Civil No. 3831

39 In previous briefs filed in this case by the State of Wash-  
40 ington, the law applicable to the Court's determination whether  
41 state law applies to waters located on non-Indian lands within the  
42 exterior boundaries of an Indian reservation has been thoroughly  
43 analyzed. The purpose of this brief is to provide a short synopsis

44 WRITTEN  
45 CLOSING ARGUMENT -  
46 WASHINGTON

239

1 of the state's legal position, followed by a discussion of the  
2 facts developed during the recent trial.

3 Based on the framework of law and on the facts developed in  
4 the course of this trial, the State believes its position has been  
5 fully sustained. That is, the State has the jurisdictional author-  
6 ity to issue water rights to non-Indians such as Mr. Walton,  
7 located within the exterior boundaries of a reservation, such as  
8 the Colville Reservation, where there are waters in "excess" of  
9 those subject to reserved Indian rights. Furthermore, the State's  
10 authority was properly exercised in this case, and the 1949 issu-  
11 ance of the water right permit to Mr. Walton for use of No Name  
12 (or in Indian - "Su-wa-ka") Creek waters should be upheld by this  
13 Court. Whether there is sufficient water now to permit Mr. Walton  
14 to use "state" water to the full extent authorized by his permit  
15 is a separate factual matter, apart from the question of the  
16 State's authority in general, and its exercise of such authority  
17 in this case. However, the State does believe that Mr. Walton  
18 holds a portion of a reserved right also, being a successor to an  
19 Indian allottee. With this brief introduction, we turn to a  
20 discussion of the framework of the law as we see it in this matter.

21 Legal Framework

22 Since the passage of the State's Surface Water Code 1/, Chapter  
23 90.03 RCW, in 1917, 2/ the State of Washington has had a permit-  
24 based prior appropriation system of authorizing rights for the  
25

26 1/ The permit system of the water code was extended to public  
27 ground waters in 1945, by the adoption of what is now Ch. 90.44 RCW.

28 2/ Prior to 1917, there was no central repository for water  
29 rights filings. Although riparian rights were recognized under  
30 certain circumstances, Washington also followed other western  
31 states in accepting the "first in time, first in right rule."  
Early Washington Territorial legislation (18 Laws of Washington  
Territory 520, 1873) adopted the appropriation rule. After state-  
hood, the legislature passed legislation providing for appropria-  
tion for irrigation purposes, and for the beneficial use of public

1 beneficial use of the public waters. 3/ Pursuant to that statute,  
2 persons have since been applying for and receiving "water rights"  
3 (permits) both within and without the boundaries of the several  
4 Indian reservations located in this state. 4/ However, since the  
5 early 1970s, the respective Indian tribes, and the United States  
6 as trustee, have asserted the position that the State of Washington  
7 cannot, as a matter of law, issue water rights to non-Indians even  
8 where there are "excess" waters available. 5/

9 In a nutshell, the State's position is that state law is  
10 applicable with respect to non-Indian water uses within the boun-  
11 daries of a reservation unless

- 12 1. A federal statute or treaty preempts state water rights  
13 law; or
- 14 2. The exercise of a state's water right laws impairs a  
15 tribe's limited powers of self-government over Indians and Indian  
16 interests.

17 \_\_\_\_\_  
18 waters. Wash. Sess. Laws, Sec. 2 and 4, 1891, provided a "notice-  
19 posting" system of establishing a use right and priority therefor.  
20 Pursuant to these enactments, persons were required to file their  
21 claimed right with local county auditors.

22 In 1969, the legislature passed the Water Rights Claims  
23 Registration Act, Ch. 90.14 RCW, to attempt to develop a record of  
24 pre-1917 water rights (known as "vested rights"). Exhibit NNNN-SW  
25 is such a documentation of a claimed "vested right," in the No Name  
26 Creek area.

27 3/ See RCW 90.03.250 et seq. for a description of the applica-  
28 tion - permit system. Basically, a person desiring to use water  
29 makes application therefor, with a priority date as of the date of  
30 application. The state water rights agency - now the Department of  
31 Ecology - makes a field examination of the proposed use, and, if  
32 there is water available for a beneficial use, which use will not be  
33 detrimental to existing rights or to the public interest, a permit  
to develop and use the water may be issued. During the application  
process, notice of the proposed use is provided to the public, and  
any "aggrieved person" may appeal the issuance of a permit to the  
Pollution Control Hearings Board. A certificate is issued after a  
permit, confirming and recording the right established.

4/ Some of the earliest water permits and certificates issued  
under the 1917 Code were issued to water users within the Colville  
Indian Reservation. See Exhibit SSS-SW, where, for example, right  
number S3-956-C has a priority date of January 20, 1919, and several

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 The analysis starts with a recognition that in our federal  
2 system, certain powers rest with the federal government, pursuant  
3 to various constitutional provisions - for example, the war and  
4 navigation powers. The states, however, retained plenary powers,  
5 as recognized by the Tenth Amendment, U.S. Constitution. These  
6 state powers are limited by the Constitution's "Supremacy" Clause,  
7 Art. VI, Cl. 2, and to some degree, by the character of ownership  
8 of property over which the jurisdiction is asserted, or by a need to  
9 protect Indian tribes' exercise of limited tribal powers of self-  
10 government, Mescalero Apache Tribe v. Jones, 411 U.S. 145 (1973),  
11 Organized Village of Kake v. Egan, 369 U.S. 60, 72 (1964). See also  
12 Oliphant v. Suquamish Indian Tribe, 98 S.Ct. 1011 (1978); Cohen,  
13 Federal Indian Law 513 (1958).

14 Thus, unless one of the jurisdictional "ouster" requirements  
15 stated above is met, state water rights laws are applicable to  
16 waters located on non-Indian or federal land within a reservation.

17 With respect to the possibility, above, that Washington's  
18 exercise of its water rights laws will "impair" Indian rights of  
19 self-government, the State submits that this case does not present  
20 the Court with an impairment problem. Assuming, arguendo, that a  
21 tribe has powers over any waters within a reservation reserved by  
22 the United States for its benefit, 6/ the implementation of Wash-  
23 ington's water rights laws cannot impair tribal self government  
24

---

25 other rights with priority dates in the early 1920s are shown.  
26 Indeed, the in-reservation permits carry priority dates from 1919 on,  
27 until the early 1970s, when litigation concerning reserved rights  
arose.

28 5/ The State recognizes the reserved rights doctrine, and the  
29 "paramount" priority date of most such reserved rights. The state's  
jurisdictional claim extends only to the "excess waters" on  
non-Indian lands.

30 6/ A position which requires acceptance of some notion of Indian  
31 "sovereignty," over non-Indians and non-Indian interests, with which  
we are unable to agree. See Oliphant v. Suquamish Indian Tribe,  
32 98 S.Ct. 1011 (1978).

33 WRITTEN  
CLOSING ARGUMENT -  
WASHINGTON

1 powers because the State's law only authorizes establishment of  
2 rights subject to existing rights, including any prior reserved  
3 rights of the Indians.

4 As a practical matter, the Indian reserved rights - carrying a  
5 priority date as of the establishment of the reservation - are  
6 encompassed within the "existing rights" limitation which all state  
7 rights are subject. Thus, state law, as a matter of law, applies  
8 only to excess waters - waters not required to satisfy Indian  
9 reserved rights. Stated another way, any use of water authorized  
10 by the State of Washington respecting "excess waters" is within the  
11 context of a system of priorities and would yield to any prior or  
12 subsequently initiated water usage from No Name Creek which is  
13 within the scope of prior reserved rights of the United States,  
14 established for No Name Creek, held for the benefit of Indians.

15 Furthermore, it should be noted that the State's jurisdictional  
16 claim does not extend to Indians, Indian lands, water on such  
17 lands, or to the reserved rights themselves. State law does not  
18 interfere with "self-government;" it simply does not apply.

19 With respect to the possibility that state water rights law  
20 is ousted or rendered inapplicable within a reservation because of  
21 the operation of federal law, treaty, or executive order, it is the  
22 State's position that no federal statute or treaty has built such a  
23 "wall" around the various Indian reservations. 7/

24 Careful examination of the various statutes and enactments  
25 does not support the plaintiff's theory of an impregnable legal  
26 "wall" around reservation boundaries:

27  
28 7/ This position comports with the well-recognized doctrine that  
29 state law may, under proper circumstances, apply to non-Indians and  
30 non-Indian (also nonfederal) interests within the original boundaries  
31 of the reservation. Langford v. Monteith, 102 U.S. 145 (1880);  
Draper v. United States, 164 U.S. 240 (1896); United States v. Bratney,  
104 U.S. 621 (1881); New York v. Martin, 326 U.S. 496 (1946).

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1           1.     The Enabling Act, 25 Stat. 676, Sec. 4, which auth-  
2 orized Washington State's submission to the federal union  
3 does not.

4           COMMENT: The act would apply to claimed state jurisdic-  
5 tion over Indians and Indian land; it does not reach the  
6 State's authority over non-Indians and non-Indian land.

7           2.     Likewise, Washington State's Constitution, Art. 26,  
8 Sec. 2, with language identical to the Enabling Act, does not.

9           3.     28 U.S.C. §1360(B) (Public Law 83-280) does not, and

10          4.     Washington's counterpart statute to PL 83-280,  
11 chapter 37.12 RCW, does not.

12          COMMENT: Again, the statutes relate to Indian interests,  
13 not non-Indian interests. Nothing in either statute bars the  
14 application of state law to excess waters on non-Indian lands.  
15 In fact, PL 83-280 would support state jurisdiction over non-  
16 Indians. (See footnote 10 below.)

