Alkali bulrush is a keystone species for migratory birds

Why care?

Phragmites australis monotypic stand

Post *P. australis* treatment

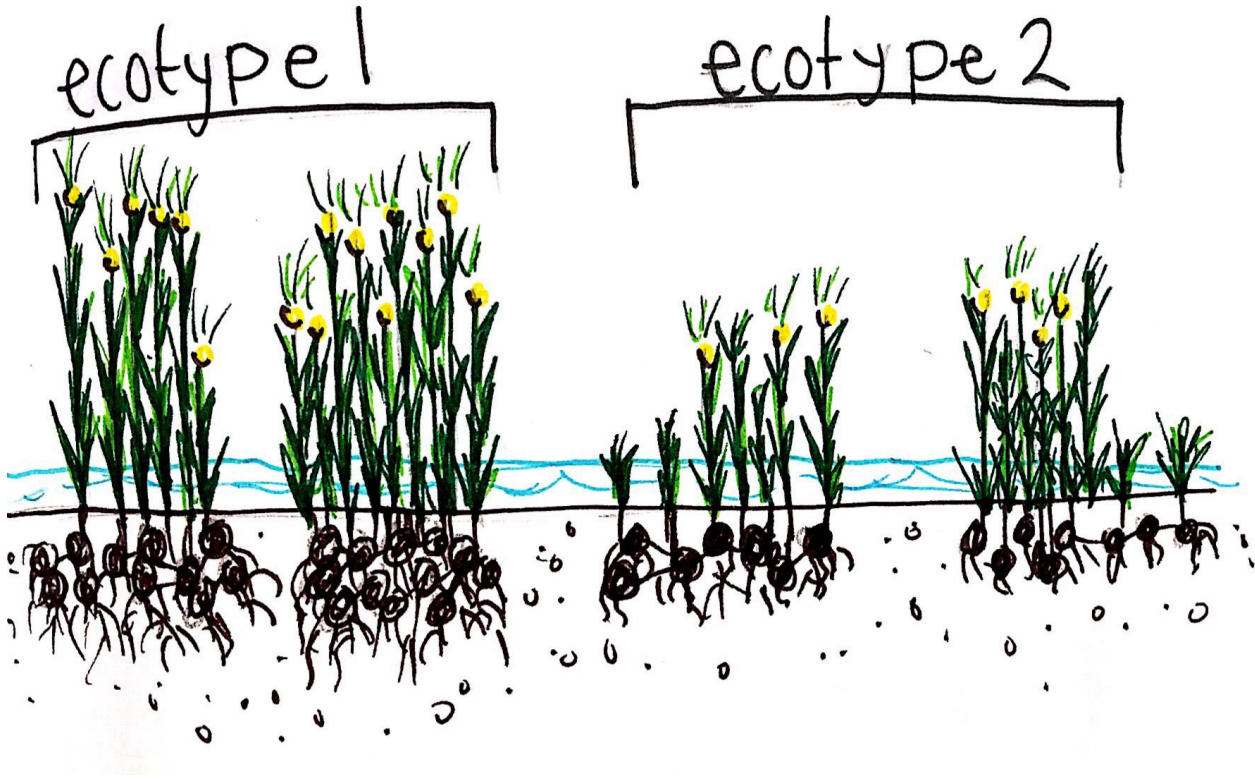

Inform Wetland Restoration Managers

Karin Kettenring

Alkali bulrush traits vary between ecotypes

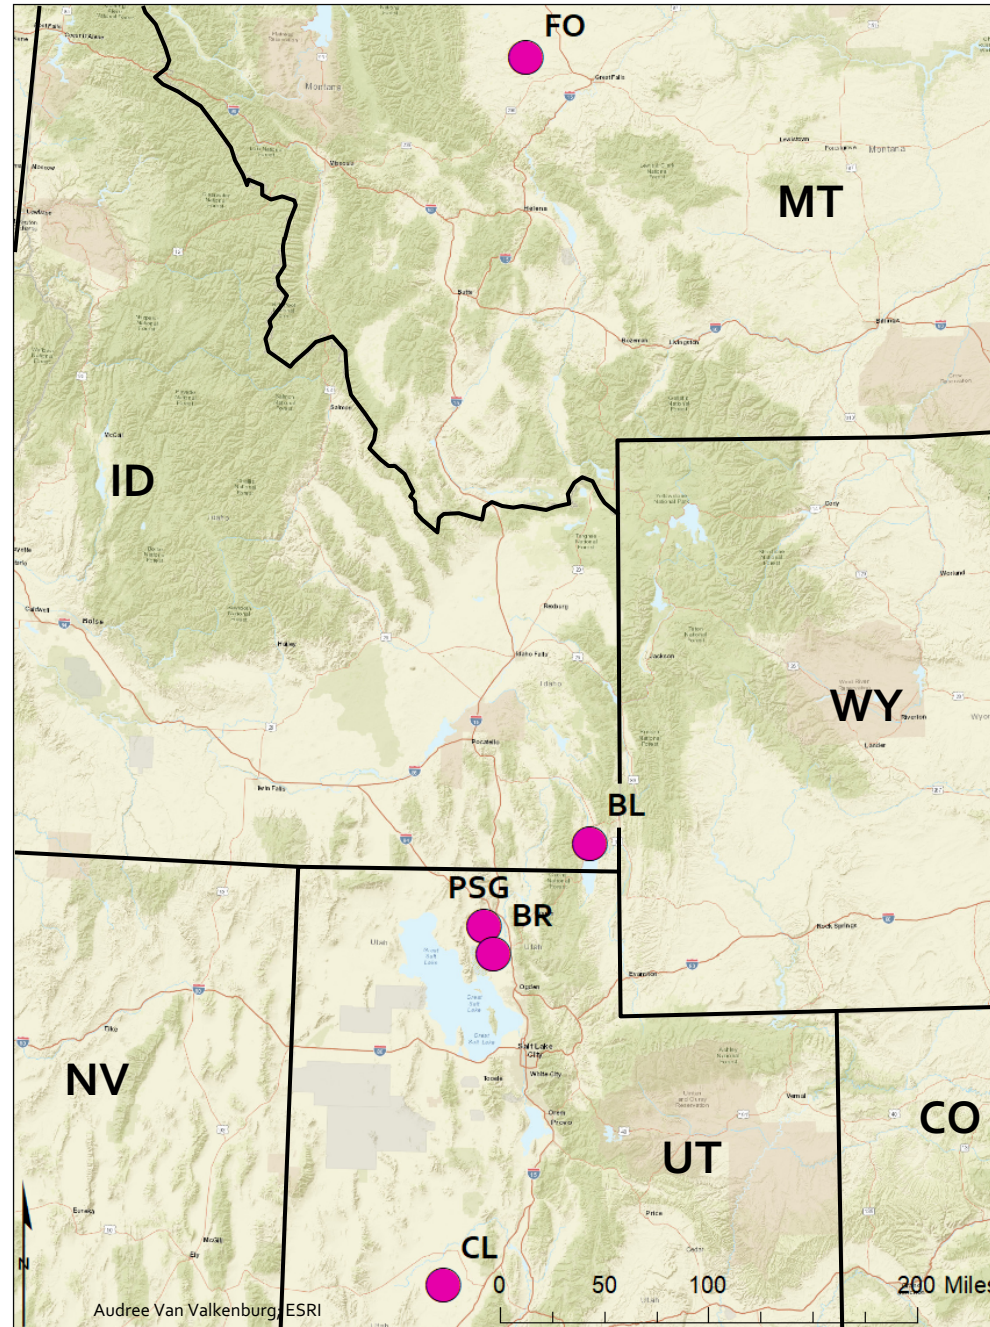

Hypothesis

Traits between different ecotypes will be different and traits within ecotypes will be similar.

Ecotype Locations

- FO:** Freeze Out Lake, MT
- BL:** Bear Lake Wetlands, ID
- PSG:** Public Shooting Grounds, UT
- BR:** Bear River Migratory Bird Refuge, UT
- CL:** Clear Lake, UT

Five replicates per ecotype

Common Garden Experiment

Above Ground Traits:

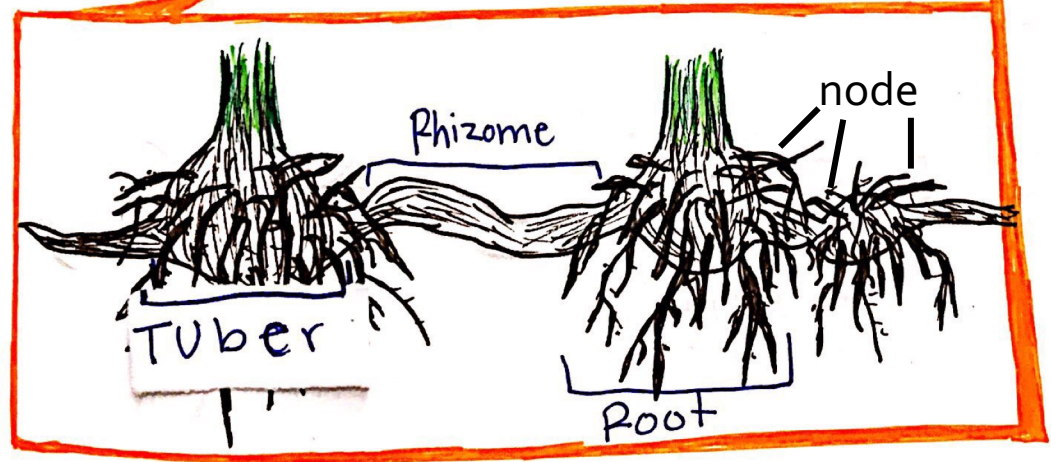

- Above ground biomass
- Maximum Vegetative Height
- Average height
- Stem count
- Inflorescence count

Below Ground Traits:

- Below ground biomass
- Stems per tuber
- Nodes per tuber
- Root biomass per tuber

