# Octonionic Maxwell Equations

B. Shaw, C. Torre

May 1, 2019

## Abstract

An introduction to Quaternions and Octonions is given, and the Maxwell Equations are formulated in terms of each. The conventional, source-free relativistic theory of eight dimensional electromagnetism is introduced and examined. Similarly, the source-free Octonionic Maxwell Equations are developed, and it is shown that the seven dimensional electric and magnetic fields—pure Octonions—each admit plane wave solutions. An Octonionic Faraday tensor is constructed and compared with the conventional Faraday tensor, and it is shown that, in the source-free case, the conventional and Octonionic theories are equivalent.

## 1 An Introduction to Quaternions and Octonions

The general form of a complex number is  $a + bi$ , where  $a$  and  $b$  are real numbers, and  $i = \sqrt{-1}$ . Quaternions can be thought of as an extension to the complex numbers, and their general form is  $a + bi + cj + dk$ , where  $a, b, c$ , and  $d$  are real numbers,  $i^2 = j^2 = k^2 = -1$ , and  $ijk = -1$ . We note from this rule of multiplication that Quaternions are not, in general, commutative:  $ijk = -1 = i^2$  implies that  $jk = i$ ,  $ijk = -1 = k^2$  implies that  $ij = k$ , which two conditions reveal that  $jij = i$ , or that, multiplying both sides by  $j$ ,  $-ij = ji$ . Using these formulas, first discovered by William Rowan Hamilton in 1835 [1], one can construct a unique multiplication table for the Quaternions.

The general form of an Octonion is similar to that of a Quaternion, only with eight components instead of four. By convention, subscripts of the letter  $e$  are used to denote square roots of  $-1$ , with  $e_0$  used to denote the real number 1. Thus, the general form of an octonion is  $a_0e_0 + a_1e_1 + a_2e_2 + a_3e_3 + a_4e_4 + a_5e_5 + a_6e_6 + a_7e_7$ , with each  $a_i$  a real number. Like Quaternions, Octonions are not commutative. In addition, Octonions are not associative [1], making them notoriously difficult to work with. Octonions are, however, alternative [2], which is considered a weak form of associativity: for Octonions  $X$  and  $Y$ ,  $X(XY) = (XX)Y$ , and  $(XY)Y = X(YY)$ . The Real numbers, Complex numbers, Quaternions, and Octonions form the only normed division algebras [1]. Quaternions are an extension to the Complex numbers in the sense that the Quaternions can be constructed from the Complex numbers using the Cayley-Dickson construction [1]. It is in this sense that the Octonions are an extension to the Quaternions, and that the Complex numbers are

an extension to the Real numbers.

Where the rules of multiplication of Quaternions define a unique multiplication table for the Quaternions, there is no unique multiplication table for the Octonions. While there is a rigorous approach to explaining this result, we adopt a more intuitive explanation. We invoke the strong correlation between pure Quaternions and vectors in Cartesian coordinates, which is expounded upon in the next section: let  $i$ ,  $j$ , and  $k$  define the three orthogonal directions in Cartesian space. We can begin by pointing in any direction and defining that to be the  $i$  direction. Now, we can point in any direction that is perpendicular to the  $i$  direction and define that direction to be the  $j$  direction. This leaves us with only one choice for the direction of  $k$ , since the  $k$  direction must be orthogonal to both  $i$  and  $j$ . Now, we repeat the experiment in seven dimensions. Having chosen our first two directions, which we now call  $e_1$  and  $e_2$ , we now find that we have more than one choice for the direction of  $e_3$ , since there are more directions than one which are orthogonal to a two-dimensional plane in seven dimensional space. Notwithstanding the difficulty in truly comprehending seven spatial dimensions, we find that this non-uniqueness in the orthogonality of a line with a plane in seven dimensions is the starting point of the non-uniqueness in the multiplication table for the Octonions.

