NWCSAF

Overview

I. Introduction to EUMETSAT Nowcasting SAF

II. Convective Rainfall Rate (CRR)

- ✓ Algorithm description
- ✓ Applications, limitations and visual examples

III. Convective Rainfall Rate from Cloud Physical Properties (CRPh)

- ✓ Algorithm description
- ✓ Applications, limitations and visual examples

IV. Comparison of Convective Rainfall Rate products (CRR and CRPh): visual examples

Introduction to EUMETSAT NWCSAF

The Nowcasting Satellite Application Facility was established in 1996 between Eumetsat and INM (Instituto Nacional de Meteorología).

Consortium:

Objectives:

- ✓ Development of Nowcasting products derived from both GEO and PPS satellite systems
- ✓ To be delivered to users as SW Packages

Responsible for

- ✓ Development and maintenance of the NWC products
- ✓ Development and maintenance of the SW Packages
- ✓ User's support tasks made through dedicated Help Desk (**training**)

Introduction to EUMETSAT NWCSAF

Products are generated in the users' premises

Features of the products:

- Near Real Time (NRT)
- Full resolution
- Frequency to be selected by the user (default every repeat cycle)
- Region to be selected by the user

More information on the project is available at Nowcasting SAF Web site:

<http://www.nwcsaf.org>

PGEs Execution Time

- The [general input data](#) for running NWCSAF software are :
 - MSG package: MSG SEVIRI data and NWP (in some of them).
 - PPS package: AVHRR/3 data and NWP (in some of them).
- The user should be aware that using old NWP data might reduce the quality of the product.