17          5.     Likewise, 25 U.S.C. §381 does not contain state law -  
18 preempting language.

19          A court should not conclude Congress legislated an ouster of  
20 state authority ". . . in the absence of an unambiguous congression-  
21 al mandate to that effect. . . ." Florida Lime and Avocado Growers  
22 v. Paul, 373 U.S. 132 (1963). The Allotment Act and the other  
23 noted federal statutes contain no such preemptive language.

24          An examination of the Executive Order establishing the Colville  
25 Reservation in 1872 (Ex. Col. 2 (3)) does not furnish support for  
26 an "ouster" of state jurisdiction over non-Indian excess waters.  
27 First, the executive order does not expressly preempt the State  
28 from applying its water laws to waters within the reservation. 8/  
29

30 8/ Indeed, the executive order is devoid of detail other than a  
31 description of the lands reserved. The reservation first extended  
32 over most of north central Washington to Idaho, but was reduced  
33 three months later to an area between the Okanogan and Columbia  
rivers, apparently on the outcry of local settlers and miners who  
feared the Indians were getting the best land. Land area was

WRITTEN  
CLOSING ARGUMENT -  
WASHINGTON

1 Second, while recognizing that the establishment of the  
2 Colville Reservation impliedly reserved certain rights to waters  
3 within the Reservation for the Colvilles, United States v. Winters,  
4 207 U.S. 564 (1908), the Winters doctrine does not, as a matter of  
5 law, apply to all waters within the Reservation.

6 The impliedly reserved right ("Winters Right") is related to  
7 the purposes and intention of the reservation's creation: waters  
8 within the reservation are reserved in those amounts necessary to  
9 carry out the purposes for which the reserve was created. The  
10 right's priority dates from the establishment of the reservation -  
11 here, 1872 - and the scope of the right and the purposes for which  
12 it may be used are measured by the intention of the reserve's  
13 creator at the time the reserve was created. 9/ Most importantly,  
14 as the U.S. Supreme Court recently emphasized, the right estab-  
15 lished is for that amount necessary to carry out the purposes for  
16 which the reservation was created "and no more," Cappaert v. United  
17 States, 426 U.S. 128, 141 (1976).

18 Further, and closely associated with this latter point, the  
19 Winters doctrine does not stand for the proposition that all  
20 waters within a reservation are reserved. The Winters case itself,  
21 and subsequent cases such as Conrad Investment Co. v. United States,  
22 161 Fed. 829 (9th Cir., 1908) recognize that waters in excess, or  
23 "surplus" of those amounts required to satisfy a reserved right are  
24 subject to appropriation under state law. See also United States v.  
25 Ahtanum Irrigation Dist., 330 F.2d 897 (9th Cir. 1964). 10/

26  
27 clearly the prime concern in the reservation process; jurisdiction  
28 over land was secondary.

29 9/ The intended purposes of the Colville Reservation are dis-  
cussed in greater detail at pp. 23-27.

30 10/ Even if it is necessary, before Washington State's water code  
31 may be applied, to find a federal statute authorizing state water  
law applicability within the Colville Reservation, there are at

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 The creation of the Colville Reservation, then, does not bar  
2 the exercise of State jurisdiction with respect to excess waters on  
3 non-Indian lands within the Reservation. The issue of "excess" or  
4 "surplus" waters to which state law attaches in No Name Creek is a  
5 matter of fact for the court to decide. Whether such waters exist  
6 involves a consideration of various facts; e.g., (1) availability  
7 of water, (2) scope of reserved right, (3) intent to exercise a  
8 reserved water right, and (4) the timeframes in which that intent  
9 was (or will be) carried out.

10 It is in this context that the Court must determine factually  
11 whether all waters within No Name Creek were reserved in such  
12 fashion that it can be stated that all waters within the creek were  
13 required to satisfy reserved rights from the first day of creation  
14

15  
16 least three federal statutes which so provide as to waters located  
17 on non-Indian lands within the reservation. They are:

18 1. Public Law 83-280, as enacted in 1953, invited the  
19 State of Washington to apply its civil or criminal laws, or both,  
20 to both Indian and non-Indians and their interests. Through  
21 implementation of chapter 37.12 RCW by the State of Washington,  
22 Washington's civil laws have been applied to unrestricted fee  
23 land within the Indian reservation of the State of Washington  
24 including the Colville reservation. See RCW 37.12.010. Thus,  
25 Washington States water laws may be applied to waters located on  
26 defendant Walton's lands. See RCW 37.12.010.

27 2. Lands, constituting allotments, severed from federal  
28 ownership and trust pursuant to the Dawes Act "shall have the benefit  
29 and be subject to the laws, both civil and criminal, of the state  
30 or territory in which they reside . . . ." 25 U.S.C. § 349.  
31 Thus Walton, as successor in land ownership to an Indian allottee,  
32 may obtain the benefits of state laws such as Washington State's  
33 water code for such lands. See Dillon v. Antler Land Company,  
34 507 F.2d 940 (9th Cir. 1974), cert. denied, 421 U.S. 993 (1975).  
35 See also Dickson v. Luck Land Co., 212 U.S. 371 (1917), and United  
36 States v. Hibner, 27 F.2d 909 (D. Idaho, 1928).

37 3. By the Act of 1906 (34 Stat. 80) the Reservation was opened  
38 to entry and settlement under the "homestead" laws. Under  
39 these federal laws, lands transferred from federal to nonfederal  
40 ownership are not accompanied by any federal water rights, water  
41 rights establishment upon and after transfer being a matter of state  
42 water rights law, California - Oregon Power Co. v. Beaver  
43 Portland Cement Co., 295 U.S. 142 (1935). While there are  
44 apparently no "homesteaded" lands in the No Name Creek basin, there  
45 are within the rest of the Colville Reservation. Thus there is no  
46 impermeable wall around the Colville Reservation barring state  
47 water rights laws.

1 of the Colville Reservation in 1872. In the following analysis of  
2 the evidence before the Court, we shall point out that the weight of  
3 the evidence clearly supports a conclusion that there have been  
4 significant amounts of "excess waters" in No Name Creek in the past  
5 to which state water rights laws have been properly applied. Thus,  
6 Walton's State right issued under the water availability conditions  
7 of the later 1940s was clearly valid.

8 We shall also point out that if present trends continue, there  
9 will be fewer and fewer excess waters available to allow (1) for the  
10 full exercise of state-based water rights issued in the past or  
11 (2) for the establishment of new state-based rights in the future.

12 The essential fact derived from the evidence is that there have  
13 been and will be excess waters in No Name Creek to which state water  
14 rights laws may apply. There is, as a matter of fact and law, no  
15 wall on the original boundaries of the Colville Reservation which  
16 bars the reach of such laws to No Name Creek waters.

17 \* \* \*

18 FACTUAL DISCUSSION

19 With the legal framework in mind, we turn to a discussion of  
20 the case's factual aspects. The jurisdictional questions related to  
21 the existence of "excess" waters in No Name Creek, now or in 1949,  
22 are discussed first. Space and time limit our discussion of other  
23 topics touched on in trial, but we do comment on the following:

- 24 1. The historical background of the Colville Indian Reserva-  
25 tion's establishment.
- 26 2. The scope of the reserved right.
- 27 3. Water availability.
- 28 4. Water duty and usage.
- 29 5. Omak Lake and the Lahontan fishery.

30 We turn immediately to the discussion.

31 \* \* \*

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 State's Issuance of Walton Permit

2 In 1948, Mr. Wilson Walton submitted an application to the State  
3 for permission to use surface water (3 cfs) from No Name Creek for  
4 irrigation of his farm. (Ex. IIII-SW, p. 16a). The application was  
5 duly published in the local paper; 11/ no protests were received  
6 during the protest period. 12/ As part of the standard application  
7 processing procedures, a field exam of the proposed use was made,  
8 and, on October 31, 1949, Mr. Herbert Pollock of the Department of  
9 Conservation signed the Report of Examination, Ex. IIII-SW, p. 13.  
10 A permit was duly issued on the basis of the Report's recommenda-  
11 tion. 13/ (Trans. 2698-2700-Wallace).

12 Were there "excess" waters when the permit was issued? Because  
13 of the present unavailability of the Department of Conservation  
14 employees who handled the Walton application, there is no eyewitness  
15 testimony of what the State "saw" in 1949. However, the Report of  
16 Examination itself, (Ex. IIII-SW, p.13), based on the department's  
17 field exam, provides several important indications:

18 1. Under the heading "Other use made of water," the notation  
19 is "stockwater 1 ranch downstream."

20 2. Under "Special Remarks," the notation is "One ranch down-  
21 stream utilizes this stream for stockwater and possibly for other  
22 domestic uses."

23  
24  
25 11/ See RCW 90.03.280 and Ex. IIII-SW, p. 15.

26 12/ See RCW 90.03.470(12); counsel for Colvilles and for the United  
27 States stipulated that there was no protest filed as to the Walton  
28 application or others (Trans., 2265-67; see also Trans. 312,  
29 Covington).

30 13/ Permit No. 6105, Ex. III-SW, p. 12. The Certificate subse-  
31 quently issued after Walton filed his Proof of Appropriation, is No.  
32 3743, Ex. R-W. The certificate is identical to the permit except  
33 that the authorized acreage, 65 acres, is reduced from the permit's  
75 acres, Mr. Walton having made full appropriation only as to 65  
acres.

1 3. Fish in the stream are mentioned, indicating a year-round  
2 supply of water.

3 4. The quantity of water authorized for appropriation was  
4 reduced from the requested 3 cfs to 1 cfs, presumably to both protect  
5 stream flows and give a more reasonable appropriation amount for the  
6 75 acres the department then deemed "feasible" for irrigation.