alkali bulrush

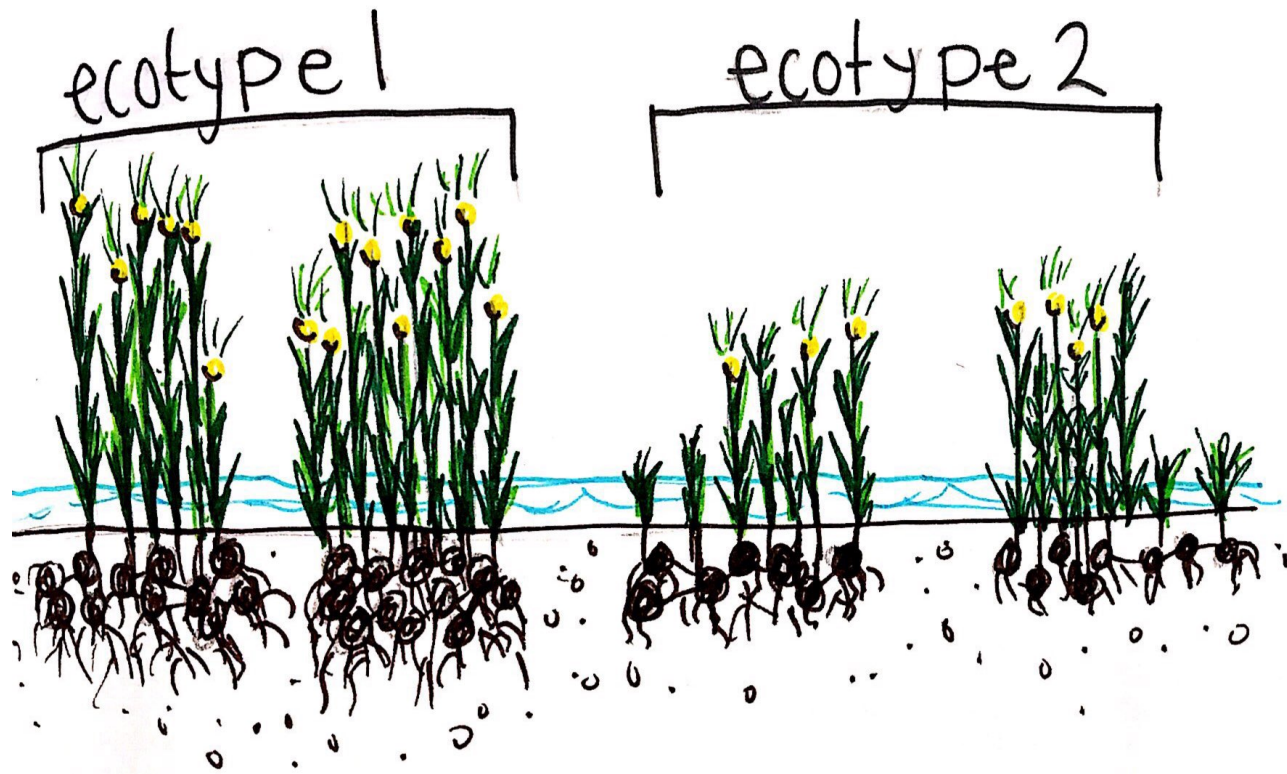

below ground structure

Statistical analysis

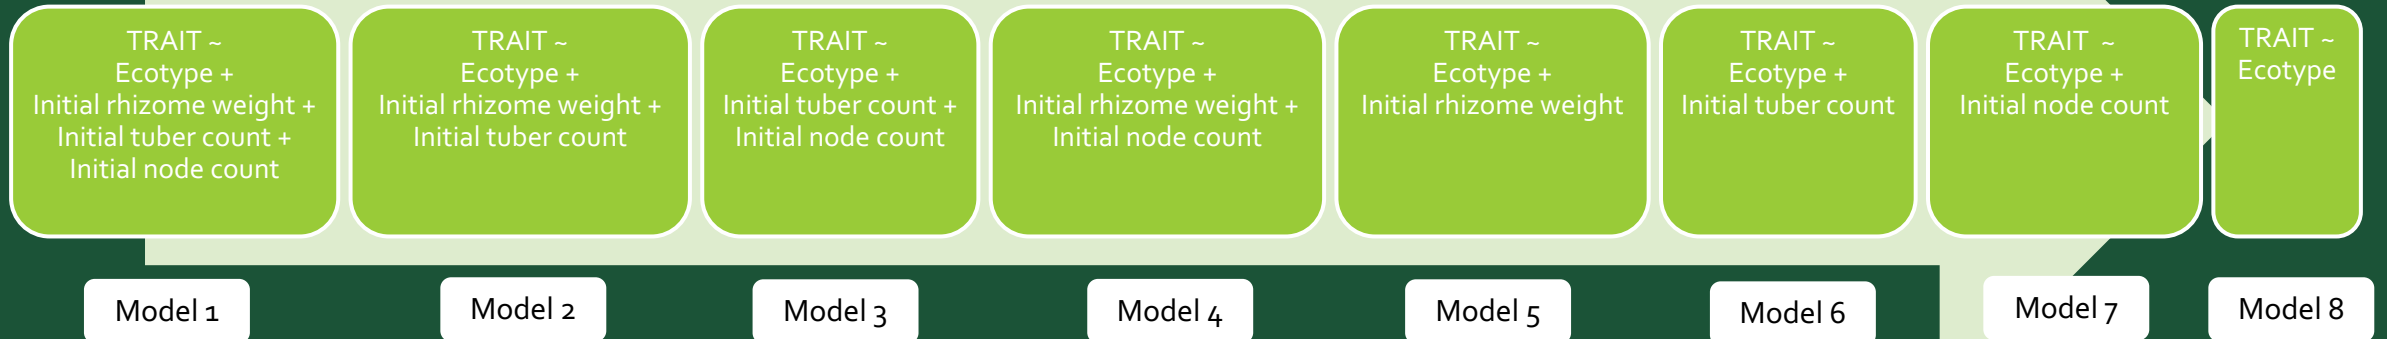

Levene's test: $p\text{-value} > 0.05$ for all traits

Variation is equal between ecotypes for each trait

Statistical analysis

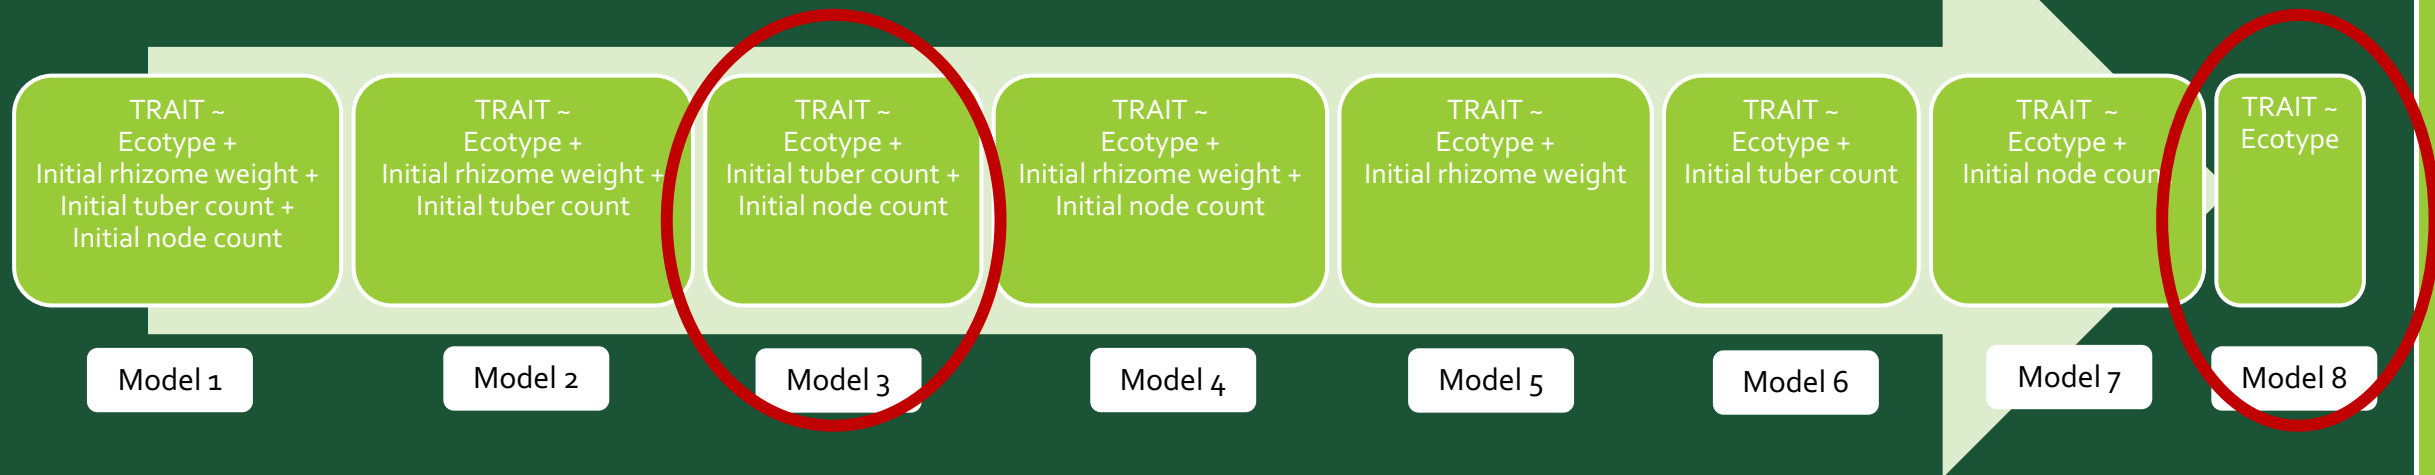

Generalized Linear Model

- Akaike's Information Criterion (AIC) to find the best fit model