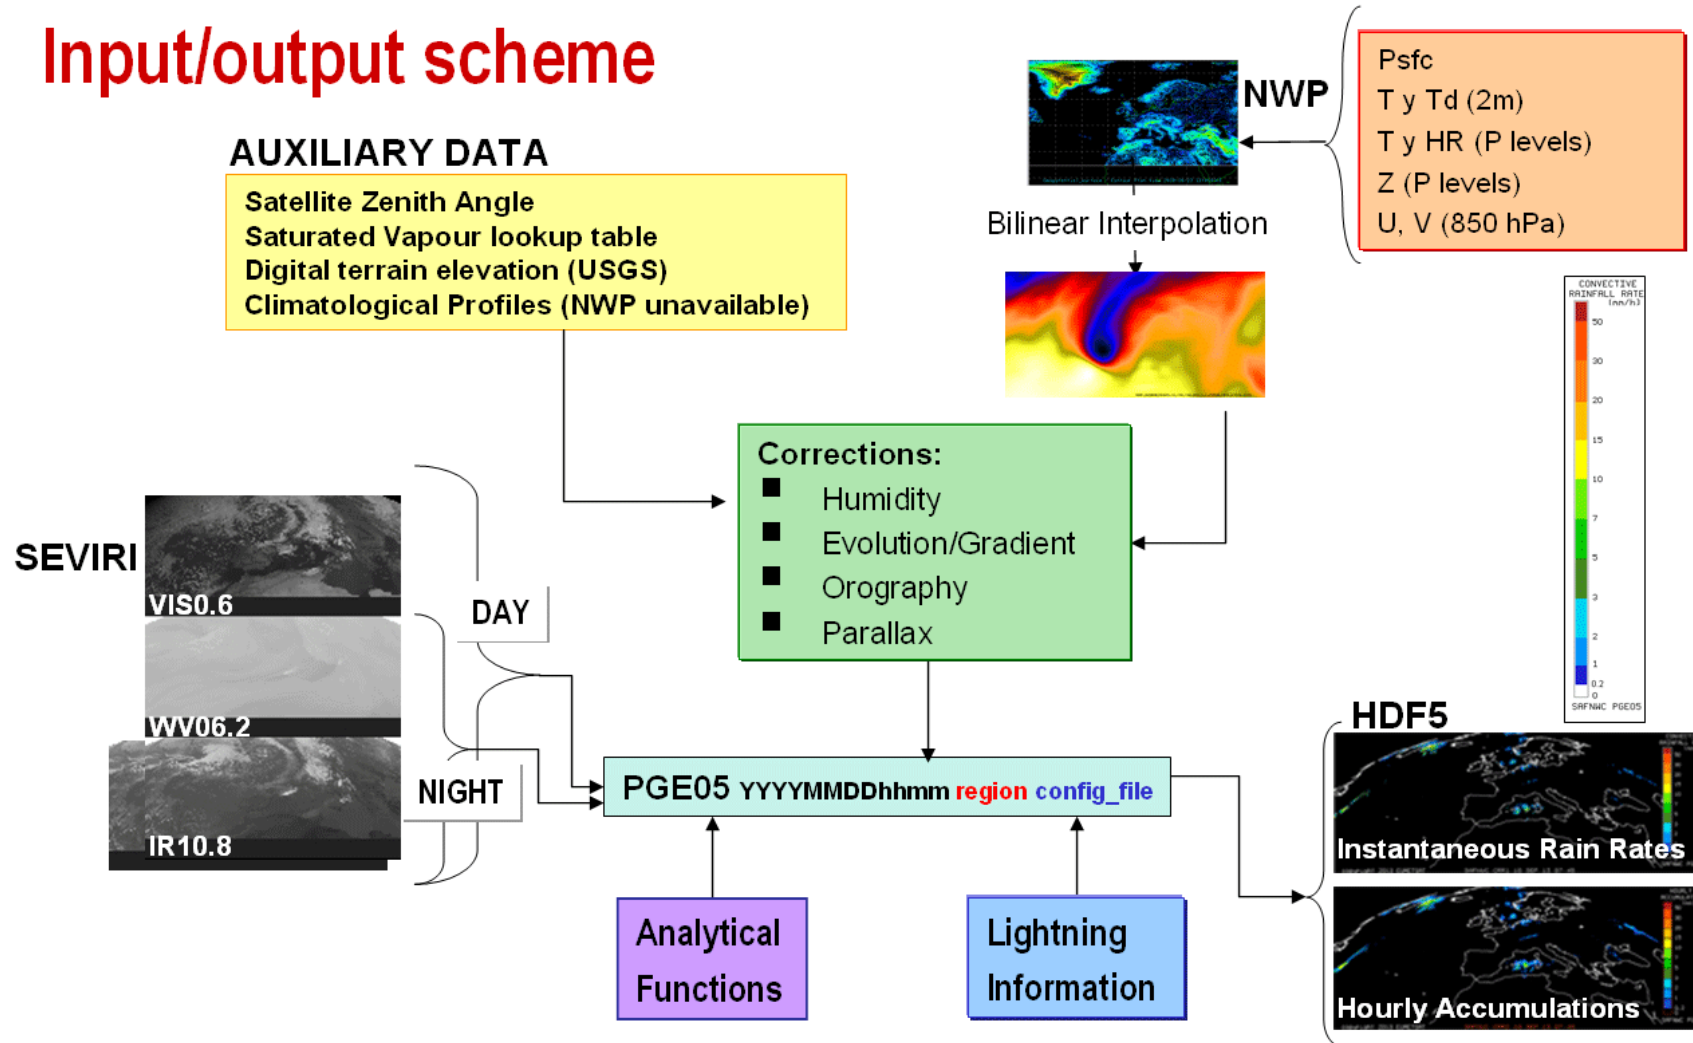

Convective Rainfall Rate (CRR)

INTRODUCTION:

The CRR goal is to estimate rainfall rates from convective systems, using IR, WV and VIS MSG SEVIRI channels and lightning information (as optional input).