7 5. Estimated low flow of No Name Creek was "1.5 cfs"; maximum  
8 flow was estimated at "3 cfs."

9 Taken together, the Report of Examination does indicate that,  
10 at that time, there was water available for the requested appropria-  
11 tion, 14/ and there were no other uses except as noted. Thus, on  
12 its face, the Report of Examination and permit indicate "excess"  
13 waters.

14 The testimony of the "oldtimers" as to the state of No Name  
15 Creek Valley development in 1948-49 corroborates the Report.  
16 Mr. Walton stated that, in 1950, there was no irrigation south of  
17 his property (Trans. 2163). Mrs. Sampson, former tenant on Allot-  
18 ment 901, indicated she had left the allotment by the early 1940's.  
19 (Trans. 324). Mr. Hampson stated that there was no irrigation below  
20 the Waltons in 1948 (Trans. 2084), as did Mr. Boyd Walton  
21 (Trans. 2283), for 1950.

22 The situation in 1949, then, was this: The State had received  
23 a surface water application for No Name Creek waters. The surface  
24 flow of No Name Creek 15/ starts at the spring area just north of  
25 the Walton property (Trans. 589-Watson). Reasonably, then, the  
26

27  
28 14/ RCW 90.03.290 requires a determination of a) water availabil-  
29 ity, b) beneficial use, and c) no detriment to prior users or the  
30 public interest before a permit may issue. The Walton application  
31 was subject to these tests, of course.

32 15/ There were occasional floods on flows down from Omak Creek to  
33 No Name Creek (Trans. 2209-B. Walton, see also Aston), but the  
ordinary flow starts near the North property line of the Waltons.

WRITTEN  
CLOSING ARGUMENT -  
WASHINGTON

1 extent of the stream at which the State was looking in 1949 was from  
2 the spring zone flowing down to Omak Lake through allotments 901 and  
3 903. 16/ It was those properties against which the excess waters  
4 "determination" is to be considered, 17/ not as against the northern  
5 allotments in the valley, Nos. 526 and 892, for which the logical  
6 surface water source would have been Omak Creek, not No Name  
7 Creek. 18/

8 Furthermore, there were no wells between the Walton property  
9 and Omak Creek except domestic wells. (Trans. 314-Covington; 2092-  
10 Aston; see also USGS report, USA Ex. (1) and Ex. 30-14). There  
11 would thus have been no suggestion that the proposed Walton diver-  
12 sion could in any way adversely affect ground water resources. 19/  
13 Also, because of the unique formation known as the granite lip,  
14 south of Walton, the lower No Name Creek area is a separate ground  
15 water basin. (Trans. 1263, 1264-Kaczmarek). Thus, the only use  
16 which could have been affected by the Walton surface diversion would  
17  
18

---

19 16/ The stream originally flowed into the lake through Lot 903, but  
20 after channel renovation now flows through Lot 901 (Trans.  
334-Sampson; see also testimony of Koch).

21 17/ This was not a formal finding, of course, for as Mr. Wallace  
22 stated, the issue simply never came up (Trans. 2739). That is, there  
was simply no question at that time that the Walton's use was non-  
detrimental to others' uses.

23 18/ Indeed, there was considerable testimony that at least Allot-  
24 ment 526 (an upper lot) had been irrigated from Omak Creek, and that  
25 there were ditches running off Omak Creek. (Trans. 1813-Bennett;  
340-Sampson)

26 19/ As a matter of fact, it is far more likely that a upstream  
27 groundwater withdrawal will affect a downstream surface use, rather  
28 than vice versa. The surface flow can only affect downstream - not  
"uphill" in the aquifer. It has taken the sophisticated research  
29 resources of the Colvilles and the USGS to document No Name Creek's  
30 source as being primarily surfacing ground water from Omak Creek.  
The complex surface - ground connection was simply not apparent or  
31 provable until the advent of this litigation. The point still  
remains, however, that Walton's use of No Name Creek itself can only  
affect downstream users of the stream, for if he does not use the  
stream the water would still flow south, not north.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 have been a use on the creek downstream from his diversion. As  
2 already demonstrated, there was practically no downstream use in  
3 1948-50; there was no irrigation use from the stream at that time in  
4 Allotments 901 and 903. To the extent there was some stock and  
5 grazing use, the State's Report of Examination noted it and took it  
6 in to account in the amounts authorized for diversion.

7 It should also be noted that the Waltons were the only resi-  
8 dents and irrigators in No Name Creek Valley until the advent of the  
9 Colville Irrigation Project in the mid-1970's. 20/ From 1948 to  
10 1975, then, the only irrigation water user was Mr. Walton. The  
11 record is bare of any suggestion of contemplated or imminent water-  
12 requiring development by the allottees, the Tribe or anyone else,  
13 until the late 1960's. There is simply no factual basis, then, to  
14 conclude that the Walton permit no. 6105 was infringing on or issued  
15 in the face of an impending exercise of reserved rights. From 1949  
16 to the mid-1970's, the waters used by Walton pursuant to his State  
17 permit were, quite literally, excess. They would have run, unused  
18 and unproductive, into an ever-rising "dead" Omak Lake, had the Wal-  
19 tons not made beneficial use of the water for their lands and cattle.

20 To summarize: when the State issued Permit 6105, there were  
21 excess waters, and the permit was properly within the State's juris-  
22 diction to issue. The validity of the permit should be confirmed by  
23 this Court.

24  
25  
26  
27 20/ According to Mr. Tonasket's testimony, the first impetus for  
28 the project was Edgar Disautel's complaint in 1970 that he couldn't  
29 get enough ground water from Lot 901 (which we now know as a poor  
30 aquifer) for the Lake resort, (Trans. 212-Tonasket.) There was no  
31 earlier evidence of complaint, concern or otherwise about Walton's  
32 diversion.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 \* \* \*

2 Current Status of Walton's State Right

3 We have seen that, at the time of permit issuance, there were  
4 excess waters available for appropriation from No Name Creek. The  
5 record is also clear that, with the advent of the Colville Irriga-  
6 tion Project, stream flows of No Name Creek have diminished, if not  
7 disappeared altogether. (See, e.g., Trans. 669-Watson).

8 One of the unique features of the Winters right is that, unlike  
9 state-based rights which are lost for non-use, see, e.g. Ch. 90.14  
10 RCW, the Winters right may be exercised at any time. Assuming,  
11 then, that the Colville Irrigation Project is a proper exercise of a  
12 long-dormant Winters right, 21/ that exercise carries with it a  
13 priority date as of the date of the Reservation's establishment,  
14 1872.

15 Mr. Walton's state right carries a priority date of 1948.

16 The state right issued to Mr. Walton, like that issued to any  
17 other permittee, is issued "subject to existing rights," RCW 90.03-  
18 .010. One of the "existing rights" to which the Walton permit is  
19 subject, therefore, is an exercise of a reserved right to use the  
20 water supply, here, No Name Creek. 22/

21 Under the terms of the permit itself (Ex. IIII-SW, p. 12),  
22 Washington water law (RCW 90.03.010), and standard Western law of  
23

24  
25 21/ Elsewhere in our discussion we point out some of the limita-  
26 tions on the scope and quantity of the right, pp. 22-25.

27 22/ The exercise of a reserved right by the Colville Indians on,  
28 for example, the Columbia River, could not affect the No Name Creek  
29 water resource. This illustrates the point that the determination  
30 of "excess" waters is a factual question, directly related to the  
31 particular water resource, not to the Reservation as a whole. It is  
32 for this reason that the state contends the relief requested in  
33 Issue 12, Pretrial Order, is premature and cannot be made on the  
basis of this record.

1 appropriations, "subject to existing rights" is enforceable in terms  
2 of priority:

3 "First in time shall be the first in right."  
4 Simply stated, the Colville Indian reserved right has priority over  
5 the Walton State right. In case of water shortage of No Name Creek,  
6 the Walton right 23/ must yield to the exercise of the Indian right,  
7 as it would to the exercise of any right, state-based or Winters-  
8 based, with a greater priority to that particular water resource or  
9 water body.

10 By the same token, if at some point the Colville Irrigation  
11 Project did not use all waters, the Walton right could be exercised  
12 to the extent of excess, cutting back as the excess was picked up  
13 again by the Project.

14 The ability of the state right to expand (up to the authorized  
15 amount) and contract (to nothing) is not a mere trick, it is the  
16 very basis upon which the law of water use in the West is founded.  
17 That is, the water right is a use right, not a right of ownership of  
18 the stream, per se. See RCW 90.03.010 and Weil, Running Water, 22  
19 Harv. L. Rev. 109 (1909). That right to use necessarily depends  
20 both on the physical state of the stream itself, and on the other  
21 use rights held by other stream users, whether Indian or non-Indian,  
22 within the reservation or not, and may therefore expand or contract  
23 as stream conditions and priority warrant.

24  
25  
26 23/ The Walton right here discussed is the state-based right. The  
27 State also supports Mr. Walton's claim to a portion of the Winters  
28 right, as successor to an Indian allottee, United States v. Hibner,  
29 27 F.2d 909 (D. Idaho, 1928); United States v. Powers, 305 U.S. 527  
30 (1939). Purchasers of Indian allotments stand, in effect, in the  
31 shoes of the Indians. A purchaser obtains a reserved water right.  
The State's discussion is concerned solely with Mr. Walton's water  
use pursuant to State permit, not with the water to which he is  
entitled as a successor to an allottee. We recognize that Mr. Wal-  
ton's exercise of his portion of the Winters right may "diminish"  
his own state right.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 In summary: Because of recent water resource development in  
2 the No Name Creek vicinity, it is possible the "excess" water avail-  
3 able in 1949 no longer exists to satisfy part or all of the right  
4 authorized to Mr. Walton. Basically, No Name Creek may be "fully  
5 appropriated," 24/ at any one time by holders of rights with greater  
6 priority - the Colvilles and their successors. To that extent, the  
7 Walton right is (and must be by law) diminished.