In this study, due in large part to the difficult nature of performing calculations with Octonions, Maplesoft™ has been used to make direct calculations: in particular, the “DifferentialGeometry” package was used<sup>1</sup>. Relevant calculations made using this software have been included as an appendix to this report.

## 2 Differential Operators and the Maxwell Equations

We will now consider the multiplication of two Quaternions. For Quaternions of the form  $a + bi + cj + dk$ , the so-called “imaginary” part of a Quaternion is  $bi + cj + dk$ , while the “real” part is just  $a$ . Thus the multiplication of two Quaternions  $Q_1$  and  $Q_2$  is the sum of the real and imaginary parts of the product:  $Q_1 Q_2 = \text{Re}(Q_1 Q_2) + \text{Im}(Q_1 Q_2)$ . A Quaternion whose real part is zero is called a “pure” Quaternion.

As it happens, there is a strong correlation between pure Quaternions and ordinary three-dimensional vectors in Cartesian coordinates, as was alluded to in the preceding section—correlated in the sense of the transformation  $i \rightarrow \hat{x}$ ,  $j \rightarrow \hat{y}$ , and  $k \rightarrow \hat{z}$ . The imaginary part of the product of two pure Quaternions is correlated with the cross-product of two vectors in  $xyz$  space, and the real part of the product of two pure Quaternions is correlated with the Dot product. Just as the  $x$ ,  $y$ , and  $z$  directions are orthogonal in the sense that the dot product of any two of them which are different is zero,  $i$ ,  $j$ , and  $k$  are orthogonal in the sense that the real part of the product of any two of them which are different is also zero.

---

<sup>1</sup>The “DifferentialGeometry” package is the product of the “Differential Geometry Software Project,” and is maintained at Utah State University by faculty members Dr. Anderson and Dr. Torre. It is available at <https://digitalcommons.usu.edu/dg/>

We now ask whether classical, source-free Electromagnetism can be formulated in terms of Quaternions instead of ordinary vector calculus. We define the differential operator to be the pure Quaternion

$$\nabla = \frac{\partial}{\partial x_1} i + \frac{\partial}{\partial x_2} j + \frac{\partial}{\partial x_3} k$$

which resembles the Cartesian differential operator. With this differential operator, and with the dot and cross product defined in terms of the Quaternion product, we define the curl of a pure Quaternion to be the cross product of the differential operator and the Quaternion; similarly, we define the divergence of a pure Quaternion to be the dot product of the differential operator and the Quaternion. We pose the source-free, Maxwell equations for Quaternions as

$$\nabla \cdot \mathbf{E} = 0 \tag{1}$$

$$\nabla \times \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t} \tag{2}$$

$$\nabla \cdot \mathbf{B} = 0 \tag{3}$$

$$\nabla \times \mathbf{B} = \mu\epsilon \frac{\partial \mathbf{E}}{\partial t} \tag{4}$$

Where  $\mathbf{E}$  and  $\mathbf{B}$  are meant to represent the Electric and Magnetic fields, respectively. They are pure Quaternions with coordinate-dependant coefficients—“Quaternion fields,” meant to resemble Vector fields. As it turns out, Maxwell originally formulated his equations in terms of Quaternions, later reverting to Vectors as Vectors became the convention [3].

Now, we ask whether  $7 + 1$  dimensional Electromagnetism can be expressed in terms of Octonions. We say  $7 + 1$  instead of  $8$  to distinguish the single time coordinate (which corresponds to the  $e_0$  direction) from the seven spatial coordinates. There is already a theory of  $7 + 1$  dimensional Electromagnetism, which is formulated in terms of the Faraday Tensor, which will be explained in a coming section. However, we propose a theory in terms of Octonions, whose source-free equations will have the form of equations 1-4, though with Octonionic fields in place of Quaternionic fields, and with

$$\nabla := \frac{\partial}{\partial x_1} e_1 + \frac{\partial}{\partial x_2} e_2 + \frac{\partial}{\partial x_3} e_3 + \frac{\partial}{\partial x_4} e_4 + \frac{\partial}{\partial x_5} e_5 + \frac{\partial}{\partial x_6} e_6 + \frac{\partial}{\partial x_7} e_7$$