Convective Rainfall Rate (CRR)

Input/output scheme

Convective Rainfall Rate (CRR)

CRR - 10th June 2014 – 17:00 UTC

Radar (PPI) - 10th June 2014 – 17:10 UTC

Moisture Correction : (PWRH)

Depends on total precipitable water (surface- 500 hPa) and relative humidity

No corrections applied

Only Moisture correction applied

Convective Rainfall Rate (CRR)

Moisture Correction : (PWRH)

11th Dec 2013 – 03:00 UTC

Depends on total precipitable water (surface- 500 hPa) and relative humidity

No corrections applied

Only Moisture correction applied

Convective Rainfall Rate (CRR)

Evolution Correction / Gradient Correction :

Evolution Correction:
Rain rate decreases if the analysed pixel becomes warmer in the second image

Cloud-top Temperature Gradient Correction:
Rain rate decreases if the analysed pixel has a temperature maximum, which indicates that this pixel is warmer than its surroundings

No corrections applied

Radar (PPI) - 10th June 2014 – 17:10 UTC

Evolution Correction

Gradient Correction

Convective Rainfall Rate (CRR)

Parallax correction:

A spatial shift is applied to every pixel with precipitation according to the basic CRR value

Only Moisture correction applied

Moisture + Evolution corrections applied

Moisture + Evolution + Parallax corrections applied

Convective Rainfall Rate (CRR)

Orographic correction:

This correction uses the interaction between the wind vector (taken from the 850 hPa. numerical model) and the local terrain height gradient in the wind direction to create a multiplier that enhances or diminishes the previous rainfall estimate, as appropriate.

Moisture + Evolution + Parallax corrections applied

Moisture + Evolution + Parallax + Orographic corrections applied

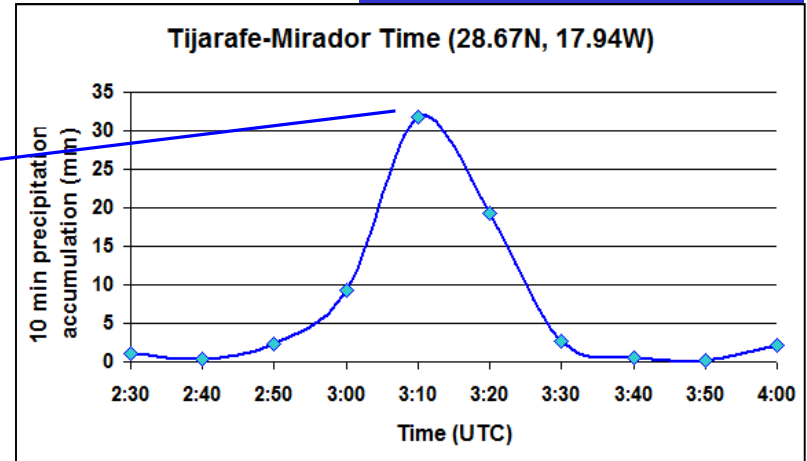

11th Dec 2013 – 03:00 UTC

Convective Rainfall Rate (CRR)