8 It is also most likely that, given the demands currently related  
9 to the No Name Creek water resource, a new State attempt to issue  
10 further state rights there would be impossible. There would simply  
11 be no 'excess' waters available to satisfy the state law requirement  
12 of water availability 25/ prior to permit issuance. This determina-  
13 tion, of course, would be based on the factual circumstances related  
14 to No Name Creek. This points out again that the state system and  
15 the Winters right do "mesh" remarkably well to allow water resource  
16 development, based on the practical circumstances of the particular  
17 water body or resource.

18 It is also clear that future issuance of state permits else-  
19 where on the reservation rests on a factual determination of 'excess'  
20 waters for each such stream or water resource. If there are 'excess'  
21 resources, they can be put to use; if not, a state right-based use  
22 will yield to the higher priority use of the reservation's benefici-  
23 aries, the Colville Indians. Clearly, it would be premature to now  
24 give injunctive relief as requested in the Pretrial Order, Issue 12,  
25 and the Court should deny the request.

26  
27  
28  
29 24/ See Trans. 2703-Wallace, concerning state practice in appropri-  
30 ating streams.

31 25/ RCW 90.03.290.

1 \* \* \*

2 Historical Background - Water and the Colville Reservation

3 The Colville Reservation was created by executive order. (Ex.  
4 2(3)-Col). That order is silent as to the extent and nature of  
5 reserved water rights on the reservation. It is also silent on the  
6 extent that the federal government contemplated restriction of state  
7 jurisdiction within the boundaries of the reservation.

8 Treaties and executive orders are similar to statutes in their  
9 effect. Where they are ambiguous or silent, long-accepted and  
10 mandated methods of judicial interpretation are required. The courts  
11 will look to the practice and understanding of the particular execu-  
12 tive agency specially authorized to act in the area, to determine  
13 the full effect of the congressional or executive action. This rule  
14 of construction is likewise applicable to cases involving treaties  
15 and orders dealing with Indian tribes. Such documents must be "read  
16 in light of the common notions of the day and the assumptions of  
17 those who drafted them." Oliphant v. Suquamish Indian Tribe, 98  
18 S.Ct. 1011, 1019 (1978). In this area, shared presumptions of the  
19 Congress and the Executive Branch carry "considerable weight."  
20 Oliphant, Id.

21 What are those presumptions with regard to the Colville Reser-  
22 vation?

23 First, we begin with the main reasons for the creation of this  
24 particular reservation. One such reason was

25 . . . to provide a definite location for  
26 certain Indian bands which then were roaming  
27 around over the Northwest country without  
any fixed abode, . . .

28 House Report No. 1070, 58th Cong., 2d Sess., (1904), p.1. The reser-  
29 vation creation followed a request by the Farmer-in-Charge at Fort  
30 Colville; he believed that such a reservation was necessary to avoid  
31

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 the outbreak of hostilities between Indians and non-Indian settlers.  
2 Report of William P. Winans to Gen. T. J. McKenney, Sept. 1, 1871,  
3 as reported in Report of the Commissioner of Indian Affairs for the  
4 Year 1871 (1872), p. 295.

5 In establishing the reservation it was clear that the federal  
6 government did not consider the Tribes involved to possess any of  
7 the sovereign powers which they assert now before this court. In  
8 1869 the Commissioner of Indian Affairs informed the Superintendent  
9 of Indians for Washington:

10 Arrangements now, as heretofore,  
11 will doubtless be required with tribes  
12 desiring to be settled upon reservations  
13 for the relinquishment of the rights  
14 to the lands claimed by them . . . but  
15 I am of the opinion that they should not  
16 be of a treaty nature. . . . . A treaty  
17 involves the idea of a compact between  
18 two or more sovereign powers . . . . The  
19 Indian tribes of the United States are  
20 not sovereign nations.

21 Report of the Commissioner of Indian Affairs, 1869 (1870),  
22 p. 6.

23 In 1887, the Commissioner's report to the Secretary of the  
24 Interior commented on Indian "sovereignty":

25 ". . . to maintain any such view is to  
26 acknowledge a foreign sovereignty,  
27 with the right of eminent domain,  
28 upon American soil - a theory utterly  
29 repugnant to the spirit and genius of  
30 our laws, and wholly unwarranted by the  
31 Constitution of the United States."

32 Report of the Commissioner of Indian Affairs, 1887, p. 87.

33 The nature of the Colville Tribes' right to the reservation  
34 created for them was different - and always recognized as such by  
35 the federal government - than that of other tribes. The Commissioner  
36 of Indian Affairs stated:

37 The Indian title to lands within the  
38 limits of the States and Territories  
39 of the United States is well settled  
40 to be the right of occupancy alone,  
41 except in special instances where,  
42 perhaps, a title of a higher nature

43 WRITTEN  
44 CLOSING ARGUMENT -  
45 WASHINGTON

1           has been vested by statute or treaty  
2           provision.

3 Annual Report of the Comm. of Ind. Aff., 1872, p. 82.

4           The order establishing the Colville Reservation was not such a  
5 special instance.

6           The Congress understood that the Colville Tribes:

7           . . . have no right, except the right of  
8           occupancy, and they have no title,  
9           except a mere license based upon an  
          Executive order establishing the  
          reservation.

10 Senate Report No. 468, 58th Cong., 2d sess. (1904), p.3.

11           It was clear to the Congress that the Colvilles were set apart  
12 from other tribes. Their legal relationship was different:

13           It has been the policy and the practice  
14 of the Government to consult the Indians  
15 having title in the land of the reservation  
16 to be opened, and their consent should be  
17 obtained, yet such consent ought not to  
18 be required when the Indians do not have  
19 title to the land to be opened, and that  
          is the case provided for in this bill  
          (S. 345). The Indians occupying these  
          lands are there only by sufferance of  
          the United States. They have no title  
          to the land whatever. Id., p. 4.

20           Before creation of the reservation whatever right or title they  
21 had must have been "a very shadowy one, if any at all, . . ."

22 House Report No. 1070, 58th Cong., 2d sess. (1904), p.3.

23           This Executive Order defines the Colville  
24 Reservation as it now exists, and is the  
25 sole basis upon which the right of occupancy  
26 of these Indians rests. Under this order  
27 the Indians were given a license to occupy  
28 the lands described in it so long only as it  
          was the pleasure of the Government they  
          should do so, and no right, title, or claim  
          to such lands has rested in the Indians by  
          virtue of this occupancy. Id., p. 2.

29           The government clearly contemplated, moreover, that by allotting  
30 land on the Reservation, it would help to determine which lands were  
31 irrigable for general agriculture and which lands were not. We look  
32 to the government's behavior to see that this was in fact the inten-  
33 tion of the government in reserving the lands in the No Name Creek

1 Valley. On the Colville Reservation, the government intended that  
2 allotments of 40 acres were suitable for use as irrigated agricul-  
3 tural land, and allotments of 160 acres were suitable only for use  
4 as non-irrigated grazing land. See Report of the Commissioner of  
5 Indian Affairs, 1910-1911; see also Annual Report of the Department  
6 of Interior, Indian Affairs, 1906, p. 81, and Senate Report N. 468,  
7 58th Cong., 2d sess. (1904), p. 3; see also Deposition of Eri  
8 Parker, one of the original surveyors of allotments, Ex. JJJJ-W,  
9 pp. 11-12; 15; 20-23; 31.

10 The reserved right for the Colville Reservation was also  
11 peculiarly limited in two other ways.

12 First, it was always recognized that local water rights custom  
13 and the local laws of the State were applicable to the exercise of  
14 water rights on the Reservation. Local custom was applied to Indian  
15 rights. For example, the Commissioner of Indian Affairs instructed  
16 the Secretary of the Interior in 1906:

17 . . . in allotting land to an Indian a tract  
18 of land larger than he can hope to till -  
19 especially when his tenure of the water  
20 necessary to make it productive depends  
21 upon his beneficial and continued use  
22 thereof - we place upon him not only a  
23 physical but a moral handicap. (Emphasis  
24 added.)

25 Annual Report of the Department of Interior, Indian Affairs,  
26 1906, p. 80.

27 It was also recognized that non-Indians could establish water  
28 rights pursuant to the laws of the State of Washington, and Indians  
29 would have to protect their prior Winters rights by taking appropri-  
30 ate action. Captain John Webster, Agent at the Colville Agency,  
31 reported to the Commissioner of Indian Affairs that:

32 The question of water rights for the  
33 irrigation of Indian allotments from small  
streams flowing through them is assuming  
prominence, causing a great deal of hard-  
ship and ill feeling between Indians and  
their white neighbors in the opened north  
half of the Colville Reservation. It is

34 WRITTEN  
35 CLOSING ARGUMENT -  
36 WASHINGTON

1 very unfortunate that the laws on the sub-  
2 ject are so meager, for the problem is a  
3 serious one, affecting nearly every farmer  
4 in this region, and in this new age of  
5 general irrigation will lead to untold  
6 trouble and frequent litigation before  
7 it is solved. White homesteaders have  
8 diverted most, and in some cases all,  
9 of the water from sources used by the  
10 Indians for many years, even their  
11 drinking-water supply in some instances  
12 being entirely cut off. From consultation  
13 with the United States attorney I learn  
14 that there is no adequate remedy at this  
15 late day in the case of Indians of the  
16 north half, and to prevent as far as  
17 possible the recurrence of like condi-  
18 tions on the Colville and Spokane reser-  
19 vations, about to be opened, I propose  
20 to see that every Indian allottee posts  
21 notice of claim and makes a regular filing  
22 and record of water rights where a supply  
23 is available, prior to the opening of the  
24 lands for homestead entry. Id., pp. 371-  
25 372.

