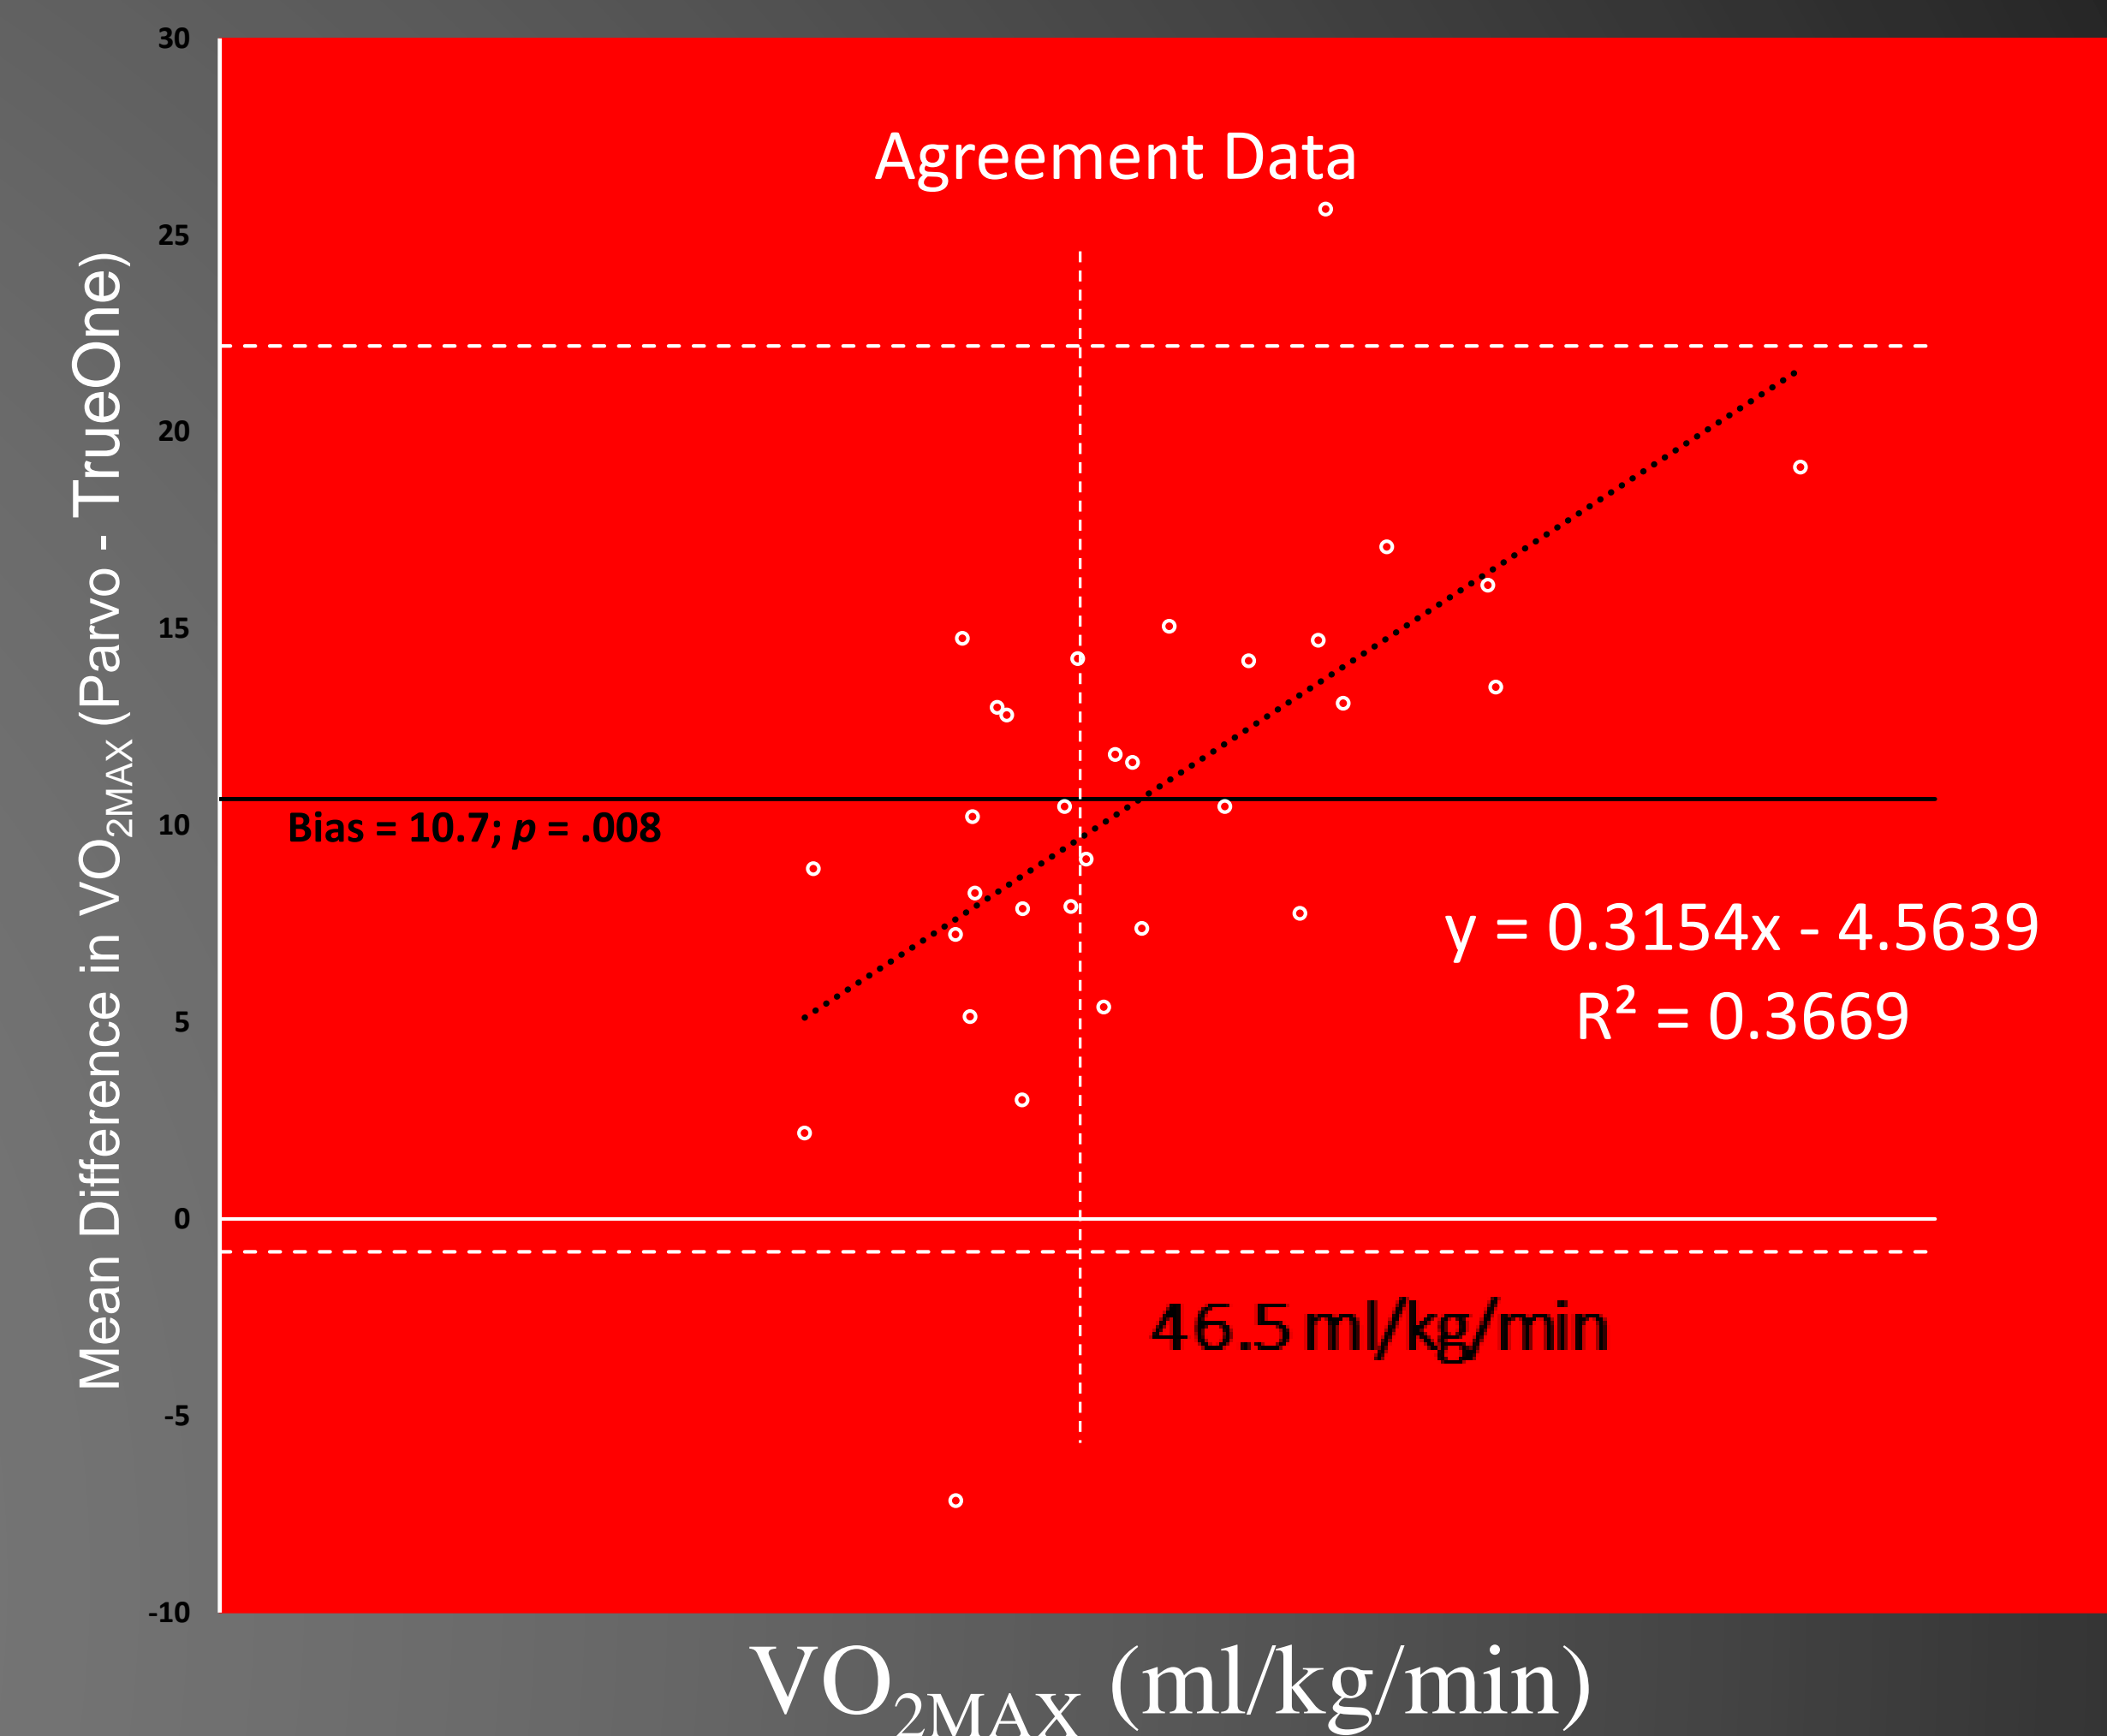

Figure 1. Agreement Data

## Conclusion

- The CPX unit demonstrates good reliability yet a significant overestimation of aerobic capacity.
- The CPX is a tool that can be used for individuals that are less trained, more average individuals.
- For clinical populations the CPX is a good tool for assessing cardiopulmonary fitness.
- For trained athletes and individual that work out regularly, should use the Parvo Medics to assess aerobic capacity.
