## ABSTRACT

Hydrographic and CTD data collected during R.V. Endeavor cruise 129 are presented. These data include temperature, salinity and dissolved oxygen observed at standard levels by a Neil Brown Instrument Systems' CTD-O<sub>2</sub> profiler and salinity, dissolved oxygen, silica, phosphate and nitrate values at the observed depths of the collected water samples. Ninety-two stations were occupied on two short sections within the Caribbean and one long meridional section at (nominally) 64° West from the British Virgin Islands to the 200 m depth contour south of Newfoundland. Also presented are a series of sectional profiles of the six observed parameters as a function of depth.

HYDROGRAPHIC DATA FROM R.V. ENDEAVOR CRUISE # 129

Data Report  
by  
George P. Knapp

GENERAL DESCRIPTION OF WORK

This report tabulates the hydrographic and CTD data obtained during the R.V. Endeavor cruise 129. During April, 1985, 92 stations were occupied on two short sections within the Caribbean Sea and one long meridional section at (nominally) 64° West. The short sections ran across the Jungfern Passage to the west of St. Croix and the Virgin Island Basin north of St. Croix, and the long section runs from the British Virgin Islands to the 200 m depth contour south of Newfoundland. On each station a Neil Brown Instrument Systems' Conductivity-Temperature-Depth-Oxygen Profiler (CTD-O<sub>2</sub>) equipped with a General Oceanics Co. rosette sampler with 24 1.2 liter Niskin bottles and a bottom finding pinger was lowered to within 20 meters of the bottom. During the station pressure, temperature, conductivity and dissolved oxygen were measured continuously. Water samples were collected at selected depths for calibration of the CTD-O<sub>2</sub> salinity and oxygen sensors and for the analysis of silica, phosphate and nitrate. In addition, tritium-He<sup>3</sup> samples were collected at selected stations for later analysis ashore. (That data is not included in this report. Contact W. Jenkins, WHOI, for further information.)

Water-sample salinities were measured on a Guildline Model 8400A Autosal salinometer installed in a portable laboratory that is capable of maintaining temperature to within  $\pm 1^\circ \text{C}$  (Knapp and Stalcup, 1987). A single batch of I.A.P.S.O. standard water was used for the entire cruise: Batch P-93. All salinities have been corrected for the difference between this batch and the PSS78 KCl standard, as recommended by Mantyla (1987), and the resulting accuracy is  $\pm 0.001 \text{ p.s.u.}$  (practical salinity units). Dissolved oxygen values were determined by a modified Winkler titration method (Carpenter, 1965) with a colorimetric endpoint determination. Standardizations were performed with 0.01N potassium iodide solutions that were prepared prior to the cruise. Accuracy of the oxygen values is considered to be  $\pm 0.04 \text{ ml/l}$ . Silica, phosphate and nitrate analyses were performed at sea on a Technicon AutoAnalyzer using standard solutions prepared aboard ship from preweighed standards. The final phosphate values are accurate to  $\pm 1\%$ , and the silica and nitrate values to  $\pm 2\%$ . The temperature sensor on the CTD-O<sub>2</sub> was calibrated before and after the cruise and is believed accurate to  $\pm .002^\circ \text{C}$ . The raw data from the tem-

perature, conductivity and oxygen sensors were processed by the standard techniques of the W.H.O.I. CTD Group (Millard, 1982). Both the final CTD-O<sub>2</sub> data set (sorted by 2 db intervals) and the nutrient data set have been submitted to the National Oceanographic Data Center.

The CTD-O<sub>2</sub> and hydrographic data in this report are presented in two separate formats. The first listing on each page is the CTD-O<sub>2</sub> temperature, salinity and oxygen values at standard pressures obtained during the down-cast. These values are the average of a six decibar segment of the water column, centered on the standard pressure. Following the oxygen column are calculated variables, based on the 1980 equation of state of seawater (Fofonoff and Millard, 1984): potential temperature, density relative to 0, 1500 and 3000 db, dynamic height, Brunt-Vaisala period and depth.

The second listing on each page contains the water sample data obtained during the upcast of the station along with the pressure and temperature from the CTD.

Also presented are sectional profiles showing the six observed properties as a function of depth for each of the three sections. Vertical distortion of the two short Caribbean sections is 100:1 and of the 64°W section is 500:1. The bathymetry between stations was recorded continuously during the cruise, and is plotted here at approximately four nautical mile intervals. The dots on the nutrient profiles represent bottle positions.

#### ACKNOWLEDGEMENTS

Appreciation is extended to the officers and crew of the R/V Endeavor for their cooperation and excellent seamanship exhibited during the cruise. Thanks are also expressed to the University of Rhode Island's URI/GSO Marine Technician group under the direction of Mr. William Hahn. This work was generously supported by the National Science Foundation grant no. OCE84-14243.

<b>16. Abstract (Limit: 200 words)</b>  Hydrographic and CTD data collected during R.V. <i>Endeavor</i> cruise 129 are presented. These data include temperature, salinity and dissolved oxygen observed at standard levels by a Neil Brown Instrument Systems' CTD-O <sub>2</sub> profiler and salinity, dissolved oxygen, silica, phosphate and nitrate values at the observed depths of the collected water samples. Ninety-two stations were occupied on two short sections within the Caribbean and one long meridional section at (nominally) 64° West from the British Virgin Islands to the 200 m depth contour south of Newfoundland. Also presented are a series of sectional profiles of the six observed parameters as a function of depth.