### 3 The Wave Equation

With the source-free Maxwell equations given, it is useful to find solutions for the Electric and Magnetic Fields. We will show that both fields satisfy the wave equation. We begin by taking the Curl of both sides of equations 2 and 4:

$$\nabla \times \nabla \times \mathbf{E} = -\nabla \times \frac{\partial \mathbf{B}}{\partial t} \tag{5}$$

$$\nabla \times \nabla \times \mathbf{B} = \nabla \times \mu\epsilon \frac{\partial \mathbf{E}}{\partial t} \tag{6}$$

Now, we consider some very useful facts about our differential operators. Even with Octonions, scalars factor out, the curl operator commutes with partial derivatives, and the Curl of the Curl is the Gradient of the Divergence less the Vector Laplacian:

$$\nabla \times \nabla \times \mathbf{E} = \nabla(\nabla \cdot \mathbf{E}) - \nabla^2 \mathbf{E} \quad (7)$$

$$\nabla \times \mu\epsilon \frac{\partial \mathbf{E}}{\partial t} = \mu\epsilon \frac{\partial}{\partial t}(\nabla \times \mathbf{E}) \quad (8)$$

where the gradient is defined as in ordinary Cartesian coordinates—which it can be, seeing as the divergence of an Octonion or Octonionic field has no imaginary component. Therefore, equations 5 and 6 reduce to the following:

$$\nabla(\nabla \cdot \mathbf{E}) - \nabla^2 \mathbf{E} = -\frac{\partial}{\partial t}(\nabla \times \mathbf{B}) \quad (9)$$

$$\nabla(\nabla \cdot \mathbf{B}) - \nabla^2 \mathbf{B} = \mu\epsilon \frac{\partial}{\partial t}(\nabla \times \mathbf{E}) \quad (10)$$

We can now substitute from equations 1-4 to obtain wave equations for both the Electric and Magnetic fields, which we emphasize is in terms of Octonions.

$$\nabla^2 \mathbf{E} = \frac{1}{c^2} \frac{\partial^2 \mathbf{E}}{\partial t^2} \quad (11)$$

$$\nabla^2 \mathbf{B} = \frac{1}{c^2} \frac{\partial^2 \mathbf{B}}{\partial t^2} \quad (12)$$

## 4 Wave Equation Solution to Maxwell Solution

It can be shown that the following are solutions to equations 11 and 12<sup>2</sup>:

$$\mathbf{E} = \tilde{\mathbf{E}} e^{i(\mathbf{k} \cdot \mathbf{x} - \omega t)} \quad (13)$$

$$\mathbf{B} = \tilde{\mathbf{B}} e^{i(\mathbf{k} \cdot \mathbf{x} - \omega t)} \quad (14)$$

Now we have introduced the “wave vector” and “position vector” as  $\mathbf{k}$  and  $\mathbf{x}$ , respectively, as well as  $\tilde{\mathbf{E}}$  and  $\tilde{\mathbf{B}}$ . They are each pure octonions with arbitrary, constant coefficients. These solutions to their respective wave equations can also be constrained to become solutions to the Maxwell equations, which we show now. We begin by taking the divergence of equations 13 and 14, which actually turn out to be exactly what one would expect:

$$\nabla \cdot \mathbf{E} = i \mathbf{k} \cdot \mathbf{E} \quad (15)$$

$$\nabla \cdot \mathbf{B} = i \mathbf{k} \cdot \mathbf{B} \quad (16)$$

---

<sup>2</sup>It was later realized that there is some ambiguity in using  $i$  in these solutions, as it may correlate to one of the unit vectors in the Vector Space of Octonions: i.e. we may have  $i = e_1$ . In this case, it may be appropriate to use a solution of the form  $\cos(\mathbf{k} \cdot \mathbf{x} - \omega t)$ . However, the distinction is nearly inconsequential to what will become the proposed function relating the components of the Octonionic and conventional Faraday tensors, and so the complex exponential form will be used, seeing as it was used in the original calculations.

