This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact [scholarworks@library.umass.edu](mailto:scholarworks@library.umass.edu).

# Injury and Mortality of Two Mekong River Species Exposed to Turbulent Shear Forces

**ZD Deng, AH Colotelo, RP Mueller, RA Harnish, JJ Martinez, Thonglom Phommavong, Khamla Phommachanh, G Thorncraft, LJ Baumgartner, Joshua Hubbard, BM Rhode**

December 12, 2018  
The 2018 International Conference on River Connectivity (Fish Passage 2018), Albury, Australia

PNNL is operated by Battelle for the U.S. Department of Energy

# Background

## Mekong River Basin

- Approximately 1,200 native fish species
- Largest freshwater fishery
- Second largest river in the world

## Freshwater fish

- Major source of protein
- High species diversity
  - Size
  - Abundance
  - Life cycle

## Many dams are planned

- Small and large
- Mainstem and tributaries

**Little information available to guide construction of downstream fish-friendly hydro systems in a manner safe for Lower Mekong species**

# Background

## Sources of injury

### Mechanical Strike

- Bruising
- Cuts
- Ruptured blood vessels

### Shear Forces

- Bruising
- Cuts
- Gill damage
- Eye damage

### Rapid Decompression

- Swim bladder rupture
- Exophthalmia (eye pop)
- Emboli/emphysema
- Ruptured blood vessels

# Objectives

Evaluate effects of shear stress

- Two Mekong River native species
  - Blue gourami (*Trichopodus trichopterus*)
  - Iridescent shark (*Pangasianodon hypophthalmus*)

Determine strain rate thresholds

Inform design and operation of turbines

# General Approaches

1. G  
er
2. Ex  
th
3. Ex
4. R
5. P  
ki
6. Ex  
bi

# Experimental variables

Jet velocity (m/s)	Strain rate (s <sup>-1</sup> )	Blue gourami	Iridescent shark
3.0	168	✓	✓
6.1	339	✓	
12.2	688	✓	✓
15.2	852	✓	
18.3	1,008	✓	✓
21.3	1,185	✓	✓ S & L

Sample size = 15 fish per treatment

Species	Length (mm) median (Range)	Mass (g) median (Range)
Blue gourami	58 (45 - 72)	3.7 (1.6 - 6.2)
Iridescent shark small	56 (43 - 67)	2.6 (1.5 - 4.3)
Iridescent shark large	76 (70 - 86)	7.1 (4.7 - 10.5)