15 Even more startling is certain proposed legislation offered by  
16 Secretary Garfield in 1908. The clear implication of the Secretary's  
17 message is that the federal government did not make a complete reser-  
18 vation of all waters on the Colville Reservation. Indeed, if such  
19 had been the case, there would have been no need for special legis-  
20 lation to reserve additional water for power purposes.

21 During the past summer the Commissioner  
22 of Indian Affairs visited this reservation,  
23 and the allotting agent invited his attention  
24 to certain large creeks flowing down from  
25 the mountains on the diminished Colville  
26 Reservation, affording valuable water power  
27 which will be of great value in the future  
28 to the public and to the Indian allottees,  
29 and which, if not protected by the Government,  
30 will be acquired by settlers and developed  
31 for private gain.

27 Allotment work on the Colville Indian  
28 Reservation will be taken up shortly, and  
29 upon its completion the classification and  
30 opening of the surplus lands to settlement  
31 will follow. If these sites are to be  
32 protected with a view to their conservation  
33 and development along broad lines of govern-  
34 mental policy, legislation is necessary.

31 Other evidence bears out the lack of intent by the Government

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 to exclude the States' water laws. For example, superintendants  
2 were instructed in November, 1915, to describe Indians' water rights  
3 as being derived from "adjudication and decree" or "Approved permit  
4 no." (see Pro. Ex. YYY-SW), before land sales, indicating recogni-  
5 tion of these means of obtaining water rights.

6 Indians have filed claims with the State, pursuant to its Water  
7 Right Claims Registration Statute. (Trans. 2712-Wallace). There  
8 was a history of silence on the part of the federal government and  
9 the Tribe as to State issuance of permits on the reservation.  
10 (Stipulated; see also Trans. 312-Covington).

11 Patented allotments were placed on the local county's tax rolls.  
12 (Tr. 2495-Thorp). Neither the United States nor the Tribe objected  
13 to County assessments that took into account water rights.  
14 (Trans. 2497-2498-Thorp).

15 Non-Indian settlers filed to "protect" their water rights under  
16 the law of Washington as it existed prior to 1917; in the 1960's,  
17 after the enactment of Water Rights Claims Registration Act, Ch.  
18 90.14 RCW, those same water users filed "claims" forms to protect  
19 what they thought they had established as rights. (Ex. NNNN-SW;  
20 HHHH-SW). 26/

21 To summarize: There was historically no clear intent or policy  
22 with respect to the waters of the Colville Reservation which would  
23 preclude the State's position on 'excess' waters.

24 \* \* \*

25 Historical Background - Scope of the Reserved Right:

26 Uses and Quantities

27 As stated, the touchstone in determining the scope of the  
28

29 26/ St. Mary's Mission filed such claims, for waters from Omak  
30 Creek. The St. Mary's Mission lands were owned in fee by the Jesuit  
31 Fathers when these "rights" were established. Presumably the Tribe,  
as purchasers of the fee title, own those "rights" now.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 Winters right, both as to uses and as to quantities, is the inten-  
2 tion of those who established the reservation. What was intended  
3 for the Colvilles? In summary form, we suggest the following pur-  
4 poses for uses:

5 1. Agriculture: The Indians were to be settled and become as  
6 homesteaders. Because of the recognized mountainous nature of much  
7 of the Reservation, 27/ the contemplated agricultural uses would  
8 probably not be extensive.

9 2. Timber Production: A use which follows logically from the  
10 creation of the Colville Reservation, which was recognized to be, and  
11 is, heavily forested. 28/

12 3. Fishing: A use historically related to the large salmon  
13 runs on the Columbia. 29/ For the smaller streams and lakes, the  
14 "fishery right" would be only for the preservation of subsistence  
15 native fisheries in those streams, as relied on by the Indians.

16 4. Mineral Production: The Colville Reservation does have  
17 mineral resources, and waters for the exploitation of those resources  
18 were probably 'intended' to be reserved, where appropriate. (No  
19 mineral production uses would be appropriate in the context of No  
20 Name Creek).

21  
22  
23 27/ See letter of James McLaughlin, 20 Dec. 1905, quoted in HR 1681,  
24 59 Cong. 1st Sess. (Feb. 23, 1906):

25 It must be borne in mind that the southern  
26 half of the Colville Reservation is a very  
27 mountainous country, containing much land  
28 which is not of any particular value for  
29 agricultural purposes; but to offset this  
30 it contains a vast area of very fine  
31 timber..."

32 28/ Ibid.

33 29/ See letter, 15 Aug. 1872, McKenney to Walker, quoted at  
Annual Report of the Commissioner of Indian Affairs, 1872, p. 347,  
stating that Kettle Falls on the Columbia was "where they all  
get their winter's supply of salmon."

WRITTEN  
CLOSING ARGUMENT -  
WASHINGTON

- 1 5. Domestic uses
- 2 6. Stockwatering uses
- 3 7. Firefighting uses

4 As to the quantities reserved for such uses, we are again  
5 guided by intention principles. Amounts are only to the extent  
6 necessary to achieve those purposes, Cappaert v. U.S., 426 U.S. 128  
7 (1976).

8 For agriculture the current rule of quantification, adopted by  
9 the Supreme Court, in Arizona v. California, 373 U.S. 546, 600-01  
10 (1963), set as the outside limit in that case the "practicably irri-  
11 gable acreage."

12 Agriculture as practiced at the time of the reservation's estab-  
13 lishment was mainly grazing, dry cropping, and irrigation from  
14 surface-water fed gravity and flume systems. These systems required  
15 more water than modern sprinklers, but probably covered less land  
16 than sprinklers are now capable of irrigating. There is therefore  
17 some question as to whether the extent of agricultural water reser-  
18 vation should be measured by the irrigation technology existing at  
19 the time of the reservation. For rill irrigation from the flow of  
20 No Name Creek, the irrigable acres would be approximately 115  
21 acres. 30/ If this Court should adopt a sprinkler-based "irrigabil-  
22 ity test," the testimony indicated that approximately 400 acres in  
23 the No Name Creek Valley are irrigable. 31/ (Ex. 11- U.S.).  
24

---

25 30/ The figure is derived from the 75 Walton acres feasible for  
26 creek water irrigation, and the approximately 40 creek-water irri-  
27 gated acres for the two lower allotments, (Ex. IIII-SW, p. 13;  
Trans. 2062-Hampson.)

28 31/ Whether the manner in which the irrigation water is presently  
29 used (pumped in the north, shipped wastefully to the south) was  
30 within the intention of the reservation's creation presents a related  
31 issue. That is, was it intended that the Lots 901 and 903, whose  
own ground water resources are limited, (Trans. 1264-Kaczmarek), were  
to receive the benefit of ground water pumped from Lots 526 and 892?  
Or were the lower lots "intended" simply to receive the naturally  
occurring flows of No Name Creek as it came over the granite lip? Is

1 For timber purposes, the right need not be quantified in this  
2 litigation, there being no timber production element herein.

3 Water quantities for fisheries purposes are limited to those  
4 amounts necessary to ensure the continuance of the native fishery,  
5 but only if that fishery was "intended" to be protected.

6 Domestic and stockwatering uses are, for all practical purposes,  
7 de minimis.

8 Firefighting uses again are not directly related to this case,  
9 but quantification would be futile, as the need is instantaneous, on  
10 an emergency basis.

11 Regarding ground waters, no reservation of such waters could be  
12 made by the federal government unless it clearly contemplated that  
13 such waters underlay the lands in question. Indeed, it would be  
14 most difficult to find an intention to reserve such waters unless  
15 they were known at the time the reservation took place. Moreover,  
16 to the extent that any reservation of ground waters was made, that  
17 reservation was for the use of such ground waters in quantities suf-  
18 ficient to fulfill domestic purposes. There was no intention to  
19 reserve ground waters for modern, high-capacity irrigation wells.  
20 The State does not argue here that such ground waters must now be  
21 used for all time solely for domestic use, but the extent of the  
22 right (the limit of the volume under that right) is determined by  
23 the original intended use.

24 For practical purposes, then, in this litigation it is the agri-  
25 cultural use which constitutes the major element of the reserved  
26 right.

27  
28 \_\_\_\_\_  
29 the reserved right the Tribes' to move, in gross, or ascribable on  
30 a pro rata basis to each allottee? In considering this quantifica-  
31 tion of the agricultural use, the Court will have to keep in mind  
the "intention" touchstone when threading through the somewhat  
difficult ground-surface water relationships in No Name Creek, before  
and after development.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 \* \* \*

2 Water Availability

3 In analyzing the estimates of various experts as to the amount  
4 of water available in the No Name Creek Valley for irrigation pur-  
5 poses, the Court should keep in mind that inherent in all of the  
6 estimates are certain and varying resource management assumptions  
7 and preferences. As testified to by Dr. Maddox and Mr. Jones, the  
8 concepts of "firm annual supply" and other similar expressions are  
9 based on certain assumptions of how water is to be managed. Every  
10 year that irrigation has taken place in the No Name Creek Valley is  
11 a year in which some scheme of water management was in effect. Why  
12 should the scheme of management imposed by the Tribe in 1977 (with  
13 one eye on the pumps and the other eye on U.S. v. Walton) be the  
14 scheme of management by which all others are to be judged, and  
15 eventually rejected? This Court is being seriously misled when it  
16 is told that it must not seem to be imposing a water management  
17 scheme on all of the parties here when it makes its decisions.