Statistical analysis

Generalized Linear Model

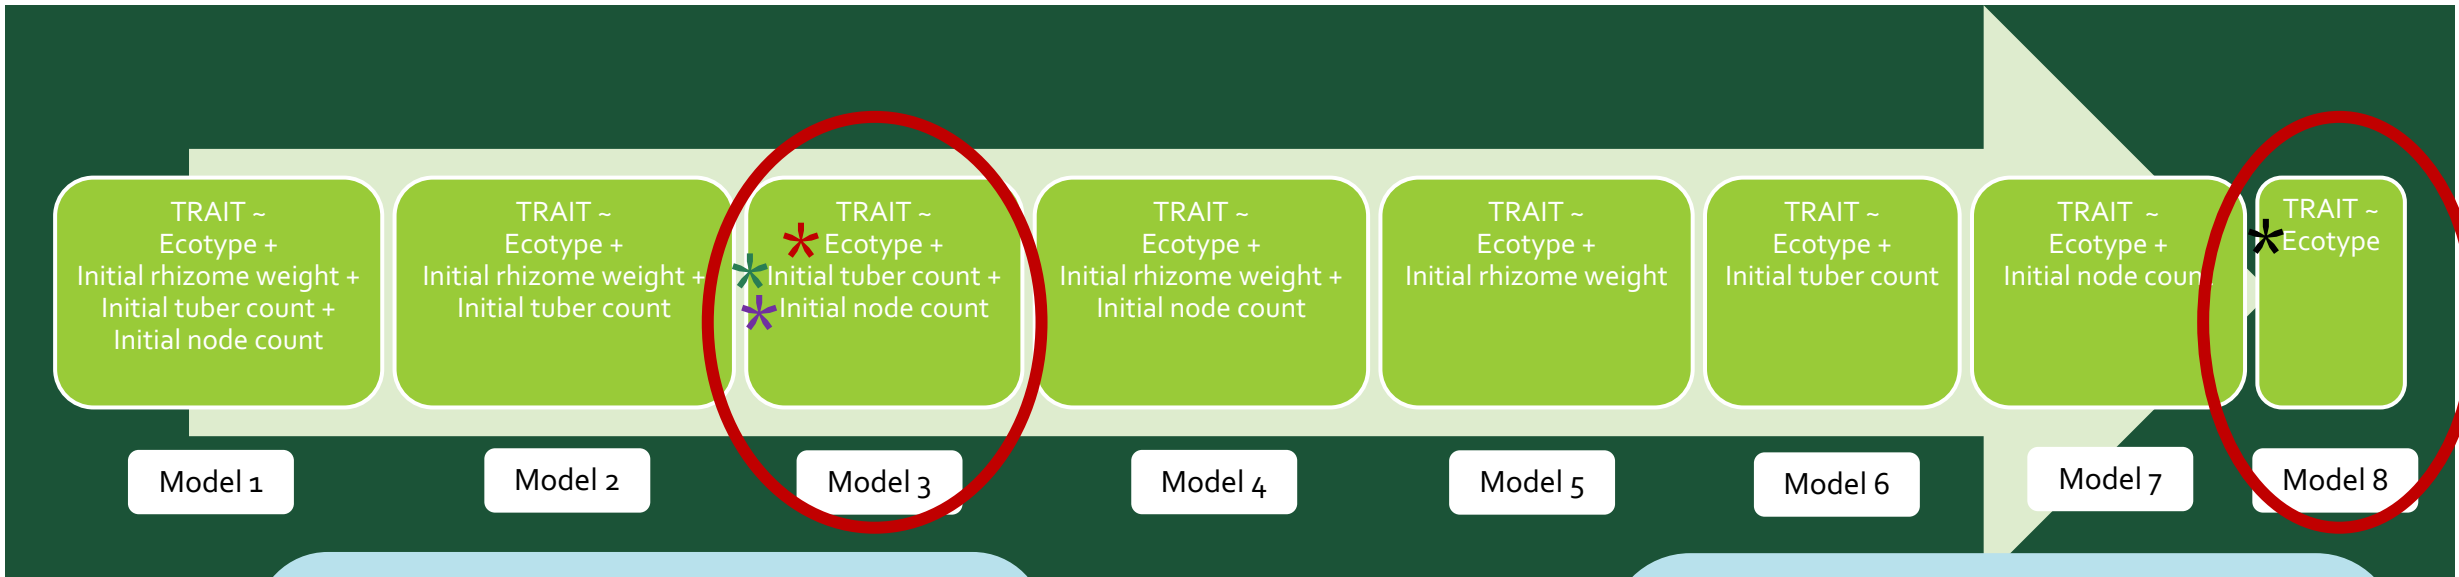

- Akaike's Information Criterion (AIC) to find the best fit model

Statistical analysis

Generalized Linear Model

* P-value < 0.05 **The variable has an effect on the ecotype**

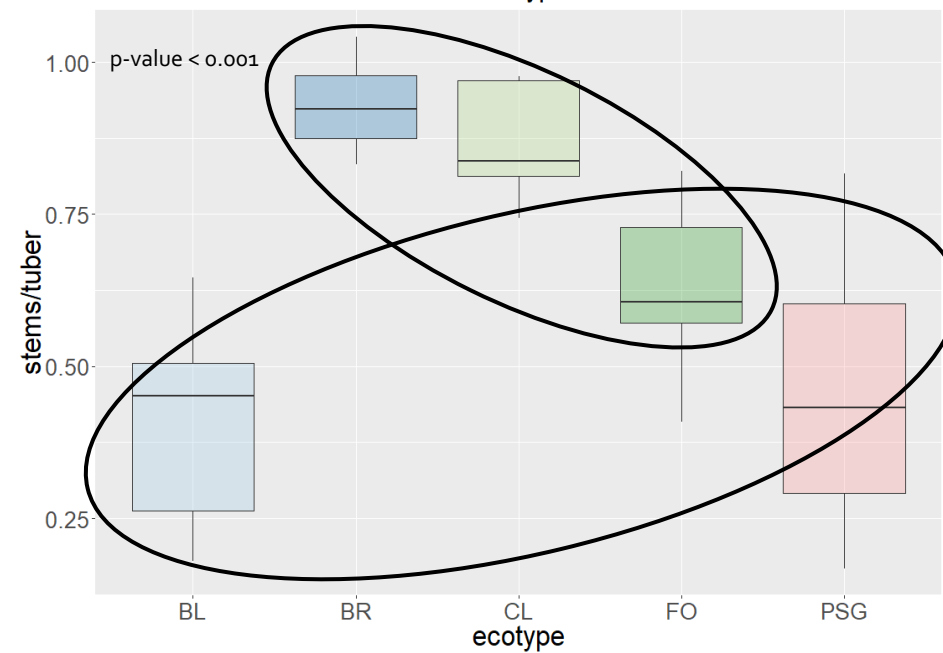

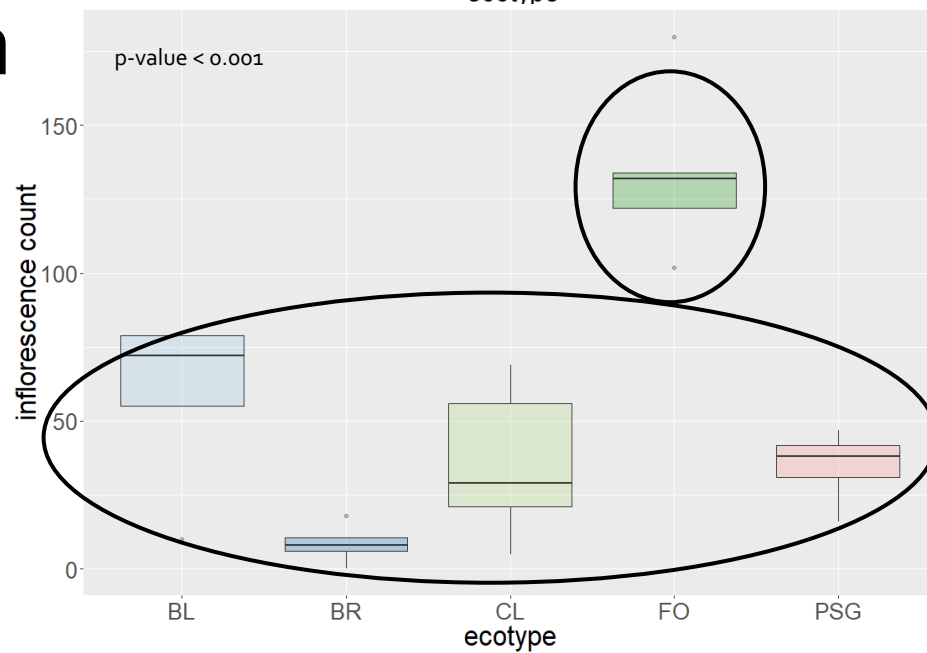

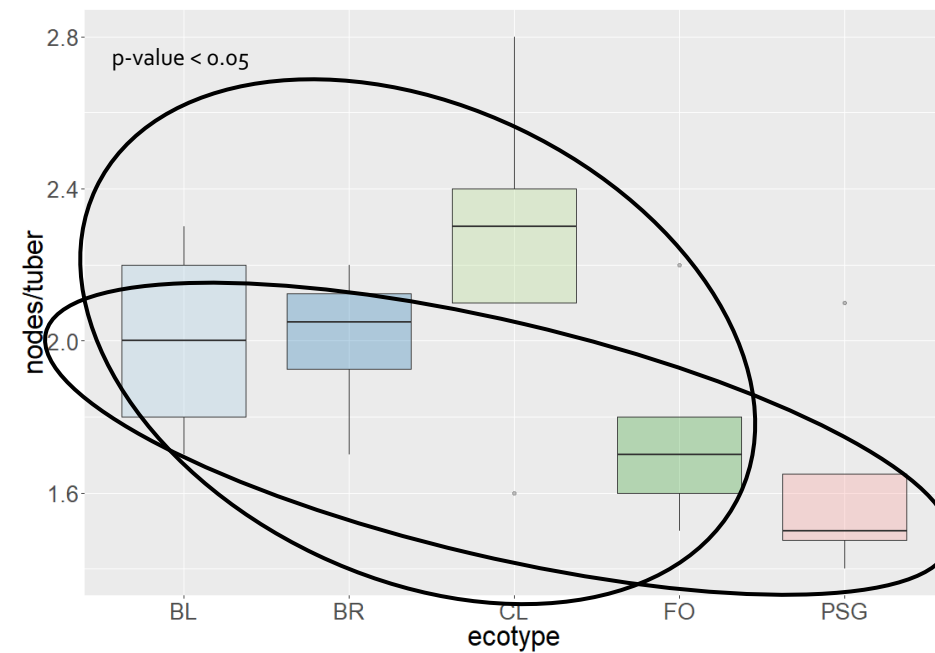