# High speed video

## Blue gourami

# High speed video

## Iridescent shark

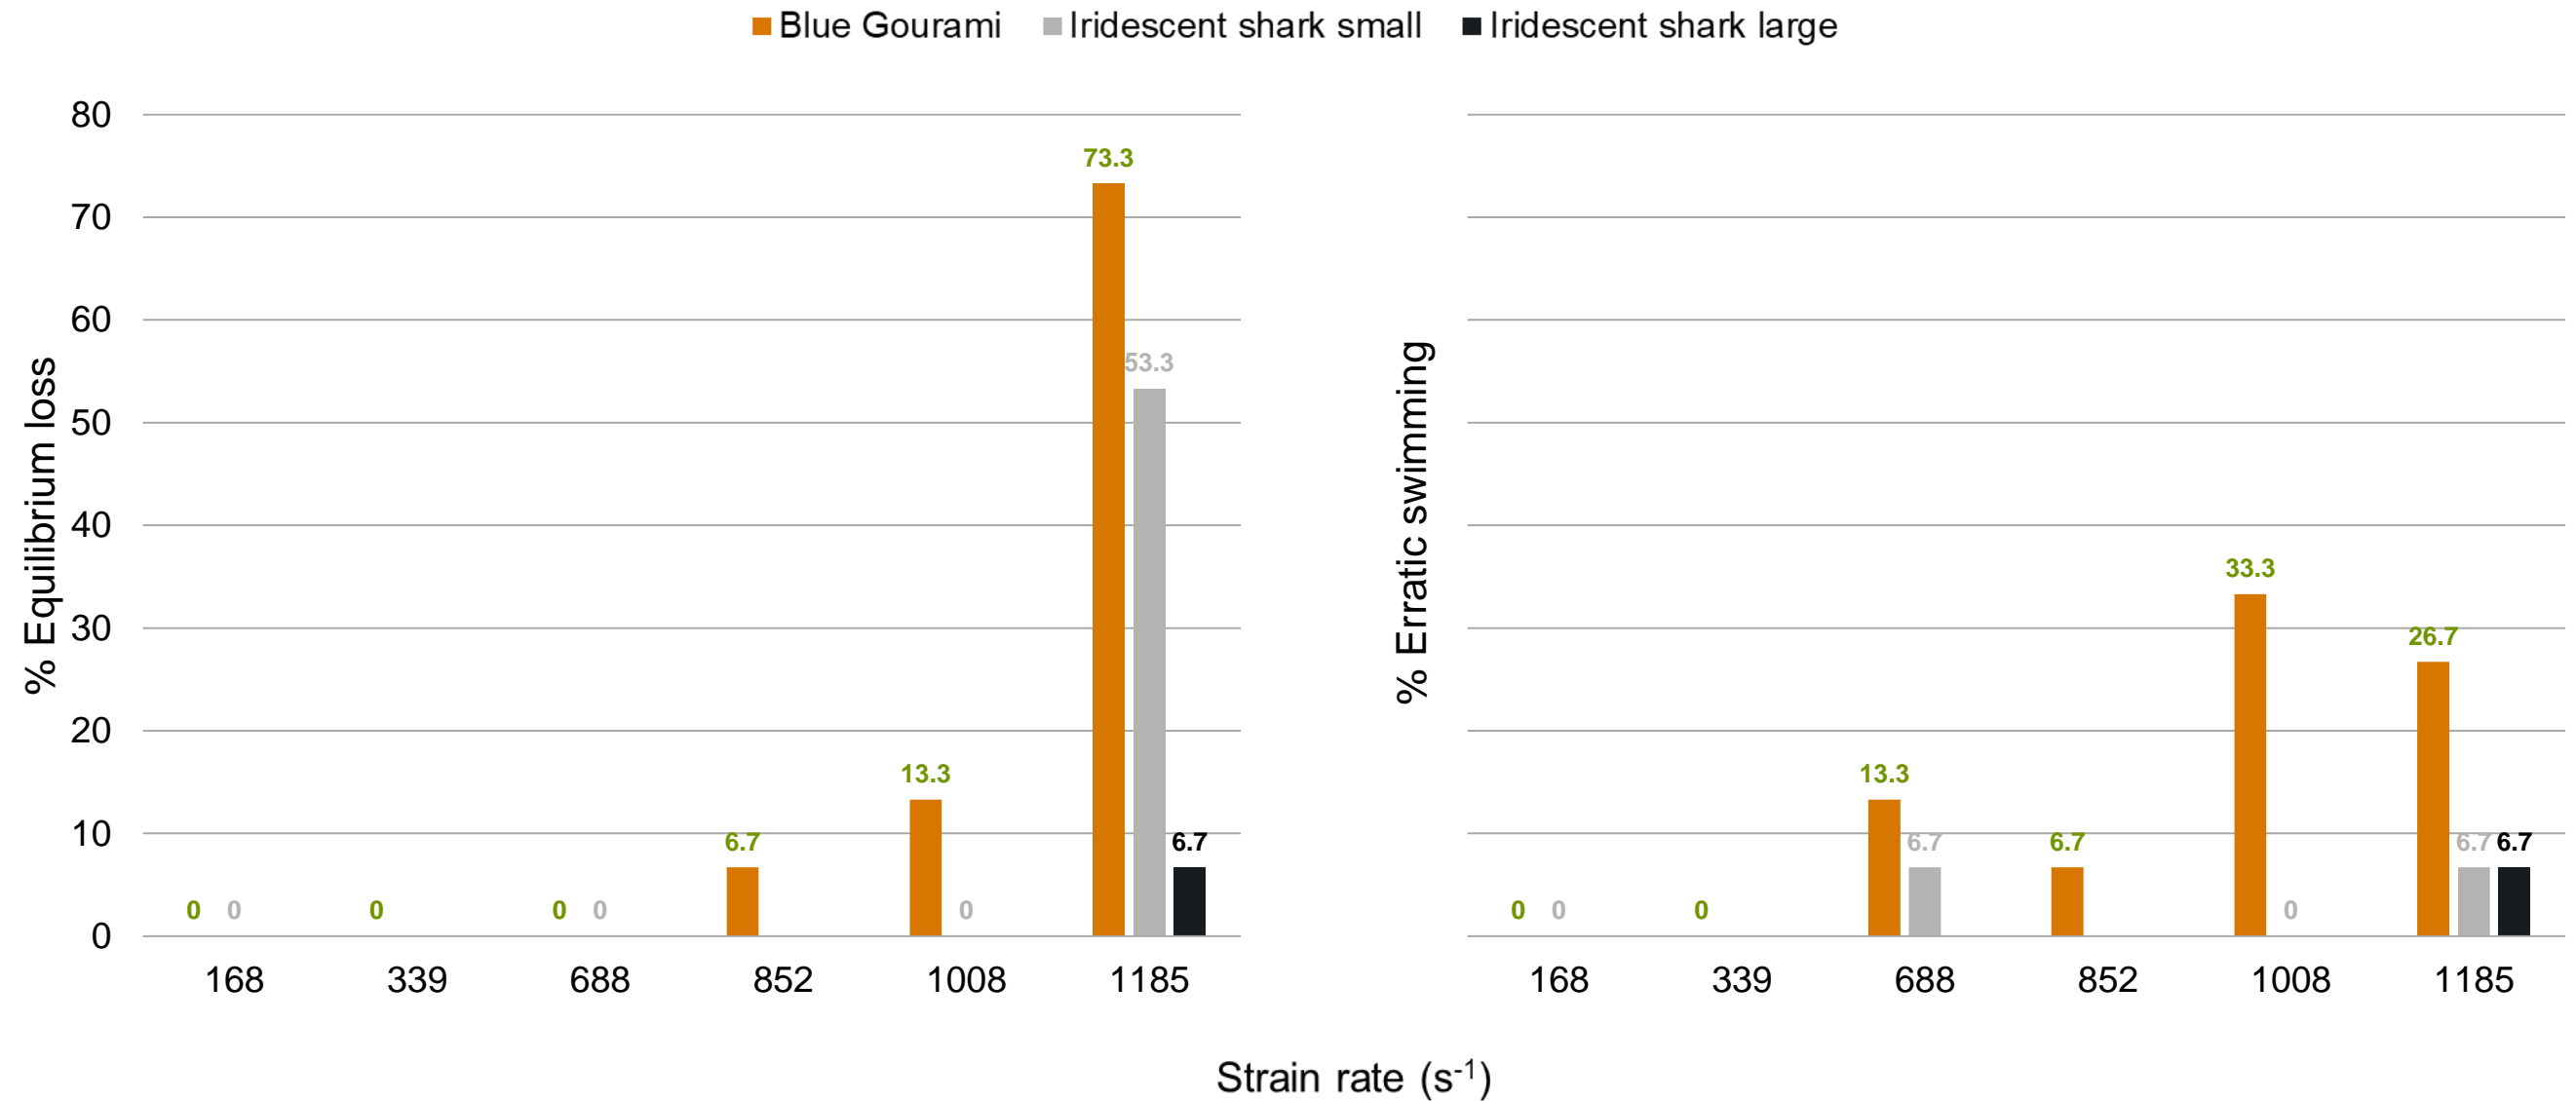

# High speed video

## Chinook salmon

# Results

## Equilibrium loss and erratic swimming

# Results

## Injury – blue gourami

# Results

## Injury – iridescent shark

Damaged operculum

Missing eye

# Results

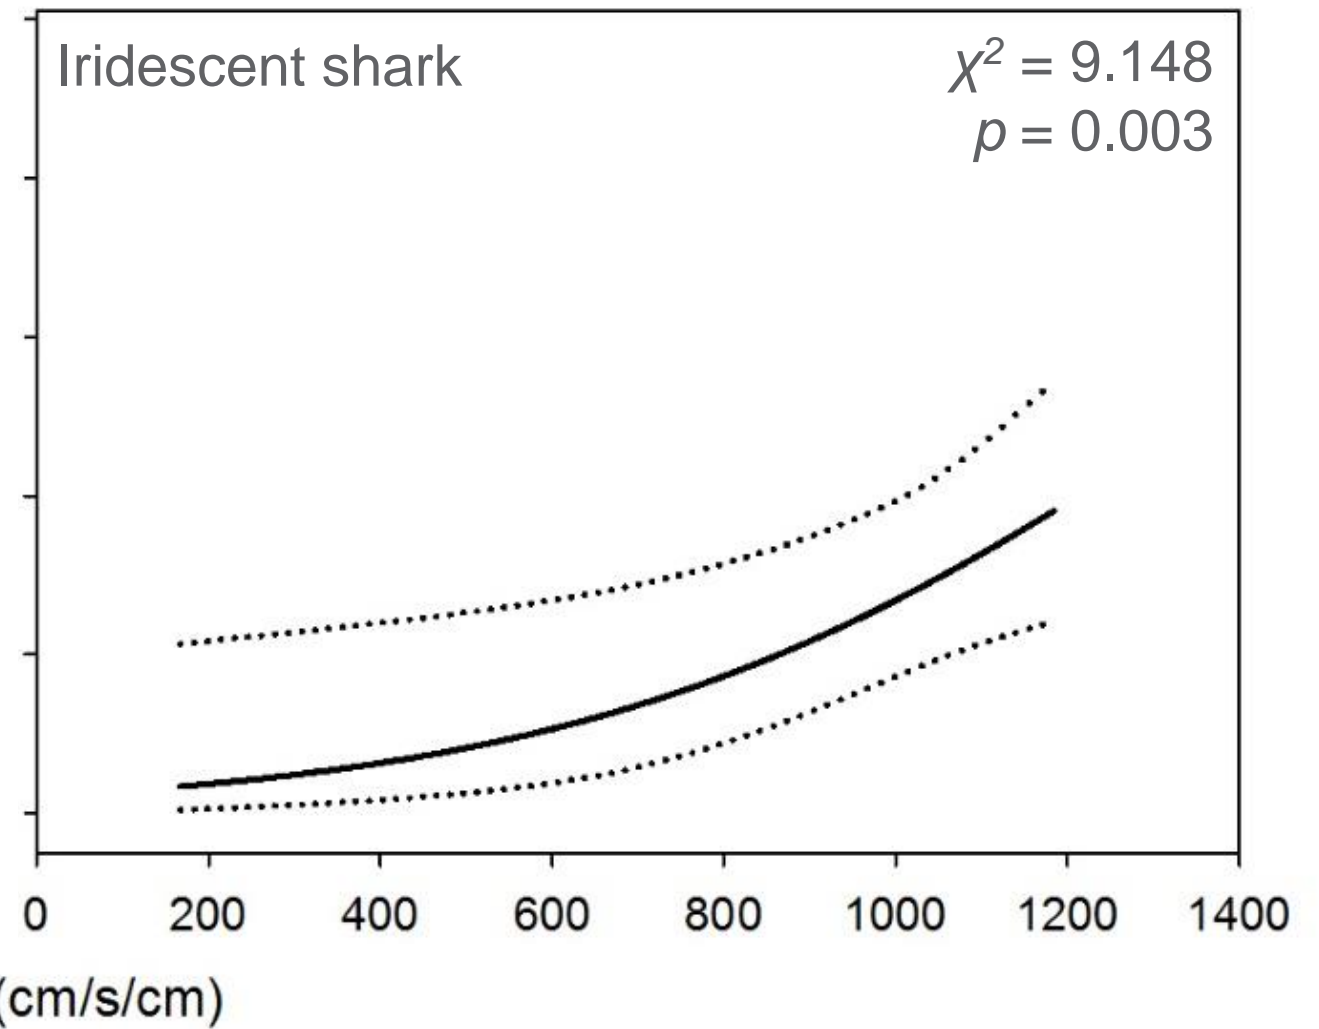

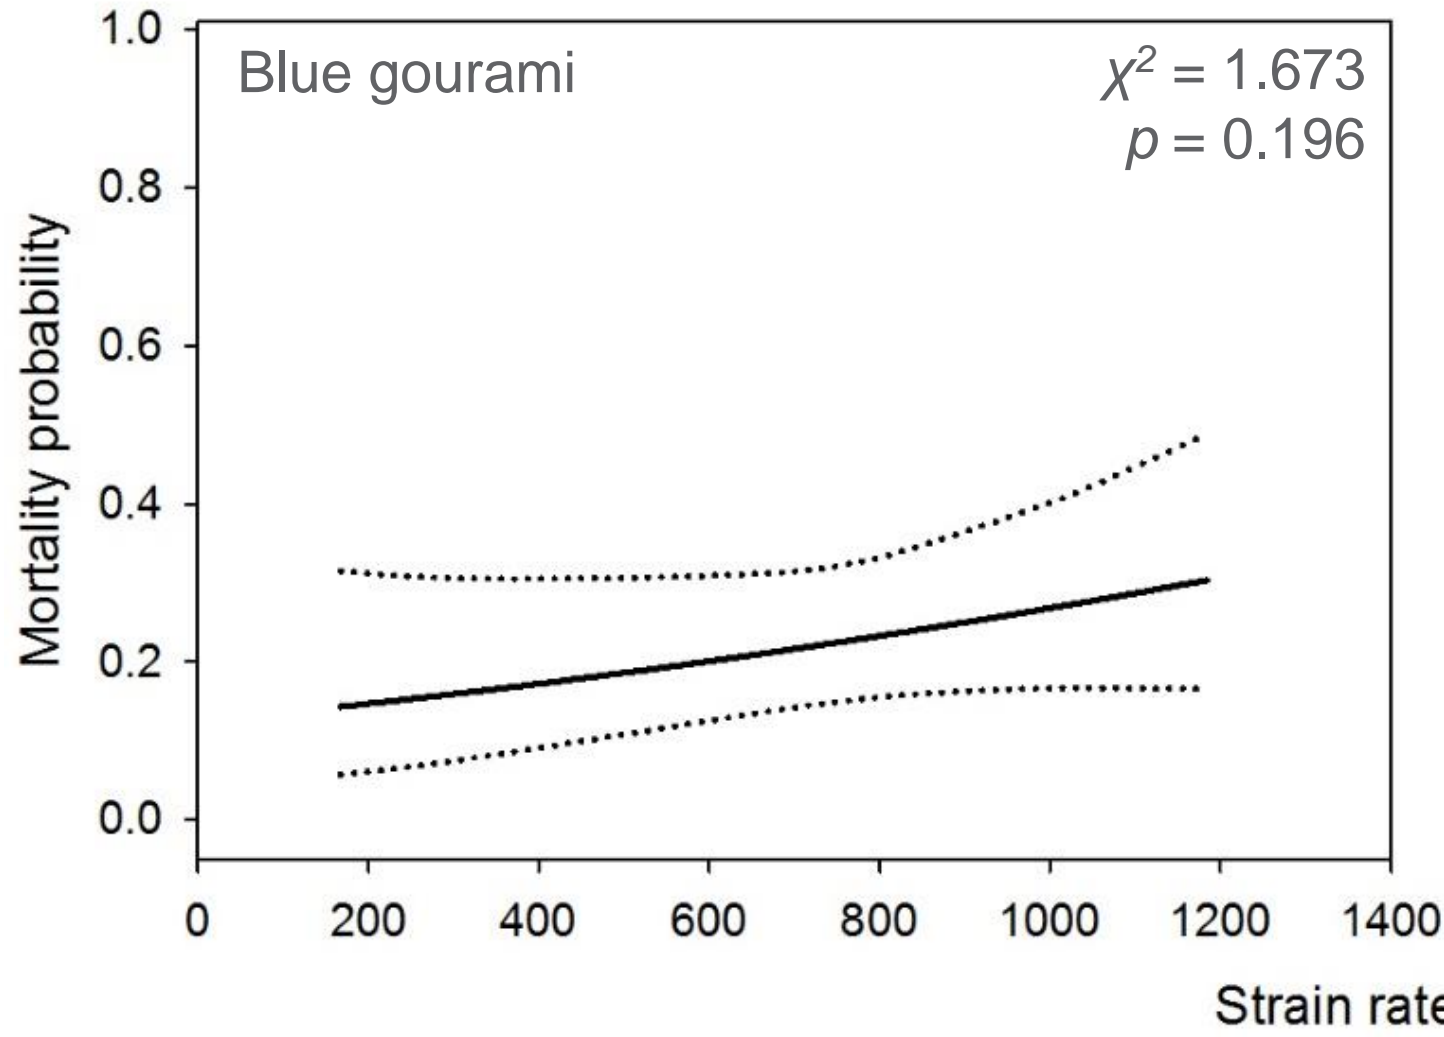

## Mortality

■ Blue gourami    ■ Iridescent shark small    ■ Iridescent shark large  
 Stripes - Immediate mortality    Solid - delayed mortality

# Results

## Probability of mortality

# Parallel research

## Exposure to rapid decompression

Blue Gourami – emphysema in peritoneal cavity  
\*Most common injury

# Summary

## Abnormal behavior (equilibrium loss and erratic swimming)

- Increased with exposure to higher strain rates
- Gourami more susceptible than iridescent shark

## Injuries

- Increased with exposure to higher strain rates
- Operculum damage most common injury
- Gourami more susceptible than iridescent shark

## Mortality

- Ranged from 0-67% per treatment
- Highest immediate and delayed mortality rates observed 1,185 s<sup>-1</sup>
- Similar rates to juvenile American shad
- More susceptible than juvenile Chinook salmon, rainbow trout, and steelhead

# Recommendations

Species responded different to shear stress exposure

- Examine additional important species

Negative effects increase with shear force severity

- Minimize shear stress in hydroturbine design and operation

Pa soi (*Henicorhynchus lineatus*)

Snakehead (*Channa striata*)

# Acknowledgements
