TABLES AND GRAPHS OF MEASUREMENTS
MADE ACROSS FOUR CAPE COD BEACHES

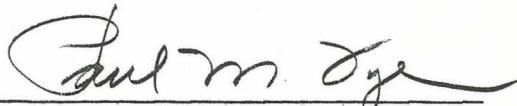

1957 - 1958

by

John Zeigler, Sherwood Tuttle, * Barbara Gill
Herman Tasha and Graham Giese

* State University of Iowa, Iowa City, Iowa

APPROVED FOR DISTRIBUTION

Paul M. Fye, Director

FIGURES

- Figure 1. Index map, Cape Cod and beaches studied.
- Figure 2. Location of points measured in plan and profile at the beaches studied.
- Figure 3. Profiles across Highland Beach, December 1956 to October 1957.
- Figure 4a. Profiles across High Head Beach, January 1957 to October 1957.
- Figure 4b. Profiles across High Head Beach, January 1958 to May 1958.
- Figure 5. Profiles across Race Point Beach, January 1958 to May 1958.
- Figure 6. Profiles across New Beach, January 1958 to May 1958.

TABLES

- Table I Measurements made across Highland Beach, December 1956-May 1958. Slope of the foreshore, elevation and distance seaward from the origin of the reach, volume and volume changes are given for the same time interval.
- Table II Measurements made across High Head Beach, January 1957-May 1958. Slope of the foreshore, elevation and distance seaward from the origin of the reach, volume and volume changes are given for the same time interval.
- Table III Measurements made across Race Point Beach, January 1958-May 1958. Slope of the foreshore, elevation and distance seaward from the origin of the reach, volume and volume changes are given for the same time interval.
- Table IV Measurements made across New Beach, January 1958-May 1958. Slope of the foreshore, elevation and distance seaward from the origin of the reach, volume and volume changes are given for the same time interval.
- Table V Measurements made on the spits and bars at High Head (stakes 9 and 10) and Highland (stakes 10 and 11).

The primary purpose of this report is to present tables of measurements made across four Cape Cod beaches, (Figure 1). A report discussing the significance of these measurements has been accepted for publication (Zeigler and Tuttle, in press, *The Journal of Geology*). The tables were too lengthy to be included in that report, but somehow the measurements must be stored in a way that they can be distributed to those who wish to do more work with them. A second paper based on these tables is in preparation.

Discussion will be kept to a minimum in this presentation, on the assumption that persons sufficiently interested in using the tables will have read the published reports. Some of the figures from the published reports are included here also, and a bibliography of published and unpublished reports is given in Zeigler (1960), pp. 4-6.

In brief, iron pipes were driven into the beach on a line perpendicular to the shore and the elevation of their tops determined (Figure 2). Each time a beach profile was to be made, the elevation of the sand with respect to the tops of the pipes was measured. Thus, it was possible to compute the elevation of the beach at each of the measuring points by addition or subtraction. All of these beach elevations are given in Tables I, II, III, and V. Profiles from these data are given in Figures 3, 4a, 4b, 5, and 6.

For each of the profiles measured we computed the slope of the foreshore, defining the foreshore as that part of the beach between mean and mean low water. Foreshore slope values in degrees are also given in the tables.

Beach volumes were likewise computed for each profile measured. The

depth of the beach sand was considered to extend to a plane defined by mean low water, width of the beach parallel to the shore was arbitrarily chosen as one foot and the length of the beach was the measured profile itself. Total volumes and volume changes are given in the tables.

Distance of the reach from the foot of the dunes (origin stake) and the elevation of the reach are given. We define the reach as the most landward point on the beach reached by the last high tide prior to the measurement.

ACKNOWLEDGMENTS

There has been a vast amount of data processing associated with these beach measurements. A written acknowledgment cannot begin to convey our thanks to Mrs. Nancy Lander who patiently typed the thousands of numbers. Mr. Charles Innis, head of the Drafting Department and Mr. Herbert Ashmore, draftsman, provided such willing service that the writers had the temerity to ask for rather elaborate illustrations, which certainly make digestion of the tables easier.

The field work was supported entirely by the Geography Branch of the Office of Naval Research under contract number Nonr-1254 (00) (NR-388-018).

Table I Measurements made across Highland Beach, December 1956-May 1958. Slope of the foreshore, elevation and distance seaward from the origin of the reach, volume and volume changes are given for the same time interval.

Table IV Measurements made across New Beach, January 1958-May 1958.
Slope of the foreshore, elevation and distance seaward from the
origin of the reach, volume and volume changes are given for
the same time interval.

New Beach 1958