Orographic correction

11th Dec 2013 – 03:00 UTC

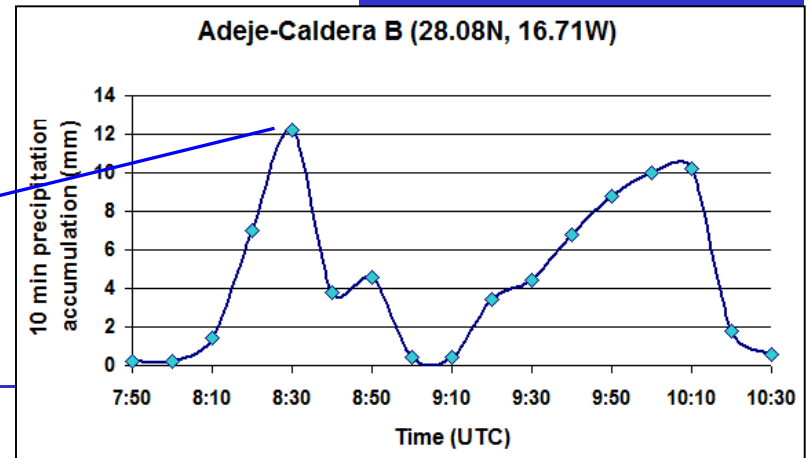

Moisture + Evolution + Parallax corrections applied

Moisture + Evolution + Parallax + Orographic corrections applied

11th Dec 2013 – 08:30 UTC

8 – 12 June 2015

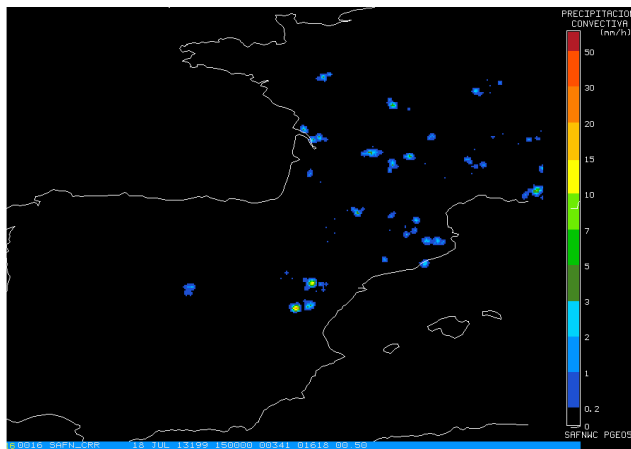

Convective Rainfall Rate (CRR)

LIGHTNING ALGORITHM:

- The Lightning algorithm assumes that the higher are the spatial and temporal density of lightning, the higher are the probability and the intensity of convective precipitation.
- The rain rates assigned to every lightning takes into account:
 - the time distance between the lightning event and scanning time of the processing region centre.
 - the location of the lightning.
 - the spatial density of lightning in a time interval.
- Only Cloud-to-Ground lightning flashes are used by this algorithm.

18 July 2013 – 15:00 UTC

Radar (PPI)

Lightning algorithm

CRR without lightning

CRR with lightning

Convective Rainfall Rate (CRR)

OUTPUTS:

- CRR rainfall rates expressed in classes
- CRR rainfall rates expressed in mm/h
(required for hourly accumulations)
- CRR Hourly Accumulations
- CRR-QUALITY
- CRR-DATAFLAG

Convective Rainfall Rate (CRR)

Problems:

13th July 2013 - 19:00 UTC

- Similar to the cloud tops
- Too big estimated precipitation area and lower rain rates than Radar

Different result for day and night

Convective Rainfall Rate (CRR)

Applications: Estimation of rain rates for convective events over extensive areas, out of the radar coverage or as a radar compliment.

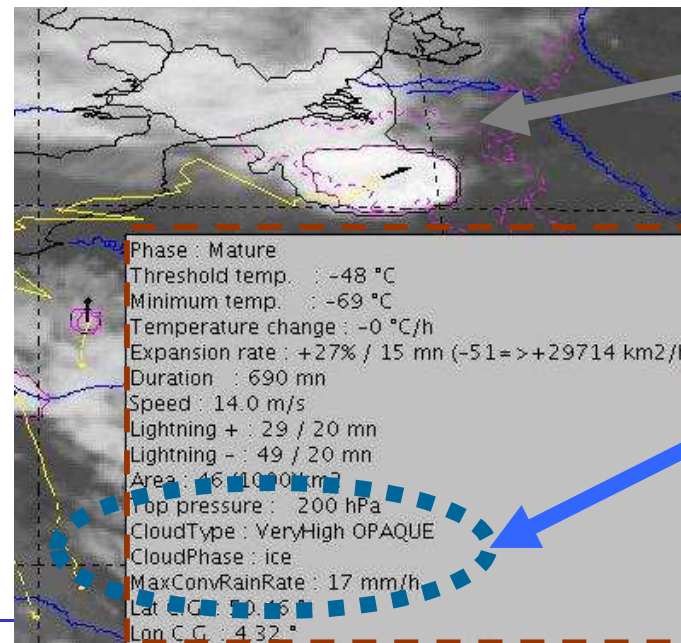

Links between SAF/NWC products

Use of CRR in RDT (Rapid Development Thunderstorm)–Implemented in v2012

RDT takes advantage of CRR data and different **options** are proposed to the users