However, the divergence of both fields are zero by the Maxwell equations: hence, both  $\mathbf{k} \cdot \mathbf{E}$  and  $\mathbf{k} \cdot \mathbf{B}$  are zero, meaning that the wave vector  $\mathbf{k}$  must be orthogonal to both  $\mathbf{E}$  and  $\mathbf{B}$ . We can impose another crucial condition, and that is using equation 2. The following can be shown:

$$\nabla \times \mathbf{E} = i\mathbf{k} \times \mathbf{E} \quad (17)$$

$$\frac{\partial \mathbf{B}}{\partial t} = -i\omega \mathbf{B} \quad (18)$$

Thus, by equation 2, we get the following:

$$\mathbf{B} = \frac{1}{\omega} \mathbf{k} \times \mathbf{E} \quad (19)$$

Thus, we can write the Magnetic field in terms of the Electric field, which we find of use later.

## 5 The Octonionic Faraday Tensor

We can now construct an electromagnetic tensor for the Octonions ( $\tilde{F}^{\mu\nu}$ ), and we will do so by borrowing the formulas from the conventional 3 + 1 dimensional theory:

$$\tilde{F}^{0i} = -\tilde{F}^{i0} = E^i \quad (20)$$

$$\tilde{F}^{ij} = \epsilon_{ijk} B^k \quad (21)$$

which we modify to the following:

$$\tilde{F}^{0i} = -\tilde{F}^{i0} = E^i \quad (22)$$

$$\tilde{F}^{ij} = -\text{Re}(\text{Im}(e_i e_j) B) \quad (23)$$

This gives us a tensor whose indices are shown below in the form of a matrix, in a basis of our choosing. The subscripts in this case indicate the component of the given quantity.

$$\tilde{F}^{\mu\nu} = \begin{bmatrix} 0 & E_1 & E_2 & E_3 & E_4 & E_5 & E_6 & E_7 \\ -E_1 & 0 & B_3 & -B_2 & B_5 & -B_4 & -B_7 & B_6 \\ -E_2 & -B_3 & 0 & B_1 & B_6 & B_7 & -B_4 & -B_5 \\ -E_3 & B_2 & -B_1 & 0 & B_7 & -B_6 & B_5 & -B_4 \\ -E_4 & -B_5 & -B_6 & -B_7 & 0 & B_1 & B_2 & B_3 \\ -E_5 & B_4 & -B_7 & B_6 & -B_1 & 0 & -B_3 & B_2 \\ -E_6 & B_7 & B_4 & -B_5 & -B_2 & B_3 & 0 & -B_1 \\ -E_7 & -B_6 & B_5 & B_4 & -B_3 & -B_2 & B_1 & 0 \end{bmatrix} \quad (24)$$

Because we can write the components of the Magnetic field in terms of the Electric field, we can express  $\tilde{F}^{\mu\nu}$  in terms of the components of  $\mathbf{k}$  and  $\mathbf{E}$ , which we suppress due to the longevity of the expression.

## 6 The Source-Free Conventional Maxwell Equations

We now turn our attention to the conventional approach to  $7 + 1$  dimensional electromagnetism, where there is no cross product. The Maxwell equations have only a tensorial representation, which was the primary motivation behind constructing an Octonionic tensor. In tensor notation, the conventional, source-free Maxwell equations are as follows:

$$F^{\mu\nu}_{;\nu} = 0 \quad (25)$$

$$F_{\mu\nu;\lambda} + F_{\nu\lambda;\mu} + F_{\lambda\mu;\nu} = 0 \quad (26)$$

The solution of equation 26 is the following:

$$F_{\mu\nu} = A_{\mu;\nu} - A_{\nu;\mu} \quad (27)$$

We call  $\mathbf{A}$  the vector potential, and now invoke equation 25 to constrain the nature of  $\mathbf{A}$ .