18 All of the "firm annual" estimates, for example, contained  
19 built-in assumptions of how water should be managed. (Trans. 2625-  
20 Maddox). None of these assumptions should be blindly accepted by  
21 the Court. However, it would be appropriate for the Court to look  
22 to the customary experience in many areas of the western states:  
23 planned declines in water table over a set period of time so as to  
24 more efficiently make use of a scarce resource. (See Trans. 2336-37-  
25 Maddox; 2707-Wallace; see also RCW 90.44.130, on "safe sustaining  
26 yield" and "controlled decline.") As the determination of water  
27 availability in this case will necessarily involve an implicit man-  
28 agement scheme, the Court should be well aware of the values embodied  
29 in such choice.

30 The first estimate of water availability presented at the trial  
31 was that of Mr. Cline of the USGS. His figure - an annual supply of

1 1100 AF - assumed the deepening of certain wells that tap the  
2 northern aquifer so as to place a strong, but safe, stress on the  
3 ground water system. (Trans. 62-Cline). On the other hand, assuming  
4 the use of water resources in the area without any significant change  
5 in the methods of withdrawal, Mr. Cline estimated an annual available  
6 supply of 950-1000 AF. (Trans. 71-72-Cline). The amount of water  
7 available in the aquifer system would be increased, of course, by  
8 increased pumping; take more out and you put more in, as more water  
9 is induced to enter the system. (Trans. 169-Cline). This phenome-  
10 non of shifting ground water boundaries is observable, shown by the  
11 additional water induced recently by tribal pumping. (Trans. 2630a-  
12 Maddox). In fact, more water could be produced from the aquifer if  
13 it were not for the present poorly planned spacing of wells in the  
14 Valley. (Trans. 2633a-Maddox).

15 Mr. Cline's figure is solid. It is "accurate, though conserva-  
16 tive," as one expert testified. (Trans. 2325-Maddox.) It is far  
17 from the wild-eyed guess that the Tribe's experts attempted to make  
18 it. The figure, which is explained at U.S. Ex. 1, p. 31, was the  
19 product of an extremely thorough report, was based on accurate data  
20 (Trans. 2338-Maddox) and was produced by individuals with excellent  
21 professional reputations. (Trans. 2337-Maddox). The analysis used  
22 to derive the figure was based on a "water budget" method, one of  
23 the acceptable methods for such a problem as presented here.  
24 (Trans. 2543, 2544-Grimstad).

25 The estimate that was derived from the other major and regular  
26 method testified to at trial (Trans. 2545-Grimstad) was the modified  
27 "flow net" analysis used by Dr. Maddox. Like all complex techniques  
28 of geohydrologic analysis, this type of analysis relies on certain  
29 assumptions. (Trans. 2340-Maddox). After explaining his careful  
30 analysis and its attendant computations, Dr. Maddox stated that the  
31 availability for annual withdrawal from the No Name Creek aquifer is

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 a total of 1200-1300 AF (Trans. 2309-2319, 2323-24-Maddox). This  
2 figure is far closer to that derived by the USGS experts (who, it  
3 should be noted, became active in investigation in the No Name Creek  
4 Valley under the authority of the Court and who were not hired by  
5 any party to prepare their work for the purpose of presenting a  
6 particular case at litigation) than are the figures of the expert  
7 for the Tribe. The figure derived by Mr. Jones was closer to the  
8 USGS figure than it was to the Tribal consultant's estimation. 32/

9 In stark contrast to the figures derived from two of the experts  
10 from this state -- Dr. Maddox and Mr. Cline -- is the figure selected  
11 upon by Mr. Watson: 550 Acre Feet. In analyzing this figure --  
12 exactly half the amount believed available by the USGS -- we begin  
13 first with the knowledge that, as he testified, Mr. Watson was  
14 operating within certain analytical constraints apparently imposed  
15 by this litigation (Trans. 793 - "Those are my orders, Mr. Mack."-  
16 Watson).

17 And when did he come to decide that 550 Acre Feet, and no more,  
18 was the "capacity" of the No Name Creek aquifer? His analysis was  
19 based on data from the spring, 1976, and from the fall, 1976 to the  
20 spring, 1977. After digesting and interpreting the data, he deter-  
21 mined that 550 Acre Feet was the "safe annual yield." This number  
22 was conveniently the same number proposed by counsel for the Tribes  
23 in the Pre-Trial Order herein - submitted to the Court in the summer  
24 of 1976. (Pretrial Order, p. 14).

25 The Watson approach includes many flaws pointed out below. One  
26 of the more serious flaws of the 550 AF number is that, based on  
27 Mr. Watson's own logic, the number is actually either 480 AF or 962  
28 AF! That is, Mr. Watson derived his 550 figure from the .66 cfs  
29

---

30 32/ Trans. 1891-Jones. See the discussion, below, p. 30, as to why  
31 the Tribal figure is actually 480 AF, not 550.

1 measurement in March 1976 and January-April 1977, at Walton's drive-  
2 way. 1 cfs converts to approximately 2 AF/day. 33/ Thus, as he  
3 testified, .66 cfs equals approximately 480 AF/yr ( $.66 \times 2 \times 365 =$   
4 483).

5 He then divided the .66 cfs into two portions, one for "precipi-  
6 tation" and one for "Omak Creek leakage" contributions, as follows:

7 .12 cfs - precipitation

8 .54 cfs - leakage

9 .66 cfs Total

10 (Trans. 759-Watson). However, rather than using the standard conver-  
11 sion factor, some unknown factor was used, for he then suggests that:

12 (Trans. 758-9; see also 1171 and 1155-1194-Watson)

| 13 | Watson                             | (Standard Conversion) |
|----|------------------------------------|-----------------------|
| 14 | .12 cfs = 175 AF                   | ( 87 AF               |
| 15 | .54 cfs = <u>375</u> from Omak Cr. | ( <u>393</u> AF )     |
| 16 | 550                                | ( 480 AF )            |

17 Further, even if the Watson "conversion figure" is accepted, the  
18 proportions between the .12 cfs and the .54 cfs figures are such that  
19 .54 cfs should be 787 AF, not 375 AF. ( $.54 = 4.5 \times .12$ ;  $4.5 \times 175 =$   
20 787). Adding,  $787 + 175$  equals 962 AF. The 550 figure, in and of  
21 itself, is simply not scientifically correct, nor is it even consis-  
22 tent with its own internal logic, whatever that may be. This Court  
23 should be cautious in using such figures. 34/

24 Mr. Watson's figures, of course, assumed that one plans for  
25 water use and allots rights to the use of water on the most pessi-  
26 mistic projections. Under such an assumption, there is no better  
27

28 33/ See Attachment A.

29 34/ We also note that, on cross-examination, Mr. Watson was unable  
30 to come to a reasoned explanation of the 550 figure, see, i.e.,  
31 Trans. 1167-93.

1 year than a drought year to calculate the amount of water available  
2 for use in a particular area. Such an analysis, of course, runs  
3 counter to all custom and practice in Washington and the western  
4 states. (See Trans. 2703-Wallace).

5 The tribal expert's analysis had other failures, which the Court  
6 should note.

7 First, Mr. Watson's analysis heavily relies on data from the  
8 Peters Observation Well, a well that is particularly ill-suited to  
9 serve as a major foundation for a hydrologic analysis. The well is  
10 a bad one to use for such puposes. (Trans. 2298, 2304, 2317,  
11 -Maddox; 2593-Cline).

12 Second, Mr. Watson relied on weather data from two weather  
13 stations without making the necessary correlation of data from the  
14 stations. (Trans. 2602,-Cline; Trans. 2624-Maddox).

15 Third, the one surface flow measurement which is the linchpin  
16 of Mr. Watson's analysis is also an unreliable datum on which to  
17 rely. (Trans. 2604-Cline).

18 Fourth, Mr. Watson's use of a water budget shows why he is not  
19 particularly comfortable with this accepted technique. His water  
20 budget figures do not confrom with reality; his budget is hopelessly  
21 out of balance. (Trans. 2583-Cline).

22 Fifth, whereas the Tribe underestimated recharge to the aquifer  
23 (Tr. 2632A-Maddox), and overestimated discharge - thereby coming up  
24 with a low net inflow figure - (Trans. 2605-Cline), the predicted  
25 recharge of Mr. Cline was remarkably accurate. (Trans. 2762-MacNish).

26 Sixth, Mr. Watson's attack on the methods and data used by USGS  
27 tends to show no one's unreliability but his own. Mr. Watson doubts  
28 the accuracy of all USGS measurements, but he relies on them. Indeed,  
29 Mr. Kazcmarek stated that the Tribe's experts relied on unreliable  
30 data (Trans. 2873-Kaczmarek); Dr. Robinson testified that calcula-  
31 tions based on unreliable data are unreliable themselves. (Trans.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 2888-Robinson).

2 Seventh, the reliance on the .66 cfs figure to show, indirectly,  
3 inflow into the aquifer, assumes that all the outflow was counted in  
4 the .66 cfs figure. However, all the outflows were not counted.  
5 (Trans. 2604-Cline; see also the testimony of the Waltons concerning  
6 the other springs on and below the Walton property, e.g., Trans. 2207.)