- **CRR** can be used to identify maximum **convective rain rate under cloud cell**
- **High CRR values** can help to qualify a cloud cell as **significant** and thus to encode this cell in BUFR output (only for the last BUFR version)
- **Very high CRR values** can be used to set diagnosis of **convection to « YES »** (only for the last BUFR version)

RDT main outlines

Attributes

Attributes coming from other NWC SAF products : Cloud Top Pressure, Cloud Type, Cloud Phase, **Convective Rain Rate**

Precipitation products from Cloud Physical Properties (PPh)

INTRODUCTION:

Two products generated:

- **Precipitating Clouds from Cloud Physical Properties – PCPh**

PCPh provides estimation on the probability of precipitation (PoP) occurrence.

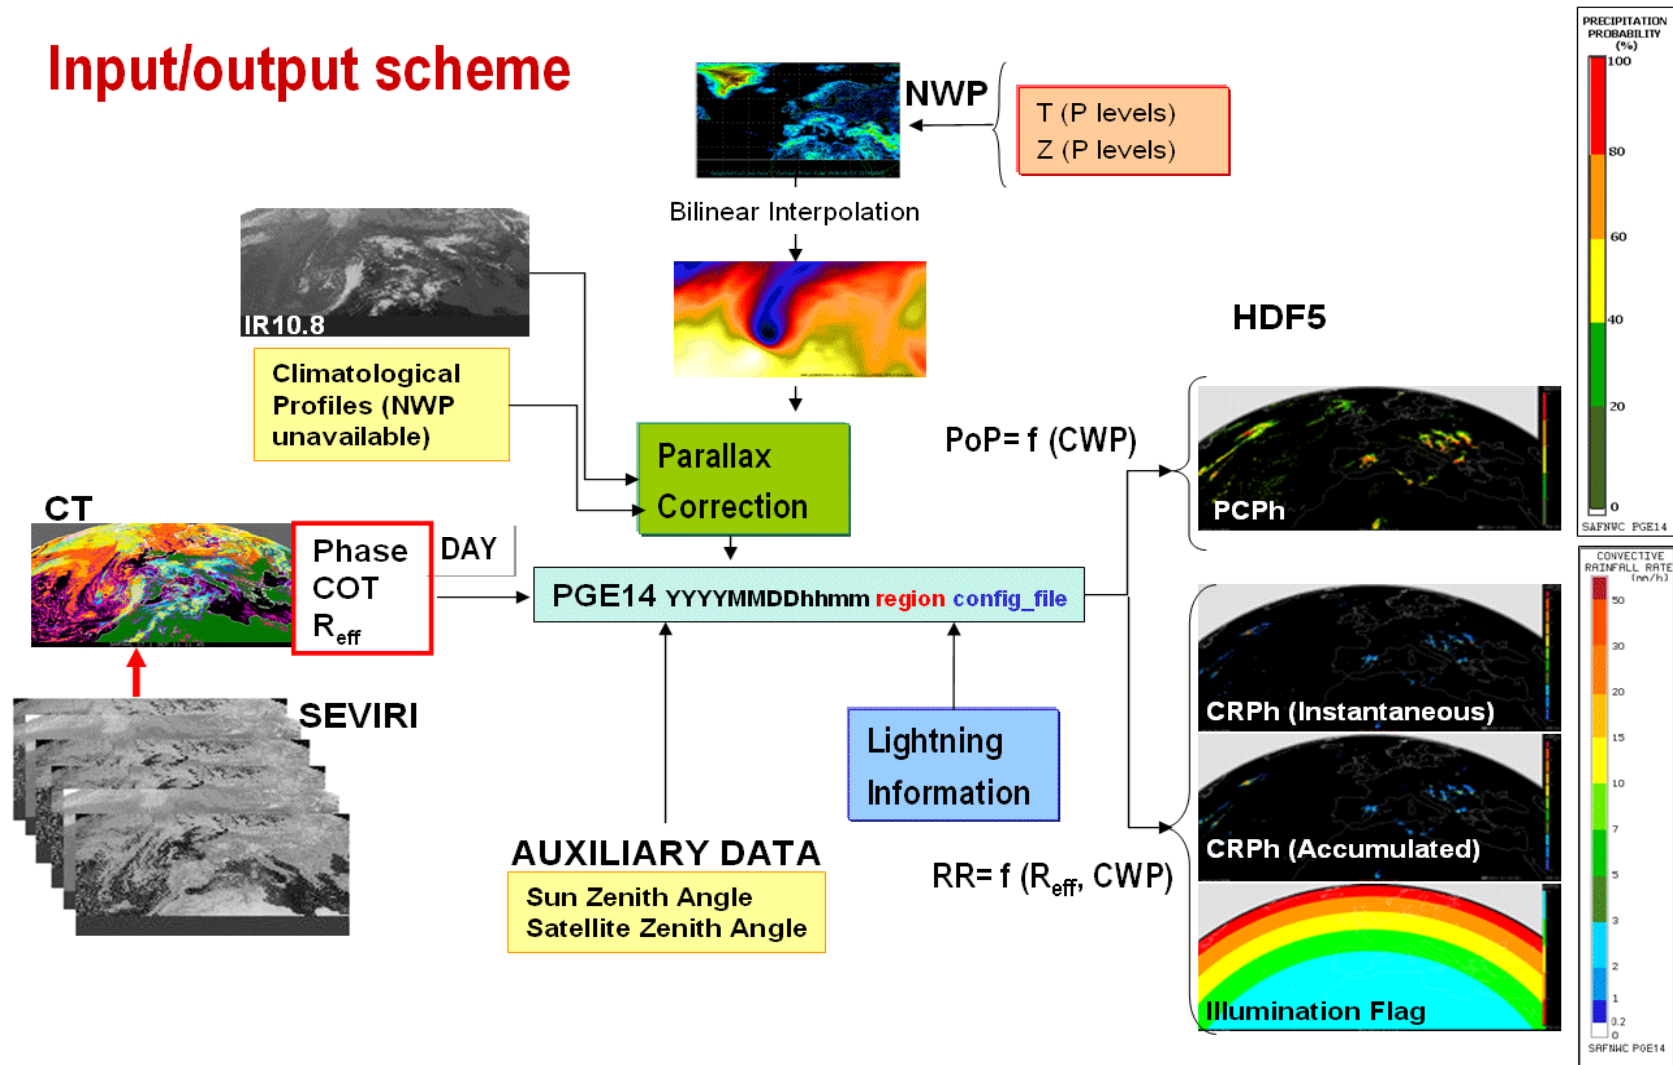

PoP is defined as the instantaneous probability that a rain rate greater than or equal to 0.2 mm/h occurs at the pixel level.

- **Convective Rainfall Rate from Cloud Physical Properties – CRPh**

CRPh provides information on convective, and stratiform associated to convection, instantaneous rain rates and hourly accumulations.