$$F^{\mu\nu}_{;\nu} = (\partial^\nu A^\mu - \partial^\mu A^\nu)_{;\nu} = \partial_\nu \partial^\nu A^\mu - \partial_\nu \partial^\mu A^\nu = \partial_\nu \partial^\nu A^\mu - \partial_\mu \partial^\nu A^\nu = 0 \quad (28)$$

However, in the Lorenz gauge, the second term in the last expression vanishes, and we are left with

$$\partial_\nu \partial^\nu A^\mu = 0 \quad (29)$$

Which is nothing more than the wave equation. We choose a solution of the form

$$A^\nu = \tilde{\mathbf{A}} e^{i(k \cdot x - \omega t)} \quad (30)$$

Here,  $\tilde{\mathbf{A}}$  is a vector with arbitrary, constant coefficients. Now, the Faraday tensor can be written as follows, via equation 27, where  $n$  and  $m$  are indices ranging from 1 to 7:

$$F^{0,\nu} = -ik^\nu A^0 - i\omega A^\nu \quad (31)$$

$$F^{\mu,0} = ik^\mu A^0 + i\omega A^\mu \quad (32)$$

$$F^{n,m} = ik^m A^n - ik^n A^m \quad (33)$$

$$F^{\mu,\nu} = F^{0,\nu} + F^{\mu,0} + F^{n,m} \quad (34)$$

## 7 Comparison

Now, we consider whether the components of the Octonionic and conventional Faraday Tensors can be equated. Because both tensors have each entry multiplied by the same exponential expression, what remains to be seen is whether there is a solution for the coefficients  $\tilde{\mathbf{A}}$  and  $\tilde{\mathbf{E}}$ . After analyzing what becomes a rather large system of equations, we propose that the following formula is a solution:

$$E^\nu = -i\omega A^\nu - ik^\nu A^0 \quad (35)$$

This formula has an inverse, though at first sight it may appear as though it does not, due to the seven components on the left and eight on the right. However, recall that  $\mathbf{A}$  was chosen to be divergenceless: this implies that

$$i\omega A^0 = ik^n A^n$$

which means that there are only seven independent components of  $\mathbf{A}$ . Using the conventional relation between  $A^0$  and the scalar potential  $V$ , we then generalize our formula in equation (35) as follows, in correlation with the  $3 + 1$  dimensional case:

$$\mathbf{E} = -\frac{\partial \mathbf{A}}{\partial t} - \nabla V \quad (36)$$

## 8 Conclusion and Further Study

We conclude that source-free,  $7 + 1$  dimensional Electrodynamics can be formulated either conventionally or in terms of Octonions. Where there are interesting differences between the two theories, such as the existence of a Magnetic field, both theories make the same predictions about Electrodynamics in  $7 + 1$  dimensional space-time.

Now, there is a question as to whether the general Maxwell equations can be formulated in terms of Octonions. Since the source-free equations admit plane wave solutions, it is thought that the general equations may have solutions which are superpositions (possibly infinite) of the plane wave solutions, demonstrating that the general Maxwell equations can indeed be formulated in terms of Octonions. However, that question is left for another study.

\end{aligned}$$

## Orthogonality

Here, we define orthogonality.

$$O > \text{evalDG}(\text{DGRe}(A.\text{DGIm}(A.B))); \quad 0 \text{ e0} \quad (2.1)$$

$$O > \text{evalDG}(\text{DGRe}(\text{DGIm}(A.B).B)); \quad 0 \text{ e0} \quad (2.2)$$

## Magnitude

Here, we verify different formulas for the magnitude.