7 The study of the USGS is the best study of its type that has  
8 been performed anywhere in the nation. (Trans. 2748-2756-MacNish).  
9 The measurements obtained were extremely accurate and were obtained  
10 by use of the finest techniques. (Trans. 2557-58, 2573-74-Carpenter;  
11 2630-Maddox).

12 Contrast this with the work of the tribal consultants. These  
13 witnesses attack the USGS surface flow measurements as unreliable on  
14 account of daily fluctuations, which, in fact, are indications of  
15 nothing of the sort. (Trans. 2572-Carpenter). On the other hand,  
16 the tribal experts made the following errors in their surface flow  
17 measurements:

18 1. They relied on unreliable flume readings (Trans. 2559,  
19 2562-Carpenter).

20 2. They use and rely on a manufacturer's rating curve for  
21 their weirs and flumes, when reliance on such is misplaced.  
22 (Trans. 2562-Carpenter).

23 3. They made poor velocity measurements (Trans. 2564-67-  
24 Carpenter).

25 4. Their measuring points are at too shallow depths.  
26 (Trans. 2570-71, Carpenter).

27 5. They are apparently ignorant of the pump-setting in one of  
28 their wells (Trans. 2589-Cline).

29 6. They prepared exhibits on their surface flow measurements  
30 that are either incomplete, sloppy, or deceptive (Trans. 2568-  
31 Carpenter).

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 It is based on this type of work that they assail the USGS-  
2 supplied data on which all parties have justifiably relied. In the  
3 face of this, is their other work reliable? Is the 550 Acre Feet  
4 figure one in which this court can have confidence?

5 We think not.

6 Finally, we note that all of the water availability figures  
7 ignore the water available from the surface flow of Omak Creek.  
8 That Creek runs through the lands in question. Its waters histor-  
9 ically have been used for irrigation of lands in the No Name Creek  
10 Valley. For efficient use of water today, those waters should be  
11 used. (Trans. 2642-Maddox). There is sufficient water there to  
12 satisfy all present uses in the No Name Creek Valley. (Trans. 2368,  
13 2362-Jones). Its use should not be ignored by the court. The sur-  
14 face waters of Omak Creek are as much part of the waters available  
15 for use in the No Name Creek Valley as are the waters of No Name  
16 Creek, particularly as the pre-trial order does not limit this court's  
17 scope of analysis to the waters of No Name Creek.

18 \* \* \*

19 Omak Creek and No Name Creek

20 Omak Creek is connected to the ground water system of No Name  
21 Creek. Indeed, No Name Creek is nothing more than a distributary  
22 stream of Omak Creek. The principal source of recharge to the No  
23 Name Creek aquifer is vertical percolation from Omak Creek. (Trans.  
24 58-Cline). There is an obvious hydrologic connection between Omak  
25 Creek and the No Name Creek aquifer (Trans. 2628A-Maddox), even  
26 though the connection is not perfectly direct (Trans. 2266-Jones).

27 The discussion at trial by the tribal experts about an allegedly  
28 massive Omak Creek subflow was much ado about nothing (or, rather,  
29 very little). There is simply no significant subflow. (Trans.  
30 2618-Cline). If there were, of course, it would simply mean that a  
31 greater area would tend to contribute to the vertical percolation

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 that all parties admit is occurring. Indeed, although the tribal  
2 experts believe that this subflow is large, they are hard-pressed to  
3 explain - indeed, cannot explain - why its water is not apparent  
4 where it should be. (Trans. 2859, 2867-Kaczmarek).

5 The ground water divide of the No Name Creek aquifer can be  
6 shifted to the north, based on pumping in the valley, and therefore  
7 can take in a larger area from which the aquifer is supplied.  
8 (Trans. 54-Cline). Indeed, such a shift occurred last year, due to  
9 increased stress on the aquifer. (Trans. 53, 2595-Cline;  
10 2635-Maddox).

11 It is obvious to all but the most myopic that Omak Creek flows  
12 through allotments in question in this suit, and flows across the  
13 lands that are the subject of the suit. Omak Creek is certainly a  
14 part of the No Name Creek basin. (Trans. 2261-Jones).

15 We note that historically Omak Creek waters have flowed into  
16 the No Name Creek. Mr. Cline thought that it was likely (Trans. 172;  
17 Boyd Watson observed this in modern times (Trans. 2209-2210). This  
18 is contrary to the testimony of Dr. Robinson, who testified that  
19 such a flow could not have occurred since prehistoric times.

20 We also know that water from Omak Creek has been artificially  
21 induced southward into the valley. The Tribe itself has done so  
22 recently. (Trans. 2212-B. Walton). Historically, all irrigation of  
23 the upper allotments was done from Omak Creek, by gravity-based  
24 ditch and flume systems.

25 Look at the setting. Clearly the government intended that it  
26 was reserving surface waters, if any, not from No Name Creek but  
27 from Omak Creek for the upper allotments of No Name Valley. In the  
28 days of rill irrigation - the time when the reservation was created -  
29 only the Omak Creek waters would have been considered as a source  
30 for irrigation of these allotments. And, of course, the history of  
31 use bears this out. Indian witnesses stated that irrigation from

1 Omak Creek had been made by Indians at least near the turn of the  
2 century. (Trans. 310-Covington; see also Ex. NNNN-SW), and the  
3 testimony of Bennett (Trans. 1841-43) and Hampson (2067) also indi-  
4 cate water use from Omak Creek. It was within the contemplation  
5 of the federal government that Omak Creek waters would be the ones  
6 used for irrigating the upper allotments.

7 No comparable reservation was made of ground waters (1) because  
8 no one could have contemplated that large volumes would exist or  
9 would be extracted and (2) because to the extent they were reserved  
10 they were done so only in small amounts for stock and domestic use.  
11 (Trans. 314-Covington). The agency records show no ground water use  
12 for irrigation. They do show in 1922, 20 acres of Allotment 526  
13 were being irrigated - from Omak Creek. (Ex. AAAA-SW).

14 When President Grant created the Reservation and reserved water  
15 for it, he did not only reserve water from No Name Creek for use in  
16 the No Name Creek Valley. Omak Creek also runs there. Counsel for  
17 the Tribe and the United States can pretend that it does not occur  
18 there, but, it is there. The State did not put it there. Winters  
19 rights have been exercised from it for years. Winters rights for  
20 Lots 526 and 892 have attached to it. Those rights are just as  
21 appurtenant to the lands they serve as any other water right. Those  
22 allotments have their rights from Omak Creek, and should not properly  
23 be "charged" against No Name Creek water resources.

24 \* \* \*

25 Water Duty and Irrigation Practices

26 In general terms, "water duty" is the amount of water which  
27 must be applied to lands to grow crops. Water duty multiplied by  
28 the number of acres to be irrigated gives a figure for the total  
29 water requirements of a farm area. Soil moisture, crop, and system  
30 efficiency are factors taken into account in assigning a water duty  
31 (see generally, Trans. 1807-08-Bennett).

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 In the Pretrial Order, the Tribe originally contended for a  
2 water duty of approximately 4.8 AF/ac (Pretrial Order, p. 11), and,  
3 at trial, its witnesses testified that during 1977 the Tribe used  
4 approximately 4.8 to over 5 AF/acre of water (Ex. 24-10 Col.). The  
5 State has always contended that, at maximum, a water duty of 4 AF/  
6 acre would be sufficient for irrigation in the area. 35/ However,  
7 experience with similar irrigation projects and crops indicates  
8 that the actual water use would be somewhat less. Dr. Maddox  
9 testified that a figure two-thirds of the amount shown for "Omak  
10 Alfalfa" on Table Two, WSU Circular 512, (Ex. Col.-36.2) (2/3 x 39"  
11 = 26"), was, in practice, a sufficient amount of water for crop  
12 production.  
13 (Trans. 2331-2-Maddox).

14 The most telling testimony with regard to water duty was that  
15 of Mr. Bennett, of the Okanogan office, U.S. Soil Conservation  
16 Service. Virtually Mr. Bennett's entire professional career has  
17 dealt with irrigation systems and water requirements in the Omak  
18 area. Based on his testimony, an appropriate duty in the area is  
19 about 3.6 AF/acre (Trans. 1810-Bennett). Even in years where serious  
20 drought conditions exist, Mr. Bennett's testimony was that a duty of  
21 4.3 AF/acre would be sufficient. 36/ The Bennett figures do take  
22 into account the efficiency of the irrigation system used, but are  
23

24 35/ We note other adjudication proceedings awarded water duties in  
25 the 3-4 AF range. In re Chiliwist Creek, 77 Wn.2d 658 (1970) a case  
26 involving both Indian and federal interests, in Okanogan County, an  
27 average water duty of about 4 AF was granted; in the Chamokane Creek  
28 case, pending before this court, a water duty of 3 AF/acre in a  
29 similar situation was requested by the United States.

30 36/ Any greater use of water, would, of course, indicate a waste of  
31 water, a possibility abhorred in western water law.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 conservative in the sense that soil moisture content is not  
2 included. 37/ There was absolutely no showing by the Colville wit-  
3 nesses or any others that lands in No Name Creek Valley are in any  
4 fundamental manner different from other Okanogan County lands for  
5 which Mr. Bennett and the local SCS have provided advice. The claims  
6 to any water duty over 3.6 AF/acre, must therefore be based on a  
7 system which does not use water efficiently - certainly not something  
8 this Court should be encouraging in a water-short basin. If the  
9 "reasonable standard" to which other farmers in the Okanogan area  
10 adhere is a water duty of 3.1 to 3.6 AF/acre, that standard should  
11 also apply to lands in the No Name Creek Valley.