Convective Rainfall Rate from Cloud Physical Properties (CRPh)

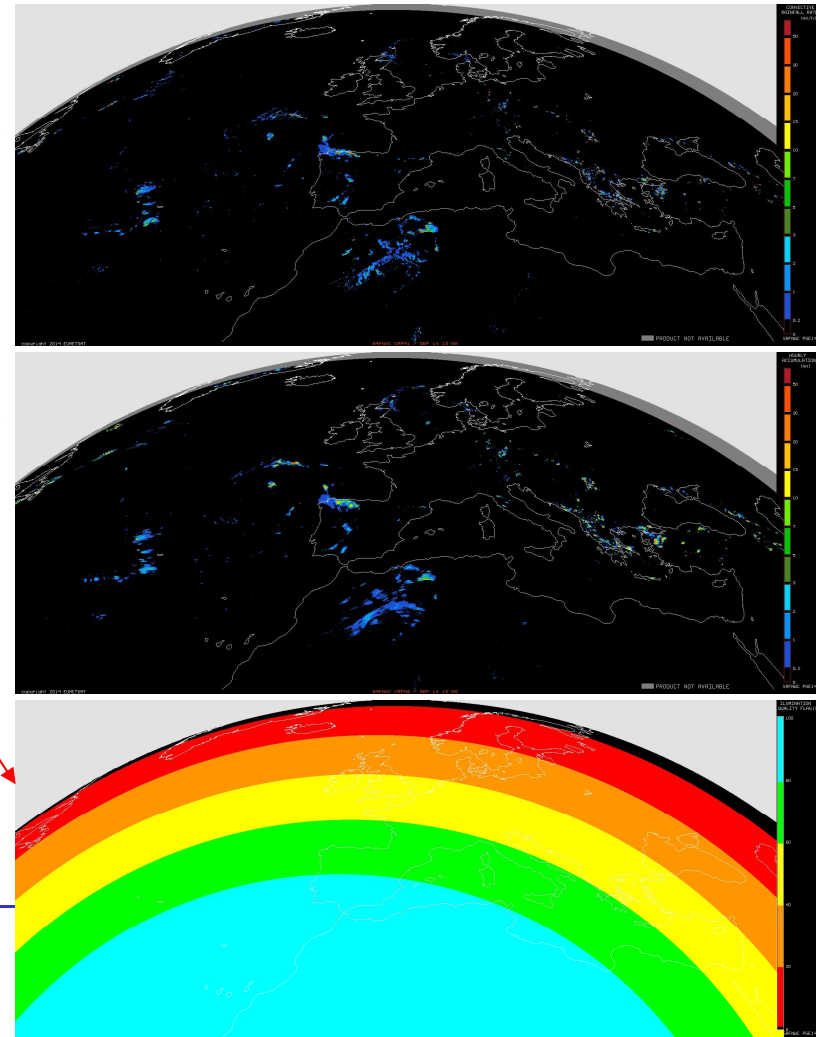

Input/output scheme

Convective Rainfall Rate from Cloud Physical Properties (CRPh)

CRPh OUTPUTS:

- Rainfall rates from 0.0 to 51.0 mm/h with a step of 0.2 mm/h.
- CRPh Hourly Accumulations
- CRPh Illumination Quality Flag
- CRPh_QUALITY
- CRPh_DATAFLAG

Convective Rainfall Rate from Cloud Physical Properties (CRPh)

Limitations:

Only day time

Only for estimated phase

High dependance on illumination conditions

Illumination Quality flag

Comparison of Convective Rainfall Rate products (CRR and CRPh)