This is  $(\text{abs}(AxB))^2$ :

$$\begin{aligned}
O &> AxB := \text{DGIm}(A . B); \\
AxB &:= (a_2b_3 - a_3b_2 + a_4b_5 - a_5b_4 - a_6b_7 + a_7b_6) e1 - (a_1b_3 - a_3b_1 - a_4b_6 - a_5b_7 + a_6b_4 + a_7b_5 \\
&\quad ) e2 + (a_1b_2 - a_2b_1 + a_4b_7 - a_5b_6 + a_6b_5 - a_7b_4) e3 - (a_1b_5 + a_2b_6 + a_3b_7 - a_5b_1 - a_6b_2 \\
&\quad - a_7b_3) e4 + (a_1b_4 - a_2b_7 + a_3b_6 - a_4b_1 - a_6b_3 + a_7b_2) e5 + (a_1b_7 + a_2b_4 - a_3b_5 - a_4b_2 \\
&\quad + a_5b_3 - a_7b_1) e6 - (a_1b_6 - a_2b_5 - a_3b_4 + a_4b_3 + a_5b_2 - a_6b_1) e7
\end{aligned} \quad (3.1)$$

$$O > \text{evalDG}(-\text{DGRe}(e1.AxB)); \quad (a_2b_3 - a_3b_2 + a_4b_5 - a_5b_4 - a_6b_7 + a_7b_6) e0 \quad (3.2)$$

$$\begin{aligned}
O &> \text{comp} := \text{GetComponents}(AxB, \text{Basis}); \\
\text{comp} &:= [a_2b_3 - a_3b_2 + a_4b_5 - a_5b_4 - a_6b_7 + a_7b_6, -a_1b_3 + a_3b_1 + a_4b_6 + a_5b_7 - a_6b_4 - a_7b_5, a_1b_2 \\
&\quad - a_2b_1 + a_4b_7 - a_5b_6 + a_6b_5 - a_7b_4, -a_1b_5 - a_2b_6 - a_3b_7 + a_5b_1 + a_6b_2 + a_7b_3, a_1b_4 - a_2b_7 \\
&\quad + a_3b_6 - a_4b_1 - a_6b_3 + a_7b_2, a_1b_7 + a_2b_4 - a_3b_5 - a_4b_2 + a_5b_3 - a_7b_1, -a_1b_6 + a_2b_5 + a_3b_4 \\
&\quad - a_4b_3 - a_5b_2 + a_6b_1]
\end{aligned} \quad (3.3)$$

$$\begin{aligned}
O &> \text{sqmagAxB} := \text{sum}((\text{comp}[i])^2, i=1..nops(\text{comp})); \\
\text{sqmagAxB} &:= (a_2b_3 - a_3b_2 + a_4b_5 - a_5b_4 - a_6b_7 + a_7b_6)^2 + (-a_1b_3 + a_3b_1 + a_4b_6 + a_5b_7 - a_6b_4 \\
&\quad - a_7b_5)^2 + (a_1b_2 - a_2b_1 + a_4b_7 - a_5b_6 + a_6b_5 - a_7b_4)^2 + (-a_1b_5 - a_2b_6 - a_3b_7 + a_5b_1 \\
&\quad + a_6b_2 + a_7b_3)^2 + (a_1b_4 - a_2b_7 + a_3b_6 - a_4b_1 - a_6b_3 + a_7b_2)^2 + (a_1b_7 + a_2b_4 - a_3b_5 \\
&\quad - a_4b_2 + a_5b_3 - a_7b_1)^2 + (-a_1b_6 + a_2b_5 + a_3b_4 - a_4b_3 - a_5b_2 + a_6b_1)^2
\end{aligned} \quad (3.4)$$

The following is the proposed formula for the magnitude (squared):

$$O > AdotB := \text{GetComponents}(\text{evalDG}(-\text{DGRe}(A.B)), [e0])[1]; \quad (3.5)$$