12 With respect to water duties for rill irrigation, the State  
13 submits that the issue is misleading. At the beginning of the allot-  
14 ment period in the 1920's, before the advent of more efficient  
15 sprinkler systems (Trans. 1815-16-Bennett), gravity or pump-assisted  
16 flume systems were used for irrigation in the area. (Trans.  
17 2087-Aston; 2060-Hampson). However, gravity systems were limited by  
18 the source of surface water supply and the slope of the land, see,  
19 e.g., Trans. 331-Sampson, regarding "dry-cropping" on Lot 903. The  
20 now-Walton lands and the 901 and 903 lots are therefore the only  
21 lands which could reasonably have been "reserved" for irrigation  
22 under a gravity or flume system from No Name Creek itself. Further-  
23 more, some of the lands in Lots 901 and 903 would not have been  
24 irrigable under rill irrigation as practiced. (Higher percentage of  
25 Class 3 and 4 lands, Trans. 1794-Harvey; "dry-cropped," Trans.  
26 331-Sampson).

27  
28 37/ If Mr. Bennett's estimate 4 inches of soil moisture is taken  
29 into account, the 3.6 AF figure is thereby reduced, leading to an  
30 actual duty of 3.1 AF in average years, (Trans. 1834-Bennett). We  
31 also note that all of the Tribe's water duty figures, except the  
32 1977 figures, were based on calculations, not on actual experience  
33 in the area, as with Mr. Bennett. The Tribes' 1977 water use was  
about 5 AF and therefore either inherently excessive, or inefficient.

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 Thus even if the Court finds that the intended Winters reserva-  
2 tion was made with rill irrigation in mind, leading to a higher water  
3 duty to compensate for the method's inefficiency (Trans. 1815-Bennett),  
4 the "irrigable" area would be considerably less than that now con-  
5 sidered "irrigable" (Trans. 2062-Hampson).

6 It is probably for that reason that the Plaintiff Colvilles  
7 have not argued that the amount of water reserved was reserved in  
8 terms of rill irrigation. However, the Colvilles are now attempting  
9 to suggest to the Court that they should get the "benefit" of the  
10 higher water duty, ignoring the source-of-supply-location and slope  
11 limitations the rill theory originally embodied. The newer test of  
12 irrigability, based on sprinkler irrigation which permits greater  
13 development of marginal lands (Trans. Mar. 23 - p. 83-84-Kaczmarek),  
14 is apparently being combined with the "old" water duty. The argu-  
15 ment for rill irrigation water duties is obviously a latter-day  
16 contention, of dubious validity in the face of the considerable sums  
17 expended to put in large modern and permanent sprinkler systems  
18 (Trans. 380-81, Corke) and the lack of any evidence to suggest that  
19 the Colvilles are going to redo the irrigation project for rill  
20 irrigation. (Trans. 2817-Watson).

21 \* \* \*

22 Lahontan Trout, Omak Lake, and Water Quality

23 Omak Lake is the largest saline lake in Washington (Ex. TTT-SW).  
24 As a consequence of its salinity, native biota were somewhat limited.  
25 The native fish in the lake (and which still live in the lake) appear  
26 to consist primarily of suckers and red-side shiners (Trans.  
27 1758-Koch), some of which could grow to catchable and edible size  
28 (Trans. 333-Sampson). No evidence was produced to show that Omak  
29 Lake ever supported a trout or salmonid population. (In fact, the  
30 Tribes' fishery expert estimated that a healthy adult rainbow trout  
31 could only survive one-half hour in the lake, presumably because of

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 the salinity. (Trans. 1755-Koch.)

2 There were also some trout, of small size and number, residing  
3 in the lower reaches of No Name Creek, apparently as a result of  
4 earlier unsuccessful attempts at stocking the lake. (Trans.  
5 1756-Koch). Trout in upper No Name Creek were planted by the  
6 Walton's predecessors, the Whams. (Trans. 2144-Walton). No evi-  
7 dence suggested that the "native" fishery resource of No Name Creek  
8 or Omak Lake has been a fundamental subsistence element for the  
9 Colville Indians since the establishment of the Reservation. Also,  
10 it should be noted that the Lake was often avoided or ignored by the  
11 Indians, belying a suggestion that it was a major fishery resource.  
12 (Trans. 312-Covington; 256-Tonasket).

13 The Lahontan trout species, which is adapted for saline waters,  
14 was introduced to the Reservation in the late 1960's and is not a  
15 native of the Colville Reservation or Omak Lake (Trans. 1754,  
16 1764-Koch). This exotic fishery uses water in the renovated channel  
17 of No Name Creek during certain seasons for spawning (Trans.  
18 1744-Koch), but the adult Lahontan live in the lake itself. Culti-  
19 vation of Lahontans at the nearby Winthrop, Washington, fish hatchery  
20 has also been extensively used (Trans. 1724-Koch), indicating that  
21 No Name Creek waters are not absolutely necessary for the Lahontans'  
22 propagation.

23 There was no evidence, in terms of fish kill, loss of produc-  
24 tion, or otherwise, to prove that Walton's activities have detri-  
25 mentally affected the Lahontan fishery. In fact, each year since  
26 1975, the fishery has been successful, and an increasing fishing  
27 season has been allowed. (Trans. 1763-64-Koch.)

28 The Tribe produced evidence of two coliform samples, both taken  
29 in September 1976 by the U.S. Bureau of Reclamation above the granite  
30 lip, to "prove" pollution. These were apparently the only two samples  
31 taken for this water quality parameter, for the Tribe's expert did no

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 such sampling, during the entire time of his association with the  
2 project from 1975 to the present, (Trans. 1754-Koch). No coliform  
3 samples were taken in the lake, nor was there any evidence of "pol-  
4 lution" in the lake. In fact, because of agricultural and resort  
5 activities of the Tribe, as well as Walton, as well as agricultural  
6 practices on Kartar Creek, at the lake's south end, it would be  
7 impossible to ascertain the specific cause of "pollution," if any,  
8 in the Lake.

9 The fact that the lake is relatively unpolluted is borne out by  
10 the Tribe's own successful establishment of the Lahontan fishery.  
11 Presumably, the fish would not thrive in a dirty lake (Trans. 1677-  
12 78-Koch). To further demonstrate Walton's lack of effect on the  
13 lake, the testimony showed that his withdrawal of No Name Creek  
14 water was de minimus, especially in comparison with evaporation  
15 from the lake (Trans. 2551-Grimstad; 2628-Maddox). The fact that  
16 the lake level has risen significantly since 1948 (Trans. 2095,  
17 2104-Aston) also belies the tribe's contention that the  
18 use of waters pursuant to State permit is in any way damaging the  
19 Lake.

20 Water uses have indeed had an effect on the native fishery in  
21 the area, but not by Mr. Walton's acts. The resident "native"  
22 trout in lower No Name Creek apparently still exist (Trans. 1731-  
23 Koch). It was the total 1977 pumping which dried out trout habitat  
24 in upper No Name Creek (Trans. 2175-Walton.)

25 In brief, there is simply no evidence (sufficient to meet the  
26 preponderance-of-the-evidence-test) suggesting Mr. Walton's (or the  
27 State's) contribution to "pollution," lake size or quality reduction,  
28 fish loss, etc., was and is anything other than de minimis. To hold  
29 only Mr. Walton or the State accountable for the purported "ill-  
30 effects" is simply not justified by the facts.

31 The Lahontan program has also been used as the basis for a

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

1 claim for "reserved rights" for their propagation. The Lahontan  
2 fishery may be a commendable program. Water uses for that program  
3 are not, however, properly within the scope of the Winters right  
4 reserved for the Colville Indians. The United States has also  
5 reached this conclusion, see Memo, March 1, 1978, on Motion for  
6 Partial Summary Judgment, p. 13-16, and authorities cited therein.

7 As discussed in greater detail, above, p. 22, the purposes for  
8 which the Reservation was established include providing permanent  
9 homes, agriculture, timber, limited fishing and mineral extraction.  
10 Nothing in the history of the Reservation's creation, or in this  
11 record, remotely suggests that one of its purposes was to serve as a  
12 breeding and swimming ground for an exotic and imported trout  
13 species. If waters were historically reserved for fisheries pur-  
14 poses, it was for the salmon runs since wiped out by the large river  
15 dams. Those large salmon runs (or other valuable subsistence fish)  
16 never existed in No Name Creek or Omak Lake, so it is questionable  
17 whether any fishery water reservation was intended for No Name  
18 Creek or the lake. In short, no No Name Creek waters were reserved  
19 for the propagation of the Lahontans, and this Court should recognize  
20 no right for fisheries.

21 \* \* \*

22 CONCLUSION

23 We believe a fair reading of the evidence shows, among other  
24 things, water duty to be 3.1-3.6 AF/acre, a water supply of approxi-  
25 mately 1100 AF/year, no intention to reserve waters for the Lahontan  
26 trout program, and clear historic patterns of water use from No  
27 Name and Omak creeks. Most importantly, the record demonstrates  
28 the propriety of the State's issuance of Permit No. 6105 to Mr. Walton  
29 in 1949. There were sufficient waters (excess waters) in No Name  
30 Creek, and the State's jurisdiction was properly exercised. We  
31 respectfully urge the Court to affirm the validity of the Walton

32 WRITTEN  
33 CLOSING ARGUMENT -  
WASHINGTON

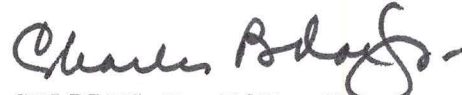

1 State water right, and to deny any requested injunctive relief as to  
2 both No Name Creek and any other water source on the Colville Indian  
3 reservation.

4 Dated June 9, 1978.