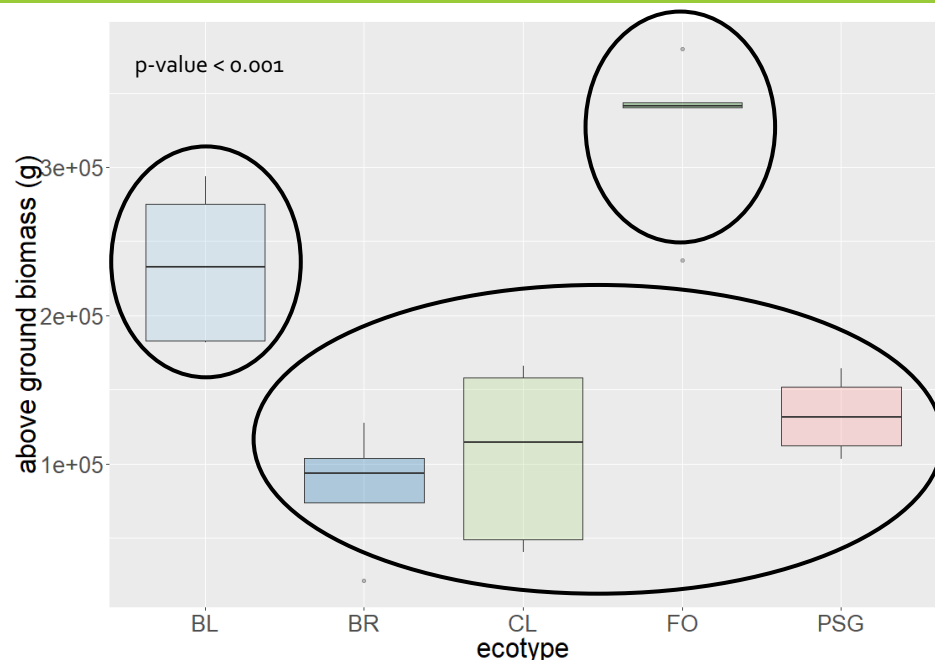

Model 3

- Above Ground Biomass * *
- Below Ground biomass
- Proportion of stems to tubers *
- Stem count *

Model 8

- Proportion of nodes to tubers *
- Root biomass per tuber *
- Maximum vegetative height
- Inflorescence count *
- Average height

Pairwise comparison

Variable traits

High biomass and inflorescence count

Greater production, reproductive potential, and crowding resistance

Lower biomass and inflorescence count

Lower production, reproductive potential, and crowding resistance

High nodes per tuber

High crowding resistance

Stems per tuber = 1

High production and crowding resistance

Lower nodes per tuber

Lower crowding resistance

Stems per tuber = 0.25

Lower production and crowding resistance

Conclusion and Implications

- Plants from different ecotypes have **variable traits** for
 - **Crowding resistance**
 - **Productivity**
 - **Spread**
 - **Reproductive potential**
- Inform **managers** on restoration of alkali bulrush
- Inform **researchers** on methods to analyze below ground traits of wetland plants

Thank you
Karin Ketterring,
Trisha Atwood,
and Rachel Chamberlain
for your support and
contributions!