$$AdotB := a_1 b_1 + a_2 b_2 + a_3 b_3 + a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7 \quad (3.5)$$

```
O > compA:=GetComponents(A,Basis);
sqmagA:=sum((compA[i])^2,i=1..nops(compA));
compA := [ a_1, a_2, a_3, a_4, a_5, a_6, a_7 ]
sqmagA := a_1^2 + a_2^2 + a_3^2 + a_4^2 + a_5^2 + a_6^2 + a_7^2
```

```
O > compB:=GetComponents(B,Basis);
sqmagB:=sum((compB[i])^2,i=1..nops(compB));
compB := [ b_1, b_2, b_3, b_4, b_5, b_6, b_7 ]
sqmagB := b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2
```

```
O > costhetasq:=((AdotB)^2)/(sqmagA * sqmagB);
sinthetasq:=1-costhetasq;
costhetasq :=  $\frac{(a_1 b_1 + a_2 b_2 + a_3 b_3 + a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7)^2}{(a_1^2 + a_2^2 + a_3^2 + a_4^2 + a_5^2 + a_6^2 + a_7^2) (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2)}$ 
sinthetasq := 1 -  $\frac{(a_1 b_1 + a_2 b_2 + a_3 b_3 + a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7)^2}{(a_1^2 + a_2^2 + a_3^2 + a_4^2 + a_5^2 + a_6^2 + a_7^2) (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2)}$ 
```

```
O > magsq:=simplify((sqmagA) * (sqmagB) * sinthetasq);
magsq := (b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2) a_1^2 - 2 b_1 (a_2 b_2 + a_3 b_3 + a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7) a_1 + (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2) a_2^2 - 2 b_2 (a_3 b_3 + a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7) a_2 + (b_1^2 + b_2^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2) a_3^2 - 2 b_3 (a_4 b_4 + a_5 b_5 + a_6 b_6 + a_7 b_7) a_3 + (b_1^2 + b_2^2 + b_3^2 + b_5^2 + b_6^2 + b_7^2) a_4^2 - 2 b_4 (a_5 b_5 + a_6 b_6 + a_7 b_7) a_4 + (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_6^2 + b_7^2) a_5^2 - 2 b_5 (a_6 b_6 + a_7 b_7) a_5 + (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2 + b_7^2) a_6^2 - 2 a_6 a_7 b_6 b_7 + a_7^2 (b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + b_6^2)
```

```
O > simplify(magsq-sqmagAxB);
0
```

## Vector Procedures: curl, etc

This section defines procedures that were central to this project. One must execute this section before examining the "Maxwell's Equations" section.

```
O > Z:=DGzip([seq(z[i](x0,x1,x2,x3,x4,x5,x6,x7),i=0..7)],extBasis,"plus");
Z:=z_0(x0,x1,x2,x3,x4,x5,x6,x7) e0+z_1(x0,x1,x2,x3,x4,x5,x6,x7) e1+z_2(x0,x1,x2,x3,x4,x5,x6,x7) e2+z_3(x0,x1,x2,x3,x4,x5,x6,x7) e3+z_4(x0,x1,x2,x3,x4,x5,x6,x7) e4+z_5(x0,x1,x2,x3,x4,x5,x6,x7) e5+z_6(x0,x1,x2,x3,x4,x5,x6,x7) e6+z_7(x0,x1,x2,x3,x4,x5,x6,x7) e7
```

```

|| i) * evalDG(e||i . e||j) ), i = 1 .. 7) ), j = 1 .. 7) )

```

```
end proc
```

```

O > evalDG(evalDG(-Div(Z)+Curl(Z))-DivNcurl(Z))
0 (4.8)

```

## Maxwell's Equations

This section is the bulk of the project. We first define Maxwell's equations using the vector procedures. We then check for plane wave solutions and constrain them using Maxwell's equations. We conclude by constructing an Octonionic Faraday tensor in tandem with the conventional faraday tensor and show that they can be equated.