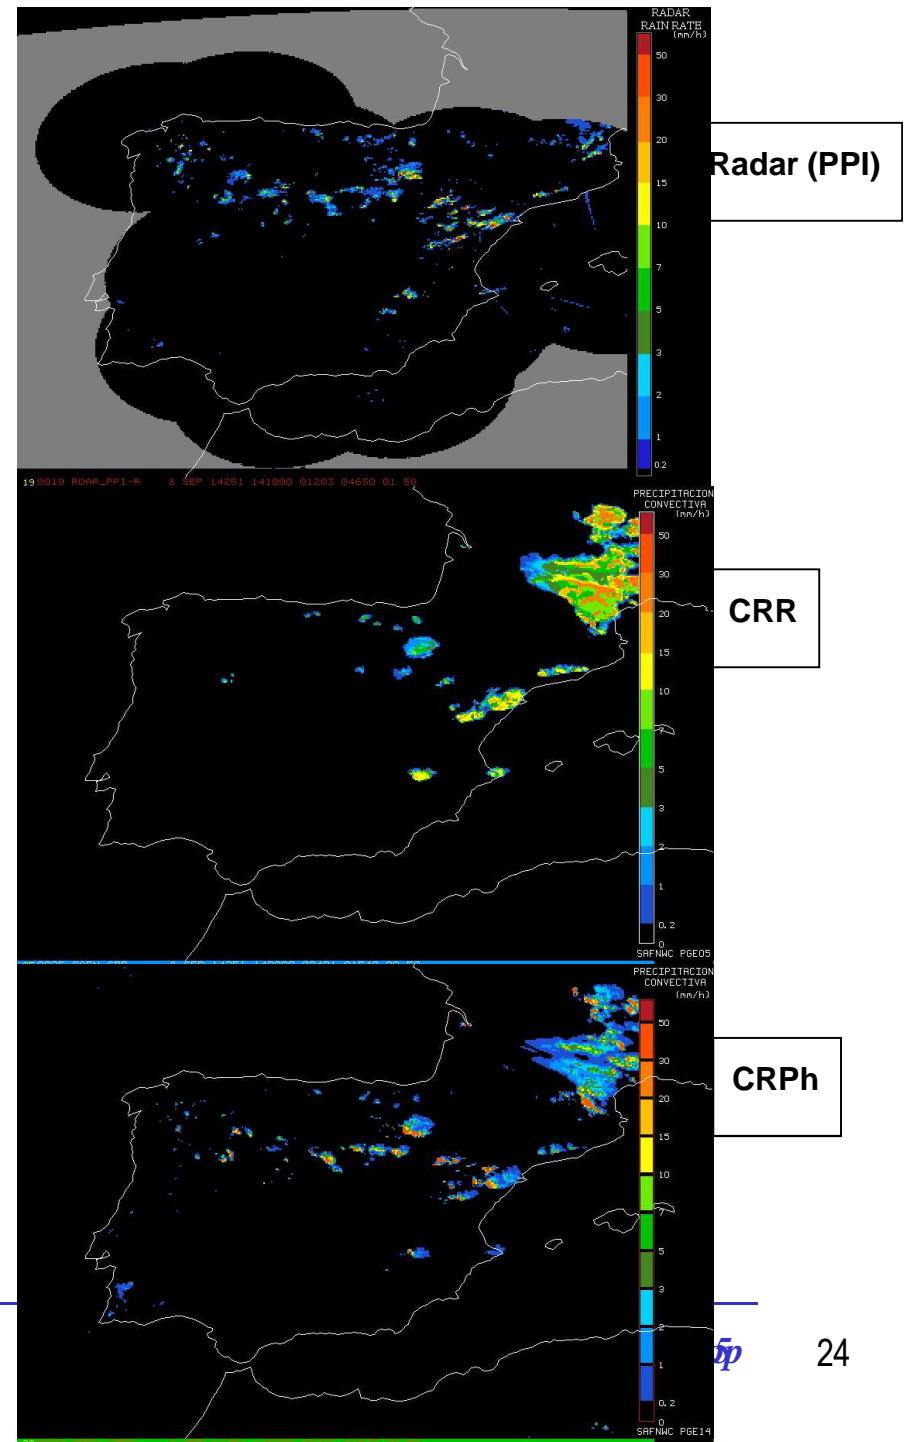

CRPh cons and pros with respect to CRR:

CONS:

- Only day time
- Only for estimated phase
- High dependence on illumination conditions

PROS:

- Precipitation areas and intensities closer to the radar ones
- Improvement of the Cold Rings problem
- Detection of smaller precipitation nuclei
- Detection of precipitation for warm top clouds

Comparison of Convective Rainfall Rate products (CRR and CRPh)

Precipitation areas and intensities closer to the radar ones