### Define the equations

```

O > E:=DGzip([seq(Epsilon[i](t,x1,x2,x3,x4,x5,x6,x7),i=1..7)], Basis,
  "plus");
B:=DGzip([seq(beta[i](t,x1,x2,x3,x4,x5,x6,x7),i=1..7)], Basis,"plus");
E := E1(t,x1,x2,x3,x4,x5,x6,x7) e1 + E2(t,x1,x2,x3,x4,x5,x6,x7) e2 + E3(t,x1,x2,x3,x4,x5,x6,

```

$x7) e3 + E_4(t, x1, x2, x3, x4, x5, x6, x7) e4 + E_5(t, x1, x2, x3, x4, x5, x6, x7) e5 + E_6(t, x1, x2, x3, x4, x5, x6, x7) e6 + E_7(t, x1, x2, x3, x4, x5, x6, x7) e7$   
 $B := \beta_1(t, x1, x2, x3, x4, x5, x6, x7) e1 + \beta_2(t, x1, x2, x3, x4, x5, x6, x7) e2 + \beta_3(t, x1, x2, x3, x4, x5, x6, x7) e3 + \beta_4(t, x1, x2, x3, x4, x5, x6, x7) e4 + \beta_5(t, x1, x2, x3, x4, x5, x6, x7) e5 + \beta_6(t, x1, x2, x3, x4, x5, x6, x7) e6 + \beta_7(t, x1, x2, x3, x4, x5, x6, x7) e7 \quad (5.1.1)$

## Wave Equation in Vacuum?

This section explores whether the wave equation can be recovered for the Electric and Magnetic fields. This discussion relies heavily on what vector identities hold for octonions.

### Electric Field

$$\begin{aligned}

## Test solutions in ME's

We now test that these are solutions to Maxwell's equations.

$$O > \text{tkvec} := \text{evalDG}((1/\sqrt{2})^* \mathbf{k}^* \mathbf{e1} + (1/\sqrt{2})^* \mathbf{k}^* \mathbf{e2});$$

$$\text{tkvec} := \frac{\sqrt{2}}{2} k \mathbf{e1} + \frac{\sqrt{2}}{2} k \mathbf{e2} \quad (5.4.1)$$

The following works as long as the magnitude of the wave vector is k.

$$O > \text{DGRe}(-1 * \text{tkvec}. \text{tkvec});$$

$$k^2 \mathbf{e0} \quad (5.4.2)$$

$$O > \text{tkdotx} := \text{GetComponents}(\text{DGRe}(-1 * \text{tkvec}. \text{xvec}), \text{extBasis})[1]$$

$$\text{tkdotx} := \frac{1}{2} \sqrt{2} k x1 + \frac{1}{2} \sqrt{2} k x2 \quad (5.4.3)$$

$$O > \text{kdotE0} := \text{GetComponents}(\text{DGRe}(-1 * \text{tkvec}. \mathbf{E0}), \text{extBasis})[1];$$

$$\text{kdotE0} := \frac{1}{2} \sqrt{2} k E01 + \frac{1}{2} \sqrt{2} k E02 \quad (5.4.4)$$

$$O > \text{indets}(\text{kdotE0}, \text{name});$$

$$\{E01, E02, k\} \quad (5.4.5)$$

$$O > \text{orthcond} := \text{solve}(\text{GetComponents}(\text{DGRe}(-1 * \text{tkvec}. \mathbf{E0}), \text{extBasis})[1] = 0, \text{indets}(\text{kdotE0}, \text{name}), \text{useassumptions}) \text{ assuming } k::\text{positive};$$

$$\text{orthcond} := \{E01 = -E02, E02 = E02, k = k\} \quad (5.4.6)$$

$$O > \text{tEwavesol} := \text{evalDG}(\text{eval}(\text{evalDG}(E0 * \exp(I * (\text{tkdotx} - \omega * t + \phi))), \text{orthcond}));$$

## Octonionic and conventional Faraday Tensors: equality of Tensors.

In this section, we first introduce the Octonionic Faraday Tensor. We then construct the conventional tensor in terms of the vector potential and show that these two tensors can be related.

\end{aligned} \tag{5.5.2.21}$$

Because the alphas and k's commute, each of these equations is true, and so the proposed solution for the octonionic electric field is valid. Note that there are only 7 independent components of the conventional vector potential, due to our choosing a divergenceless vector.
